High Explosive Shell Manufacture

Staff Article

Instances have been numerous throughout the country where plants have had to be greatly extended in order to cope with the demand for war material. Certain lines of industry have not been forced to extend so much as others, and in the following article is described a 4.5 in. shell plant which found convenient accommodation in a disused power house.

4.5 SHELL PRODUCTION IN A SHIP-BUILDING PLANT

OWING to the difficulty of obtaining delivery of new tools in reasonable time, this plant was equipped with such existing machines as were suitable for handling 4.5-in. howitzer shells, new machinery of special design being installed when available.

The forgings are received in the rough state and all subsequent operations are performed necessary to prepare the shell for receiving the charge of explosive, and being assembled with the cartridge case.

The manufacture of this size of shell (4.5-in.) was undertaken after all the available factory space had been occupied with shrapnel. The building in which the work is carried in was formerly a power house, 100 ft. x 50 ft. The adoption of hydro-electric power supply enabled the necessary electrical apparatus to be concentrated in a space 20 ft. wide across one end of the building. The height of the building was ample to allow of adding a floor, thus more than doubling the floor space. The result has been the development of a 4.5-in. department which, though limited in size of equipment, is producing shells in a satisfactory manner both as regards quality and quantity.

The general arrangement of the shop is shown in Fig. 1, which gives plans of the ground floor and first floor respectively.

Rough forgings are received at the south end of the building where ample space has been left for handling material. The work is elevated to the first floor by means of an electric hoist running on a track, the opening in the upper floor being immediately above the door mentioned. The space on the ground floor underneath has accordingly to be kept amply clear for reasons of safety.

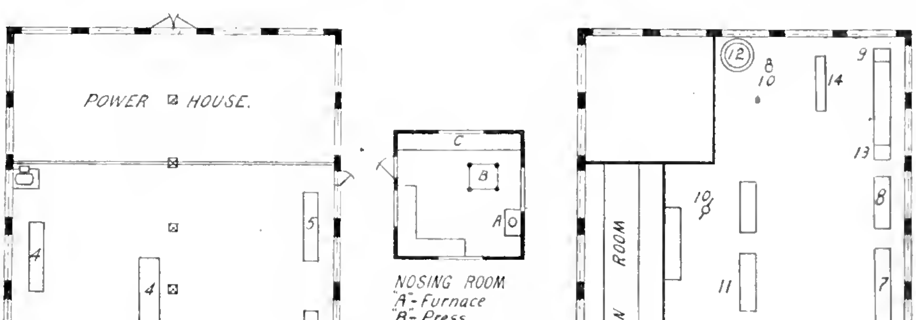

FIG. 1. LAYOUT OF PLANT SHOWING LOWER AND UPPER FLOORS.

Cutting-off and Centering

A "Hall" cutting-off machine is used for trimming both base and mouth of forgings. In accordance with recognized practice, the shell is positioned with the inside of the base against a stop-rod held inside the hollow spindle, and the base is machined off to the necessary thickness, two cutting tools being employed. After a suitable number of forgings have been faced, the positioning rod is readjusted and the shell inserted base first so that the open and is now in position to be trimmed, leaving the forging ready for centering.

Centering is performed accurately and quickly on a small "Aurora" drill press equipped with a centering arbor of the tilting type. This machine, along with the cutting-off machine, is shown in Fig. 2. The arbor is fitted with three flat spring strips which approximate closely to the shape of the inner surface of the shell. A horizontal arm with adjustable counterweight maintains the forging in a vertical position while being centered, any readjustment from

time to time being obtained by moving the counterweight along the inclined face on which it rests. In placing or removing the shell, the arbor is tilted to a horizontal position, as shown in the illustration.

FIG. 2—CUTTING-OFF MACHINE AND DRILL PRESS WITH CENTERING ARBOR

Rough Turning

The machines employed on rough turning are a 26-in. "New Haven" engine lathe and a 30-in. "C. M. C." engine lathe. The latter machine is fitted with a simple cross-slide on the carriage, supporting a square tool box of the four-tool type, which has been so largely adopted by shell makers for the simpler operations. The absence of a compound rest gives increased stiffness to the structure and enables the heaviest possible cuts to be taken without any signs of distress.

The forgings are mounted on an expanding arbor with two sets of driving dogs, the mechanism being operated by a hand-wheel at the tail end of hollow spindle. These arbors give excellent service and no trouble has been experienced at any time with forgings slipping under heavy cuts.

The shell is turned to the dimensions shown in Fig. 3, the base being finished, while a finishing cut is left on the parallel portion, and suitable material on the part which is formed in the nosing operation.

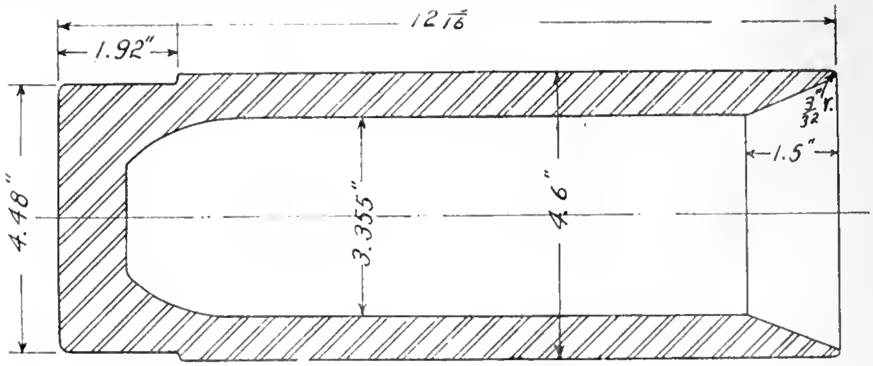

FIG. 3. DIMENSIONS OF SHELL FORGING WHEN ROUGH TURNED READY FOR NOSING.

Boring

The machining of the interior is divided amongst three machines. Two of these are "American" turret lathes which do the boring proper, while a "Gisholt" turret lathe is used for putting the proper outline on the nose. The shells are held in a large split sleeve chuck tightened by means of two bolts. The parallel portion is rough bored by a single tool bar of ample stiffness, and the bottom roughed out by a notched-formed cutter. Finish reaming on both portions completes the work of these machines.

The shells are next held in a similar chuck while the outer edge of the mouth is well rounded off to facilitate the action of the nosing die, and the inside of the mouth is deeply countersunk so that when the nose is formed, the closed-in material leaves a practically parallel hole of desired size to admit the boring tools used in finishing the nose.

The heating furnace and hydraulic press for closing in the nose are conveniently located in a separate building about 15 ft. square, formerly used for storage purposes. This minimises the fire risk, which would be incurred through installing the furnace in a shop with the usual amount of woodwork in the shape of floors and partitions.

An oil burning furnace made by the Tate-Jones Co. is installed along with a "Southwark" hydraulic press of the ordinary vertical four-column type with ram below the lower platen. An annealing bed of ample capacity occupies one side of the nosing room, the general layout of which is shown in Fig. 1.

FIG. 4 GROUND FLOOR OF BUILDING WHERE ROUGH MACHINING IS PERFORMED

Finishing the nose

The nosed-in shells are now returned to the machine shop where the nose is finished. This consists of four operations, viz., boring, facing to length, beveling mouth, and tapping. Two 26-in. lathes built by J. B. Reed are engaged on this work, seven-hole turrets being mounted on the standard carriage in

place of ordinary tool slides. Four tools are carried in these turrets, performing the operations in the order mentioned

FIG. 5—VIEW OF NOSING PRESS AND HEATING FURNACE

above. Collapsing taps are used to advantage on these machines, the type adopted being that made by the Manufacturers Equipment Co.

The completion of this operation terminates the amount of work done on the lower floor, the remainder of the work including enamelling and painting, being completed on the upper floor.

Finishing the Outside

Two 26-in. engine lathes are engaged in machining the outer diameter of the shell to the required size and shape. These are built by Prentice Bros. and Edwin Harrington & Co., and are fitted with sleeve chucks which grip the base end of the shell where it was finished to size during the rough turning operation. This finished diameter acts as a gauge for setting the finishing cut quickly and accurately. A centre plug is screwed into the threaded nose to allow the tailstock to support that end of the shell.

Profile bars of the now familiar type are used for controlling the movement of the tool, suspended counterweights keeping the tool guide up to the copy.

An old Gisholt lathe of an early design has been pressed into service and is doing good work recessing the bases preparatory to being threaded.

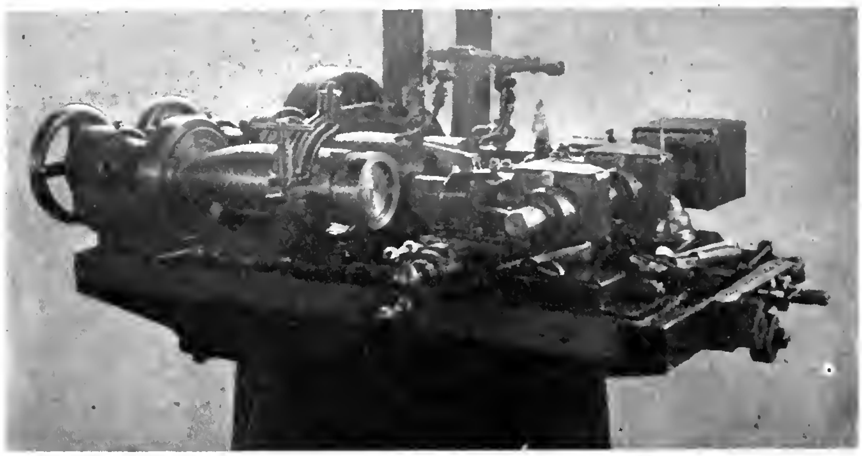

FIG. 7 DUPLEX AUTOMATIC THREAD MILLING MACHINE

Threading Base Recess

A duplex automatic thread milling machine is used for forming the thread in the base. This machine is illustrated in Fig. 7 and consists of a box-form bed on which are mounted at the left two driving spindles fitted with draw-in collet chucks. These chucks hold driving plates, in the centre of which is a threaded boss on to which the nose of the shell is screwed. The two shells are supported in a double steady rest. At the right of the machine are the cutter arbors, which are mounted in sliding carriages travelled by gearing to suit the pitch of the thread, the shell meanwhile being revolved at the necessary rate by means of suitable gearing.

Owing to the use of long cutters, which steady the cutting teeth, the pitch of the thread is maintained accurately. Should occasion arise when a thread is not exactly to gauge, it is corrected by using a Pratt & Whitney adjustable tap.

Inserting Base Plates

The shells are now ready to receive the base plates, the threads being coated with red lead cement to insure a tight joint. The shells are held in a vertical chuck mounted in a pedestal secured to the floor, the tightening of the plate being done by two men who use a long double-ended wrench and pull till the square boss on which the wrench fits is twisted off. The stress necessary to do this insures a satisfactory degree of tightness on the thread.

The riveting of the plate around the joint is done with a pneumatic hammer and caulking tool, a heavy sleeve with an opening of the required size being slipped over the inverted shell. This sleeve guides the caulking tool around the joint and permits the operator to give his entire attention to the action of the tool, see Fig. 8.

FIG. 6 VIEW OF UPPER FLOOR

Machining the Groove

Grooving, undercutting and waving are performed on a J. B. Reed lathe fitted with "Bertram" attachments which have been frequently mentioned in connection with shell manufacture.

The base is now faced off in a "Hall" cutting-off machine after which the

nace. During the last two or three years rapid strides have been made with the duplex or Bessemer-open-hearth process, and costs are being obtained which compensate for the excessive metal loss in the Bessemer part of the process.

It may be that the duplex process in connection with either the basic or acid electric furnace will give us the solution. However, enough has been already done with the manufacture of the heavier or lower priced products to indicate that, provided it is turned out in producing units of equal size, the total cost of electric steel will be near enough to that of open-hearth steel, so that the manufacturer can afford to stand the difference in order to give the consumer quality, the requirements for which are constantly growing more rigid.

The possibility of bringing the cost of the two steels near together will appear more feasible if we consider such incidental savings as the use of cheap pig iron at the beginning of the process and the smaller discard of rolled product due to having an ingot free from segregation.

Electric Furnace in Germany and France

In Germany, Luxembourg and eastern France, the electric furnace is the best apparent solution of a condition which is a menace to the steel industry of those countries. While the high phosporus ores of Luxembourg and Lorraine, together with the basic Bessemer process, made possible the great steel development of Germany, the quality of basic Bessemer steel does not to-day give it a standing with open-hearth steel, while the demand for better quality is daily growing. On the other hand, basic Bessemer steel, after refining in the electric furnace, is superior to open-hearth steel. The manufacture of electric steel by this method was begun in Germany several years ago, and has in moderate quantities been made into all kinds of steel products. It seems probable that the American steel manufacturer will find it necessary to adopt electric steel to meet the competition which he will meet in the world's markets.

Fast Progress in America

It has been remarked that the process of electric steel manufacture in America has been slow as compared with that in Europe, but the indications are that this relation will soon be reversed. It was natural that the invention of the electric furnace should be made in countries where cheap hydroelectric power was already in extensive use for other electrochemical processes, but it was only a couple of years before the first electric furnace was installed in the United States. We must also remember that the first large furnace, namely, one of 15 tons capacity, requiring electrodes 2 ft. in diameter, a then unheard of size for steel furnace use, was built here; also that this furnace was the first to use 3-phase electric current, which adapted it to utilize the kind of current in general commercial use. There are now (September) either built or building over 40 electric furnaces in America, of which there are 27 of the Heroult type alone. The average size of these furnaces is also greater than the average size in Europe. These figures have however, been considerably exceeded in the last three months, says the Iron Age, to which we are indebted for this condensed statement of the Author's views.

If the electric furnace be used for the further refining of steel made in present installations of the older processes, as now seems probable, the amount of electric steel produced should then eventually be commensurate with that now being produced by those processes; and it follows that "electric steel production in the United States will exceed that of any other country."

TUNGSTEN

By Roy C. McKenna.*

THE greatest use of tungsten is as an alloy of high-speed steel: that is, of steel used for making tools for metal turning lathes running at high speed, to which tungsten and chromium impart the property of holding its temper at higher temperatures than will carbon steels. In such steels, from 16 per cent. to 20 per cent. of tungsten is used. The use of tungsten in magnet steel has consumed large amounts of tungsten; however, probably 90 per cent. of all tungsten ore mined is used in the manufacture of high-speed steel.

Tungsten Ores and Their Location

Tungsten ore is mined in many parts of the world. Its production in the United States has been recorded only since 1900; before that time, the amount mined was insignificant. There are four kinds of tungsten ore, known as Ferberite, Wolframite, Hubnerite and Scheelite. All of these are mined in the United States.

Ferberite ore is a combination of iron and tungsten; Hubnerite ore, a combination of manganese and tungsten; Scheelite, a combination of lime and tungsten, and Wolframite ore is a combination of iron, manganese and tungsten.

Tungsten ore is mined in the United States, in Arizona, California, Colorado, Idaho, Nevada, New Mexico, South Dakota, Washington and Alaska. The oldest and best known tungsten mines in the world are located in Spain and Portugal. The best grade of ore and the best producing mines are found in Boulder County, Colorado. In the U. S. Geological Survey's Report on Mineral Resources of the United States, 1913, Mr. Frank L. Hess, in speaking of the Boulder Colorado field, says: "The district is unique, in that it is the only large ferberite producing district in the world." The Burma fields are the most recent, and in the year 1914 were the largest producers of tungsten ore in the world.

Tungsten ore is also mined in Australia, India, Japan, Siam, Argentina, Brazil and Peru; and although tungsten ore deposits are found in so many sections of the world, there were produced in the year 1912 only 9,654 tons (short) of 60 per cent. tungsten trioxide concentrates, or less than 10,000,000 pounds of tungsten metal. The main source of supply in the United States for scheelite ore is in California; scheelite ore is also imported from South America and Japan.

Wolframite ore is imported into the United States at the present time from Spain, Portugal and South America. In normal times large quantities of wolframite ore is imported from the Burma tungsten fields and Australia. However, the British Government has now prohibited the exportation of tungsten ore from any of the British colonies to any country except Great Britain and her Allies.

Hubnerite ore is mined in Arizona and New Mexico; but the quantity of hubnerite ore on the market is very limited.

Both wolframite ore and hubnerite ore are likely to contain copper and tin, two elements which are extremely detrimental, and must be very carefully eliminated in ferro-tungsten before it can be used in the manufacture of high-speed steel.

Ferberite ore is the best grade of tungsten ore, and has always brought a premium in price over the other grades. The only large ferberite-producing district in the world is in Boulder County, Colorado.

Mining Methods

The methods of mining all kinds of tungsten ore and the formation of all tungsten fields are similar. The writer is, however, more familiar with the tungsten fields of Boulder County, Colorado. Tungsten minerals, like tin ore, generally occur in veins cutting through granite rocks. Tungsten ore in the Boulder field is mined in veins, the vein in many cases being no thicker than a lead pencil. Again, it may be as thick as a man's arm, and in some instances, it may be as thick as a man's body. The ore in these veins contains from 3 per cent. to 10 per cent. tungsten trioxide. It is only when one vein leads into or crosses another that there is found a "pocket" of tungsten. A pocket of tungsten generally contains about one cubic foot of ore of about 65

*President, Vanadium Alloys Steel Co., Pittsburgh, Pa.

per cent. tungsten trioxide. If three or more veins meet at the same point, there may be formed a room of tungsten. A room of tungsten would contain about two cubic yards of mostly 10 per cent. tungsten ore, with several pockets of high-grade ore averaging from 60 per cent. to 65 per cent. tungsten trioxide.

Tungsten mining in the United States and in all other parts of the world is conducted with very primitive methods; in fact, for years tungsten mining has been unprofitable, for the reason that the cost of obtaining the ore has been in excess of its market value.

Investments in tungsten mines have been unattractive to conservative investors, and most large tungsten properties in Boulder County, Colorado, are owned and controlled by ultimate users of tungsten metal. The ownership of tungsten mines is only justified in securing the permanency of supply to the manufacturer of high-speed steel or ferro-tungsten. The large producing properties in Colorado are operated through lessees. It is a general practice in Colorado for the mining company to allow the lessee 75 per cent. of the market value of tungsten ore mined. With 25 per cent. the mining companies of Boulder County have furnished their lessees with electric hoists free of charge, the lessees having to pay only for the electricity used. In many of the shafts, the mine owners have furnished compressed air for drilling at or near cost to the lessee. There is, however, a fascination in tungsten mining, and there is always that gambling chance of striking a rich deposit. Owing to the small size of the tungsten vein, it is necessary to remove a great amount of dirt and rock.

In the Boulder County fields very few of the tungsten mines are profitable to work to a greater depth than 100 feet. It is a fact, however, that the deeper the mine shaft is sunk, the richer the deposit of tungsten ore. The deepest mine in Boulder County is 800 feet in depth, and, although at this depth the ore is richer, the increased cost of mining is such as to hardly justify operation.

War Conditions Increase Price

In the past year the enormous demand created for high-speed steel by the acceptance in America of large orders for war munitions, together with the prohibiting of the exportation of ore from British colonies, has increased the price of tungsten ore to five times normal. To meet the increased demand for tungsten ore, the mine owners and miners are forced to operate the least desirable veins. In the State of California there is being mined at the present time a vein of 1 per cent. scheelite ore two inches in diameter, running through solid granite, more than 800 feet under ground.

Owing to the nature of tungsten deposits, there is no likelihood of the discovery of any large fields. It is, however, a fact that upon the discovery of new fields tungsten ore is produced rapidly, owing to the fact that it can be operated as a placer mine. It is very seldom that a new tungsten field produces nearly as large a quantity the second or following years that it produces the year of discovery.

Only the Burma tungsten fields rival in production the fields of Boulder County, Colorado. The Burma tungsten fields produced and sold in past years more tungsten than Boulder County, not on account of being richer, but on account of the lack of tariff protection. The price of tungsten ore in the United States was such that mining operations could not be carried on profitably; Burma fields could operate only because of the extreme cheapness of coolie labor.

The primitive methods used in mining tungsten in the United States are not due to lack of progress, but are due entirely to the unwillingness of capital to invest the large sums of money necessary in a business of such uncertainty. Experience has taught mine owners that the temptation that lured the gold miner to lose his fortune is ever present in tungsten mining, even to a greater extent. The mine owners have adopted a safe and sane policy of allowing the men whose bread and butter depends upon production to select the vein to be worked; this leads to conservativeness otherwise impossible.

A New Industry

One of the least known, and yet one of the most important of our new industries, established through necessity occasioned by the war, is the manufacture of ferro-tungsten. Formerly the American users of this product bought their supply from foreign manufacturers. As ferro-tungsten is almost entirely used in making high-speed steel, it does not require much explanation or imagination to show the helpless position of the people of this country in event of hostilities with or between other nations. It is hoped that our Government will recognize the great value of this new industry, which, in fact, is more vital to the country than many people realize—and that Congress will afford a measure of protection to the capital already invested, so that we may continue always to be independent and safe from the menace of foreign control.

Considerable quantity of tungsten is also used in the manufacture of incandescent lamps, which are fast displacing carbon lamps. It is understood that tungsten wire may be drawn to smaller sizes than any other metal now known; it is used for contact points in spark coils, etc. Dr. Fink, of the General Electric Company, says that tungsten is well suited for standard weights, since wrought tungsten can be made so hard it will readily scratch glass and still be ductile.

Tungsten weights remain wonderfully constant; even medical science is beginning to recognize the value of tungsten. It has been suggested to use the fine tungsten wires in surgical operations, instead of the coarser gold and silver wires.

Automobile manufacturers, recognizing within the past few years that tungsten, combined with chromium, imparts to steel the quality of retaining its hardness at high temperatures, have created an unusual demand for high-speed steel for automobile valves.

Evidently the commercial possibilities of tungsten are as yet hardly touched. New uses are being found daily for this wonderful metal. Unquestionably the future has many secrets to unfold for the benefit of all mankind.

PROTECTION AGAINST CORROSION

PROTECTION against corrosion is most difficult in the case of quantities of small-size articles. A method which has been giving first-rate results in the case of buckles, rings, and harness fittings generally may help to solve this vexed question elsewhere. Cheap varnish is diluted to two or three times its volume with methylated spirits. On account of evaporation, the mixture is made up as required. The apparatus consists of two oil drums each minus one end. An ordinary 5-gallon drum, which is 11in. in diameter, has ½in. holes punched in the bottom and sides. The other drum may be of 6¾-gallon capacity, of 12-in. diameter, or a 10-gallon drum. The larger vessel is filled about one-quarter full and the articles to be treated put in the smaller vessel. The perforated drum is lowered into the liquid, immersing the articles to be coated. Withdrawing the smaller vessel immediately, the major portion of the fluid drains back again in a minute or so. To finish draining and to harden the coating, the contents are then shot out on a wire draining surface, and in fifteen minutes are ready to pack. The process is really a cheap and effective form of cold lacquering in bulk. The articles remain bright for long periods of time, while the coating is not in the least obvious.

If the world does not recognize your talents, don't get discouraged; get mad. An angry man sometimes accomplishes something; a discouraged one never does.

A PECULIAR FEATURE OF LARGE STEEL FORGINGS

OCCASIONALLY when machining large forgings a difference in the cutting properties of the metal makes itself apparent at certain points on the surface with more or less regularity, so that as the tool travels along, these spots develop into lines along the work. These lines are caused by the tool either "jumping" over the spot, or "dragging," so as to leave the lines either as slight projections, or depressions.

The cause of these "ghost lines" has been very fully investigated by Professor J. O. Arnold, of Sheffield University, who traces their origin to a definite alloy of iron with sulphide of manganese which segregates during the solidification of the steel when cast into ingot form previous to forging.

This segregation takes place at a series of centres or nuclei, to which are attracted some of the carbon, phosphorus, sulphur, and if present, nickel which are in the steel originally. These segregations form globules which on forging are drawn into lines. On annealing the forging, the carbon in the segregation seems to be expelled leaving the ghost lines in a soft condition.

Test pieces were cut from two propellor shafts, one containing ghost lines, and one without. With the ghost lines running parallel with the length of the specimens, it was found that neither under tensile, torsional, nor alternating stress was any difference observable in the two specimens. Further, no cracking or opening at the ghost lines was detected.

Examining a Large Specimen

On a recent occasion, an opportunity occurred to examine the nature of certain gigantic "ghosts" about 5/8 in. in diameter by 9 in. long, which were found in a chrome-nickel steel ingot intended to weigh about fifty-seven tons. A "burst out" took place five minutes after casting, and seventeen tons of metal were lost before the "bleeding" was stopped. In each of the octagonal angles of the portion remaining in the mould, protruding ghosts of the general dimensions stated were found when the ingot was sawn up cold.

Chemical analysis showed that in the ghosts the carbon present was 0.27 per cent. as compared with 0.19 per cent. in the ghost free portions. Manganese was 0.57 in the ghost, and 0.53 elsewhere. Silicon, sulphur, and phosphorus were much higher in the ghost, amounting to 0.215, 0.12, and 0.082 per cent. respectively as compared with 0.168, 0.037, and 0.028 respectively in other parts. The chromium content was practically the same, 0.74 and 0.75 per cent., but the nickel was largely increased being 4.24 per cent. in the ghost, against 3.74 per cent. in the body of the ingot.

THE BONTEMPI RUST-PROOFING PROCESS

AN addition to the number of rust-proofing processes is announced in an English contemporary. According to the information so far published, the process consists in the oxidizing of cast and wrought iron and steel pieces used in civil, mechanical, electrical, and naval engineering work, thus rendering them able to withstand for a practically unlimited period the corrosive action of the atmosphere, of water, and of sulphurous and other gases.

The pieces to be treated are first cleaned by means of emery paper or by sand blasting. They are then placed on a kind of steel-wire cage; this is driven inside an air-tight muffle which has been previously heated by means of gas jets. When the muffle has been closed in front, after insertion of the pieces to be treated, superheated steam is delivered inside the muffle, with the object of preparing the surfaces of the pieces for the subsequent action of chemical fumes. After the pieces in the muffle have been subjected to the action of the superheated steam for about 30 minutes, the delivery of steam is cut off, and the chemical substance, in the form of a powder, is placed in a separate retort at the back of the muffle. The retort is heated separately, also by gas-jets; the fumes from the chemical powder enter the muffle under pressure, and give the pieces under treatment a protective coating of oxide. On the cage being removed from the muffle, it is covered by a casing, to allow of the gradual cooling of the pieces under treatment.

The pieces so treated, on being removed from the muffle, are of a light grey color, and in that state they are practically non-corrosive in any medium; whilst they are still hot, they are dipped in oil, with a view to render them of a more attractive rich blue-black color. If required, the material so treated can be painted; the paint is more adhesive on treated than on non-treated material. The chemical used is non-poisonous and non-explosive.

The process described has been invented by Augusto Bontempi, an Italian chemist, and is being operated by the British Bontempi Rust-Proofing Company, Ltd., Creek Street, Deptford, London, S.E., which has acquired the British and British Colonial patents.

THE INFLUENCE OF MOLYBDENUM ON HIGH SPEED STEEL

THE recent production of molybdenite, the ore which contains the metal molybdenum, has occasioned considerable interest in engineering circles in view of the demand for this metal in the production of high speed steel. The enormous cost of high speed steel has caused a wide-spread interest in the various alloys which impart to it the peculiar edge-retaining properties under the high temperature produced by high speed and heavy cuts.

A series of researches has just been concluded by Professor J. O. Arnold, of Sheffield, and Professor A. A. Read, of Cardiff, dealing with the relations of iron and carbon with nickel, chromium, manganese, vanadium, tungsten, cobalt and molybdenum.

The molybdenum researches involved the making of five varieties of steel, each with a different percentage of molybdenum, but with the other constituents as nearly as possible constant in value. These steels were prepared at Sheffield University, being cast in the form of ingots weighing about 36 lbs. each, and a section two inches square. These were then reheated and hammered into bars 3/4 in. dia. All of the steels behaved well under the forging treatment, in contrast

to reports by previous investigators who noticed "red-shortness"—the superior behaviour of these steels being probably due to greater purity of the molybdenum. After forging, the bars were annealed at 800 deg. Cent., for about eight hours, and then cooled down over a period of twenty-four hours.

PROPERTIES OF MOLYBDENUM STEELS.

Steel.	A	B	C	D	E
Molybdenum	2.43	4.95	10.15	15.46	20.7
Carbon	0.77	....	.....	.....	....
Silicon	0.079	....	.....	.....	....
Manganese	0.23	....	.....	.....	....
Phosphorus	0.017	....	.....	.....	....
Sulphur	0.036	....	.....	.....	....
Aluminum	0.01	....	.....	.....	....
Yield point. Tons sq. in.	25.24	38.28	38.84	41.00	39.64
Max. stress. Tons sq. in.	45.8	49.32	49.16	55.26	53.72
Elongation, per cent.	15.6	11.6	11.6	14.5	13.6
Reduction of area, per cent.	29.1	19.9	23.5	24.9	19.3

Several discs of steel D, ⅝ in. in diameter by ¼ in. thick were prepared. These were heated to various degrees and quenched in cold water. A disc quenched from 1,571 degs. Fah., filed easily and was not brittle. Another quenched from 1,814 deg. could be filed, and was not brittle. A third quenched from 1,940 deg. filed with difficulty and was rather brittle. Discs quenched from 2,057 deg. and 2,156 deg. were both dead hard to the file and very brittle.

Referring to the value of molybdenum to the industries, Professor Arnold did not think the future of molybdenum steel was bright. As an element in steel molybdenum was curiously unreliable. It was more than twice as powerful as tungsten, but tungsten was very reliable in its action. Much money had been lost by steel makers by the reckless use of molybdenum, because of the uncertainty of its action. The general verdict of practical steel makers with regard to its use seemed to be that, while a good molybdenum steel, when obtained, could not be beaten—four or five bad batches of such steel were produced for every good batch.

While corrosion tests on the whole series of steels were still in course of operation, the information was given that with 15 per cent. of chromium present, a steel was obtained which seemed to be practically incorrodible.

CHART FOR CONVEYOR BELT CALCULATIONS

By J. D. Mooney and B. L. Darnell

THE accompanying chart has been drawn for the convenience of engineers as a means of quickly determining the correct number of plies of conveyor belts operating under specific conditions. The calculations are based on the average safe strength with a factor of safety of 15, of the various standard rubber conveyor belts. The calculations assume maximum loading conditions; that is, the belt is considered as carrying the greatest load that it will handle without spillage at ordinary belt speeds. This not only produces the most economical operating conditions, but also the maximum tension in the belt.

The chart is a graphical representation of the formula where:

$p = kgW\ (L+10H)$

p = the correct number of plies

k = a constant depending on the type of drive

g = the weight in pounds per cubic foot of material handled

W = the width of the belt in inches

L = the length of the belt in feet

H = the difference in elevation between the head and tail pulleys, in feet.

For a simple drive, with a bare pulley,

$$k = \frac{1}{250,000}$$

For a simple drive, with a rubber-lagged pulley,

$$k = \frac{1}{300,000}$$

For a tandem drive, with bare pulleys

$$k = \frac{1}{375,000}$$

For a tandem drive, with rubber-lagged pulleys,

$$k = \frac{1}{455,000}$$

The chart is drawn for a simple drive, with a bare pulley, therefore, the number of plies obtained from the chart should be multiplied by the factor 0.83 or 5/6 for simple, lagged drive: the factor 0.67 or 2/3 for tandem, bare; and the factor 0.55 or 11/20, for tandem, lagged.

The formula $p = kgW\ (L+10H)$ has been developed mathematically from the following formulae, which have been found to work very satisfactorily in average good practice:

$$U = \frac{0.08W^2Sg}{5,000}$$

$$HP = \left(\frac{0.021}{200} + \frac{0.011}{10}\right) U$$

$$T = \frac{C \times HP \times 100}{S}$$

$$p = \frac{T}{24W}$$

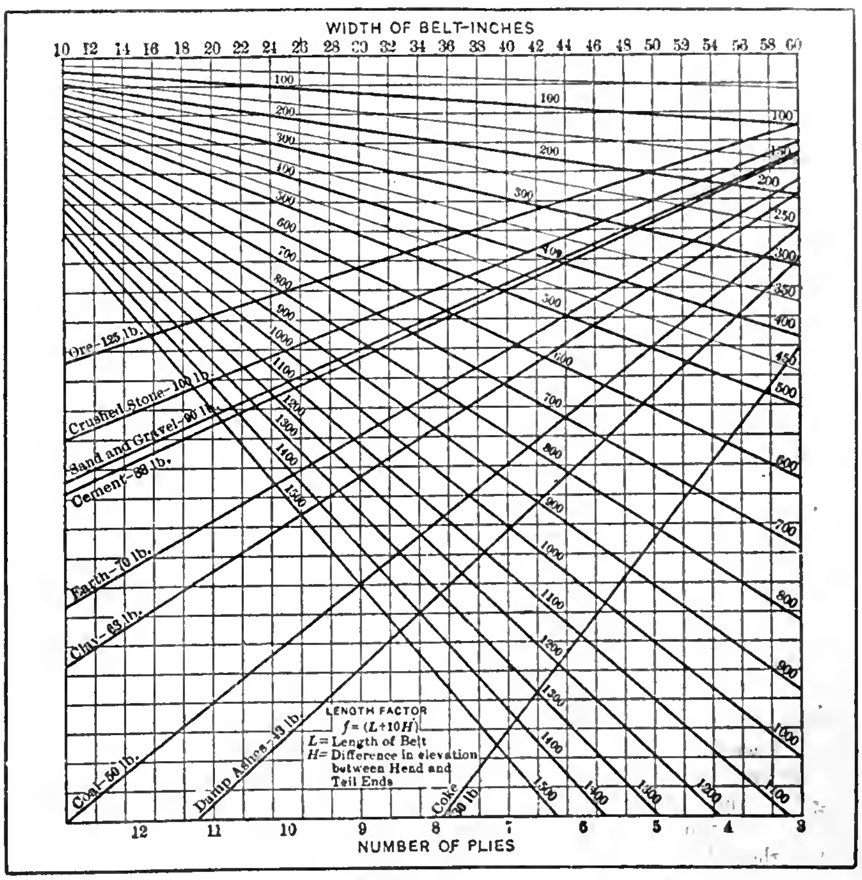

CHART FOR CONVEYOR BELT CALCULATIONS.

Where—
C=Capacity in tons per hour
W = Width of belt in inches
S = Belt speed in feet per minute
g = Weight per cubic foot of material handled
HP = Horsepower developed in driving conveyor belt
l = Length of the conveyor, in feet (approximately ½ L)
H = The difference in elevation between the head and tail pulleys, in feet
T = The total tension in the belt, in pounds.
p = Correct number of plies
C = The constant of the drive.
For a simple drive, bare pulley C = 600
For a simple drive, rubber-lagged pulley C = 500
For a tandem drive, bare pulley C = 400
For a tandem drive, rubber-lagged pulleys C = 330

The length factor, f = (L+10H), represented on the chart by the lines 500, 600, 700, etc., is a developed factor equal to the sum of the length of the belt and ten times the difference in elevation between the head and tail pulleys. To find the correct number of plies for a conveyor belt, knowing the width, the length, the difference in elevation between the head and tail ends, and the kind of material to be handled:

Start from the width given at the top of the chart and move down until this line intersects the line corresponding to the proper length factor; then move either right or left until the line corresponding to the given material is met; then move down again to the scale of plies, where the next largest figure will give the correct number of plies.

For example:—To find the correct number of plies for a conveyor belt 36 inches wide and 300 feet long, with 20 feet difference in elevation; handling sand and gravel: Follow the line from the 36-inch width downward until it intersects the 500 length factor line; then follow to the right until the sand and gravel line is intersected; then down to the ply scale, where the ply will be found to be seven.

ORDER OFFICE PRINCIPLES

EVERY order received from a customer gives your firm an opportunity of making a certain amount of profit. This places your firm under an obligation to each of its customers.

You will fulfil your share of this obligation by guarding your customers' interests. Again, unless you serve your customers well, you serve your firm badly.

Every dissatisfied customer is a wasted opportunity, repeat orders only being obtained by efficient service.

Every contented customer is a stone in the foundation of good-will, on which alone a successful business can be built. By studying your customers' interests, you will best serve your own.

The first order received from any source is the result, direct or indirect, of work done by some other department, and the way in which the transaction is handled by your department will have an important bearing on the obtaining of further business.

You do not come into contact with your firm's customers until an order is placed. See, then, that the service you render is such as to make them willing to repeat the experience.

Whilst you are handling a customer's order, his interests are in your keeping. Show him that they are being properly considered. Thought must be expressed by word and deed.—Herbert's Monthly.

BIG ORDER FOR FREIGHT CARS

THE Canadian Car & Foundry Co. closed an order a few days ago for nearly two thousand freight cars, valued at about $2,000,000, for the French Government. Work on the order is to be started at once. The order ranks as one of the largest equipment contracts yet entered into by a Canadian firm for export.

Last July Canadian Car & Foundry Co. secured a contract for 1,200 freight cars, valued at $1,200,000, from the British Government. The Eastern Car Co., a subsidiary of the Nova Scotia Steel & Coal Co., has also been turning out a large number of cars for the Russian Government, while the National Steel Car Co., of Hamilton, for some time past has been manufacturing small sized cars for France. All this export equipment business represents a new development for Canada.

We understand that the Canadian Car & Foundry Co. recently received its first payment on the big munition contract entered into with the Russian Government last winter. Deliveries under the sub-contracts entered into with American manufacturers are now being made at regular intervals, and will be continued until the various contracts are completed.

It is stated authoritatively that the company's financial position has been considerably strengthened. Gossip regarding an early resumption of dividends is considered premature, however, as the directors are not likely to recommend disbursements to shareholders until the greater portion of the business now on the company's books is completed, and any possibility of future financial difficulties removed. The fact that the company is in a position to take on new business, such as the car contract closed recently, is regarded as a satisfactory sign.

Improvement in ordinary domestic business is said to be having a favorable effect on one of the company's large subsidiaries, the Canadian Steel Foundries. Some large orders for next year were closed recently, and these will supplement the company's activities in the manufacture of war material of various descriptions.

PREVENTING CORROSION IN MARINE BOILERS

A DEMONSTRATION was recently given in London, Eng., of the Cumberland Electrolytic Process for preventing corrosion of all metals immersed in liquids. This system has been developed with special reference to marine boiler application.

According to the inventor, Mr. Elliot Cumberland, the boiler or condenser shell is connected to the negative pole of a 10-volt dynamo; the iron anodes being attached to insulated bolts passing through the shell, and each anode separately joined to the positive pole through an adjustable resistance and a switch. An anode lasted 18 to 24 months, the system requiring very little attention. The current which compensated the corrosive electromotive force also effectually removed hard scale from heating surfaces; the hydrogen bubbles detached the scale, and prevented its further formation. About 2 amperes were requird per 100 sq. ft. of heating surface; the anode, of wrought iron, could be utilized until almost eaten away. The British Admiralty has now adopted the system, and surprising results as to scale removal have been obtained on recent trips across the Atlantic.

Watching the Apprentice—The proprietor of an engineering works in Scotland was watching the leisurely efforts of an apprentice who was swinging his hammer in a gentle way. "Look here laddie," he said, going up to the youth and taking the hammer from him; "when I see a man that takes his hammer by the end of the shaft, and strikes a blow like that, I give that man thirty-two shillings a week; but a man that takes it in the middle like this only gets twenty-five shillings a week, and the sack whenever we get slack. See!" But the boy required an extension of his lesson. "Please, sir," he said, "and where do I hold it for five shillings a week?"

The Goldie & McCulloch Co., of Galt., Ont., will supply the boilers for the new plant being built by the Toronto Carpet Mfg. Co

PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

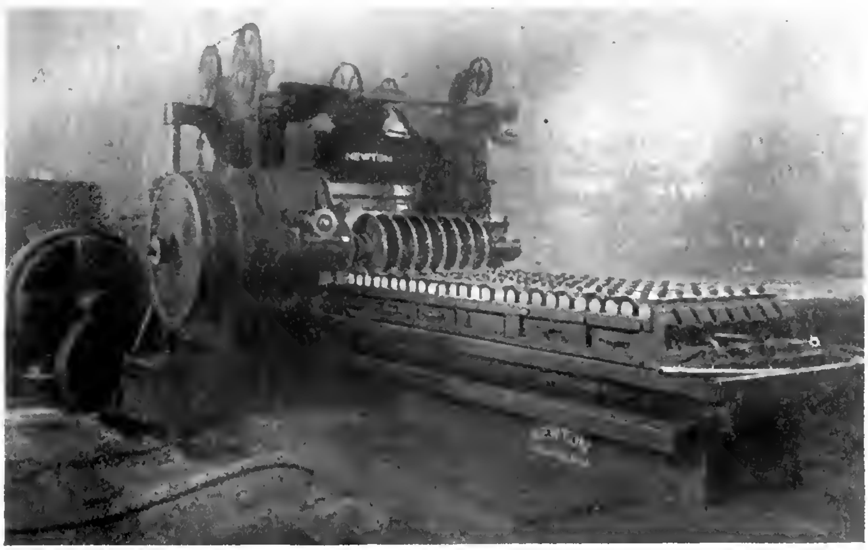
HORIZONTAL MILLING MACHINE

THE 50-in. horizontal milling machine illustrated was originally designed for milling locomotive side and connecting rods, and is now being used for cutting off shrapnel blanks. The method of handling the work is as follows:—Bars, 50 in. in length, are cut off from sixteen bars of steel, which are stacked from three to five high for this operation on the cold saw. The 50 in. lengths are then transferred to the milling machine to be cut up into eight short forging lengths by eight inserted tooth saw blades mounted on an arbor. The rapidity with which this cutting can be done is such that the labor cost is only 25 cents per hundred for the short lengths, which includes the cost of preliminary operation of cutting the steel bars up into 50-in. lengths.

The spindle is arranged to drive a 4-in. arbor by means of a broad-faced key, which is held in place by a through bolt, thus relieving the outboard bearing of all end strain.

The drive to spindle is by a sleeve worm wheel, 35½ in. diameter of steep lead, the teeth being cut in bronze run. The worm is made of hardened steel, and is provided with roller thrust bearings.

Carriage has reversible fast power traverse by means of a friction clutch,



HORIZONTAL MILLING MACHINE FOR SHELL BILLETS.

and the direction in which the lever moves indicates the direction in which the table will travel. Another lever controls the clutch for the feed mechanism, which is provided with an automatic stop. A hand wheel provides hand movement of the table and another wheel governs the adjustment of the spindle saddle and outboard bearing, which can also be raised or lowered by means of an independent three-horse power motor. The saddle is counterweighted, and has square locked gibs bearing on the upright, which can be adjusted by means of taper shoes.

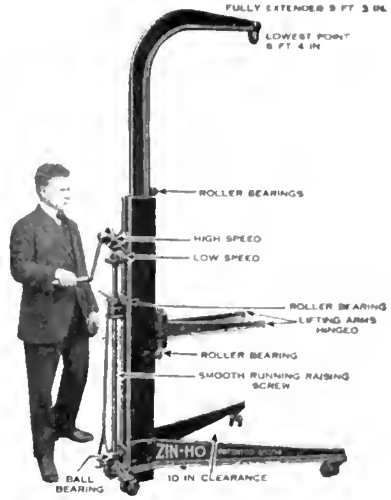
The elevating screws have a top and bottom bearing to maintain alignment at all times. The work table is of heavy construction, and is driven by a spiral rack and pinion. The work table and bed are both connected to the lubricating system and the drip pan is cast integral.

The machine occupies a floor space 21 by 15 feet, weighs 38,000 pounds, and is built by the Newton Machine Tool Works, Inc., Philadelphia, Pa.

PORTABLE JACK AND CRANE

THE adaptability of the screw jack principle to the operation of portable cranes has been made use of in a portable jack and crane recently placed on the market. The device, as will be observed from the illustration consists of a boom or mast similar in appearance to a ship's davit, which can be moved vertically by means of a raising screw located at the back of the vertical guides, thus raising or lowering a nut fastened to the lower end of the boom. The upper end of the raising screw is provided with two sets of hand operated bevel gears which give high and low speeds.

The upper end of the boom is curved over to give a suitable length of reach, and the lower end is provided with a



PORTABLE JACK AND CRANE

couple of arms which swing horizontally out of the way when not required. These arms are very useful in garage work, and are of considerable assistance in assembling many types of machinery where accurate lifting and locating of parts is essential.

This crane is well adapted to handling large shells; its capacity is ample, and the load is self sustained in any position so that one man can adjust the work in his machine with the greatest of ease and accuracy.

Roller bearings support the contact points of the boom on the column, and steering gear of the type usually adopted for this class of device, is employed.

The lowest height of the boom eye is 6 ft. 4 in. from the ground, and the extended height is 9 ft. 3 in. A clearance of 10 in. is provided between the base and the floor.

The total weight of the crane is 300 lbs., and the guaranteed lifting capacity is 4,000 lbs. This device is the product of the Zin-Ho Mfg. Co., 1324 Michigan Avenue, Chicago.

A PEN FOR ENGINEERS

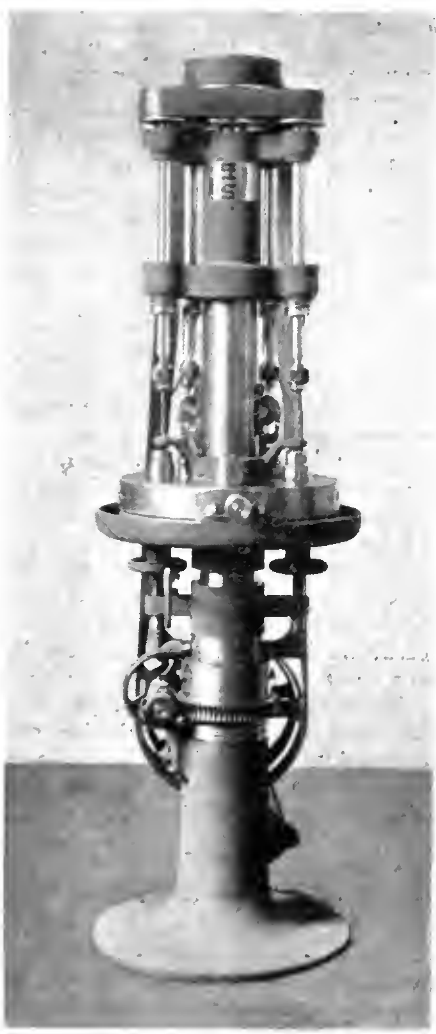
THE desirability of making notes, records, etc., in ink instead of pencil is a practice which is constantly growing amongst mechanics, power engineers and others. The element of permanency is much in its favor but the neces-

sity for ink supply, etc., occasionally is against its adoption. Many skilled tradesmen, however, include a fountain pen in their tool kit, and recent developments in self-filling pens will tend to increase the custom.

A pen which will appeal to users of this class has been placed on the market by the Laughlin Mfg. Co., Detroit, Mich. This instrument is self filling and is conspicuous for the absence of external mechanism.

The barrel is made in two halves which when drawn apart, expose a pressure bar. A slight pressure of the finger on the bar compresses a collapsible ink tube, which when the pressure is released fills itself through the penpoint. When the barrel is closed again the appearance of the pen is that of the familiar middle-joint type.

A feature which appeals to hard users is the safety point inside the non-breakable cap. When the cap is screwed on the point section, an internal shoulder is tightened against a small flange on the end of the point section. By this means, any leakage due to rough handling or other extraordinary treatment is safely confined, and all trouble due to leakage is eliminated.



SEMI-AUTOMATIC, FOUR-SPINDLE DRILL PRESS.

This pen is made in a variety of styles and sizes suited for all classes of work.

SEMI-AUTOMATIC FOUR-SPINDLE DRILL PRESS

A SEMI-AUTOMATIC four-spindle ball-bearing drilling machine for drilling the four clearance holes in threading dies and similar work is being placed on the market by Edgar W. Bemis, Worcester, Mass.

The work table has five chucks so that one chuck is open to the operator for placing and removing work, while the four drills are in operation. This semi-continuous method of operation is the distinctive feature of the machine in connection with its capacity to bore holes in a circle of small diameter with one setting of the work.

In operation the piece to be drilled is placed in the chuck on the front of the table, then the lock pin is drawn and the table is revolved to the first spindle. While the table is rising and the first piece is being drilled, the operator is placing the second piece in the next chuck. The machine has a rated capacity of 1,800 threading dies, 5/16 in. thick, per day. The lock pin, which locks the work table to the lifting table, can be so located by a simple attachment as to allow the chuck center to be moved from the centre of the drill. On the size of machine illustrated, this permits drilling four holes in any circle up to 3½ in. in diameter.

The work table is supported on ball bearings on the lifting table, which moves up and down to feed the drills into the work. The lifting table is sustained by lifting rods, located under opposite sides of the table, which travel on rolls on cams fastened to a worm gear, which revolves around the post, being driven by gears on the main driving shaft. The worm gear and lifting cams rest on ½-in. balls. The contour of the lifting cams governs the depth of work which can be drilled. Small hand wheels on the threaded portion of the lifting rods are employed to adjust the table to the drills. A handle conveniently placed on the side operates a sliding clutch on the worm shaft for stopping and starting the feed.

The chucks are mounted on work spindles which have keyed to them gears meshing with a gear fastened to the hub of the lifting table. As the work table is rotated to bring the piece successively under each drill, these spindle gears index the work to the proper position for drilling. The shank of the chuck is drilled halfway through its length so that the drill can be put up in the shank, then adjusted to the proper position.

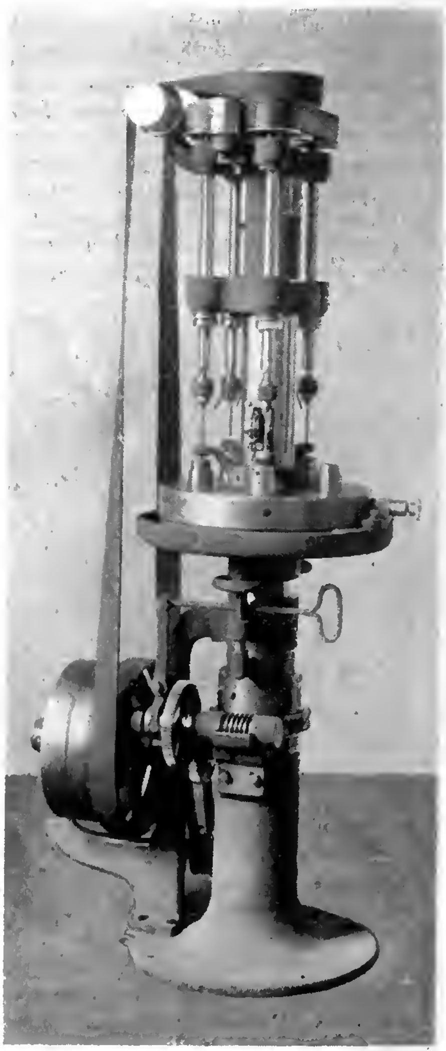
A stud in the top of the post supports a cone pulley, the top section of which receives over idlers a belt from the main driving pulley, the bottom section carrying an endless belt, which travels around the four pulleys on the drill spindles, the belt being kept tight by idlers on opposite sides of the post.

An oil chamber is cored around the head back of the spindle bearings and drip valves are tapped into it from which pipes carry the oil to each drill. A pump driven from the main shaft supplies the oil chamber.

SHELL CUTTING-OFF MACHINE

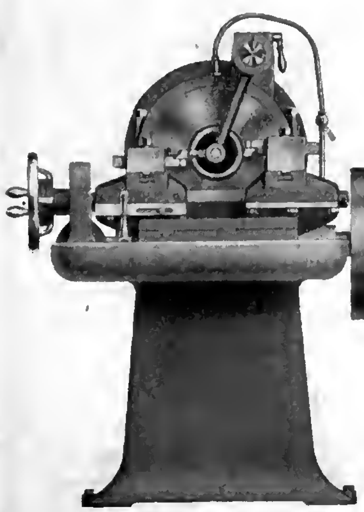
A HIGHLY specialized design of machine for removing the excess length on the open end of shell forgings and facing off the base is illustrated in the accompanying figure. Two sizes, 6 in. and 9 in., are made, the photograph showing the smaller machine.

The headstock is of peculiar design, being of large enough diameter to enclose at either end a powerful universal scroll chuck. These chucks are mounted in each end of the hollow spindle, which is 16 in. dia., and is driven by a 30 to 1



SEMI-AUTOMATIC, FOUR-SPINDLE DRILL PRESS.

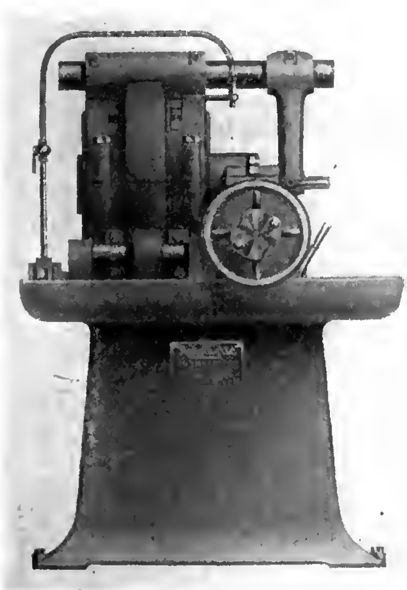
worm gear, located between the bearings. The worm is submerged in oil, and the shaft projects in the rear of the machine, carrying a 20 in. x 6 in. pulley, which runs at 600 revs. per min., when cutting speed is 30 ft. per min.



SHELL CUTTING-OFF MACHINE.

Mounted on the top of the headstock is a sliding bar carrying a gauge arm and stop, adjustable to any required length, and which may be entirely reversed so as to act at the rear end of the spindle if necessary.

A heavy cross slide is arranged across the front of the spindle, carrying front and back tool posts, which are independently adjustable, and moved to and from the work in unison by a substantial power feed mechanism operated with automatic stop-feed device.



SHELL CUTTING-OFF MACHINE.

Both the headstock and cut-off feed mechanism are mounted on a substantial pedestal, having a generous chip and oil pan combined in one casting, the base of the pedestal being used for a lubricating tank, from which a geared pump carries an ample supply of lubricant to the cutting tools.

At a cutting speed of 30 ft. per min. the machine is capable of cutting off the open end of a 6 in. shell in approximately three minutes, with a wall of 1 in. thickness.

The over-all dimensions of the 6 in. machine are 36 in. lengthwise of spindle, 42 in. wide, and 56 in. high, with a weight of 4,500 lbs.

The 9 in. machine requires approximately five minutes per cut, and has over-all dimensions of 60 in. lengthwise of spindle, 58 in. wide and 64 in. high, with a weight of 7,000 lbs.

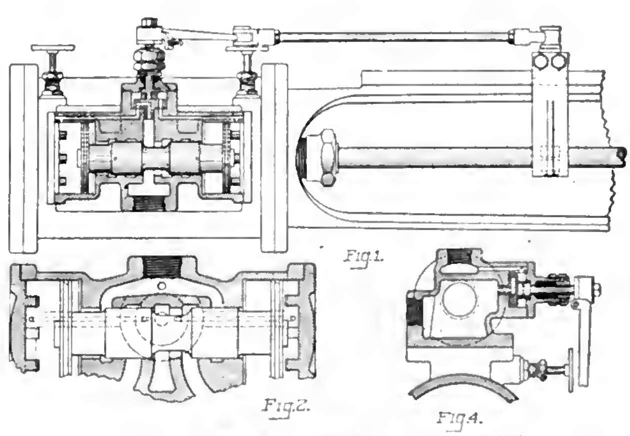
These machines are produced and marketed by the Automatic Machine Co., Bridgeport, Conn.

STEAM PUMP WITH NEW TYPE VALVE

A STEAM pump with a new type of valve gear, which embodies some very unique features, has recently been placed on the market by the American Steam Pump Co., of Battle Creek, Mich.

The pump will be known as the "American-Marsh," this name having been chosen because of the fact that the pump will combine some of the best features of the well-known "American" and "Marsh" pumps which have been manufactured by this firm for many years, and of which they claim to have over 130,000 in successful operation.

As will be noted from the accompanying cut, the pump has a steam valve, which is mechanically actuated, and which is also self-governing. The fact that it is mechanically actuated insures positive action at all times, while the self-governing device allows only just enough steam to enter the pump to do the required work. If the work is light, the admission steam is cut down, while, if the work is heavy, the portage is automatically enlarged. This feature insures an unusually low steam consumption.



STEAM PUMP WITH NEW TYPE VALVE.

The steam valve is of the balanced piston type equipped with expansion rings, while the auxiliary valve is of the semi-rotative disc type, which wears to a perfect seat. There are no slide valves to wear and no noisy links or tappets in the valve gear. In action it is claimed to be perfectly quiet.

It is claimed that this pump cannot hang up even under the most severe conditions, and even if the suction line is broken the pump will not race. The length of the stroke is regulated by two adjusting screws located at the fulcrum of the lever arm.

WAR PROFITS AND THE PATRIOTIC FUND

THAT the patriotism of Canadian Manufacturers does not evaporate with the production of munitions and the pocketing of the profits incidental thereto, is exemplified in the statement recently issued from headquarters of the Canadian Patriotic Fund.

"It has been said that no true patriot will allow himself to be richer at the end of the war than at the beginning. Certainly he should not be so as a result of the war. It was doubtless this feeling that prompted a certain woollen manufacturer, in a town not far from Ottawa, to tell the local branch of the fund that at the end of 1915 he was going to estimate his profits for the year, and should they prove to be greater than his average annual profits for the preceding quinquennial period, the excess profit would be handed over to the fund. He did not wish, he said, that the conclusion of the war should find him better off financially than he was at the outbreak of hostilities.

"The same spirit is beginning to manifest itself in the actions of other people and commercial companies. A noteworthy example is the Dominion Bridge Co., of Montreal. At its annual shareholders' meeting on December 16, the following resolution was passed: 'Resolved that the meeting approve and authorize a contribution to the National Canadian Patriotic Fund for 1916 of two per cent. of the gross amount received on ammunition orders to the end of the calendar year.'

"It is understood that other firms will follow suit, and the same course will doubtless commend itself to many corporations profiting by war contracts."

Vol. XV. JANUARY 6, 1916 No. 1

THE NEW YEAR OUTLOOK

WITH the opening of the New Year and the anticipation of another twelve months of war in Europe, it may be said that the activities of metal-working plants generally continue at high pressure. So far as steel mills are concerned, this is especially true, and all indications point to a similar, if not more intensive set of conditions for several months to come. The development of a widespread domestic demand, both here and in the United States, is responsible in large part for the prolonged, into-the-future, abnormal activity.

A feature worth noting is the sustained effort being put forth by Great Britain to become self-contained to the fullest extent possible, not only in the production of war munitions as regards the raw, semi-finished and finished materials entering therein, but also in the matter of the equipment for their manufacture. What is true of munitions is equally true regarding every class of import, and while doubtless those under the wing of her Empire will be given opportunity while opportunity lasts to furnish the work of their craftsmen as well as the flower of their manhood in order to carry the struggle to its only logical conclusion, the time is imminent, yea is here, when we should begin to cast about for war-created opportunities of peace-time trade and commerce.

For the first time in many months, the note has been sounded that the machine tool demand is at least swinging back to normal; it is therefore incumbent on those developing along such a line to proceed discreetly. Shell orders for Great Britain and her Allies are likely to dwindle both in number and extent so far as the United States is concerned in the near future, and while an equivalent of or even more than what has already been placed in Canada may continue on tap for the greater part of this New Year, every day is bringing the lessening and closure of even our opportunity more imminent.

Live interest is already being displayed by engineering firms of every size and type in Great Britain as to what is going to happen when the manufacture of war munitions ceases. How much interest is Canada displaying relative to her position in the like circumstance? We have increased our production capacity enormously, and have given it unstintingly for the prosecution of the war. Should we not, right now, set about preparing to utilize every unit of it with the equally unstinting, equally intelligent, and equally energetic desire towards the accomplishment of peace-time commercial and manufacturing achievement?

We are not of those who expect much Government assistance or co-operation, on the latter's own initiative at least, it is therefore up to our manufacturers—our metal-working plants, to get together in one united body, in addition to planning and charting an individual course of action, and make offer to help or co-operate with the Government toward the desired end, and if the latter be recalcitrant or indolent, then set about "firing" it. It has been very aptly said that "mere grumbling submission is, in a democratic State, an evasion of duty, and deserves to be penalized for the benefit of more active sections who know what they want and how to get it."

Independent action by our large industrial corporations might produce satisfactory results so far as they only are concerned, but to ensure all-round participation and general national prosperity arising out of our new capacity plant activity, the numerical as well as the financial backing of the whole, with or without Government co-operation, becomes absolutely necessary. Under the circumstances and in view of the opportunities available, we should be ashamed to even suggest the scrapping of any part or unit of our now well-equipped plants.

HONORED BY OUR KING

THE New Year Honors distributed by His Majesty the King, have, on the present occasion, not only been comprehensive in scope as far as Canadians are concerned, but they have the added feature of being for the most part demonstrative to an unusual degree of personal worth and achievement relative to their recipients.

The work and worth of such men as Sir Thomas Shaughnessy, president of the C.P.R.; Hon. W. T. White, Dominion Minister of Finance; Collingwood Schreiber, railroad engineer; John Kennedy, harbor engineer, and Brig.-Gen. Alexander Bertram, deputy chairman of the Imperial Munitions Board, have long been recognized and appreciated within and beyond our own borders. The problems to be solved and the tasks to be undertaken as a result of the war have, however, served to accentuate the peace-time usefulness of these gentlemen by reason of the war-time emergency achievement they have so effectively accomplished. All of the recipients of His Majesty's favor are well advanced in years, with the exception of Sir W. T. White, K.C.M.G., notwithstanding, we not only offer to each and all our hearty congratulations on the Honors bestowed, but trust that they may be long spared to go in and out among us in usefulness and in exemplification of good citizenship.

The engineering profession, as will be noted, is particularly prominent in our list, and due to the fact that Brigadier-General Sir Alexander Bertram, K.B., is a son of the machine shop and of the founder of the well-known firm of John Bertram & Sons Co., Dundas, Ont., machine tool builders, the honor bestowed in his case is of special interest to the patrons of this journal. Evidence of the most convincing nature is now breathed broadcast relative to the character of the work of and its achievement realization by the executive head of the late Shell Committee, and while coteries of croakers are always ready to assail and derogate the efforts of the very best of our public-spirited men, and actively have done so, we are right in saying that our "artisan" Knight will continue to receive the full support and appreciation of his craft confreres, and of every right thinking and properly-informed citizen of this broad Dominion.

INDUSTRIAL NOTABILITIES

BRIGADIER-GENERAL SIR ALEXANDER BERTRAM, K.B., Deputy Chairman of the Imperial Munitions Board, and Vice-President of the John Bertram & Sons Co., Dundas, Ont., was born in the latter township on February 18th, 1853, the son of John and Elizabeth (Bennett) Bertram.

He was educated at Dundas High School, on leaving which in 1869, he became apprenticed to his father, in the latter's machine tool manufacturing plant. Growing up with the business, "Aleck Bertram," as the natives of Dundas like to speak of him, ultimately became head of the concern on the retirement of his father and together with his brother, Henry have now made the firm name a household word wherever machine tools are operated in Canada and elsewhere.

Matters military appear to have had a peculiar fascination for the subject of our sketch, for we find him entering the 13th Regiment, Hamilton, Ont., as a bugler some

BRIG.-GEN. SIR ALEXANDER BERTRAM, K.B.

40 years ago. He rose to command the 77th Wentworth Regiment; was transferred to the Reserve of Officers in January, 1905; appointed to command the 3rd Infantry Brigade, West Ontario, 1905; and was made Colonel in 1910.

General Bertram has for many years been an ardent advocate of musketry training, and it is perhaps to some extent due to his influence that our First Overseas Contingent have done such good work on the battle front. He commanded the Canadian Bisley team in 1909, he and it acquitting themselves with marked distinction. He wears the Colonial Auxiliary Forces Officers' decoration, and was gazetted Brigadier-General in 1915. Imperial New Year honors on January 1st, 1916, included the bestowal of the rank of Knight Bachelor on Gen. Bertram, for his untiring and successful administration of the work of the Shell Committee in fostering munitions manufacture in Canada.

In May, 1877, Gen. Bertram married Millechamp, daughter of Hugh T. Smith, Toronto, there being three sons and one daughter of the union. Gen. Bertram is Presbyterian in religion, and in his public and social activities is a member of the Canadian Society of Civil Engineers; the Toronto Club, Toronto; the Military Institute, Toronto; the Rideau Club, Ottawa; and the Engineers and Country Clubs, Montreal.

His residential addresses are Ottawa and Dundas, Ont.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents

Montreal, Que., Jan. 3, 1916.—While prevailing conditions are practically unchanged from those of the past few months, it is interesting to note that the present industrial situation throughout the Dominion, at the beginning of a year has never before shown a parallel. Many remarkable achievements and developments have been recorded during the past year, but the indications are that the next twelve months will not only equal those of the past, but in all probability will surpass the most optimistic expectations.

Some of the possibilities for the coming year are the extension of shipbuilding, the establishment of factories for the production of materials for domestic purposes which have hitherto been manufactured in European countries; the possible development of industries for the making of chemicals, dyes, etc., will open up new fields.

The past year has shown that the resources of the Canadian manufacturers and Canadian workmen are practically unlimited, and the co-operation of all parties will place this country well amongst the foremost of the world.

Pig Iron

The demand for steel making pig continues, and with the exception of re-sale iron, little or none can be had by new buyers for the first half of 1916. While there has been no general buying for the third or fourth quarter, some consumers are showing considerable interest in the securing of raw material for their needs during the second half of the year. Added to the enormous demand for pig iron is the acute situation apparent in the supply of foundry coke. Coke producers are having great difficulty in supplying the abnormal demand, and there is some possibility of a good many foundries closing down temporaily until the situation can be relieved.

Locally, the situation remains unchanged and last week's quotations remain firm, although Bessemer, Pittsburgh, shows an advance of $10 a ton.

Steel

After the slight falling off in demand during the holiday season, the market has now resumed its normal condition and existing conditions indicate that the pressure of the past few months will not only continue, but will further increase to such proportions during the first quarter of the year, that present facilities will be inadequate to the demand. The shortage of cars and the congested state of seaboard terminals is gradually developing into a serious situation, material being greatly delayed in its transportation from producer to destination.

The sold-out condition of many dealers foretells a serious shortage of finished iron and steel bars, plates and shapes. Customers are requesting tonnage from their usual source of supply, irrespective of price, this to be arranged at a later date. The shortage of tonnage for marine transportation is creating many inquiries for plates and shipbuilding materials, but the present high cost of material has been and will likely continue to be one of the chief factors in the curtailing or orders for the construction of lake vessels.

Local dealers report an unchanged situation, but in some cases would not be surprised to see many changes within the next few weeks. The revision of price-list will likely take place within the present month and some interesting changes are expected.

The price of billets shows a substantial advance and Pittsburgh quotations are now: Bessemer $32, open-hearth $33 and forging $55 per gross ton.

CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.

Machine Tools and Supplies

Activity in the machine tool trade continues, and although the situation is not so acute as a few months back, the tool builders are still busy.

Small tool supplies are still in good demand and the outlook for the remaining winter months is very satisfactory. High-speed steel is still hard to get, with price ranging from $2.50 to $3.25 per pound.

Metals

The chief feature in the metal markets has been the sharp advance in the price of copper, following the heavy inquiries from abroad, and the placing of large foreign orders for 1916 delivery. It is almost impossible to obtain copper under 4 or 5 months, many of the large dealers being entirely sold out. It is the opinion of many in the trade that the present demand, if continued, will advance the price to 30 cents. Tin has been quiet, but future developments in the Far East may have some interesting effects upon the price of this metal.

The other metals show little of interest, but spelter may be weaker in the near future, as manufacturing facilities will then be in a better position to supply the demand.

Copper.—The present condition of the copper market is very strong. Substantial advances have been noted in quotations for the past two weeks, following the closing of a large order for the British Government of 60,000 tons of electrolytic copper to be delivered during the year 1916. The effect of the heavy foreign demand has been the sharp advance quoted in the past and present week's prices. Recent reports of further large munitions orders have had the tendency to add strength to the market.

Every mine, mill and smelter is working at maximum capacity, and all producers are doing their utmost to supply the demand, every facility for increased production being utilized to relieve the situation.

The almost complete loss of copper used in warfare means that consumers can hardly hope to see low figures for this metal for some time to come. The present quotation shows an advance of 4 cents per pound, lake prices being 27c, electrolytic 27c, and castings 26c per pound.

Tin.—Recent reports that certain restrictions are being placed on the shipment of tin to American ports have created considerable excitement on the market, and the situation during the coming weeks depends largely on the stand taken by the British Government in granting shipping permits.

Many inquiries have come to dealers, but consumers are not offering to bid, believing that any excessive buying under present conditions would cause sellers or importers, who have an available supply, to boost the present prices. Firmness prevails throughout the market, present prices being 45c a pound.

Spelter.—Inquiries are good for immediate shipment, but consumers are not anxious to buy, believing that prices will decline before long, as the present prices are not very inviting. The year 1916 promises to be almost as interesting as that just closed, but in the opposite direction. Indications are that before the close of the year prices will be as low as any quoted during 1915.

Present quotations are firm at 21c per pound.

Lead.—The immediate outlook is for

a stronger market. The heavy sales of the past week have advanced prices, and foreign inquiries are heavy. Premiums have been offered for prompt delivery, and orders for shipment are booked well into the first quarter. Foreign advances are noted, but locally the quotation is the same as last week—$700 per 100.

Antimony.—Spot metal is scarce, and dealers report a firm market, with prospect of further advance. Present quotations remain unchanged at 42c per pound.

Old Material.—The general condition of the scrap metals is very good, and an advance of about 5 per cent. has been placed by local dealers upon the prices paid for old metals. However, with the exception of copper, these advances may decline again before the coming week.

Toronto, Ont., Jan. 4.—The holiday season is now over, and as is usual during this period, business has been quiet. The outlook for this year is distinctly encouraging and, unless anything unforeseen happens this year should be a prosperous one. A good start has been made with record crops, large savings deposits in the banks, many factories engaged on war orders and unusual activity in the iron and steel trade; the latter is now generally conceded to be a basic industry. On the other hand some industries not benefiting from war orders are quiet and there is a general tendency towards economizing on account of the conditions prevailing because of the war. The possibility of tight money conditions and the heavy demand on the financial resources of the country on account of the war expenditure will tend toward a policy of retrenchment in national and municipal expenditure.

At the beginning of the year Canada is in an exceptionally strong financial position, due to the improvement in the export trade which has been increasing in volume during the past twelve months and has resulted in a very favorable trade balance. The customs revenue for December is estimated at nearly nine and a half million dollars, being approximately double that of the corresponding month of 1914. The revenues for the last nine fiscal months show an increase of nearly thirteen million dollars over the corresponding period of the previous year. The total volume of trade for the year is the greatest in the history of the Dominion.

Steel Market

The year opens with the steel trade exceedingly prosperous and every indication of continued activity for many months. The large contracts for steel which are being placed in the States by the Allies, a considerable proportion being for third quarter delivery, is an indication of what may be expected in Canada. Even if the demand for steel for shells, to be made in this country were to fall off during the year, there is every probability of large orders for steel being placed with Canadian mills to help to meet requirements in the Old Country. Prices on finished and semi-finished steel are very firm and some products are higher. Seamless boiler tubes have advanced from $3 to $5 per 100 feet, according to size. The discount on cold drawn steel shafting ex warehouse is now 15 per cent., as against 20 per cent. before. Chicago warehouse prices on bars, plates and shapes have advanced 10c per 100 pounds. A sharp advance of 20c in wire nails has been announced; the quotation now being $3.05 per keg, with further advances expected in the near future. Higher prices for boiler plates are looked for any time.

The galvanized sheet market is very unsettled and prices continue to advance.

> **ALLIES PURCHASING AGENTS**
>
> **The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:**
>
> **International Purchasing Commission, India House, Kingsway, London, Eng.**
>
> **French.—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendence Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.**
>
> **Russian.—Messrs. S. Ruperti and Alexsieff, care Military Attache, Russian Embassy, Washington, D.C.**

"Apollo," 10¾ oz., is now quoted at $6.50; "Premier No. 2," $6.25, and "Premier," 10¾ oz., are quoted at $6.50. Prices on English sheets are nominal, as practically none are being imported. Some makers of galvanized sheets in the States are practically out of the market, owing to the unsatisfactory conditions in the trade. Black sheets continue to advance and spelter is high in price, rendering the manufacture of sheets a very speculative and unattractive proposition. The demand in the States for black and blue annealed sheets is heavy, and deliveries are getting backward. Canada plates (dull) are stronger and are now quoted at $3.60. Black sheets, No. 28 gauge, are quoted at $2.60 and blue annealed, No. 10 gauge, at $2.25 Pittsburgh.

The embargo by the railroads in the States on export shipments of iron and steel is still in force, but prices have not been affected, owing to the strength of the market. There is no relief in sight, although the British and French Governments are exerting every effort to supply tonnage to relieve the situation. The heavy demand for steel bars for export continues. Some of the large makers of steel bars have carried over into the new year so heavy a tonnage of undelivered business against 1915 contracts that they cannot take on any further requirements before July. Prices on all steel products are very firm, bars are quoted 2c per pound, Pittsburgh. The billet market is very strong and deliveries are getting more backward than ever, owing to the increase in demand. Prices continue to advance, forging billets being now quoted at $55 Pittsburgh. Bessemer and open-hearth billets are unchanged at $32 and $33, Pittsburgh, respectively. Ferromanganese has advanced $10 and is now being quoted at $110 per ton seaboard. Shipments from England are uncertain and irregular, while, in addition, the heavy demand has created a very unsettled situation.

Pig Iron

The pig iron market is strong with a continued heavy demand for steel-making grades. Canadian consumers are taking large tonnages from American furnaces. Prices are firm and unchanged.

Old Materials

Some excitement has been caused in the market by the embargo which the Dominion Government has placed on the export of wrought and steel scrap to the States. As far as steel scrap is concerned it is reported from the States that serious objection will be raised in that country, as a considerable tonnage of billets is exported to Canada from the States, and American steel-makers claim that the scrap should return to them. The question of withdrawing the embargo is under consideration. The scrap copper market is strong and prices are higher. Wrought iron and heavy smelting steel have also advanced.

Machine Tools

The past week has been a quiet one in machine tool circles. There have been fewer inquiries received recently locally for standard equipment, although there is a fair demand for special tools. The Russian Government is buying a large number of machine tools from builders in the States, but British and French are buying in much smaller volume than was the case a few months ago. The restrictions recently placed by the British Government on the importation of machine tools was designed to eliminate speculators and will not affect responsible makers.

Supplies

Business has been comparatively light during the week, the holiday season having something to do with it. Prices are

holding very firm and some advances have to be noted. A sharp advance has been made in linseed oil, which is now quoted at 93c for raw, and 96c for boiled oil. Cotton waste has advanced again as anticipated in these columns. The new prices range from 1c to 3c higher and are given in the selected market quotations.

Metals

The sharp advance in copper and the unsettled situation in the tin market are the principal items of interest this week. Higher prices for copper have been anticipated for some time on account of the continued strength in the market. The position of this metal is a strong one and the demand continues heavy. Two matters of importance are affecting the tin market; one is the close restrictions which the British Government are placing on exports and the other is the delay occasioned to shipments from the East on account of steamers coming round by the Cape instead of the Suez Canal. The former naturally affects the New York market, but is in no way serious if importers live up to the prescribed regulations. The delay in bringing shipments round by the Cape route is offset by the decreased liability of cargoes being sunk by submarines, this also holds good for antimony shipments.

There is no change in the spelter situation and the market is firm. The lead market is firm and the "Trust" have advanced prices to $5.50 New York. The aluminum market is strong and quotations have advanced.

Copper—The market is excited and higher. The consumption of copper is so great that producers are hardly able to keep up with the demand and there is little or no possibility of any permanent decline in prices while the war lasts. In the local market, copper has advanced 2¼c, and Lake copper is now quoted at 23½c per pound.

Tin—The market is strong but unsettled for reasons already stated, and prices for spot and nearby tin are very firm. There is no serious scarcity of spot tin, so the delay in shipments need not affect the market to any appreciable extent. The New York market is affected by the difficulties being experienced in getting permits to ship tin to America, and the outlook on nearby deliveries is thus rather serious. Quotations are nominal and unchanged at 43c per pound.

Spelter—The market is quiet, both London and New York being unchanged. There is a good demand on prompt and early deliveries, but no interest is being shown in futures. Local quotations are unchanged at 19c per pound.

Lead—The market is strong and the "Trust" have advanced prices $2 per ton, making the current quotation $5.50 New York. There is a good demand for lead and a further rise in the near future is probable. Local quotations are unchanged at 7c per pound.

Antimony—The market is active for futures and strong for spot metal, which is scarce. The heavy war demand continues and the market is holding very firm. Quotations are unchanged at 40c per pound.

Aluminum—The situation is unchanged with a strong market and higher prices. Aluminum has advanced 3c and is now quoted at 68c per pound.

Winnipeg, Man., Jan. 1—There has been a marked improvement in the machinery situation during the past two weeks, although, while the demand for machine tools continues good, there is still considerable difficulty in securing supplies, and much doubt as to whether many more shell contracts will be coming this way. One hears, however, of contracts being received, among which are a company who have taken over the manufacture of a recently patented machine, which it is claimed reduces the time for turning out shells to a minimum. They are said to have taken a contract for shells to show what their machines can do, but have not yet decided whether they will put their product on the market, or sell the rights. The C. N. R., having experienced difficulty in securing machine tools with which to handle their shell contracts here, have started in to make lathes for their own use.

A gold mining company, which is about to start operations on the shores of Lake Winnipeg, will shortly be buying a considerable quantity of machinery and supplies, including engines, boilers, air compressor, blacksmith and machine shop equipment. Altogether, there is a healthier look to business with the opening of the new year. Quite a number of inquiries have been received for machine tools, and December and January, which are usually quiet months in the machinery trade here, bid fair to be the best in a long time. There is a good demand for wood-working tools. The sawmills are getting ready to start again, and are busy with repairs, and overhauling. The demand for transmission supplies of all kinds is very good, but engines and boilers are rather quiet. Business in blacksmith supplies is rather brisk. This comes about through the farmers having plenty of money which they are spending on fixing up their rigs and implements.

CANADIAN PURCHASES FOR FRENCH WAR OFFICE

Philippe Roy, General Commissioner for Canada, Paris, advises the Department of Trade and Commerce, Ottawa, that an order has been issued by the War Department of the French Government to the effect that all purchases made by the Supply Branch in Canada will pass through the Hudson Bay Co. Canadian producers should therefore submit their future offers through the office of that company at Montreal. It is further stated in Mr. Roy's communication that Canadian lumber, steel and meat will find in France an important market for years to come, but it is necessary that Canadian firms should have in Paris representatives entrusted with the necessary authority, especially if it is desired to secure Government contracts.

DYESTUFFS SITUATION IMPROVING.

ACCORDING to a statement issued by the Customs Department at Ottawa on Dec. 31, arrangements are under way by which Canadian manufacturers will be assured a supply of dyestuffs in future. Through the co-operation of the Imperial authorities, who have exerted pressure on American manufacturers of such dyestuffs, the Government has been able to relieve the serious situation which promised to develop here. It arose out of the refusal of American manufacturers to export the manufactured dyestuffs to Canada as usual. The scarcity of dyes in Great Britain has rendered export from that country to Canada almost impossible, and Canadian companies had been getting their supplies in the shape of logwood dyes from the United States. When, however, with a view to controlling the product so that the Empire's demand might be met, the British Government placed an embargo on the export of logwood from Jamaica and Honduras, the American companies cancelled their contracts with the Canadian companies, and a famine in dyestuffs threatened. Negotiations were at once commenced by the Canadian authorities looking toward relief. As a result arrangements have already been made to allow the export of 4,700 tons of logwood to the United States companies on condition that these firms shall continue to supply the reasonable demands of the Canadian mills, and further negotiations are under way, which, it is hoped, will result in a workable agreement by which a reasonable supply of goods from the countries named will be allowed to be exported to the United States dye manufacturing companies coupled with conditions which will ensure a supply of the same for Canadian manufacturing purposes.

FINANCIAL SITUATION STRONG

CANADA closes the first calendar year of war in an exceptionally strong financial position. The trade of the Dominion continues to show large expansion in the export column, thus changing the former old adverse trade balance into a favorable balance, which is the special economic importance for purposes of war financing. The measures announced by the Minister of Finance in his last budget for restoring the revenues from Customs and other sources which have suffered during the first few months of war have produced results which exceed even the estimate given to Parliament by the Minister. The statement of Customs revenues for the last month of the calendar year illustrates in a marked degree the working out of the war budget. During the month of December last year the Customs revenue fell to $4,918,798.75. This was during a period of severe trade disorganization when the revenues of Canada were falling at the rate of a million a month. The Customs revenue for the month just closing amounts to $9,432,654.92, an increase of $4,513,856.17, or nearly one hundred per cent. During the nine months of the fiscal year, that is from April 1 to the end of the calendar year, the revenues have increased by no less than $12,891,684.99 as compared with the corresponding period in the previous year. The total revenue for the nine months of this year is $58,829,618.94, as against $71,721,303.93.

SOO CANAL TRAFFIC RETURNS

FREIGHT traffic through the American and Canadian canals in the season just closed aggregated 71,290,304 tons, according to the report compiled by L. C. Sabin, superintendent of the American canals.

Traffic for the year was 15,920,370 tons greater than in 1914, and has been exceeded in volume only in two previous years—1913, with a total of 79,718,344 tons, and 1912, with 72,472,676 tons.

Wheat shipments were 255,481,558 bushels, an increase of 105,197,463 bushels; copper shipments aggregated 156,436 short tons, or 64,672 tons more than last year. Both these commodities established new season's records.

The movement of iron ore was 45,213,604 tons, an increase of 13,799,839 tons compared with 1914. General merchandise, aggregating 1,595,398 tons, represented a gain of 278,094 tons.

The season's lumber movement was 456,451,000 feet, an increase of 4,303,000.

Both anthracite and bituminous coal shipments fell short of 1914. The hard coal movement was 2,030,730 tons, a decrease of 209,775 tons, while soft coal shipments of 11,326,328 tons were 920,388 less than 1914.

Freight traffic through the canals in December aggregated 2,180,420 short tons, against 551,886 tons in 1914.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

Engineering

Toronto, Ont.—Wright & Co. are in the market for an electro-plating dynamo.

St. Thomas, Ont.—The Wabash Railway propose to build a repair shop here.

Hanover, Ont.—David Eidt is in the market for a gasoline engine of from 10 to 20 h.p.

West Lorne, Ont.—The West Lorne Motors, Ltd., will establish a plant to manufacture gasoline tractors, etc.

Arnprior, Ont.—Another mechanical pulp mill will increase the output of Ontario during 1916, it being reported that McLaughlin Bros. of this place are adding a mechanical pulp mill with a capacity of 10 tons daily. Work on the plant will commence shortly. Total cost will be $500,000. It is reported that the Galleta Power Co. is considering the purchase of a large water power at Long Rapids on the Madawaska River, near Arnprior.

Municipal

Lindsay, Ont.—The chemical plant by-law carried by a majority of 32.

Alfred, Ont.—The council contemplate the construction of a waterworks system.

Meaford, Ont.—Extensions to the waterworks system are contemplated at a cost of $4,000.

Tillsonburg, Ont.—A by-law to raise $4,275 for the building of a bridge carried by 274 majority.

Ridgetown, Ont.—The by-law fixing the assessment of D. P. McNorgan on his new mill was carried by 280 to 103.

Galt, Ont.—The by-law to raise $50,000 for a new school passed by a majority of 202.

Listowel, Ont.—The by-law granting $12,000 to a company for the manufacture of shoes carried by a majority of 210.

Woodstock, Ont.—The by-law for providing for $25,000 to build a storm sewer system was carried by a large majority.

Sarnia, Ont.—The by-law to purchase the plant of the Sarnia Gas & Electric Light Co. was carried, 978 voting for it and 503 against it.

Petrolea, Ont.—By-laws to loan a sugar factory $25,000 for general purposes and $21,000 for construction expenses carried by 700 majority.

Parkhill, Ont.—The hydro by-law voted on here was carried by a vote of 221 to 24. The vote approves the entering into negotiations for securing hydro power.

Kincardine, Ont.—The by-law granting a fixed assessment and certain tax exemptions to the People's Salt and Soda Co. carried by a vote of 298 to 46.

Peterborough, Ont.—The by-law to purchase the Exhibition Grounds was defeated, and the Peterborough Metal Products Co.'s exemption from taxation by-law carried.

St. Catharines, Ont.—A by-law to partially exempt the factory of the new company, Chemical Refineries, Ltd., for the manufacture of potash, was carried, by 705 to 147.

Cornwall, Ont.—The electors on Monday voted on a by-law to raise $25,000 for an extension to the water pumping station. The by-law passed with a vote of 295 in favor to 142 against.

Sandwich, Ont.—A by-law to grant the Cardwell Sand & Gravel Co. a fixed assessment, free water and power and light at cost in exchange for the erection of a $50,000 factory, carried by a majority of 176.

Chatham, Ont.—Three industrial by-laws carried by large majorities. These grant fixed assessments to the Gray-Dort Motor Co., American Well Works Co. and the Dominion Sugar Co., and to the last named a bonus of $18,500 toward the purchase of a site.

Sarnia, Ont.—A by-law to spend $120,000 in water main extensions was carried by 40 votes. A by-law to spend $25,000 in the extension of the new waterworks at the lake shore was defeated, 528 voting for it and 942 against it.

Whitby, Ont.—The by-law to ratify an agreement with Chas. Phillips and a syndicate of men who are to establish a $50,000 silk factory here was carried by an overwhelming majority, and the by-law to unite the sewerage system with the waterworks and electric light systems, under the Public Utilities Commission, was carried also.

Electrical

Cobden, Ont.—Voting on the by-law for Hydro-electric resulted in 90 for and 23 against.

Burgessville, Ont.—A Hydro-Electric system will be installed here at an estimated cost of $3,500.

Sarnia, Ont.—The hydro-electric by-law was carried by a majority of 1,062, there being 1,331 votes in favor and 269 against.

Tara, Ont.—The hydro by-law carried almost unanimously, the vote being 111 for, 8 against. The by-law for a new town hall carried by 104 to 17.

Komoka, Ont.—A by-law to authorize the contracting for power from the Ontario Hydro-Electric Commission was carried last Monday by 58 votes to 10.

Forest, Ont.—A by-law to authorize a contract for the taking of electric power contract for the taking of hydro-electric power carried here on Jan. 3 by a majority of 230.

New Incorporations

The George McAllister & Sons, Ltd., Guelph, Ont., has been incorporated with a capital stock of $40,000 by John A. and George McAllister and others to manufacture articles from wood, operate sawmills, etc.

Motor Trucks, Ltd., have been incorporated at Ottawa with a capital of $500,000 to manufacture motor cars and trucks at Brantford, Ont. Incorporators: James Harley, Edmund Sweet and A. M. Harley, all of Brantford, Ont.

The G. H. Tod Co., Toronto, has been incorporated with a capital stock of $40,000 by Charles W. Kerr, 710 Lumsden Building, Toronto; George H. Tod, Bruce E. Ingham and others to manufacture metals, machinery, tools, wire, etc.

The W. G Edwards Co. has been incorporated at Toronto with a capital of $40,000 to manufacture tools, machinery and vehicles of all kinds at Bridgeburg, Ont. Incorporators: William George Edwards and Frank Edwin Jackson, of Bridgeburg.

The Precision Manufacturing Co. has been incorporated at Toronto with a capital of $60,000 to manufacture all kinds of machinery tools, etc., at St. Cathar-

ines, Ont. The provisional directors are John Frampton, Arthur William Varey and M. T. McCarron, all of St. Catharines, Ont.

The Eastern Canadian Copper Corporation has been incorporated at Ottawa with a capital of $990,000 to develop mineral lands and carry on the business of a milling and reduction company. Head office is at Montreal and the incorporators are Edgar T. Sill, A. James Perkins and A. O. Whitworth, all of Montreal, Que.

General Industrial

Rossburn, Man.—The Rossburn Milling Co. will erect a mill here.

Paris, Ont.—The Paris Wincey Mills Co. are building a new factory here.

Scotsguard, Sask.—The Pioneer Elevator Co. elevator was destroyed by fire recently. The loss is estimated at $40,000.

Toronto, Ont.—The factory of the William Radford Hat Mfg. Co. was damaged by a fire on Dec. 30. The damage to the building is placed at about $1,500 and to the contents $5,000.

Tenders

St. Thomas, Ont.—The Hydro-Electric Commission will build a transformer station here. Tenders are to be in by January 15.

St. Hyacinthe, Que.—Tenders will be received up to January 11 for a mechanical filter plant. Plans and specifications may be obtained at the office of Hector Cadieux, city engineer.

Windsor, Ont.—Tenders will be received until January 31 for heating, ventilating and sheet metal work for the new Windsor Collegiate Institute. Particulars may be obtained from the architect, J. C. Pennington, Windsor, Ont.

Winnipeg, Man.—Tenders will be received at the office of the Greater Winnipeg Water District, up to January 10, 1916, for the supply of rock crushing plant. Specifications and form of tender may be obtained at the offices of the district, 901 Boyd Building.

Toronto, Ont.—Tenders will be received by the Chairman, Board of Control, City Hall, Toronto, up to Tuesday, February 1st, 1916, for the supply and delivery of a number of street cars complete, bodies, trucks, motor equipment, air-brake equipment, copper cables for street car work, and fare boxes. Specifications and forms of tender may be obtained at the Works Department, Room 12, City Hall.

Toronto, Ont.—Tenders will be received by the Chairman, Board of Control, City Hall, Toronto, up to Tuesday, January 11, 1915, for the supply and delivery of No. 34, red lead paint for Bloor Street viaduct; No. 74, cast iron special castings for main pumping station. Specifications and forms of tender may be obtained at the Works Department, Room 12, City Hall.

Quebec, Que.—Tenders for a bridge over the Sauvage River will be received at the office of the Quebec Streams Commission, Quebec, until Tuesday, January 11, 1916. These tenders shall be for the following items:—(A)—Tender for a wooden bridge, wooden piers and abutments and bridge approaches. (B)—Tender for concrete piers and abutments and bridge approaches. (C)—Tender for steel superstructure of bridge. (D)—Tender for items B and C combined, viz.: Concrete substructure and steel superstructure. Plans and specifications can be seen in the office of the Chief Engineer of the Quebec Streams Commission, Room 803 McGill Building, Montreal.

EQUIPMENT REQUIRED FOR AUSTRALIAN RAILWAY

Specifications and blue prints of drawings have been received from D. H. Ross, Trade Commissioner, Melbourne, for equipment required by the Victorian Railways. These tender forms are open to the inspection of interested Canadian manufacturers at the Department of Trade and Commerce, Ottawa (refer File No. A-1435). Particulars of the requirements, together with the date on which the tenders close at Melbourne are briefly outlined thus:—

No. 29,671. February 23, 1916—2 air pressure blowers and accessories.

No. 29,672. February 23, 1916—1 air pressure blower and accessories.

No. 29,673. March 15, 1916—1 high-speed single spindle sensitive drill with table vise, tools, gears and accessories.

The departure of mails from Vancouver and San Francisco are indicated thus:—

From Vancouver, January 19, due Melbourne on February 12, 1916.

From San Francisco, February 15, due Melbourne on March 7, 1916.

From Vancouver, February 16, due Melbourne on March 10, 1916.

Railways - Bridges

Mimico, Ont.—The hydro radial by-law carried here on Saturday by a large majority.

Toronto, Ont.—The Hydro-Electric radial by-law was carried here by a substantial majority on January 1.

Berlin, Ont.—The hydro radial by-law carried by a majority of 665 at the elections on Monday.

Three Rivers, Que.—The Three Rivers Traction Co. propose making an extension five miles long to their tracks.

Toronto, Ont.—The bridge on Mount Pleasant Road will probably be constructed of steel and concrete at a cost of $33,000.

New Toronto, Ont.—The property-owners voted in favor of the hydro radial scheme, and the by-law carried by a large majority.

Brantford, Ont.—The by-law to sell the Galt-Paris line of the Grand Valley to the Lake Erie & Northern Railway for $30,000 carried with a majority of about 300.

Ottawa, Ont.—The C.N.R. have filed plans for the development of a townsite near Rideau Junction. It is stated that the company will erect its main line repair shops there.

Guelph, Ont.—The Hydro-Electric radial by-law received a substantial majority in every polling sub-division in the city, and was carried by a vote of 932 to 306, or a majority of 626.

Quebec, Que.—The official inspection of the new branch line of 25 miles along the Quebec Central Railway, running from St. Sabine, Bellechasse, to English Lake, in Montmagny County, took place on December 21.

Wood -Working

Mafeking, Ont.—Mutchenbacker Bros. have decided to rebuild their lumber mill at an estimated cost of $20,000.

Collingwood, Ont.—Wilson Brothers will build an addition to their planning mill to cost $35,000. H. A. Currie is president.

Chatham, Ont.—A dry kiln was recently destroyed by fire at the carriage works of William Gray, Sons & Campbell, Ltd.

Buckhorn, Ont.—W. N. Blewitt's saw and planing mill has been entirely destroyed by fire. The loss is estimated at $4,000, which is partially covered by insurance.

Dacre P.O., Ont.—Harry Richards is preparing to rebuild his mill recently destroyed by fire, and is in the market for a planer, lath mill, waterwheel, etc.

Building Notes

The Canada Metal Co., Toronto, have applied for a permit to erect an additional building to their factory on Fraser avenue at a cost of $25,000.

The William Davies Co., Ltd., Toronto, contemplate erecting a new ice house at the St. Lawrence Market at a cost of $15,000, and an application for the necessary permit has been filed with the city architect.

Personal

The Hon. W. T. White, Minister of Finance, has been created a K.C.M.G.

Sir Thomas Shaughnessy, president of the C. P. R., has been raised to the peerage.

John Kennedy, consulting engineer of Montreal, and an authority on harbor works, has been knighted.

Collingwood Schreiber, consulting engineer to the Department of Railways, has been created a K.C.M.G.

Thomas Doherty, president of the Doherty Stove Co., Sarnia, Ont., has been elected mayor of that city.

Clayton E. Hurlbut, president of the Hurlbut Shoe Co., Preston, Ont., has been elected mayor of that town.

A. McKay Edwards, of the Galt Stove & Furnace Co., has been elected mayor of Galt, Ont., for the ensuing year.

F. A. Skelton, director and secretary-treasurer of the Canadian Car & Foundry Co., spent Christmas in Montreal, and has returned to New York.

Captain John Moore, of Windsor, Ont., a well-known lake captain, died recently at Cincinnati, Ohio, while on a visit.

Brig.-General Alex. Bertram, deputy-chairman of the Imperial Munitions Board, has been created a Knight Bachelor.

Lieut.-Colonel W. M. Gartshore, vice-president and general manager of the McClary Mfg. Co., has been elected mayor of London, Ont.

G. W. Caye, assistant to Morley Donaldson, vice-president and general manager of the Grand Trunk Pacific, has been appointed purchasing agent of the Grand Trunk System, with headquarters at Montreal, in place of J. G. Guess, who has resigned.

Hugh S. Wallace, Harbor Commissioner at Hamilton, Ont., has resigned his position in order to take up the management of the Standard Sanitary Co., Toronto.

Frank P. Jones, vice-president and general manager of the Canada Cement Co., Montreal, will probably join the board of the Dominion Steel Corporation.

Lindsay T. Barclay, of the Western Dry Dock and Shipbuilding Co., Port Arthur, Ont., has returned to his home in Port Arthur from Winnipeg after attending the six weeks' officers training course.

Capt. G. C. Coles, who has been lecturer on marine matters and examiner of masters and mates, for the past ten years at Collingwood, Ont., has resumed his winter's work and is holding lectures twice a week as usual.

Annapolis, N.S.—A cable despatch received here on Dec. 28, announced the sudden death at Bristol, Eng., of E. D. Arnaud, Canadian Trade Commissioner. He was formerly manager of the Union Bank branch here.

J. C. Stewart, head of the Canadian Stewart Co., Ltd., has arrived in Toronto from Chicago, to superintend the closing up for the season of the harbor work. Mr. Stewart expressed himself as satisfied with the year's work on the new harbor.

W. J. MacCormack, of the Northern Navigation Co., has accepted a new position with the Algoma Central Railway Co., as head of their fleet of steamers operating from Sault Ste. Marie, Ont., and will take up his new work at the first of the year.

I. E. Suckling, of Toronto, has been appointed general agent for Ontario of the passenger department of the new Canadian Pacific Ocean Service, Ltd. Mr. Suckling has been assistant district passenger agent of the Canadian Pacific Railway's Ocean Lines at Toronto.

Graham Fraser, a pioneer of the steel industry in Canada, died at New Glasgow, N.S., on Dec. 25th. The deceased who was 68 years old, established the Hope Iron Works in 1872, which was the nucleus of what afterwards developed into the Nova Scotia Steel & Coal Co. Mr. Fraser was general manager of the new company for some time when he resigned and was appointed manager of the Dominion Steel Co. He held this position until the Steel Co. amalgamated with the Dominion Coal Co., when he retired from active work.

Trade Gossip

The Renfrew Electric Mfg. Co. will increase the capital stock of the concern to $100,000.

The Canadian Ice Machine Co., Toronto, Ont., have been awarded the contract for a refrigeration plant for the Parisien Hotel, Montreal.

Railway Construction.—In Canada there are 375 miles of line projected, 299 miles under survey and 578 miles under construction, a total of 1,258 miles.

The Owen Sound Iron Works Co., Owen Sound, Ont., have started work on repairing the C.P.R. steamers Keewatin and Assiniboia.

Owen Sound, Ont.—Ratepayers on Jan. 3 voted in favor of a loan of $1,200 to a shoe factory being started here by W. Wilson, of London, Ont.

Kingsville, Ont.—Ratepayers here voted on three by-laws last Monday, carrying them all. A loan to the Brown-Wigle Woolen Mills Co. of $10,000 was endorsed by 131 to 56.

Strathroy, Ont.—By a vote of 304 to 122, ratepayers voted in favor of providing free light and other utilities and fixing the assessment for the Geo. Rivers' basket factory.

The Canadian Car & Foundry Co., of Montreal, has received an order for one hundred 40-ton tank cars from the Imperial Oil Co., and also an order for cars from the Michigan Central Railway.

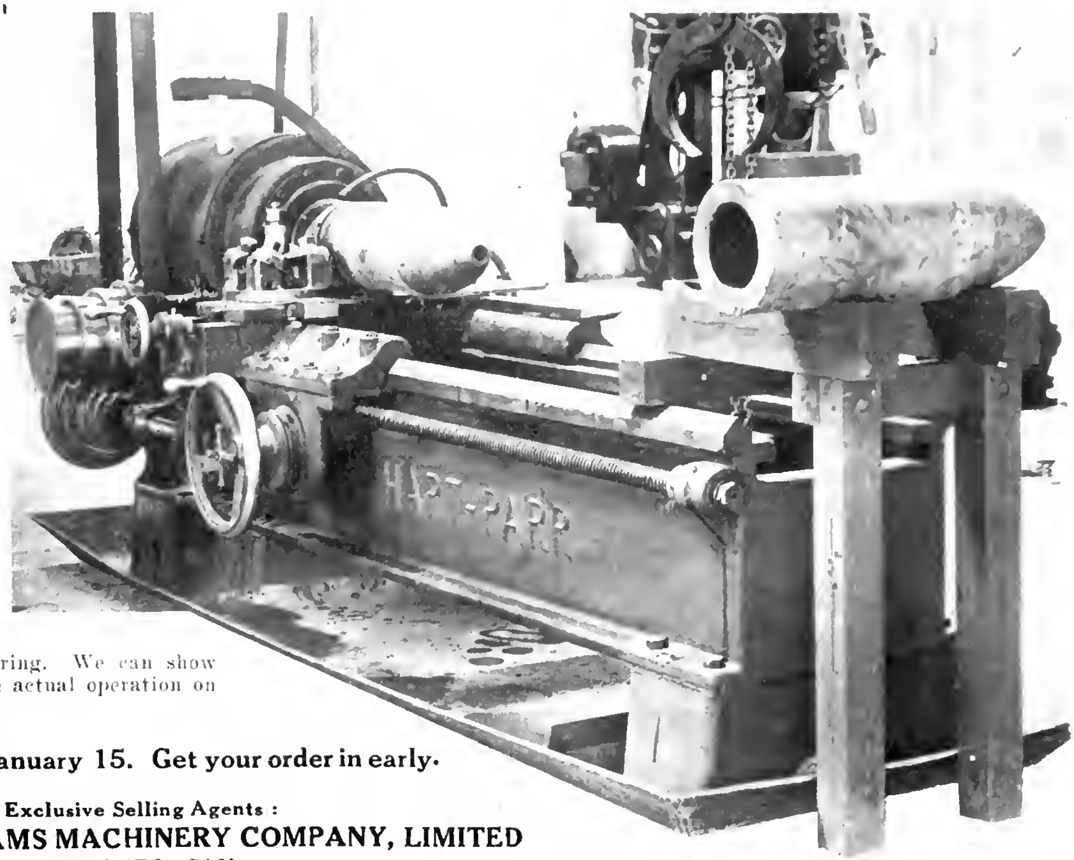
Aurora, Ont.—The Toronto & York Radial Railway Co., have made a reduction of 25 per cent. in the commercial lighting rates, and five per cent. on the street lighting and power account.

The Canadian Car & Foundry Co., Montreal, has closed an order for nearly 2,000 freight cars valued at about $2,000,000, for the French Government. Work on the order is to be started at once.

Yeomans Brothers Co., Chicago, Ill., announce that they have taken charge of the sale and installation of the Shone pneumatic sewage ejectors throughout Canada and the United States. Darling Brothers, Ltd., Montreal, are the Canadian agents for this firm.

Toronto, Ont.—The following municipalities voted in favor of the Hydro-radial project: Port Credit, Trafalgar, Milton, Wilmot, Nassagaweya, Esquesing, Guelph Township, Waterloo, New Hamburg, Stratford, Downey, St. Mary's, London Township, Biddulph. The following voted against the scheme: Waterloo Township, Blanchard, North Easthope, East Zorra.

The HART-PARR SHELL LATHE



This is a special lathe built for producing shells from 6-inch to 12-inch diameter. It requires very little attention, is accurate and possesses enormous stiffness and great durability. Fitted up with tooling complete with profile attachments for turning, and special Cutter Bars and Carriages for boring. We can show you these machines in actual operation on 9.2" British Shells.

Stock deliveries January 15. Get your order in early.

Exclusive Selling Agents:

The A. R. WILLIAMS MACHINERY COMPANY, LIMITED

TORONTO, CAN.

"Here is a Die Head that you can depend upon"

A Geometric Self-Opening and Adjustable Screw-Cutting Die Head

They are being used with absolute satisfaction on every make of Screw Machine.

A micrometer adjustment makes possible quick and accurate variations for a tight or loose-fitting screw. The chasers open automatically, so that no backing off occurs to injure the thread. Length of thread accurately governed—short or long.

Arranged for cutting any diameter, pitch and form of thread. Right or left-hand. Flush to shoulder, where required.

Let us recommend the right sort of Die Head for your work.

The GEOMETRIC TOOL COMPANY

NEW HAVEN, CONN., U.S.A.

CANADIAN AGENTS: Williams & Wilson, Limited, Montreal.

The A. R. Williams Machinery Co., Limited, Toronto, Winnipeg, St. John, N.B.

The Canadian Locomotive Co., Kingston, Ont., have received an order for 25 locomotives from the Dominion Government for the National Transcontinental Railway. It is reported that 15 of these are "Consolidation" type, and 10 are "Pacific" type engines.

Business Opportunities in Spain.—A recent issue of the Gaceta de Madrid, contains an additional list of goods, the supply of which it is proposed shall be open to foreign competition. Diving apparatus, motor boats, gas meters of more than 30 h.p., electric dynamos and electric motors of 50 h.p., or more; transformers, of all classes, of more than 200 kw.; rails of more than 40 lbs. per yard; tinplates; soft steel, etc.

C. F. Morse Co. Roll of Honor.—Fifty-two of the staff of the Canadian Fairbanks-Morse Co. have joined the overseas forces. Montreal has sent 15; Toronto 7, St. John 8; Winnipeg 10; Calgary 2, and Vancouver 10. Graham Drinkwater, vice-president, states that the company will keep open the positions of those enlisting, and adds: "We believe every Canadian business man should realize that the first business of this country is to help terminate this war, and this can only be done by sending our men, giving our money, and helping the great cause in every possible way open to us."

Workmen's Compensation.—The Ontario Workmen's Compensation Board has issued a list of new regulations numbered 65-86, which became effective on January 1. These include a rearrangement of the iron industries, the separation of the manufacture of explosives from other industries, the bringing together of the building trades in a class, and changes in the railway, canal, road-making and bridge-building industries sections. There is little change in the industries included or excluded. The regulations provide that employers must send in their next annual pay-roll statement by January 20.

Canada's Fire Loss.—The fire wastage in Canada is the worst in the world. The losses in Canada would pay off the National Debt in twenty years. They are seven times as great, per capita, as they are in Great Britain, and we pay five times as much for our insurance as they pay in Europe. The fire loss averages over $2,000,000 per month, or $67,000 per day. Fire commissioners agree that a large proportion of fires are of deliberately incendiary origin, that a still larger percentage are unconsciously incendiary, and that a not inconsiderable number are the result of carelessness or neglect. The number of fires resulting from causes beyond human control constitutes almost a negligible quantity in the year's total.

Catalogues

The Cling-Surface Co., of Buffalo, N.Y., have issued a special calendar of interest to engineers, and as long as the supply lasts will gladly send a copy to any engineer who applies to them for one.

The Electric Furnace Bulletin No. 1030 published by the Snyder Electric Furnace Co., Chicago, Ill., describes fully the "Snyder" electric furnace, its construction and method of operation. The bulletin is fully illustrated and includes views of a number of installations.

The "Cole" Boiler Feeder is illustrated and described in a bulletin recently issued by the Geo. W. Cole Co., Toronto, Ont. A table is included, giving the capacity and price of each size of trap. Other apparatus described and illustrated includes the "Otis" heater, and the "Kitts" pressure reducing valve.

Concrete Mixers made by the Koehring Machine Co., Milwaukee, Wis., are the subject of a bulletin, recently issued. The various types are illustrated and tables give information covering the proportions and quantity of materials that can be mixed in each size of mixer, also weights and capacities of "Koehring" hot mixers.

Vises.—The Rock Island Mfg. Co., Rock Island, Ill., have issued a catalogue "H" describing a complete line of vises for every service. A large number of vises are illustrated and are accompanied by a brief description and tables giving principal dimensions for each size. One of the special lines described as a combination forge, anvil and vise, while other equipment dealt with, includes drop hangers, bearings and safety collars. The catalogue is gotten up in attractive style.

Foundry Equipment. — "Buckeye" Catalogue C, issued by the MacLeod Co., Cincinnati, Ohio, deals with an interesting line of foundry equipment and oxy-acetylene apparatus, etc. The various lines are fully described and illustrated, and the essential particulars are given for the different sizes. Particulars regarding the work for which the different equipment is best suited are also included. The illustrations in a number of cases show the equipment in operation.

The Leavitt Machine Co., Orange, Mass., have issued a pump supplement No. 17 dealing with the improved Dexter pump valve reseating machine. The bulletin describes the machine and its construction while the illustrations show complete outfits for reseating all standard makes of steam pumps. Other illus-

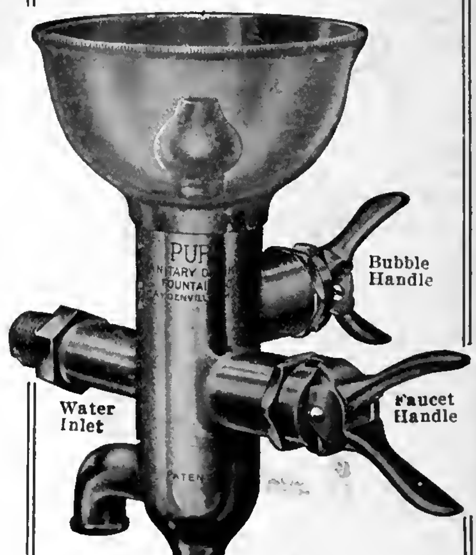
trations show the Dexter method of cutting valve seats with the machine in position. The Smith & Williams patent pump cutter is also illustrated and described.

Friction Clutches.—The "Johnson" friction clutch as applied in machine building is illustrated and described in a catalogue issued by the Carlyle Johnson Machine Co., Manchester, Conn. The catalogue contains a number of testimonials from various well-known firms who have installed these clutches on their machines. On the opposite page to each testimonial is an illustration of the machine referred to, showing location of clutch. The catalogue also serves to show the wide application of the Johnston clutch and its principal features.

The Woods Engineering Co., Alliance, Ohio, have issued a complete catalogue covering their No. 2 Universal Tool and Cutter Grinder. This machine, which is designed to meet the requirements of modern tool room grinding is described fully with the various applications illustrated and dealt with in detail. These illustrations show the setting for various operations, each accompanied by a description. Counter shaft and floor plans are also illustrated while another view shows the machine and all the attachments as listed. Tables of emery wheel speeds and clearance when using cup wheels are included.

Book Review

The "Mechanical World" Electrical Pocket Book for 1916. Published by Emmott & Co., Ltd., Manchester, England, price 25 cents. This book is similar to the "Pocket Diary and Year Book" for mechanical engineers, published by the same company. This issue as in previous years has been considerably improved and enlarged. The contents include a varied collection of electrical engineering notes, rules, tables and data, specially prepared for the use of those in charge of electrical plants or machinery, together with a conveniently arranged diary. New sections have been added, covering switchgear and switchboards, earthing, reductors for half-watt lighting, alkali accumulators, nickel storage cells, efficiencies of direct current dynamos and motors, etc. The section on lighting circuits and switching has been revised, and additional diagrams have been introduced. The sections on electric lamps and electric lighting have been brought up to date, while the book generally has been thoroughly revised. The book contains a great deal of valuable information for electrical engineers. It is fully illustrated and bound in substantial cloth covers.



CANADIAN MACHINERY

AND MANUFACTURING NEWS

A weekly newspaper devoted to the machinery and manufacturing interests.

Vol. XV, TORONTO, JANUARY 13, 1916 No. 2

EDITORIAL CONTENTS

THE MACLEAN PUBLISHING COMPANY, LIMITED

JOHN BAYNE MACLEAN, President H. T. HUNTER, General Manager

Publishers of Hardware and Metal, The Financial Post, MacLean's Magazine, Farmer's Magazine, Canadian Grocer, Dry Goods Review, Men's Wear Review, Printer and Publisher, Bookseller and Stationer, Canadian Machinery and Manufacturing News, The Power House, The Sanitary Engineer, Canadian Foundryman, Marine Engineering of Canada.

High Explosive Shell Manufacture

Staff Article

Each succeeding article appearing in our columns descriptive of shrapnel or high explosive shells has demonstrated the ability of individual firms to successfully and quickly overcome all locational and equipment disabilities. This is noteworthy because in no instance did the peace-time product of our metal-working plants in the least resemble shells.

4.5 SHELL PRODUCTION IN A GENERAL ENGINEERING WORKS

IN the earlier months of shell making the only type of projectile referred to was shrapnel, in various sizes around 3 in. dia., and in quantities which gradually grew from thousands to hundreds of thousands. The course of events, as we are all aware, caused a sudden and urgent demand for explosive shells, at first of similar size to shrapnel, but ultimately stepping up until the present maximum of 9.2 in. has been attained. In some respects the change from shrapnel to explosive shells was welcome; a number of operations were simplified, one or two were dispensed with. The size remained the same, however, and the convenience of this was emphasized in the small amount of experimental work necessary in making the change.

Experience in producing these smaller shells enabled the production of larger sizes to be undertaken with a hitherto unknown degree of certainty, and the majority of firms who took up the production of 4.5 in. and larger sizes based their plans and equipment on the results obtained by manufacturers of the 3 in. or 18-pdr. size. This interchange of experience has been one of the principal factors contributing to the successful production of munitions in this country, not the least interesting phase being its influence on the adaptation and conversion of existing machines.

The plant here described began its shell work on the 4.5 in. size and, due to the circumstances referred to, has made satisfactory progress. The forgings from which the shells are machined are $4\frac{7}{8}$ in. dia. x 14 to 15 in. in length.

After gauging the thickness of the wall, the first operation is facing off the closed end or base. The shell is held in a special sleeve type of chuck shown in Fig. 1, which is also used for the second operation, viz., cutting off open end; in the former case a long internal stop-rod is used, while for the latter a shorter stop is necessary. These operations are being performed on two old discarded lathes which were fitted up with satisfactory results, an output of 250 per day being obtained.

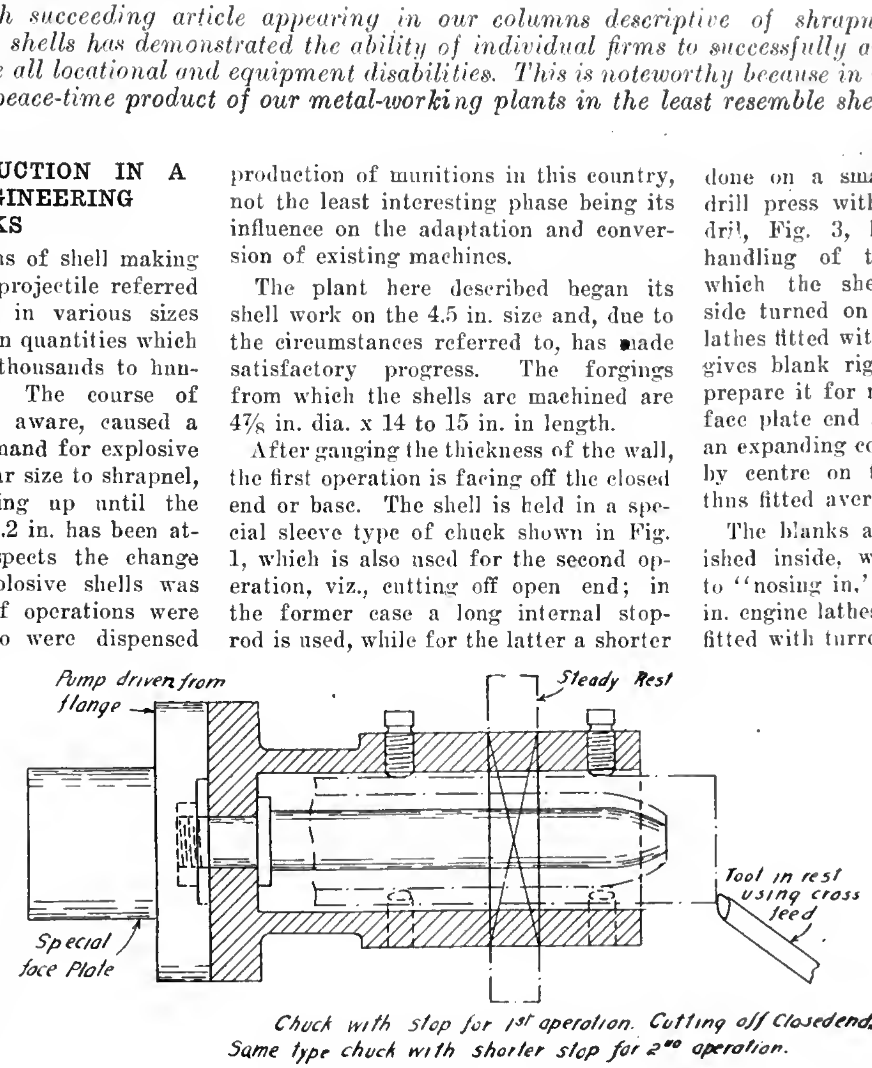

FIG. 1. EQUIPMENT FOR 1ST AND 2ND OPERATIONS

The next operation consists of centering shells true with inside, which is done on a small Wright Machine Co. drill press with special centering mandril, Fig. 3, hinged to facilitate the handling of the rough shells, after which the shell blank is rough outside turned on two "Bertram" engine lathes fitted with a former at back which gives blank right contour necessary to prepare it for nosing. Shell is held at face plate end as per sketch, Fig. 4, by an expanding collet on a taper arbor and by centre on the tailstock. Machines thus fitted average 7 per hour.

The blanks are now ready to be finished inside, which is done previously to "nosing in," on two New Haven 24-in. engine lathes as shown in Fig. 5, and fitted with turret head and tooled as per sketch, Fig. 6. Shell is held in special pot chuck, the outer end of which is carried in a steady rest to eliminate overhang. An output of 3 per hour is obtained from machines thus fitted.

The first tool is a roughing-out double cutter, and is run down the parallel portion of shell; second tool, which is a flat end twist drill, roughs down the base to required thickness and relieves the excessive strain on the next cutter. On the face of the turret head is fitted a small tool to face off the open end to required length. Third tool roughs out the tapered side and bottom, leaving a small cut for fourth tool, which is fed down

FIG. 2. CUTTING OFF OPEN ENDS OF SHELLS ON A PREVIOUSLY DISCARDED LATHE.

the entire length, sides and bottom. The fifth tool is a taper double cutter forming that portion in which the thread is cut after nosing in. It will be noticed that a notch is cut on each side of cutter at a different position; this is to relieve the strain upon the cutter and also break up the chips. On the turret head is a series of stops so set as to give each tool its required travel.

Nosing-in.

The next operation is the "nosing in" or "heading" which is done on a 90-ton hydraulic press, using a cast iron chilled die made by the Jno. McDougall Cal. Iron Works, and fitted with two stops

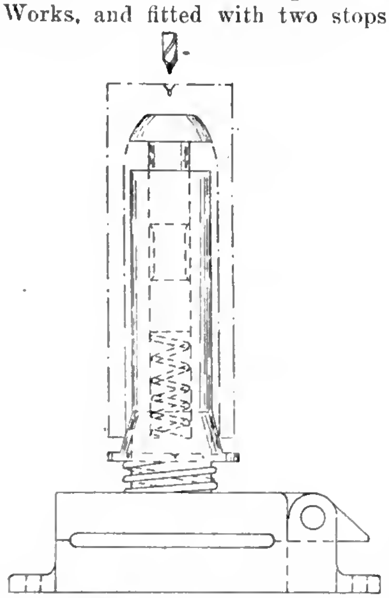

FIG. 3. HINGED MANDREL ON HIGH-SPEED DRILL PRESS TABLE FOR CENTERING SHELLS.

adjusted to the correct travel. These dies have a chill of about ⅝ inch deep, and 6,000-7,000 shells are nosed by each die. Blanks are heated in an oil furnace, constructed in the shop, capable of heating six shells at a time, which, after nosing, are allowed to cool off in powdered mica, so as to avoid any chilling effect, and at the same time relieve any forging strains that may be set up.

Finishing Nose

After nosing, shells are finished internally on the nose end on a "Bertram" engine lathe, also an old Putmans & Sons gap lathe, fitted with turret heads mounted on lathe carriage and tooled as per sketch, Fig. 7. Shell is held in special pot chuck similar to inside boring lathe. The first tool cuts off end of nose to correct length, and the second tool roughs out nose, leaving 1-32 for finish cutter, No. 3. Tool No. 4 taps the thread with a Murchey collapsible tap, while No. 5 machines out the inside of the shell to the correct radius. On this turret head is a series of stops for the cross feed, and on the carriage is another series to regulate the travel of cutters and tap.

The next operation is the "finished outside turning," which is carried out on standard lathes having a former bar at back conforming to the nose shape required. The tool post is carried on a compound slide so that adjustment may be made by means of the screw in case two or more cuts are required. In the nose of shell is screwed a driving centre that fits the driving dog on face plate, the other end being carried in tail-stock centre. Fig. 8 illustrates the arrangement, as described herewith.

After this operation the shell is weighed and enough faced off base end on another lathe to bring it to correct weight. Waving and undercutting is next done on a standard lathe, shown in Fig. 9, specially equipped for same, tooling of which is shown in Fig. 10. The three tools are carried on the four-sided turret tool post on carriage, which is held rigidly on lathe bed. Shell is carried in chuck similar to those previously described. When tool No. 1 is in position, it locates the position of recess on shell by means of a finger stop fitted to the side of tool and hinged so that it is removable when turning shell. Roughing tool is made so that it relieves the waving cutter by recessing between the waved ribs. Waving tool No. 2 is operated by a three-throw cam on outside of chuck. Tool No. 3 does the undercutting in sides of driving-band recess. Chuck for shell is similar to the others except it has a three-throw cam fitted on outside. A production of 11 shells per hour is maintained steadily on this machine.

Recessing Base

The base of shell is reinforced by a forged steel disc or plate which is screwed into it and riveted in place. The base plate recess is done on a Butler engine lathe fitted with a turret head, and tooled as shown in Fig. 11. The base recess is a difficult operation owing to its shallow depth and having to be the proper diameter for threading. Tool No. 1 is made similar to a flat drill to relieve the cutting on centre of roughing cutter No. 2, which leaves 1-32 in.

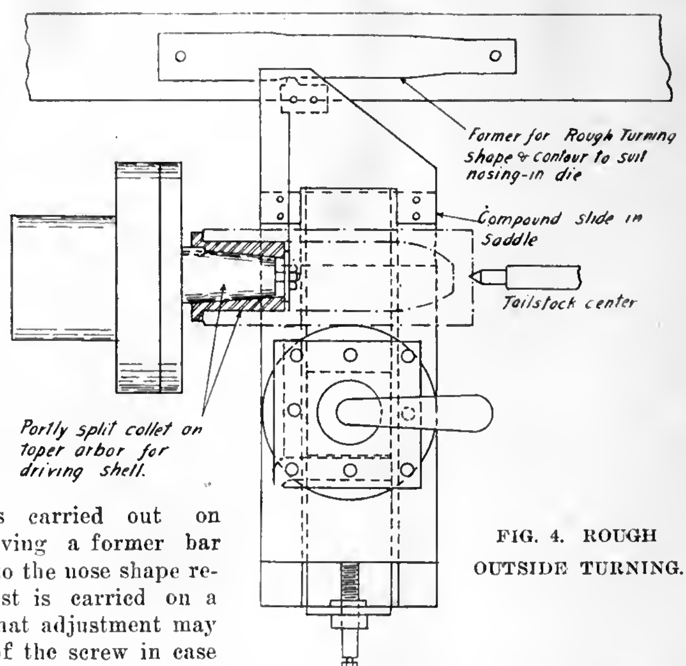

FIG. 4. ROUGH OUTSIDE TURNING.

on diameter, and a scraping on the flat base which is machined off square and made the proper depth by tool No. 3. No. 4 forms a recess at bottom or thread by using the cross-feed in carriage. Tool No.

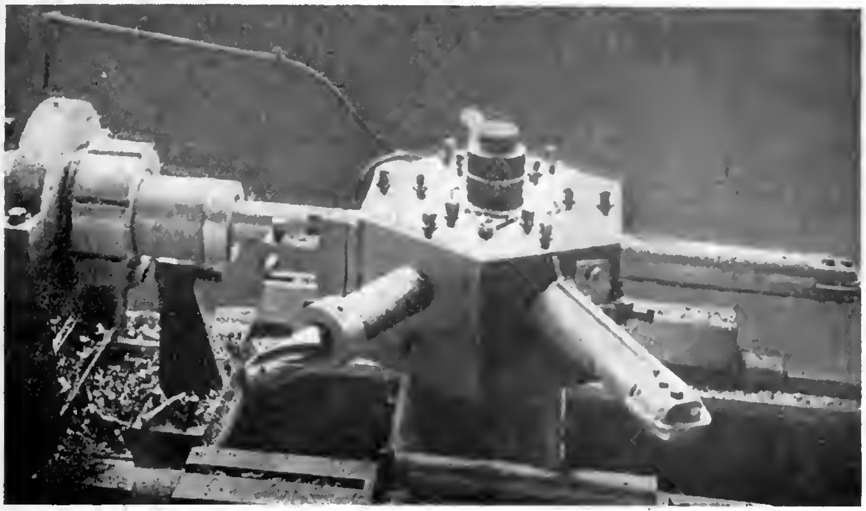

FIG. 5. BORING ON A JOHN McDOUGALL CO. LATHE.

5, finished to size, makes the counterbore the correct depth.

The shell is now ready for the threading, which is done with a Murchey collapsible tap with overhung chasers having the first thread tapered. Shell is held in special pot chuck in steady rest. On the turret head is a series of stops to regulate travel of tools, and one on carriage to locate head on centre line of lathe after using cross-feed.

In the next operation the shell is held in a special type of bench vice and a sizing tap run down the base recess by hand: nose end is also opened up with a sizing tap, after which shell is sandblasted inside to help the varnish to have a better hold, and three chisel grooves cut diagonally across waved ribs.

Preliminary Inspection

Shell is now ready for preliminary inspection, consisting of examination for freedom from cracks, flaws, rust, defective threads or piping, as well as smoothness of surface. The base is also carefully examined for flaws or blow-holes, depth, defective threads and flatness, also that the counter bore is deep enough to allow the extra space for riveting over of base plate. All sizes and measurements are gauged.

Shell is next placed in another special vise and fuse socket is screwed in with threads coated with "Pettman's" cement. Base plate is also screwed home in like manner, after which it is faced off flush with end of shell, after having edges "peaned" over by rolling. Fuse socket is next finished off to the same contour as nose, and with a specially formed internal tool sharp edges are removed. The varnishing of the inside is the next procedure, and is done by pouring varnish from one shell to another with a special protector for the threads. They are placed nose end downwards in holes in a special table with tapered trough to return the surplus varnish into the receptacle for same. After shells have drained sufficiently they are placed upside down in holes in a two-tier truck and placed in an oven where they remain for eight hours subjected to a temperature of 300 degs. F.. The oven, which is a "Mecol" type, is heated by a "Mecol" low pressure oil burner, and can accommodate 160 shells in two tiers on a special truck on tracks extending into oven, and is also equipped with a recording thermometer.

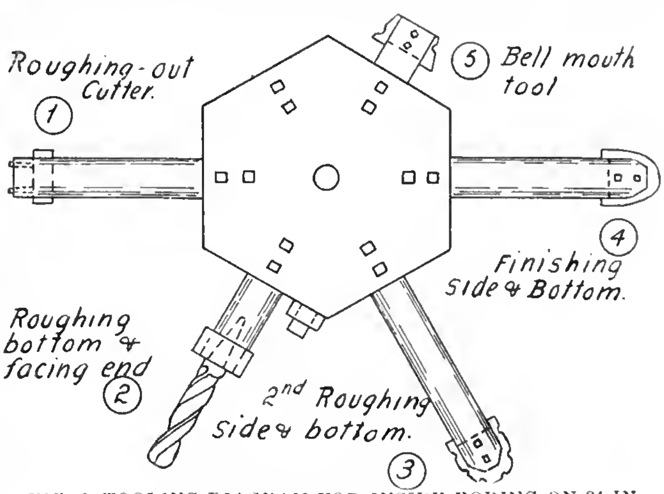

FIG. 6. TOOLING DIAGRAM FOR INSIDE BORING ON 24-IN. ENGINE LATHE.

After varnishing and baking, shells are ready to have copper bands pressed on, which is accomplished by slipping band loosely over the base and into recess, a blow from a mallet being sufficient to hold it in the recess. The band is pressed on in a hydraulic banding press, giving it from three to six strokes to ensure band being pressed in thoroughly into undercut. Shell is moved around each stroke.

The next operation is the turning of the copper bands which is done on a standard engine lathe equipped with a special band turning apparatus, being "Lymburner" product. It is fitted with three tools: 1st, roughing tool which cuts band tapered and underneath shell and moves diagonally with centre line of shell. Tool No. 2 is a rough forming tool which operates on front of band and against a stop on back of cross slide. The finishing tool, which shaves it to size and also forms the grooves and serrations on band, works in a slide carried on a vertical fixture. Limit gauges are used to test the diameter, form, and also concentricity of driving band. Special drive of 5 in. double belt, not satisfactory, was changed to chain drive as shown in Fig. 12, which gave an increase from 80 shells a day to an output of over 200.

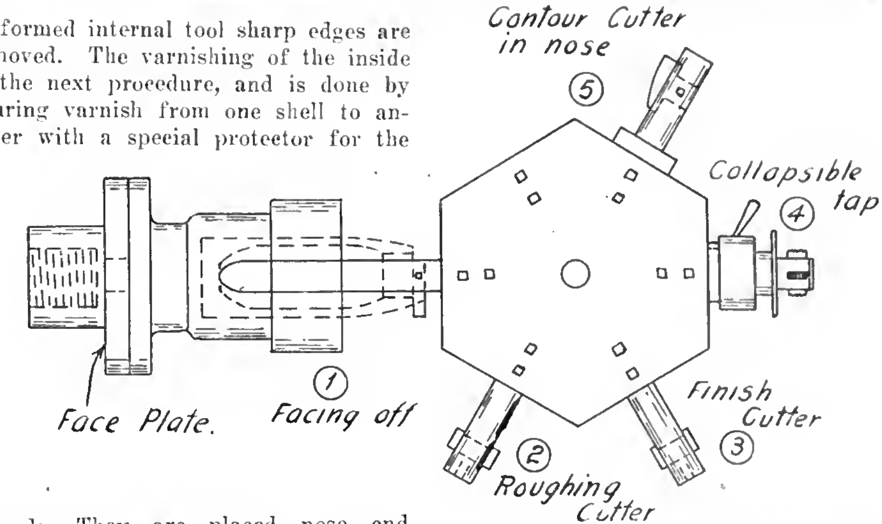

FIG. 7. TOOLING ON "BERTRAM" LATHE FITTED WITH TURRET.

Marking and Painting

Shells have now to be marked on base in a circle, which at the present time is being done by hand, and after being cleaned, they are ready for final inspection, where they are very carefully examined for flaws, blowholes, defects in the varnish, etc., and within the allowances for weight which should be (finished shell unpainted) 27 lbs. 10 oz. plus 2 oz., or minus 4 oz., and when passed final

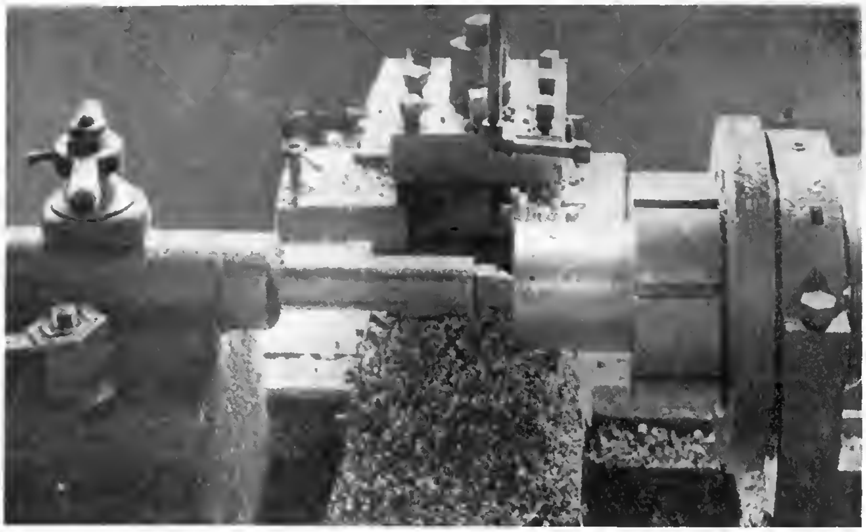

FIG. 9. GROOVING AND WAVING FOR COPPER BAND.

inspection they are coated with two coats of paint, first coat white, and second coat yellow ochre, which is done on a belt driven stationary machine, with the brass cap and fixing screw in the fuse socket: after which they are allowed to dry before being packed two in each box, and are ready for shipment.

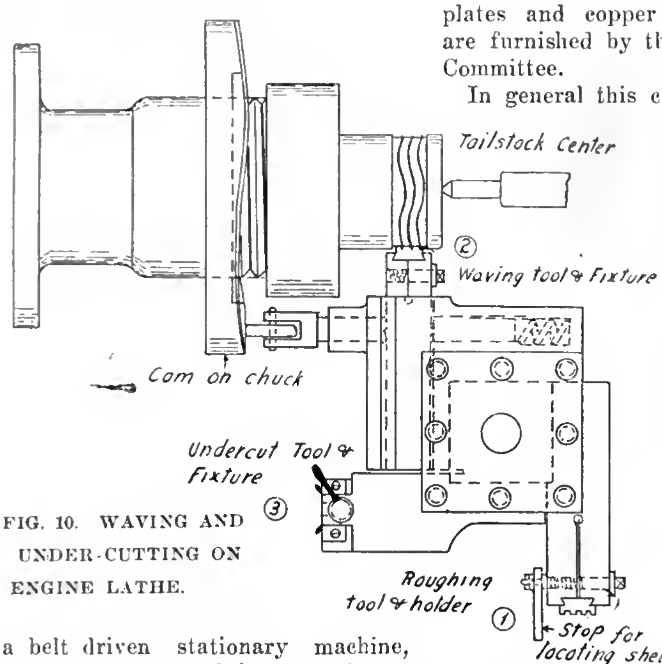

FIG. 10. WAVING AND UNDER-CUTTING ON ENGINE LATHE.

Brass plugs, screws, fuse sockets, base plates and copper bands are furnished by the Shell Committee.

In general this company has not been able to carry on all the operations under one roof owing to location of buildings and lack of space, with the result that there is much greater amount of extra handling than would otherwise be. In the preparation and installation of machinery there was found to be a number of lathes that had passed their usefulness on jobbing work, so they were all pressed into service and were all overhauled, by having all the shears planed, new bearings, new spindles, and in some cases new carriages fitted. The other machines on this work are "Butler," "Bertram," "New Haven," and "McDougall" products. Fixtures and equipment for all lathes with three exceptions were all designed by the Engineering Department, and manufactured in the works.

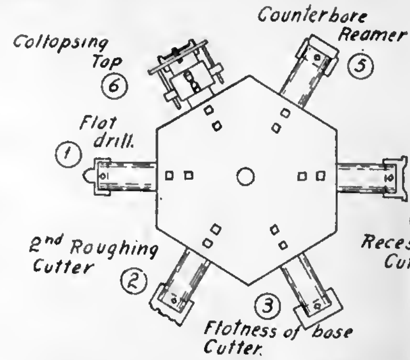

FIG. 11. TOOLING FOR BASE PLATE RECESS.

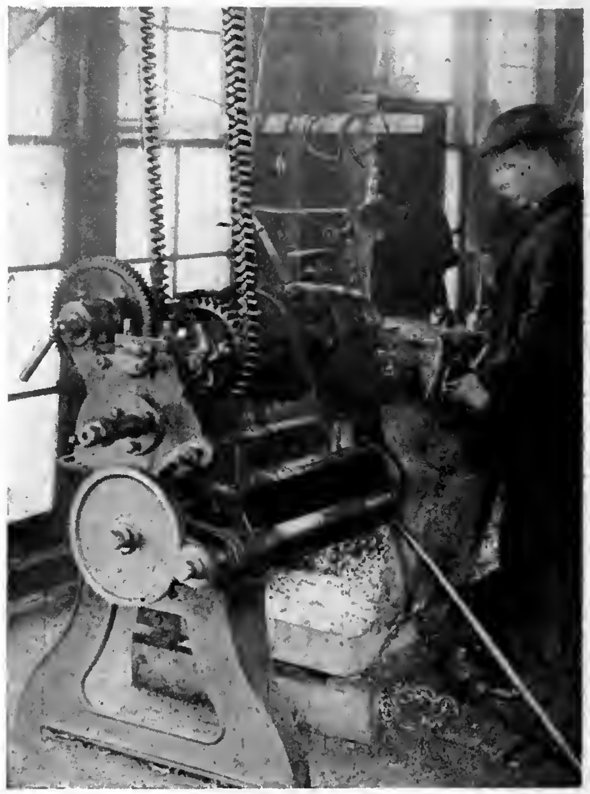

FIG. 12. TURNING COPPER BANDS. NOTE CHAIN DRIVE.

The banding press was all machined and assembled in the works, castings for which were purchased from an outside foundry.

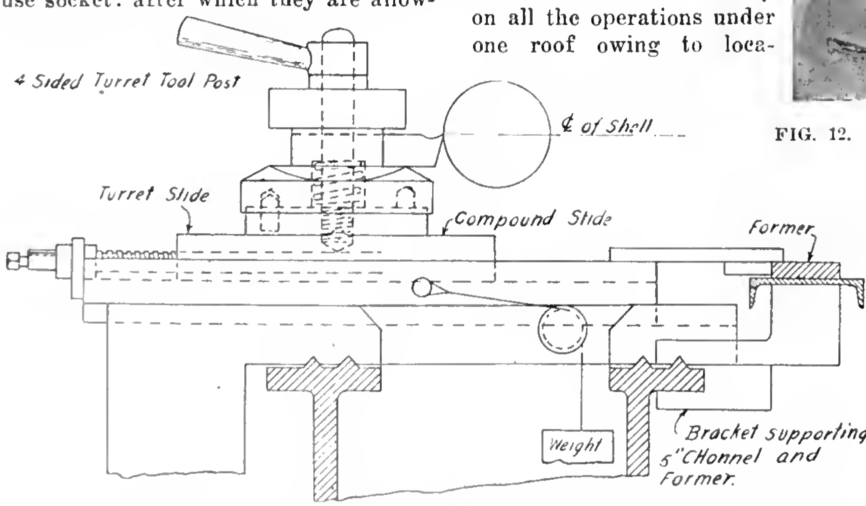

FIG. 8. END ELEVATION OF LATHE, SHOWING FORMER AND TURRET TOOL POST FOR OUTSIDE FINISH TURNING.

Industrial Safety and the Principles of Management--I.*

By W. P. Barba

The leading countries of the Western Hemisphere have been slow in following the examples set by European nations in the matter of workmen's compensation laws. Pennsylvania recently became the twenty-fourth state to adopt a law of this nature, however, and the remarks of the writer indicate the trend of public and private opinion on this subject.

THE matter of accident prevention has come to be considered as a point vital to the success of any business—through the operation of reasons, economic, humanitarian and sociological. Only a few years ago, say ten years, little was heard in this country of more than desultory efforts to minimize the waste of human effort through accidents. Now the slogan Safety First has been given widespread currency, and has lately been improved by coupling with it another, without which the first is really of little value, hence we now hear Safety First—Safety Always.

It requires no detailed presentation to make manifest the waste to the world of productive power through the suspension from their daily labor of men injured therein, of the consumption of materials without the corresponding production which normally would result therefrom—of the real suffering, both of the injured man and those dependent upon him, or of the investment laid aside and idle with every man injured. As part of a study of the principles of management (which should accompany the technical education of every man called to work amongst his fellows) much too little attention is given to the subjects of methods of employing labor, both trained and untrained, and too little weight is laid upon the cost of training any new employee into the duties for which he is hired. Few realize that each man hired into a plant is the subject of investment for quite a time before he is sufficiently trained to the work he is to perform as to return a profit. It is probable that a study of the subject would produce a figure of $150 average of investment in each man before he becomes productive.

Discharging is Non-Corrective

So when true principles of management are but little understood and rarely taught, it is customary to witness many discharges as corrective of offences which are perhaps trivial at best, but which discharges in any case only act as correctives for the benefit of the employer with whom the discharged workman may next engage for employment. A better way, for instance, is to call up the man, convict him to his own satisfaction and yours, of the wrong-doing in question, and then and there apply the punishment which should correct the offence, using means which will inure to the benefit of the employee as well as the employer. This can be effected by lay-off or fine; discharge should be rare, and only for major offences. Fines should be used most often in preference to either of the other more usual means. Fines should be laid with great care for the proper amount needed to effect the corrective, and a relatively small sum usually is sufficient. In no case should fines accrue to the benefit of the company, this having a very disturbing effect upon the value of the corrective, but fines in all cases, both for spoiled work and for discipline, should be converted into a fund for the benefit of the whole body of workers. Some mutual benefit plan, such as is now happily established in most up-to-date works, should receive the results of all fines. The result is then doubly beneficial, and has a balmy effect which removes all soreness and sense of personal injury from the transaction.

Investment Loss Through Injury

Referring again to the loss of investment from removal of trained men from production by discharge, let us also look at this loss through physical injury, and especially those arising from preventable causes. It is, of course, plain that the investment loss through injury can become a permanent loss of producing power, the loss of investment causing the employer to suffer, and the loss of producing power causing the injured man to suffer permanently, as well as through the physical pain he bears, meanwhile; his producing power and income reduced or gone, his expenses continue even on a reduced scale, his mental condition is much disturbed, and he wonders what can be done, and so the rapid but all too slow growth of the safety movement, the liability and compensation laws, the preventive measures, but most powerful of all, and as yet but little developed, the education of every person engaged or even interested in industry, to the end that all preventives be used both without and within the person of the operator subject to injury.

Figures compiled during a term of years point most strongly to the lack of proper education as the prime cause of injury—loss of productive power, and all the attendants of this condition. Hence, industrial safety and sound principles of management are without doubt most closely bound together, and cannot with success be considered apart. Commissioner John Price Jackson, of the Department of Labor and Industry of Pennsylvania, has shown in dollars and cents just what the large number of accidents that are occurring in the industries of the State, are costing the workers. He has not figured what they cost the employers.

During 1914 accidents cost employers in a score or more of the larger industries in Pennsylvania the sum of $1,048,503.96, which total is computed on the daily wage. There were 38,126 men thrown out of work, and each of these men lost on the average $27.50. The accidents from which Commissioner Jackson has computed the figures do not include those reported to the State Department of Mines or the Public Service Commission. The report shows that about one man in every 28 lost time because of accidents, as there were 1,086,508 employees in the industries from which statistics were gathered. The average daily wage was $2.45 and the total number of working days lost was 426,824.

This brief report gives one an idea of the extent to which accident prevention may go, the aggregate for this State only being so large as to appal one, and still does not include mining risks that are notoriously great. Indeed, most of the opposition which was disclosed in an organized way to the enactment of a Workmen's Compensation Act has been from the smaller operators of mines, whose whole capital could be annihilated by the liabilities arising from one accident on a small property.

A New Principle

From the operation of these causes, motives and products alone, there has within the last eight years come into being a general safety movement, looking more toward the possibilities of prevention than ever before. Out of all the upward striving of humanity toward better things and better conditions comes a new principle: namely, that a trade should bear the charges and cost of its casualties, and from this, the employers' liability and workmen's compensation movements have gained much force.

*Presented at the Philadelphia local section of the American Society of Mechanical Engineers, Nov. 23, 1915.

Rarely has there come before the public a movement involving so-called capital and labor, but in reality employer and employed, which has met with such complete support from both sides. But there are no "sides"—the interests of all employed in the world's productive work are entirely identical. To enlarge upon this thought, for it is one of the links attached to the title of this paper, these two, together with their many links, are inseparable—in practical everyday work, just like a graphically expressed formula in organic chemistry.

It will have been noticed from these prefatory remarks that this connection is quite clear. One who is charged by his owners with operating a large manufacturing plant has as his first practical concern the securing and retaining, as well as maintaining in good efficient condition, a well satisfied body of workmen, contented, well paid, and their physical condition well in hand.

After this the managing executive may take up his financing, his raw materials, manufacturing methods, selling organization, etc., but no manufacturer can possibly succeed without this satisfied body of operating workmen—fellow-employees as just outlined—to secure and maintain this condition is a prerequisite to any further success.

The Economic Aspect

The economic as well as the social side of this problem must be just as carefully looked after, now that Pennsylvania has a Workmen's Compensation Act, the twenty-fourth in the United States, which country followed quite a long way behind both Germany and England. No longer will industrial safety be thought a fad, no longer will the courts be filled with cases crying for just relief, no more will the cheap lawyer haunt the hospitals to prey vulture-like upon the unfortunate. Each trade is to bear its share of the cost of its casualties, and the ultimate consumer will pay the bill. All this is exactly as it should be, the only danger lying in the chance, a real danger too, of the whole game being absorbed into some form of political spoils, which God forbid.

Much is being said and printed about foreign trade, foreign competition, foreign methods, and many have objected that the securing of this foreign trade in normal times was difficult, due to the difference in labor conditions, rates of pay, etc. It is very interesting to note that in 1885 Germany established compensation measures, followed by England in 1891, so that our trade abroad is not menaced by the adoption here of these plans for workmen's compensation. On the contrary, we have lagged so far behind these stiff competitors, in these particular matters, as to cause unfavorable criticism of us by those who know.

Now when such compensation acts are generally in force, each employer will be placed automatically on piece work to make his plant safe; and the penalty for failure to achieve safety of equipment will be very great. There are, however, other features in the case: present and proposed laws provide greater compensation for a man with a family than a lone bachelor without dependents, some laws providing compensation for the grandfather of a man injured, when dependent. The natural result will be to select for employment men who offer the lowest risk, both as to compensation penalties and as to physical condition of the applicant, which condition exactly reflects chances of injury, and consequently, the rate of risk. The compulsory insurance laws of Great Britain, placed in operation in 1912, immediately resulted in selection of employees whose rate of risk was the lowest, and thousands of perfectly good workpeople were turned adrift for this reason.

Selection of Insurance Risks

This is one of the consequential results our legislators and agitators should consider most carefully. There will inevitably result a careful selection of the best insurance risks, and defectives of all kinds will find it most difficult to obtain and retain employment. A defective in this sense may be a man physically unfit, incipient hernia, a tendency to joint dislocation, etc. He may be defective in the sense that he just cannot keep out of trouble, and this kind of a man soon cannot keep himself in a job. He will be selected to be always out of a job, until he learns to think enough to keep himself from unnecessary injury. Study of the figures showing frequency of accident to the individual, no matter where working, inevitably searches out such men, and then the employer must move the man, either to another job or else out, both ways meaning a loss of investment, production and earning power. Again education, both of the man and his employer, most necessarily his immediate foreman, is needed and just how best to supply the lack is a task worthy the best mind in your employ.

CUTTING METRIC THREADS WITH ENGLISH LEAD SCREW.

By V. I. M.

DURING the present crisis, we have come across several little stumbling blocks which, though slight in themselves, have rather ruffled the peace of mind of the small manufacturer. One of these, the subject of the present notes, has led to a number of enquiries for lathes with metric screws. These are, however, unnecessary, as a commercially accurate screw can easily be cut to a metric pitch with the addition of one or two "master" gears similar to ordinary change gears, which will cost next to nothing.

A glance at the conversion tables shows us that one inch is equal to 25.3998 millimetres. This may be regarded as 25.4, the error being negligible. Hence by using gears of 10 and 254 on the spindle and lead screw respectively, we should have the required ratio to cut a screw of 1 mm. pitch (assuming the pitch of the lead screw to be 1 inch). The average screw-cutting lathe, however, has a lead screw of two threads per inch, and hence the necessary ratio for 1 mm. pitch will be 10 to 127.

The accuracy obtained is such that the error does not amount to half a "thou." in a length of one metre, when using this "master" gear of 127 teeth. The form of the resulting ratios is also easy to remember (for ½ inch lead screw) as every increase of one in the driving pinion results in an increase of 0.1 mm. in the lead of the screw cut.

For a different number of threads on the lead screw, a different ratio is of course necessary. The following rule sums up the matter in general terms:—

$$\frac{\text{Drivers}}{\text{Driven}} = \frac{5}{127} \times \text{No. of threads on lead screw} \times \text{Pitch to be cut in m/m.}$$

Another approximation for less accurate work can be deduced as follows:— The metre is 39.3708 inches long. This dimension, however, is only about four thousandths of an inch less than 39⅜ inches, so that for all practical purposes we may use the latter number. Since there are 1,000 mm. in the metre, and the metre equals 39⅜ inches, the ratio of gears on spindle and lead screw respectively to cut 1 mm. pitch will be 39⅜ to 1,000, or 315 to 8,000. Hence with a lead screw of two threads to the inch, the gear ratio will be 63 to 800.

Thus for a pitch of 10 mm. the ratio would be

$$\frac{10 \times 63}{800} = \frac{63}{80} = \frac{\text{Drivers}}{\text{Driven}}$$

This may be generalised by the following rule:—

$$\frac{\text{Drivers}}{\text{Driven}} = \frac{63}{800 \times 2} \times \text{No. of threads per in. of lead screw} \times \text{Pitch to be cut in m/m.}$$

It will be found that in some cases the ordinary change gears may be used as the ratio may be found to suit by using a standard gear of either 35 or 105 teeth. This, however, does not generally apply. From this we can see that any reasonable metric lead can be cut by using the master gears of 63 or 127 teeth.—Herbert's Monthly.

CORROSION OF IRON PANS FOR ZINC-MELTING.

OWING to a regrettable conservatism in terminology, engineers will speak of galvanised iron in two different senses—when iron has been coated with zinc, either by being dipped into a bath of molten zinc, or by some galvanic process, as a rule electrolysis of zinc-sulphate. We wish to refer to the former, hot zinc process. The zinc is generally fused in iron pans, and the iron pans are attached by the fused zinc. If that were not so, mechanical galvanising would hardly be efficient; for the zinc is to adhere to the iron, and it does adhere because it alloys to a certain extent with the iron. The iron pans in which the zinc is fused hence suffer, and the practice considers certain kinds of iron especially suitable for making iron pans. Two years ago the well-known establishment of Julius Pintsch, of Furstenwalde, observed to its surprise that an iron pan, supplied by an English firm of repute, which had always given satisfaction, was more quickly corroded by the zinc than lower-grade iron pans. The fact was ascribed to a certain peculiarity in the iron, but a more thorough investigation of the problem was deferred. The results of the subsequent investigation were published last May in the Zeitschrift des Vereines Deutscher Ingenieure. Sheets of ten different kinds of iron were supplied by Krupp in Essen; after having been analysed and examined metallographically, they were cut up into plates, and pairs of these plates were suspended for eight hours in molten zinc at different temperatures. All the plates lost in weight by being kept in contact with the molten zinc, the loss amounting to about 20 grammes of iron per hour, per square metre of iron surface in the well-hot bath; and as long as the temperature was not raised materially, the composition of the iron did not appear to make much difference. An increase in the carbon percentage did not favour the corrosion, nor did a change in the manganese proportion. A rise in the phosphorus percentage from 0.025 to 0.090 did not effect the corrodibility either, though the introduction of phosphorus into the zinc bath is, of course, undesirable. An increase in the silicon percentage did increase the solubility of the iron, noticeably, however, and want of homogeneity in the structure of the iron had the same effect. But these influences were not important, and the temperature of the bath proved of much greater consequence. Zinc melts at 419.4 deg. Cent. As the temperature of the bath was slowly raised from about 437 deg. Cent., at which the first observations were taken, the loss of iron increased slowly at first, but much more rapidly afterwards, when the temperature exceeded 500 deg. Cent. In one case the losses of weight were:— 20 grammes at 437 deg., 23 grammes at 467 deg., 28 grammes at 486 deg., 41 grammes at 495 deg., 68 grammes at 500 deg., and 288 grammes at 532 deg., the loss being understood as before, per hour per square metre of iron surface. This was not the worst case; one iron lost over 500 grammes, another 800 grammes in the eighth hour. At higher temperatures, moreover, the differences between the different sorts of iron became much more pronounced. The chief thing to guard against, then, is an unduly high temperature of the zinc bath. It was further observed that it is advisable to keep the pan, so far as possible, at fairly even temperatures, and to avoid repeated complete cooling and reheating, lest crusts of hard zinc peel off and impair the iron.—Engineering.

EFFECTS OF LEAD UPON GUN METAL

A PAPER read before the Insitute of Metals furnishes some interesting information concerning the effects of lead upon gun bronze tested at different temperatures. It was found that straight gun bronze (88-10-2) dropped from a tensile strength of about 32,500 550° F., above which it rapidly decreased substituting one-half per cent. of lead for an equal amount of copper (giving 87½, 10, 2, ½) it was found that the strength of the bronze remained at about 32,000 lb. up to a temperature of 550° F., above which rapidly decreased to 22,500 lb. at 600° F. The variation in elongation was found to be even more pronounced; at 550° F. the alloy containing one-half per cent. lead gave an elongation of 18 per cent. and the straight gun bronze at the same temperature gave an elongation of a trifle less than two per cent. In gun bronze to which had been added 10 per cent. of lead at the expense of the copper was found a strength of 28,500 lb. and an elongation of 10 per cent., and when the amount of lead was increased to 16 per cent. the alloy still had a strength of 25,000 lb. and elongation of five per cent. This test was made with the metal heated at 500° F. In considering these results it should be borne in mind that lead softens the brasses, and therefore a casting which is to be subject to great erosive action should contain but very little lead.—Engineering.

New Westminster, B.C.—The value of building permits issued by the City of New Westminster, B.C., for the eleven months, up to the end of November, 1915, amounted to $83,795.

CARE OF CRUCIBLES

A hanger issued to brass foundries by the Joseph Dixon Crucible Co., Jersey City, N.J., contains suggestions for the care and treatment of crucibles in foundry operations. On its reverse side is given a table containing specific gravities and melting points of various metals, as well as a number of low fusion alloy mixtures. The suggestions, all of which are valuable, follow:

Refit tongs and shanks to crucibles every 30 days.

Keep fuel in a dry place, as damp or wet fuel causes scalpel crucible.

Don't wedge the metal in the crucible.

There should be about 3 inches of coke space on the sides and 6 or 10 inches of fuel under the crucible, depending upon the size of the latter.

Keep an accurate record of heats.

Store crucibles in a warm, dry place about two weeks, then anneal by heating very slowly and gradually—upside down, preferably—to 250 degrees Fah. or over.

Where oil or forced draft is used, be careful about too much air pressure which produces an oxidizing flames, thereby eating away the plumbago in crucible.

Set the crucible in a bed of dry sand when removing it from the furnace and be sure there are no clinkers left on the bottom or sides of the crucible.

Don't leave the crucible in the fire after the metal is ready to pour.

If possible, recharge the crucible and put it back into the fire before allowing it to cool if an after-heat is to be run.

Don't leave metal in the crucible to cool.

Have shanks fit the crucible, but if clips have to be used be sure that they are sufficiently wide. Better use two sizes of shanks and don't use gates as clips.

Avoid hard, sharp pieces of coke under the crucible.

Be careful with the use of the poker; it is easy to punch a hole through a hot crucible.

Place the crucible in the centre of the furnace so as to give equal fuel distribution all around.

Don't set the crucible in a cold draft or near an open door in the winter.

Avoid fluxes unless absolutely necessary.

Don't drop heavy pieces of metal into the crucible from a distance.

Don't drop large pieces of cold metal into a crucible containing molten metal, without first heating it, or it will chill back.

The top of the crucible should not be set higher than the bottom of the flue hole at the beginning of the heat.

Electric Welding Processes: Developments and Applications--I*

By C. B. Auel **

The development of electric welding to its present state of perfection, has been noteworthy, not only for the economies effected over previous methods of doing the same work, but also for rendering possible the production of many articles and the performance of numerous operations which were formerly quite impracticable as commercial propositions.

THERE are three clearly defined processes of electric welding—arc, incandescent and electro-percussive—of which the last is very recent. The arc processes are autogenous in that welding can be accomplished without pressure, simply by allowing the metals to melt under the influence of the electric current, then to mix and unite as they cool; the incandescent and electro-percussive processes, however, invariably require pressure as a necessary adjunct to their successful accomplishment. The arc processes commercially developed are as follows:

Zerener Process

In the Zerener process the apparatus employed resembles certain types of direct-current flaming arc lamps, the carbons being inclined toward each other and automatically adjusted by a suitable mechanism as they are consumed. By means of an electro-magnet, the arc, which is formed between the ends of the carbons, is directed downward in the shape of a pencil point. The metals to be welded are brought within the influence of the arc where they are then melted or fused as desired. The apparatus is complicated and does not lend itself readily to the carrying of large currents. It is not used in America and only to a limited extent elsewhere.

Benardos Process

In the Benardos process, the arc is drawn between a carbon electrode, which forms one terminal of a direct-current circuit, and the metal to be welded, which forms the other electrode. The welding apparatus itself, aside from the current supply, is exceedingly simple, and there is little to get out of order. As a minimum, 15 kw. at approximately 70 volts should be provided, though rather greater capacity is desirable especially when large work is likely to be undertaken. The voltage across the arc will ordinarily range from 40 to 50 volts, depending upon the class of work.

Slavianoff Process

In the Slavianoff process, the arc is drawn between a metal electrode, which forms one terminal of a direct-current circuit and the metal to be welded, which forms the other electrode. Otherwise, the apparatus is similar to that used in the Benardos process, although the minimum current supply necessary in this latter process may be said to be the maximum supply required in the Slavianoff process. The voltage across the arc is also lower in the Slavianoff than in the Benardos process, ranging from 18 to 30 volts.

Temperature of Arc

The temperature of the carbon arc has been variously estimated to lie between 3500 and 4000 deg. C. All metals may be readily melted by it. In a direct-current carbon arc, the greatest energy consumption and, therefore, the highest temperature occurs at the positive terminal.

When using the Benardos process, and making the metal to be welded the positive electrode, as is the practice, melting of the metal should and does take place at a faster rate than if the carbon electrode were made the positive. In the latter case, it is exceedingly difficult to weld at all below 500 amperes. The reason for this may lie in the fact that the conductivity of an arc depends in great measure upon the kind as well as the quantity of vapor in it. As iron and steel are more readily vaporized than carbon and their vapors better conductors than carbon vapor, there is, for a given current and with the metal forming the positive electrode, a greater quantity of metal vapor in the arc than would be the case were the polarity reversed and, therefore, current flows more readily from the metal to the carbon electrode.

In the Slavianoff process where both electrodes are of metal, the limitation just explained does not exist, and welding may be effectively done with either the work or the electrode as positive, though it is more usual to make the former positive. There might, however, be occasions when it would perhaps be of advantage to reverse these conditions and make the metal electrode positive so that the melting and therefore the deposition of metal would be more rapid owing to the greater heating effect at the electrode.

In both the Benardos and the Slavianoff processes, there are required, in addition to the direct-current supply with its necessary controlling apparatus, electrode holders and electrodes, coverings for the operator and the work, fire clay or carbon blocks, etc., for molding purposes, fluxes and metal filling material.

Direct current, at approximately 70 volts for the Benardos and 50 volts for the Slavianoff process, is necessary. A higher voltage may be used, but is wasteful and is only to be recommended where the amount of welding required is either so small or so infrequent as not to make advisable the installation of a separate outfit; and any excess voltage must first be reduced to the proper amount by the introduction of suitable resistance into the circuit. Satisfactory welds may be made in the Benardos process with 15 kilowatts capacity and even less; it is, however, preferable to have more where large pieces are to be handled or where more than a single operator is to be employed, and similar reasons govern in the Slavianoff process. If current is obtained from an independent source the dynamo should be compound wound with an over-compounding of about five per cent.

Control of the Current

Means for controlling the current supply and the voltage across the arc must be provided, since welds of different kinds will require varying current strengths at varying voltages across the arc. This is attained by the use, generally, of resistance introduced into the main circuit, though sometimes the same result may be secured by weakening the field of the dynamo. This latter method is, however, extremely limited in its application as it can only be used when a single operator is at work; otherwise, other operators on the same circuit would be seriously handicapped. Fig. 1 shows a complete circuit in practically its simplest workable form, and in which barrels of water are employed for resistance.

Metal resistance grids can be substituted with certain advantages for the water barrels, as the latter in time require to be replaced due to the hoops rusting away; furthermore, the resistance of the water changes as it becomes heated, necessitating an occasional readjustment; and, finally, if the outfit is worked very hard the water boils over, involving a stoppage of work in order to allow the water to cool. All other schemes of connections are but varia-

*Abstract of a paper read before the International Engineering Congress, San Francisco, Sept. 20-25, 1915.

**Director of standards, processes and materials, Westinghouse Electric & Manufacturing Co., Pittsburgh, Pa.

tions of the above. In theory, such schemes may show to advantage over the simple diagrams of connections described; but, in practice it is reliability and simplicity that are essential above everything else, and a dynamo, when especially designed for welding, should withstand such loads as are thrown upon it. Further, too much stress is laid upon efficiency, whereas it is of secondary importance since current is drawn from the dynamo only at irregular intervals, possibly averaging 15 to 30 minutes out of every hour even when the outfit is in constant service.

Carbon electrodes will range from 1/4 to 1½ in. diameter by 6 in. to 12 ft. long, depending upon the class of welding, whether large or small, and both of these higher limits may be exceeded in certain cases. The carbons should be solid, should neither crack, crumble nor spindle and should preferably be graphitic rather than common, as the former type is of higher electrical as well as thermal conductivity.

Metal electrodes will range from 1/8 to 5/16 in. in diameter by approximately 12 in. long likewise depending upon the class of welding. For welding in wrought iron and steel, nothing can excel the genuine Norway or Swedish iron.

Fluxes and Filling Material

No flux is needed for welding either wrought iron or steel, the field to which arc welding has thus far proved to be particularly adapted. For welding wrought iron or steel, various filling materials may be used, among them being Norway—or Swedish—iron rods, boiler iron, scrap, bits of steel castings, etc.; for cast or malleable iron, Norway—or Swedish—iron rods or special cast-iron rods with a high percentage of silicon.

In the Benardos process, the carbon electrode must be connected to the negative terminal of the circuit, the metal to be welded to the positive terminal either directly, or if more convenient, indirectly by being laid upon a metal table, Fig. 1, to which the positive terminal has previously been connected. In the Slavianoff process, welding may be effected regardless of the connections. The resistance of the circuit should next be adjusted to what is deemed to be the proper amount, after which the circuit-breaker or relays and the line switch are closed. The operator then takes his position with the electrode holder in one hand and the hood (for the Benardos process) or the shield (for the Slavianoff process) in the other. Bringing the electrode as close to the metal to be welded as possible without actually touching it, he then pulls the hood down over his head or raises the shield in front of his face, touches the electrode to the work and instantly pulls it away the required distance, thus striking the arc, which, when a metal electrode is used, will approximate 3/16 in., while when a carbon electrode is employed, will vary from ½ to 2 in. or even more in length, according to the work being done.

In using the carbon electrode, the arc should be given a rotary motion by hand, thus heating the metal to be welded more

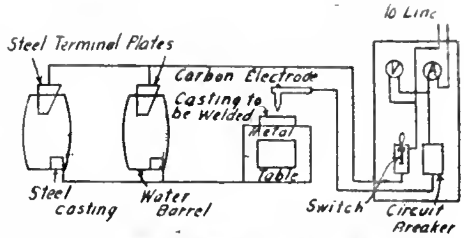

FIG. 1. ARRANGEMENT OF APPARATUS FOR ARC WELDING.

uniformly and preventing burning. It should also be borne in mind that the longer the arc, the less chance there is of carbon entering the metal and producing a hard weld. When the metal reaches a molten condition, filling material is added to it, bit by bit, the arc being interrupted only just long enough to add such material, then being struck and played upon the mass again; or the filling material can be used in the form of a long rod, one end of which is inserted in the molten metal and the arc played upon it until the end is melted off and fused with the mass.

In joining two pieces of any but the thinnest sheet metal together, the abutting edges should first be chamfered at an angle of about 45 degs. either from

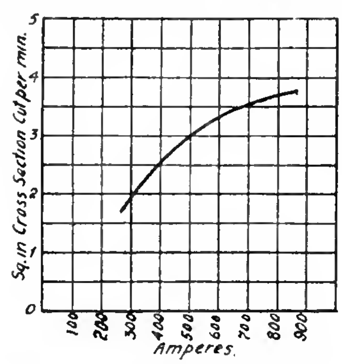

FIG. 2. CURVE SHOWING SPEED OF CUTTING WITH VARYING CONDITIONS.

one or both sides, depending upon the thickness of the material, and the chamfer should extend entirely through.

As soon as the weld has been completed and while still at a white heat, it should be briskly hammered in order to give the metal a finer grain. All oxide and other impurities should, of course, be kept out of the weld. The metal to be welded should accordingly be chipped or machined in the vicinity where the weld is to be made: or the same result may be accomplished by tilting it to a suitable angle, then turning the carbon arc upon it and allowing the slag, in melting, to fall away by gravity.

Heating the metal preparatory to welding is always beneficial as preventing and relieving strains, but is not resorted to except in special cases. Annealing is also desirable at times but like preheating, is not done except when absolutely necessary. A very decided economy can sometimes be effected by repairing a defect discovered during a machining operation, by making the repairs without removing the piece from position.

Metals Which Can Be Welded

Both of the electric arc processes are particularly well adapted to the welding of wrought iron and steel of various kinds; and, while certain other metals including cast iron can also be welded, the work is not, generally speaking, done to any advantage over some of the other processes. Welds in cast iron will prove quite variable when made by the average operator, being frequently glass hard and uncertain as to strength, so that at the present time, it would be rather unwise to make any pronounced claims for arc welding in this connection. With malleable iron, the results obtained are even more variable than with cast iron.

Comparison of Arc Processes

With the Benardos or carbon electrode process, more welding can be performed in a given time than can be accomplished with the Slavianoff or metal electrode process; and viewed from this standpoint alone, the former is the cheaper. As with cast iron, the welds will, however, at times be decidedly hard, so much so as to be occasionally impossible of machining due to carbon from the electrode entering the metal; but when no subsequent machining is necessary, hardness is no disadvantage; and, in some kinds of work, such, for example, as the rebuilding of the ends of rolling mill wabblers, pinions, etc., this very condition is a decided advantage.

In the Slavianoff process, the difficulty of hard welds is largely overcome. The welding of thin sheets can be more readily done and, in fact, a finer grade of work of the lighter kinds performed than with the Benardos process; finally, the ability to reverse connections may be an occasional advantage.

Cutting and Other Applications

In cutting wrought iron or steel with the Benardos or carbon arc the cut will be wider and the edges not comparable in smoothness with any of the oxy-gas cutting processes. However, where electric current is readily available and the finish of the cut is not of especial importance, as in the removal of sink heads and risers from steel castings, it is probably one of the cheapest methods for such work, since almost no time need be spent in setting up the casting in position, as is necessary when cutting by

machine or hand. Fig. 2 shows the rate of cutting steel with the electric arc.

The electric arc processes of welding were originally largely confined to repair work in wrought iron and steel, but since becoming better understood, their uses are extending: for example, surplus metal including fins, risers, sink-heads and nails are easily removed from steel castings, holes are bored in wrought iron or steel plates, wrought iron or steel pipe sections are readily joined together or flanged, the ends of wrought iron rings are welded, wire nails may be pinned to wrought iron or steel plates, tap holes or tuyeres in furnaces are opened, broken drills and taps are easily removed from castings, etc.

The following figures have been obtained in the works of the Westinghouse Electric & Mfg. Company, as regards the cost of welding rings by the blacksmith and by the carbon arc respectively.

Sections.	Smith Welds*	Arc Welds*
1 x 1½ in.	$0.59	$0.51
1¼ x 1½ in.	0.66	0.30
1½ x 2 in.	1.13	0.45
1¾ x 2½ in.	1.25	0.45
2 x 6 in.	3.05	0.85

*Labor costs only included in above.

For filling a drilled hole. 1¼ in. diameter by 2 in. deep in a cast steel axle cap, a 1½ x 6 in. carbon electrode was used. The current ranged from 500 to 650 amp., and the time required was 56 seconds.

The following table shows the current used and time required for welding sheet steel seams:

WELDING SHEET STEEL SEAMS.

Gage B.W.G. or In.	Metal Electrode. Diameter B.W.G. or In.	Current Amperes	Rate of Welding. ft. per hr.
28 to 20	18	10 to 25	30
18 to ⅛	1/16	20 to 40	25
⅛ to 3/16	3/32	30 to 60	20
3/16 to ¼	⅛	50 to 100	15
¼ to ⅜	5/32	75 to 150	10
Over ⅜	5/32	150 to 180	Variable

To burn a hole 1¾ in. diameter by 1½ in. deep in a wrought iron plate, using a 1½ x 6-in. carbon electrode, utilized a current of from 370 to 1,000 amp., and required 3 min., 30 sec., including 45 sec. for reversing plate. A sink head of 13½ sq. in. cross-sectional area was removed from a cast steel axle cap in 4 min., 45 sec., including time for set up, with a current of 600 to 850 amp., and using a 1½-in. by 6-in. carbon electrode.

The table below shows the time required for cutting steel with the electric arc, using a graphite rod 1 in. diameter as the negative electrode:

Strengths of Welds

Often the strength of the weld is of small consequence as it is simply a matter of filling up blow holes or equivalent imperfections, and even where strength of weld is involved, the metal to be welded usually has a large factor of safety, so that even though the welded portion may not be equal in strength to the original material, it still will have a considerable margin of safety. Furthermore, the material at the weld can often be reinforced so that a strength equal to the original can thus be obtained.

With the carbon electrode process, the current will range from possibly 100 to 600 amp. or more, depending upon conditions; in cutting, the figures will usually run slightly higher. With the metal electrode process, the current for welding will range from 10 to 200 amp.

There seems to be indicated certain best limits for current and size of electrode, and in the carbon arc process, too rapid work is harmful. Either process will give about the same strength of welds, but in machine steel the ultimate strength will average approximately 80 per cent. of the original, while in cast steel the strength of the welds will run 10 to 12 per cent. lower.

CUTTING STEEL WITH THE ELECTRIC ARC.

Size of Section Cut, In.	Area Cut, Sq. In.	Cutting Current, Amp.	Cutting Time, Min.	Cross Section Cut per Min. Sq. In.	Cross Section per Min. per 100 Amp. Sq. In.
8 x 8	64	810	27.00	2.37	0.293

.625 x 4	2.5	320	0.88	2.84	.888

Average rate of cutting, 454 sq. in. per min. per 100 amperes.

RIGHT KIND OF DISSATISFACTION.

DISSATISFACTION which moves a man to efforts to better himself is a good thing and is the only kind of dissatisfaction that a man should tolerate in himself. Any man of average mental attainments and health can put himself where he wants to be if he makes up his mind to do so and applies the proper mental force. There is always a place open for the fit man.

Study your work and improve the methods by which it is done. Study the men above you and their methods. Develop your mind, take care of your health, be honest with all men and particularly with yourself, and you will become one of those who have the habit of making good.

The man who does his work as it should be done and studies means by which it can be done better and thus proves his worth to the company as an investment, is the man who gets ahead.

The normal man who sets an objective point for himself and then works steadily toward that point will arrive with a calm, well-balanced mind and with sufficient strength in reserve to carry him through the remainder of his career.

Most men have to work, but comparatively few really like to work; that is, not all men like to do the work they are called upon to do. The other man's work seems so much more interesting. The result is, that a good many men do not give a full day's work for a day's pay. It would be difficult, if not impossible, to get these men to admit that they are dishonest, but that is what it amounts to.

COPPER DEPOSITS IN QUEBEC

THE Copper Deposits of the Eastern Townships of the Province of Quebec, is the title of a report published by the Quebec Mines Branch, under the direction of the Hon. H. Mercier. The author, Dr. J. A. Bancroft, of McGill University has gone thoroughly into the question of possibilities of these deposits, which were worked as far back as 1850. The history of the copper industry in the Eastern Townships is treated at length and is interesting. The various copper mines, prospects and occurrences are described in detail with their geological associations. The information contained, while dispelling illusions regarding some of the deposits and so-called mines, is more likely to attract the attention of serious persons to the mining possibilities of the district than literature which is liable to give misleading impressions. The report is illustrated and accompanied by a map.

Series of Practical Questions and Answers for Mechanics

Every care is being taken to include only pertinent practical questions, and give same direct, reliable answers. Catch questions will be avoided. Arithmetic, consisting of simple addition, subtraction, multiplication and division will be found a useful companion study.

Question.—A shell of 4.5 inches diameter is tested, and found to be 5 ounces over weight, how much must be faced off the base to give the shell the desired weight?

Answer.—A very close method to find the weight of round steel is to divide the square of four times the diameter by 6, for the weight in lbs. of a foot in length. The weight of an inch would be 1-12 of this. By formula we have $W = \frac{(4 \times d)^2}{6 \times 12}$ where W = weight and d = diameter. This would make one inch of steel at 4.5 inches diameter weigh

$$\frac{(4\times4.5)^2}{6\times12} = \frac{4\times4.5\times4\times4.5}{6\times12} = 4.5 \text{ lbs.}$$

or $4.5\times16 = 72$ ounces.

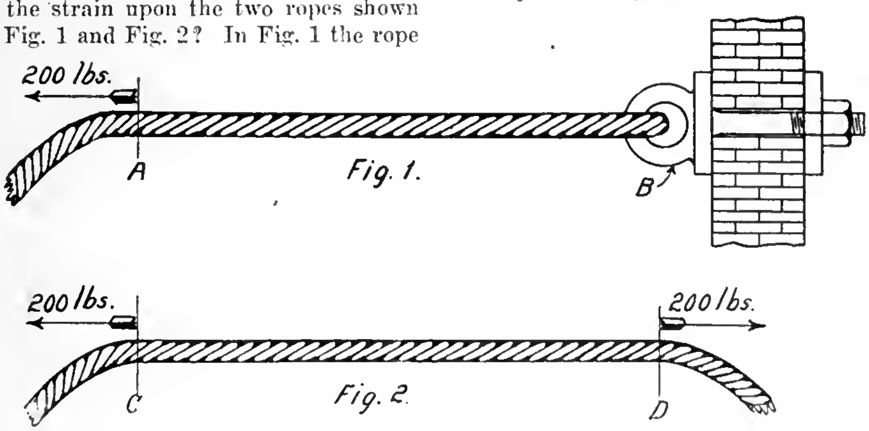
Then the thickness of stock at this diameter, weighing 5 ounces would be 5 divided by 72 or 5-72 = .0695 inches, or a little over 1-16 of an inch.

The approximate length per ounce will be .014 inch.

* * *

Question.—A question came up before a number of men a short time ago, which created considerable discussion. The difference of opinion was such that the writer felt that what would interest a few might also have a similar effect upon the readers of this journal.

The question is, what is the difference in the strain upon the two ropes shown in Fig. 1 and Fig. 2? In Fig. 1 the rope



is secured to an eye bolt in the wall, and a pull of 200 lbs. in the direction of the arrows is exerted at A. In Fig. 2 a pull of 200 lbs. is acting on each end of the rope in the direction of the arrows. It was generally agreed that the strain on the top rope would be 200 lbs., but in the opinion of those interested the strain on the lower rope varied from 200 to 400 lbs. Another interesting point raised was whether the strain was equally divided between the points C and D; some contend that the strain is greater at a point midway between C and D. Any solutions from the readers of this apparently simple problem would be appreciated.—J. R. H.

* * *

Question.—What is a good method to extinguish blazing gasoline?

Answer.—A gasoline fire can usually be extinguished by using flour, sand or earth. If the fire is confined within a small area ammonia will smother it. In some cases where gasoline is used, a supply of ammonia is hung from the ceiling of the room by a fusible link or a piece of string, which is melted in case of fire, allowing the bottle to fall and break, releasing ammonia and putting out burning gasoline.

* * *

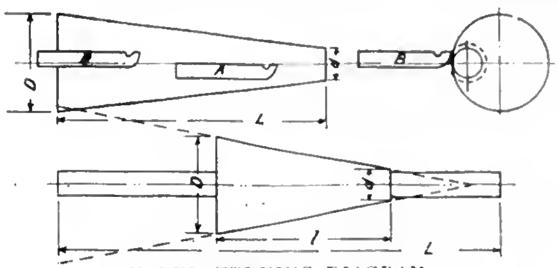
Question.—Could you suggest an easy method of annealing high speed steel?

Answer.—Take a piece of pipe or tubing, large enough, and of sufficient length to contain the piece to be annealed. Provide screw caps for both ends, and after placing in the steel, add about a tablespoonful of resin and screw on the caps. Heat in furnace for six hours and allow furnace, with steel, to cool to atmosphere temperature.

Question.—When turning tapers, what set-over should the tailstock have; and does the position of the cutting point of the tool have any effect upon the shape of the taper?

Answer.—When the taper extends over the complete length, as shown in the upper sketch, the set-over will be approximately one-half the difference between the large and the small diameters. When the taper is only on a portion of the total length, the set-over will be one-half of the extended diameters, as shown in the dotted portion of the lower sketch, or by formula set-over $= \frac{\frac{1}{2}(D-d)L}{l}$

To obtain correct results when turning tapers the cutting point of tool must be in line, horizontally, with the centres of



TAPER TURNING DIAGRAM.

the lathe. On a perfect cone or frustum of a cone the only possible straight line is from the apex to the base, and, as the cutting tool travels in a straight, horizontal direction, it is obvious that any elevation above or below the central position will effect the taper of the piece being turned. This will be clearly seen in the end view of the upper sketch where the full lines indicate the cone as turned with tool on the centre line, while the dotted line shows the difference if tool was elevated above the centre.

* * *

Question. — Without refering to a table, how can I change a decimal measurement to fraction as thirty-seconds, sixty-fourths, etc., with vice versa?

Answer.—To change a decimal to an equivalent fraction whose denominator is known, multiply the decimal by the required denominator and the integral part of the result will be the numerator of the fraction: thus .375 to sixty-fourth

$$.375\times64 = 24.000 \text{ or } \frac{24}{64} = \frac{3}{8}$$

again to change .0469 to the nearest sixty-fourth

$.0469\times64 = 3.0016$ or a shade over 3-64.

To change a fraction to a decimal, divide the numerator by the denominator and proceed to the desired degree of accuracy: thus What is the decimal equivalent of 7-64?

$$7 \div 64 = .109375.$$

BALL BEARINGS

IN a paper read recently by H. J. Moysey, before the Manchester Association of Engineers, on the design and application of ball bearings, the author described the gradual development of this type of bearing from the old cup and cone pattern to that of the present day heavy duty type. He illustrated by means of lantern slides the applications of ball bearings to railway wheel axles, hot saws, ball and tube mills, Crighton openers and scutchers,

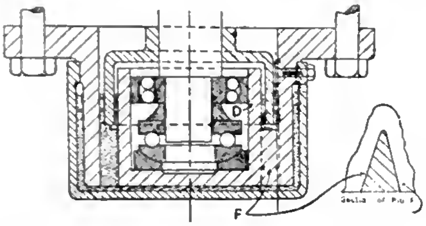


FIG. 1. FOOTSTEP BEARING FOR MORTAR MILL.

cotton ring frames, sizing machines, electric motors and machine tools.

In connection with mortar mills there was described a form of footstep bearing specially designed for the purpose. The mill for which the bearing was constructed was engaged upon the pulverizing of refractory material for the manufacture of furnace linings, the dust from which was very hard, and had to be kept from the bearing surfaces. For this purpose an oil seal was provided, as shown in Fig. 1. Besides having to withstand considerable shocks due to the lumps of material being ground, the bearing had to sustain a load on the footstep of approximately 10 tons, and it had given complete satisfaction. The construction of the bearing will be readily followed from the sketch.

Another interesting application of balls was shown in connection with the central pivot of a railway turntable. As will be observed from Fig. 2, the usual ball and socket centre support has been retained, although it does not now rotate. Its purpose is to allow the bearing to align itself when the table is tilted by the oncoming engine, thus preventing the whole of the load from coming on to a few balls at one side of the bearing. To minimize the expense in altering the table, it was decided that the centres of the bolts on which it hangs must not be increased, and it was therefore necessary to design a bearing that would carry the load with a sufficient factor of safety, with a diameter not exceeding 19¾ in. This made two concentric rows of balls necessary, as shown in the figure.

It was pointed out that in order to ensure that each ring of balls carried its proper share of the load, the lower half of the bearing consisted of two separate concentric steel rings, each forming one race, and these were supported on a sheet of aluminum or other material, which allowed either of the races which happened to be more heavily loaded than the other, to sink in until the load was properly distributed. A brass ring was fitted round the lower portion of the bearing housing to retain the grease.

Immediately before fitting this ball bearing, the table was tested with its old pivot, carrying an engine with a known quantity of coal and water that could be obtained again after the conversion. The total weight of engine and table was approximately 77 tons. The engine was carefully balanced and the pull required to turn it measured by a spring balance applied to the end of the table was found to be 112 lb. When the ball bearing had been fitted the same engine was run on and turned with a pull of 36 lb.

With regard to the application of ball bearings to line shafting, particulars were given of tests carried out on two shafts in different cotton mills in Bombay. In each case a length of shafting was separated from the main drive and driven by an electric motor. Both lengths of shafting were 2½ in. diameter, but were fitted with very different types of bearings, and differently loaded. The first length was 66 ft. long, carried in seven rigid brass-bushed, bottle lubricated bearings, about 1½ diameters long, and drove nine carding machines, the driving pulleys being fitted close to the bearings. The second length was about 150 ft. long, carried in 16 collar and channel bearings, 2½ diameters long, and drove a number of light machines in the preparation room, such as warp winders, bobbin winders, etc. The input to the motor, with all machines at work, was as follows:—No. 1 shaft, 9,114 watts; No. 2 shaft, 6,955 watts. The load was fairly evenly distributed along

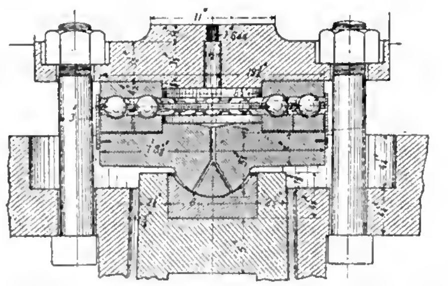

FIG. 2. CENTRAL PIVOT OF RAILWAY TURNTABLE.

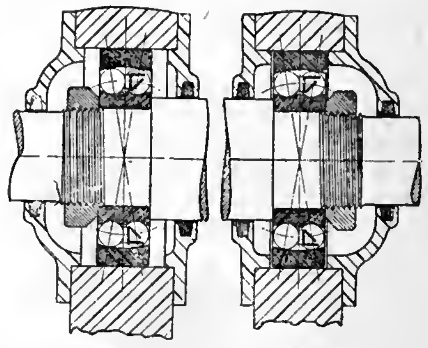
each shaft. After replacing the plain bearings by double-row ball bearings the savings were as follows:—No. 1 shaft, 1,742 watts; No. 2 shaft, 1,764 watts.

Surprise was expressed that ball bearings had not been adopted to a greater extent for the shafts of electric motors, and figures were quoted to show the saving of current which could be effected by replacing the ordinary bearing by balls. Some makers, the author said, had been adversely influenced by unfortunate experiences with their first attempts, one of the most common troubles in the early days arising out of making the inner race of the bearing too slack a fit on the shaft, with the result that it crept round and gradually wore the shaft away, necessitating not only a new bear-



FIGS. 3 AND 4. METHOD OF MOUNTING "SKEFKO" BEARINGS ON ELECTRIC MOTOR.

ing, but a new shaft. Other makers provided too small housings, so that the outer race was a driving fit, which was unnecessary and liable to lead to trouble. The author said that unless one bearing was free to move endwise in its housing, excessive end thrust was set up when the motor heated under load and the shaft expanded; and in the second place, if the housing was not perfectly circular in the bore, as might happen through the casting having been sprung somewhat in chucking in the lathe, the outer race of the bearing would be distorted to correspond with the housing, unless it was an easy fit, and would thus put an uneven load on the balls.

Figs. 3 and 4 are sectional views showing the Skefko method of mounting the bearings of an electric motor, the inner race being a tapping fit on the shaft and the outer race such that it can be pushed in by hand. It will be observed that the bearing, Fig. 4, on the right hand is fixed endwise between the housing covers, which prevents any movement of the rotor endwise; whereas the bearing, Fig. 3, on the left has freedom to slide in its housing as the shaft expands or contracts, and also to allow for any inaccuracies of machining.

What is efficiency? Is it not doing a thing in a clean, quick, competent way? Is it not doing a thing with the least expenditure of brain and force? Is it not doing a thing the way a thing ought to be done. Efficiency means effort; it means study; it means the development of our own powers; it means applying those powers to every task.—H.N.C.

PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

APPLICATION OF SPRING PINS TO JIGS AND FIXTURES.

By F. Scriber.

As a unit in the successful operation, and a large factor in the correct design of jigs and fixtures, and in most all branches of machine design, the use of pin arbors and spring pins in various combinations, plays a very important part, often contributing largely to the smooth running of a machine and eliminating noise or bracing some weak portion of a part being machined, in a jig or fixture. The object of this article is to show some of the arrangements and applications in the use of these pins, that have proved themselves, and which it is hoped will be suggestive of the general design of the pins which, very often owing to their construction cannot be seen as they are partly and often entirely out of sight or covered up by the general construction of the mechanism of which they form a part.

Perhaps the simplest construction of a spring pin and also a very common one is shown in Fig. 1, and consists of a plain round pin, A, with a spring B in the back of it, the same being placed in a hole in the body of the machine or frame casting in the manner shown, to perform the simple function of acting on the lever C, to push the rod D, and pull the connecting link E, with whatever mechanism is attached thereto, back to its starting point in the direction of the arrow, after the same has been pushed forward by the rod D. This style of pin is often used to return tripping levers to their proper place after tripping or as a cushion to prevent levers or other mechanism from pounding back into position after being released when their function is performed.

Locking Devices.

Other common types of jig pins are shown by Fig. 2 and 3, these being simple and effective, and consist of, at the left, Fig. 2, a pin A, with the spring B, under it and a screw, C, to bind the pin in place after the spring has pushed the pin up against the work being machined. At the right Fig. (2a) is shown a similar arrangement with the exception that instead of having the screw placed on an angle to bind the pin the screw Y, is placed at right angles to the pin x, as shown by the illustration with the shoe Z, beveled on the end, between the screw and pin. This method of binding is used in the illustration Fig. 4, which shows a complete method for holding the work as shown while drilling the holes X and Z. This jig is used in the following manner. The work is set on the steel seat A, and the pin B, and is located in the jig by a screw bushing C, bell-mouthed at the end to centralize the boss and at the same time to hold the work down on the seat. At

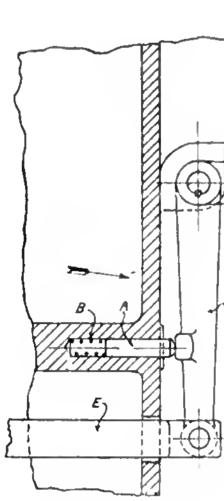


FIG. 1.

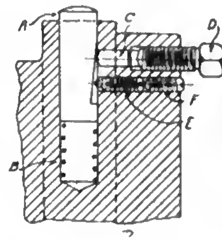

FIG. 3.

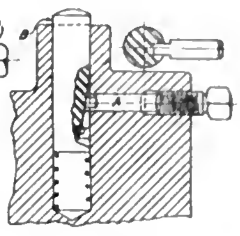

FIG. 3a.

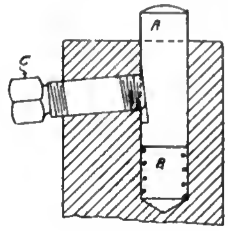

FIG. 2.

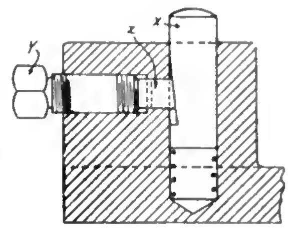

FIG. 2a.

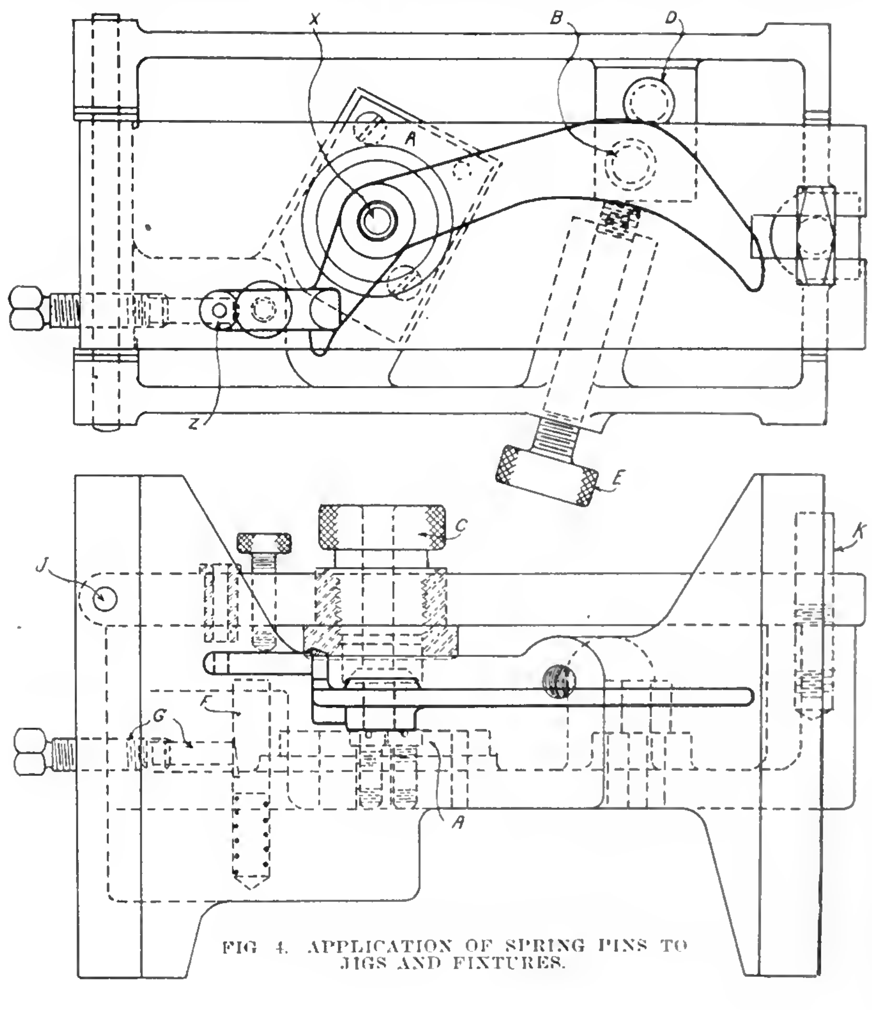

FIG. 4. APPLICATION OF SPRING PINS TO JIGS AND FIXTURES.

the end, the work is pushed against a pin D, by the screw E, and although this would be sufficient for drilling the hole X, some form of support must be used for the hole Z. This is taken care of by having the spring pin F, with binding screw and shoe G, as previously described, come as shown, under the tail of the work where the drilling is done. A small holding-down knurled screw comes on the work over the spring pin to steady it. To permit the easy removal of the work from this jig the drill bushings and holding-down screws are held in a swinging cover which can be swung out of the way, and when in operation this cover is held in place by the quarter turn screw K. All of these units make an accurate, neat and convenient method for holding the work shown, and the whole is held in a suitable cast iron frame.

The other types of pins previously mentioned Fig. 3, are of the same general construction as those in Fig. 2, but are more refined. The one at the left has in addition to the pin A, spring B, shoe C, and screw D, a small screw E, to prevent the pin from springing out of the hole or from turning should the binding screw D, be released sufficiently to permit this. The other small screw F, acts as a check screw to prevent screw E from working back out of place. At the right, Fig. (3a), the shoe A, is flattened on the sides to go into the slot in the pin B. This is a good construction but necessitates the drilling of a hole in the pin at C, to permit the tool to machine the slot.

NO LIFT MACHINE VISE

A MACHINE vise for use in connection with planers, shapers, etc., and which possesses the necessary qualifications that it holds fast and does not lift or displace the work when the grip is applied has recently been designed and patented by J. Parkinson & Sons, Shipley, England.

By referring to the illustrations an idea of the simplicity of the vise may be obtained. It consists of four parts, the base A, Fig. 1, the loose jaw B, the dog nut C, and the screw D. The three last mentioned are also shown in detail, in Figs. 2 and 3.

The base A is rigidly constructed with

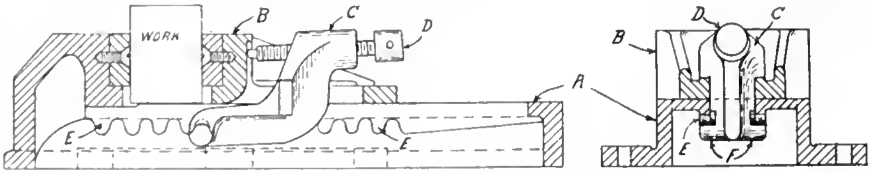

FIG. 1. NO-LIFT MACHINE VISE.

rack teeth E, formed on the under side, which engage with the projections on the dog nut when the latter is inserted. The fixed jaw as well as the loose jaw has renewable hardened steel jaw plates which are fastened in place as shown by means of countersunk set screws.

The dog nut is provided with projection F on either side, which engage with the rack teeth as previously mentioned,

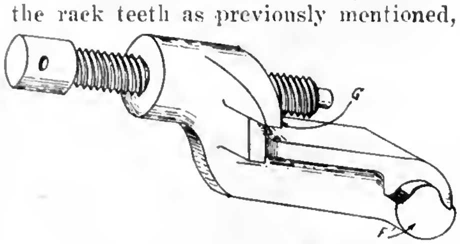

FIG. 2. DOG NUT WITH SCREW.

while shoulder G rests on the raised surfaces of the loose jaw. The clamping screw is threaded through the boss of the dog nut at a slight angle.

In clamping a piece of work all that is necessary is to raise the screw thus disengaging the projections with the rack. The loose jaw and dog nut are then moved forward till the projections and rack are engaged, and the screw is then tightened. Since the screw will have a downward pressure on the projections G, it will be seen that increased pressure tends to bind the jaw more firmly to the base, and at the same time eliminates the possibility of the work lifting.

Other noticeable features about this vise are the movable or swivel jaw which permits work of a tapered nature

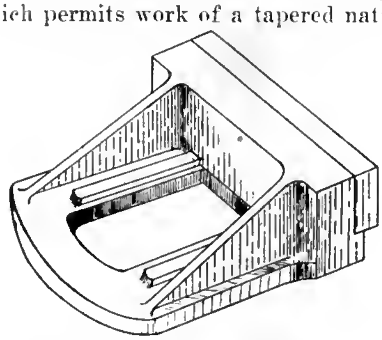

FIG. 3. LOOSE JAW.

to be held securely. Also if the vise should become worn it may be restored to its original accuracy by planing the upper and lower surfaces of the bed.

Winnipeg, Man.—Permits and buildings, numbering 1,274 and 1,304 respectively, and of a total value of $1,826,300, are reported by the Inspection of Buildings Department, Winnipeg, Man.

ELECTRIC PRODUCTION OF STEEL DIRECT FROM IRON ORE

THE production of steel direct from iron ore has been the subject of considerable experiment during recent years, and the measure of success which has attended various efforts indicates the probability of successful commercial development when normal conditions return.

The Tivani Electric Steel Company has been operating an electric smelter at Belleville, Ont., for some months, and their results have demonstrated the practicability of smelting suitable ores directly into tool steel.

The principal item of the plant is the furnace, which is operated on two-phase current. Threaded electrodes are used, 3 in. dia. arranged to feed continuously, and can be almost entirely consumed with little waste. A feature of the furnace is the provision of a preheater for utilizing waste heat from the gases given off by the furnace during smelting. This device is formed of two wrought iron pipes, about 8 ft. in length x 14 in. dia. at one end, increasing to 18 in. at the other. This inverted funnel shape facilitates the downward progress of the charge during heating. A suitable stack encloses the preheater, baffles being arranged so that the gases pass over the surface of the preheater in the most efficient manner.

Charging is done from the upper floor; iron ore, limestone, and charcoal being fed into the upper end of the preheater. The ore smelted is specially selected for freedom from sulphur and phosphorous, only a trace of the former and 0.004 per cent. of the latter appearing in the analysis. The average analysis of the ore shows small quantities of chromium and manganese and 50 per cent. iron, with 7.5 per cent. titanium, 0.11 per cent. vanadium, and 0.34 per cent. nickel.

This titaniferous ore has been used for the production of a tool steel, which is reported to show up well against high-speed steel. Tests have shown that for turning cast iron and 0.90 per cent. carbon steel, tools made of this material would stand up at the same speed as high-speed steel, although attempts to machine low carbon steels at a higher speed were not so successful.

By mixing crude chrome ore with titaniferous ore a fair quality of chrome steel has been produced. Future developments, which include the erection of a 3-ton furnace for the production of tool steel and steel castings, are awaited with considerable interest.

Victoria, B.C.—Building permits during 1915 were considerably below the average, 214 permits, only having been issued of a total value of $291,750.

PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

PNEUMATIC FFOUNDRY APPLIANCES

THE accompanying illustrations show two of the many air operated foundry appliances manufactured by the Cleveland Pneumatic Tool Co. of Canada, Ltd., Toronto, Ont. The sand rammer, Fig. 1, is adapted for floor work and has an extension handle which may be made any length to suit the height of operator. Blows at the rate of 650 per minute, according to the distance from the work are delivered, and various sizes of butts or peins can be fitted as required. Round or flat rods can be used the flat rod preventing the pein from turning in operation.

FIG. 1. SAND RAMMER FOR FLOOR WORK.

An exhaust deflector is fitted which deflects the exhaust air and moisture downward into the sand, preventing the cold air and water from affecting the operator. The packing chamber is separate from the piston chamber, and an attachment is provided to compress the packing as it wears. The resilient packing employed prevents the entrance of any dirt or grit which is so injurious to the working parts.

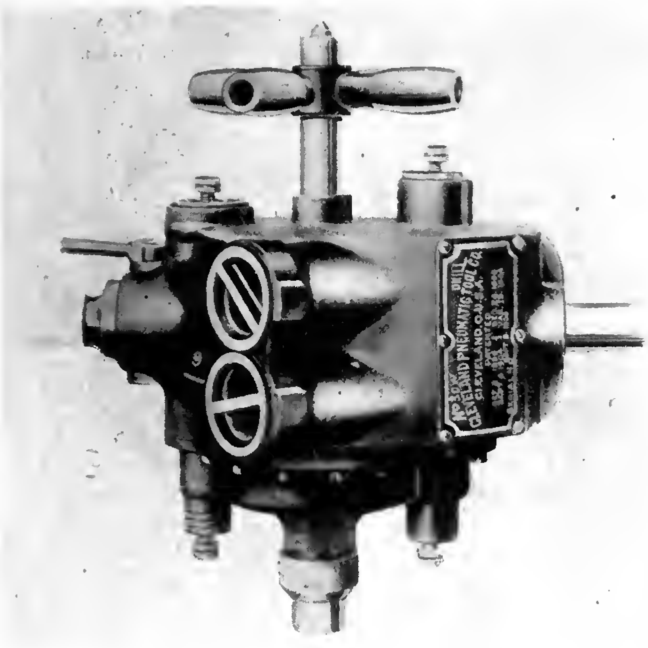
These rammers are made in five sizes and styles adapted for all classes of work such as bench and core work, heavy loam, pein and flask ramming. The centre spindle four piston Air Drill shown in Figs. 2 and 3, is one of 58 types made by this concern. The construction is alike in all types, varying only as to the size of the machine, and gear ratio for spindle speeds. The interior view shows the simplicity of construction, the fewest possible number of parts for satisfactory service being employed. The cylinder body, in which are assembled the component parts, is a one piece steel casting with hand hole openings for access to chank and connections.

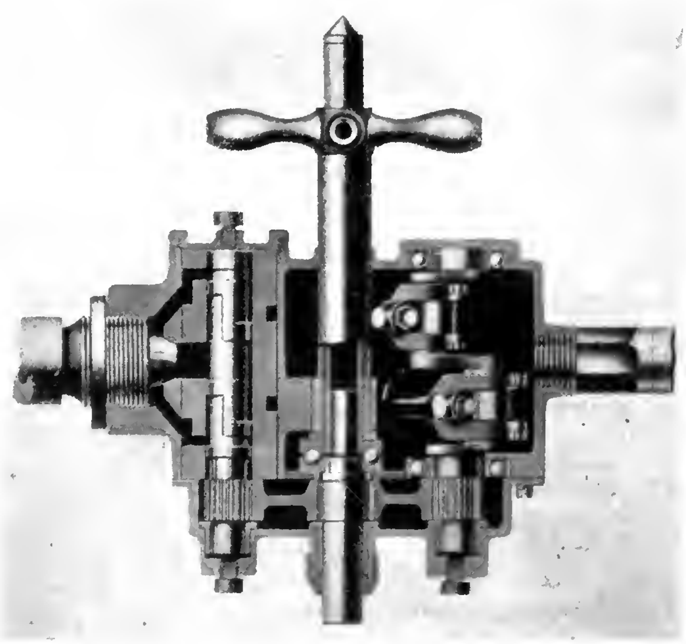
The main valve, at the left of the casing is of the rotary type, and revolves in a renewable valve bushing. It is hollow and acts as an oil reservoir. A selected grade of steel is used for this part which is hardened and ground. On the lower end of the valve is a driving pinion which meshes with the main spindle gear which in turn is driven by the pinion on the crank shaft.

The driving crank is a high-grade drop forging, hardened, ground, and mounted in annular ball bearings located close up to the crank arms or webs, maintaining its rigidity under heavy loads. The connecting rods are drop forgings, secured to the pistons by a ball and socket joint which allows of universal motion. The complete enclosing of the crank chamber allows it to be filled with heavy lubricant which maintains all the working parts in a state of high efficiency.

Another appliance, not illustrated, is a corner drill for performing work in close quarters. The body casting of this machine is designed so that one side of it, in which the spindle is mounted, may project into corners. Two cylinders only are used in this design so that the general shape is narrowed down considerably. Two ratchet arms on the spindle are oscillated by the crank shaft, thus acting as a reducing gear and dispensing with a large diameter gear wheel. The rotary valve is replaced by an eccentrically operated piston valve located between the cylinders, the whole arrangement approximating to the straight line design.

All parts are interchangeable and renewable from stock, and working parts of steel are hardened and ground.



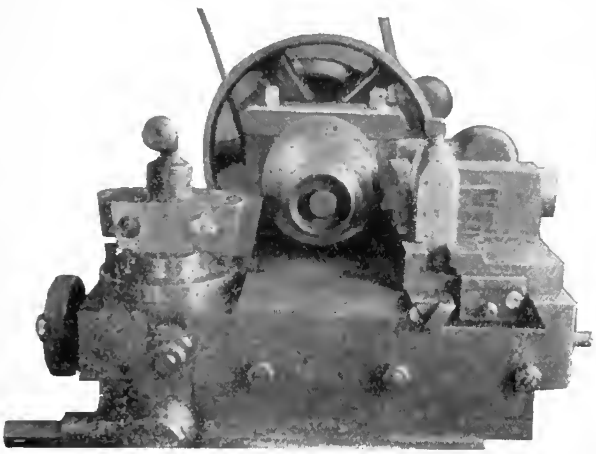


FIGS. 2 AND 3. CENTRE SPINDLE FOUR PISTON AIR DRILL.

SHELL PLUG CHASING ATTACHMENT

THIS device has been designed for chasing threads on cast iron plugs used for protecting the noses of shells during shipment. It can be fitted to any type of lathe above 6 in., but not exceeding 13 in. swing. In addition to this attachment all that is required is a headstock with a 3 in. belt, running on a 9 in. dia. pulley, mounted on a suitable bed, and fitted with a tailstock or turret.

Two methods of production are possible, one involving two operatins, and the other only one. Method A. 1st operation, chuck and drive by square hole. Form thread with tool on front of slide. Bring slide back to stop. Lift up lever which engages nut with lead screw, and at the same time bring chaser on to work. At end of stroke release the lever; the slide automatically returns to original position and in three repetitions of this motion cuts a perfect thread. Second operation, screw into chuck and form.



SHELL PLUG CHASING DEVICE

Method B, in one operation: Fit on to square arbor, and bring up steady fitted in tailstock or turret. Form complete and cut thread same as method A. This method can only be adopted with success when the squares are correct size and central in the body of the casting.

The attachment forms and threads one complete 18 pdr. plug in one minute, and a continuous output of 45 plugs per hour is guaranteed.

The makers of this chasing attachment are the Arnold Thompson Tool Co., Woodstock, Ont.

SAFETY GLASSES FOR METAL WORKERS

THE vital need for eye protection is being more widely recognized in all branches of the metal working trades, and the use of goggles is slowly but surely increasing where workmen are chipping, grinding, boring, turning, working with hot metals, etc. The recent enactment of various workmen's compensation acts, along with the strict requirements of liability companies, makes it a matter of economy as much as humanity for employers to provide adequate eye protection.

T. A. Willson & Co., Inc., Reading, Pa., have made an exhaustive study of actual

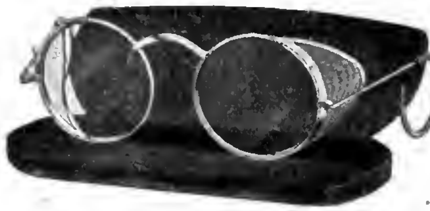


FIG. 1. STYLE MI

working conditions, in consultation with many of the foremost safety engineers, and the accompanying illustrations show three of their many styles of goggles adapted for various conditions.

In Fig. 1 is shown a light substantial goggle specially designed for grinders and men doing light work. It is made entirely of rust proof white metal, has an adjustable bridge, and fine wire screen sides with comfortable half cable temples. The provision of screw-joint end pieces makes the replacement of lenses easy.

Style SG2 (Fig. 2) is another grinder's style of lower price. This has well ventilated leather side guards, adjustable bridge and soft cable temples.

Chemists and similar workers who require protection from acids, gases, and fine dust have their requirements met in style A1 (Fig. 3). This eye protector gives protection from all angles and can be easily adjusted to fit the curves of the face. Soft leather sides, and cable temples insure complete comfort. The provision of adequate side protection is a special feature of this firm's product

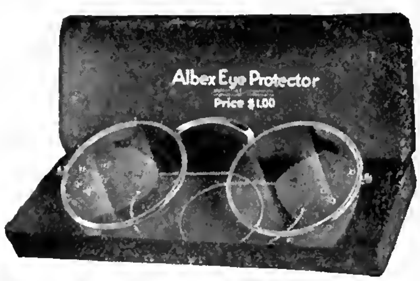

FIG. 3—STYLE A1

as investigations of engineers who have studied actual grinding conditions prove that much grit and dust will whirl around the sides of unprotected glasses.

All of the styles are furnished in a strong steel case, and are designed to slip over ordinary spectacles or eye glasses.

RELATIVE EFFICIENCY OF ROLLER AND BALL BEARINGS

AS the result of tests recently carried out at the University of Wisconsin to ascertain the relative efficiency of white metal, roller and ball bearings, it was found that in all cases the power per bearing—measured in watts—diminished with temperature up to about 100° Fah., after which there was a tendency for it to become constant.

There was a considerable increase of power required in respect of speed. Thus, at 80° Fah., with a 730-lb. load, and for white metal, the power was 13 watts at 150 revolutions, 30 watts at 250 revolutions, 48 watts at 350 revolutions, and 74 watts at 450 revolutions. The corresponding figures for roller bearings were 10, 19, 28 and 40 watts, and for ball bearings, 3, 7, 10, and 18 watts.

The co-efficient of friction followed approximately the temperature law. For white metal bearings the co-efficient was 0.005 to 0.015; for roller bearings 0.004

FIG. 2—STYLE SG2

to 0.011; and for ball bearings 0.0015 to 0.003.

Breakdown tests were made by increasing the load until there was a sudden rise of temperature, with the following results:—White metal, 4,250 lb. per bearing; roller bearings, 5,100; and ball bearings, 4,650 lb.

CONCERNING DRILLS

A FACT often lost sight of, even by experienced users of drills, is that cutting ability and hardness are not the same thing. This is especially true of high-speed drills, the apparent hardness of which varies with the composition of the steel, and is no indication of cutting ability. Some of the best high-speed tools we have ever tested could be filed so readily that if this were any indication of the work to be expected of them, they would be condemned without a working trial. A high-speed drill that cannot be filed may, by exercising the greatest care, be made to drill extremely hard material successfully; but for softer materials, or where a large amount of work must be done in a given time, it will be found so brittle as to be worthless.

IN TIME OF WAR PREPARE FOR PEACE

SPECULATION as to the future may be reckoned as meantime exercising in large part the minds and giving bent to the activities of metal-working plant interests, both neutral and belligerent, yet it is quite apparent that all conclusions arising therefrom may be classed as being evolved from processes of "dead-reckoning." There is a growing presentiment that the current year will see peace declared, and, with each succeeding month, we expect the evidences to become more marked; in consequence, commercial activities should develop correspondingly.

It is, of course, quite natural that we should be disposed to peer into the future—and such a future for it is without precedent and perhaps more imminent than many of us realize. We are of opinion that the war is likely to end quickly and abruptly, but have no sympathy with the idea that a peace little better than a pro-tem truce will be the outcome. The Allies are out for a lasting peace and need not fail to make it a reality. Manufacturers who anticipate only a truce figure that little interruption to production of both tools and munitions will result, and no doubt "the wish is father to the thought."

It is a healthy sign, however, this widespread interest in post bellum conditions, and not only should it become all-pervading in its scope, but it should evidence well-defined preparation on the part of our plant managements to be able to grasp the immediate and subsequent opportunities as they arise. The excitement due to the establishment of shell-making in Canada has quite died down, the industry, in spite of its importance and magnitude, being now considered somewhat commonplace. This, perhaps, is just as it should be, because tending to broaden the outlook.

On the outbreak of war we were bidden capture Germany's trade; we were soon made to realize, however, that the task of fighting Germany was the first consideration and it still occupies a place of much importance. We didn't even get the length of organizing for trade capture, and it is just as well, for it certainly would have been done hurriedly, and therefore badly; further, we did not then have the experience that twelve month's munitions manufacture has given us. We, as well as the Motherland, have been taught in the interval that men and munitions in number and quantity almost fabulous, and skill and administrative capacity before undreamt of and therefore unappreciated, have had to be requisitioned for the task.

What has been our experience in these respects is indicative of the commercial struggle for the world's markets that the end of the war will usher in. Germany entered into the war fully prepared, and alone in that capacity. Evidences are not wanting that, although her progress has been effectively barred in that particular enterprise, she will, on the declaration of peace, enter the world's trade and commerce markets equally prepared and with her plans developed to utilize her resources to the utmost. In time of war she is preparing for peace, just as in the peace days she prepared for war.

It has been suggested that manufacturers who, in the midst of war's alarms and war's activities, have both given thought and effect to the production of commodities for which there will be sure and certain demand immediately following the declaration of peace, will naturally reap a substantial reward for their foresight, the latter, notwithstanding, being free for all. The immediate drawback to this procedure is that capital is tied up in product, and interest return is nil meantime and while the war lasts. The plant that neither plans for its peace time product nor gets to work on it now, is sure to find itself forestalled later.

It has been said that, in the last analysis, Germany, while regarding the war as a disagreeable episode, deems it perhaps worth more than it will cost, looking forward as she does to more than regaining her position in the world's markets. Do we in Canada realize fully that we have to win and hold our own domestic market in addition to branching out, the latter of which we must, for only by so doing will we divert attention and offset and stem highly competitive imports invasion.

CO-OPERATIVE ACHIEVEMENT

PROBABLY the most outstanding and possibly most permanent-in-result feature of shell manufacture in Canada has been what might aptly be termed the esprit de corps exhibited by our metal-working plant managements. Little disposition has been apparent or expression given of the desire to limit and circumscribe production achievement or to secure a monopoly of orders for war munitions. In a word, co-operation to no insignificant degree has been practised, and not only has shell output been enlarged correspondingly, but a standard of staff and operator efficiency has been realized that under the more or less universally obtaining pre-war conditions would have remained inert.

It is doubtless true that with the return of competition in the open market, and the passing of patriotic fervor, there will disappear some, at least, of the co-operative spirit now prevailing, at the same time, and in the very nature of things, sufficient must necessarily remain to have a permanently marked effect on our future industrial relationships. The accomplishment and for all time establishment of even a little in the direction indicated will be not the least of many benefits accruing to us from shell manufacture, and will form no inconsiderable portion of our war-participation reward. Hesitancy to share our knowledge, even in part, and our systems and methods of applying same, is a development of the ages, and therefore hard to be modified, much less eradicated. We believe, however, that the "common cause" idea, arising from the war, will have been sufficiently long operative and will have proved itself so constructively effective as to insure permanent embodiment to some degree in the future plans of those responsible for our industrial enterprises, irrespective of product.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents

Montreal, Que., Jan. 10, 1916.—Encouraging conditions prevail throughout the metal working industries. Shell making is progressing without abatement, and the first week of the new year finds Canadian factories busier than at any similar period for many years. Production of the 8 and 9.2-inch shells is expected to commence within a month, and this will add considerably to the present shell making activity. A great deal of inconvenience is being experienced through the lack of transportation facilities both on land and water. The shipment of supplies and material meets with much delay owing to the shortage of cars on shore and of "bottoms" afloat.

During the past year many steamers employed in the fishing and sealing trade along the Atlantic coast have been requisitioned by the British and French Admiralties for transport purposes, and, to in some measure compensate for this, it is believed that many wooden sailing vessels will be constructed this year to take their place.

Pig Iron

Following the quiet of the holiday season, the market has taken on an interesting aspect, and heavy inquiries for second-quarter iron has been a feature. This has caused some of the producers to advance their quotations on pig, and the revised lists show substantial increases. Local dealers are now asking $26 for Clarence, No. 3; $33 for Summerlee, No. 3; $27 for Victoria, No. 1, and $26 for other grades of Victoria.

Steel

The steel situation still evidences the activity it has shown for many months. There is every probability of increased production in the immediate future, as facilities towards same are constantly being added to present plants. Munition requirements still hold premier place in the steel market. Following the advances on hot-rolled steel, many lines of manufactured product have been increased in price. Twisted reinforced bars show an increase of 3-10 cent per pound, having advanced to 2.80 cents per pound. Structural shapes and plates have advanced to 2.60 cents per pound, with the producers unwilling to accept very heavy orders for future delivery, even at this figure. Boiler heads are stronger, and this week's quotation of $3.10 per hundred shows an increase of 1-10 cent per pound.

Sheets

The demand for black sheets is still very heavy, and many producers are falling behind in supplying requirements. The price remains firm at $3.50. Canada plates (dull) have advanced to $3.40, while bright sheets are strong at last week's price of $4.60. Apollo and Queen's Head have both advanced 50 cents, and Fleur-de-Lis, with an increase of 25 cents, is quoted at $6. Viking metal, 28-gauge, has advanced from $5.25 to $5.50.

Metals

With the exception of lead and antimony, little change is noted in this week's market. The action of the British Minister of Munitions in cautioning consumers regarding prices paid for refined copper may tend to maintain a steady and firm tone to the copper market. However, what effect this will have upon the market here is not yet clear. It would not be surprising to see some advance upon present prices. Lead has become still stronger, following heavy inquiries from foreign agents, while antimony has shown a sharp advance owing to the apparent scarcity of available supplies.

CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.

Copper.—The market is still buoyant, with prospects of added strength within a short time. Further advances are looked for; but the British authorities have, during the past week, endeavored to prevent any excess speculation on the part of dealers by notifying customers in Great Britain not to pay in excess of £100 per ton for refined copper. However, if consumers feel that they must have the metal and are willing to pay the price, there would be nothing to prevent them doing so. Many producers have orders sufficient to keep them busy for some months, and in view of a heavy foreign demand, they are trying to avoid taking on business for future delivery, believing that before long prices may be higher than those at present quoted. The present outlook seems to point to higher quotations. Prices this week remain firm, with the market strong and steady.

Tin.—With a falling off in the number of inquiries, the present market is weaker than that of the previous week, but the reports of submarine activity in the Mediterranean contribute to a rather uncertain condition. The difficulty of obtaining shipping permission from England has also had the effect of producing a somewhat dull tone. Local conditions are slightly weaker, but prices remain firm at 45 cents per pound.

Spelter.—The situation is unchanged, and the market remains quiet. Very few inquiries are being received, early future deliveries are dull, although this month's shipments are fairly active. Dealers are quoting last week's prices of 21 cents per pound.

Lead.—Lead has been gradually advancing, and the market is very strong. It is expected to go still further during the coming month. The situation abroad and the continued foreign demand have been leading factors in the later advances. Domestic inquiries are also helping to maintain the firmness. Local dealers are asking $7.25 per hundred, being an advance of 25 cents over last week.

Antimony.—With increased inquiries and a scarcity of this metal, the market at present is very strong. Early shipments are expected, but the fact that these are already sold helps further to strengthen the market. This week's quotation shows an advance of 3 cents per pound, with dealers asking 45 cents.

Aluminum.—Little activity is shown in the market at present, and prices remain firm at 68 cents.

Machine Tools and Supplies

Conditions are unchanged from those of the past few weeks. Inquiries are still coming in, but not as heavy as a few months back. Equipment orders for large calibre shell production are now being placed and a number of plants are expected to be in operation in a short time. The demand for supplies is still very active.

Old Materials

Transactions in all kinds of scrap metals have been very active, and the situation is somewhat stronger than a week ago. Dealers report good business. An advance of 1 cent per pound is noted on all coppers, also on No. 1 machine compositions. Other metals are firm at last week's prices, except aluminum, which has dropped to 30 cents per pound, being a decline of 2 cents

Toronto, Ont., Jan. 11.—Industrial conditions have changed little during the past few weeks. Factories working on war orders are operating at about the same rate of production and indications point to about the same degree of activity for several months at least. Conditions are now more stable and orders are being placed on a more systematic basis than formerly. The outlook in industrial circles continues favorable and there is a general feeling of confidence in the future. Canadian manufacturers should however, bear in mind that the present period of prosperity will come to an end sooner or later, when it will be necessary to look to other markets for business. When conditions become normal again there will be increased opportunities for trade both in Canada and other countries. The British Board of Trade has already started a campaign for the purpose of capturing trade which formerly went to Germany. The time has arrived for a similar policy to be adopted in Canda.

There are no new developments with regard to shell orders and manufacturers are producing shells in satisfactory quantities. In the future, the placing of orders will apparently rest on financial considerations rather than technical. The system of credits already inaugurated by the Minister of Finance will probably have to be extended in order that Canadian manufacturers may get the large orders for shells which they are now capable of executing. All orders in future will be placed on a competitive basis as in the case of the large calibre shells for which preparations are now being made to manufacture.

There is a general tendency in both steel and metal markets for higher prices, the result is that finished products will also increase in cost. Indications point to higher prices for almost all finished products with no possibility of a reaction in sight. Steel and iron products, machine tools and machine shop supplies of all kinds have increased in cost and will no doubt go higher in the near future.

Steel Market

The greatest activity continues to prevail in the iron and steel trade and the mills are operating at capacity. The market has been steadier lately but higher prices are probable in the near future. Prices in the American market are rising steadily and a corresponding condition may be expected in Canada. Prices of galvanized sheets are very firm and the situation shows no improvement. All raw materials are increasing in cost and the output of sheets has decreased. There is a good demand for black and blue annealed sheets, the mills operating at capacity. No. 9 and 10 blue annealed are quoted at 2.25c and No. 28 black sheets 2.60c Pittsburgh.

The embargo on export shipments of iron and steel products is being maintained by the American railroads but there is a possibility of the situation being considerably relieved within the next two or three weeks. In the meantime domestic consumers are reaping the benefit by getting quicker deliveries. The situation has had no effect on prices which continue to advance steadily with a strong market. Steel bars are now quoted at 2c, iron bars 1.95c, and shapes 1.90c f.o.b. Pittsburgh. The demand for billets continues heavy and the market very firm with prices unchanged. The U. S. Steel Corporation report unfilled orders of 7,806,220 tons on Dec. 31st.

Pig Iron

The pig iron market is very strong and prices firm. The entire production of the furnaces is being consumed and there is a possibility of a shortage of pig iron in the near future. Grey Forge, Pittsburgh has advanced to $18.45. Hamilton and Victoria brands are unchanged at $23 per ton, but will advance shortly.

ALLIES PURCHASING AGENTS

The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:

International Purchasing Commission, India House, Kingsway, London, Eng.

French.—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendence Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.

Russian.—Messrs. S. Ruperti and Alexsieff, care Military Attache, Russian Embassy, Washington, D.C.

Old Materials

The embargo on the export of wrought and steel scrap is still in force and local scrap dealers believe that it will not be lifted notwithstanding the protests from American interests. The market for wrought and steel scrap is weaker, the mills are now buying very heavily at the present time. The scrap copper market is fairly strong and prices are a little higher. The lead market is strong and prices of tea and heavy lead have advanced. Aluminum and No. 1 machine composition have both advanced but other prices are unchanged.

Machine Tools.

There is no change to note in the machine tool situation. Business during the past few weeks has been much quieter, although there have been a number of inquiries for heavy lathes. The market for second-hand tools is quieter.

Supplies

A number of important price changes have been made since the New Year. Malleable and cast iron fittings have been advanced for some lines, the new discounts being given in the selected market quotations. Makers of milling cutters have again raised their prices, and have withdrawn all quotations on high-speed cutters. Carbon cutters are higher, and are now quoted at the list plus 10 per cent. New prices have been issued for "Armstrong" tool-holders. Turning and boring tools are now quoted at list plus 20 per cent., and cutting off and side tools at list plus 40 per cent. Lathe chucks have been gradually increasing in cost for some time, and are now 20 to 25 per cent. higher. Drill chucks have not changed much, but are higher for certain lines in demand. The demand for supplies from plants making shells is not so active, but there is very fair business being done with shops turning out shell parts.

Linseed oil made a sharp advance during the week ,and is now quoted at 98c for raw and $1.01 for boiled oil. The flax seed situation is acute, and higher prices for oil are quite possible. Another advance in cotton waste is looked for in the near future, due to the increase in cost of raw materials. Putty has advanced 15c, and is now quoted at $2.95 per 100 lbs. in drums. Canadian crude oil is now quoted at $1.83 per barrel, representing an advance of 10c from the last quotations; higher prices for gasoline and benzine may, therefore, be expected. Cut leather lacing has advanced, and is now quoted at $1.30.

Metals

The general market is stronger, with a fair local demand, which is gradually improving. The copper market is very strong, and quotations have again advanced, but are nominal. The British Government is restricting purchases in America, and is apparently determined, if possible, to stop further advances, and absolutely to stop speculation. How this will affect the market is difficult to say, as the copper position is an extremely strong one, and the supply is unequal to the demand. Quotations on tin are higher locally, but have declined in the primary market. The situation is more or less abnormal, and prices of tin are nominal. The spelter market is

quiet, with little interest being shown by consumers. Quotations for spelter are higher in the local market. The "Trust" have advanced lead, and the market is strong and higher. Antimony and aluminum are unchanged, but prices of solders are higher.

Copper.—The copper market is very strong and higher. It is reported that the British Government is restricting purchases of copper, and is determined, if possible, to stop further advances. This step has also been taken with the hope that speculation will be stopped. The situation is unprecedented, and it is quite possible that prices may go higher, as the supply is unequal to the demand, and production is getting behind the consumption. Local prices are 2c higher, and lake copper is now quoted at 26c per pound.

Tin.—The primary market is slightly lower, but steadier. Locally tin has advanced 2c per pound. The tin situation is more or less abnormal, and buyers are keeping out of the market awaiting developments. Local prices are higher and nominal at 45c per pound.

Spelter.—The local market is stronger and higher. London is unchanged, and New York firmer on early deliveries. Spelter has advanced 1c, and is now quoted at 20c per pound.

Lead.—The market continues strong and higher in the primary market. The "Trust" have advanced the price to 5.90c at New York. The lead position is a strong one and the demand is heavy. Lead has advanced ½c, and is now quoted at 7½c per pound.

Antimony.—The market is quiet, with an easier tendency. Spot antimony is scarce, and there is little inquiry for futures. Quotations are unchanged at 40c per pound.

Aluminum.—The situation is unchanged, and the market featureless. Quotations are firm and unchanged at 68c per pound.

Solder.—Higher prices are now being quoted for solders, due to the strength in the tin market. Half-and-half has advanced 1c, and is quoted at 24½c per pound.

Foundry Supplies

The market for practically all foundry supplies and chemicals continues very firm, with a decided tendency to higher prices. Felt polishing wheels have advanced due to the scarcity of wool, while bullneck wheels are higher on account of the increase in the price of leather. Pumice is getting scarce, and higher prices are looked for. Emery in kegs and emery composition have advanced slightly, and the market is very firm. Higher prices are being quoted for copper anodes, and tin and zinc anodes are very firm. There is no improvement in the situation with regard to chemicals: prices continue high, and some lines are very difficult to obtain. Copper sulphate is very scarce, and prices have advanced to 15c per pound, while copper carbonate is quoted at 30c per pound. Sulphuric acid and carbolic acid are very scarce, and prices are more or less nominal.

Business in foundry and plating supplies is quiet. Foundries during last year were operating at considerably under capacity, and the demand for equipment and supplies has, therefore, been comparatively light. The prospects for this year cannot be said to be very bright, although considerable improvement is expected in the agricultural implement business on account of the very favorable conditions prevailing in the West. Platers are doing a fair business, considering the conditions prevailing. The substituting of nickeled cast iron nose plugs for shells instead of brass has been productive of considerable business, and the demand for the necessary equipment is increasing.

CANADIAN PURCHASES FOR FRENCH WAR OFFICE

Philippe Roy, General Commissioner for Canada, Paris, advises the Department of Trade and Commerce, Ottawa, that an order has been issued by the War Department of the French Government to the effect that all purchases made by the Supply Branch in Canada will pass through the Hudson Bay Co. Canadian producers should therefore submit their future offers through the office of that company at Montreal. It is further stated in Mr. Roy's communication that Canadian lumber, steel and meat will find in France an important market for years to come, but it is necessary that Canadian firms should have in Paris representatives entrusted with the necessary authority, especially if it is desired to secure Government contracts.

Winnipeg, Man., Jan. 8.—As an indication of the way things are improving in Western Canada, the Manitoba Rolling Mills at Selkirk, Man., which have been completed for over a year, but have never been operated, will, it is understood, start up some time in March. They will employ about 100 men and will make merchant bars and bolts.

There is at present an exceptionally good demand for bar iron in the West, and prices are good. It was owing to the poor prices prevailing on the outbreak of war, that this mill did not commence operations on its completion. There seems to be a good demand for nuts and bolts all over the West, the bolt mill of the Alberta Rolling Mills, Medicine Hat, working full time, and sometimes overtime.

On the whole there is a decided improvement in the machinery outlook in Western Canada, enquiries coming in right along from country points for general lines of machinery and supplies, especially the latter. These are coming from machine shops, blacksmith shops, saw-mills and laundries.

The Manitogogan Mining Co., a gold mining concern who have opened up at Lake Winnipeg, have already placed orders for a large amount of machinery and equipment. Orders placed this week consisted of two 150 h.p. boilers, a Corliss engine, electric lighting plant and a large amount of mining machinery. These orders were placed with local houses. It is understood that this company has good financial backing.

Little is heard just now regarding further contracts for shells being let in Winnipeg. The impression seems to be gaining ground that with future contracts being let by tender, fewer orders will come this way, especially as the cost of transferring metal to and from the West must be exceedingly heavy.

There is a fair demand for machine shop equipment, but as few firms are able to offer delivery in less than four or six months, there is little business doing. It is understood that the Grand Trunk Pacific is in the market for five machines consisting of lathes and milling machines. Enquiries for woodworking machinery are coming in pretty freely.

TO OUST GERMAN MANUFACTURES

IN connection with a report on efforts of the British Board of Trade to capture German trade both during and after the war which has reached the Trade and Commerce Department from Commissioner Lithgow, of Glasgow, it is noted to what an extent Germany has been supplying the necessary tools for the staple industries of the different colonies of the British Empire. This is especially noticeable in the case of Canada," says the report, "which seems to get a large share of cutlery and forestry implements from German makers."

To assist British manufacturers to capture enemy trade the British Board of Trade has collected, and is exhibiting, samples of German and Austrian goods sold abroad. Of these samples the report states: "Small tools and light cutlery brought from Canada are exhibited at prices that British markets cannot at present compete with. It is no use for British manufacturers to point out that

their goods are of a more durable make. The German goods are attractive in finish, and justify their existence by the unanswerable argument that they sell in preference to British goods."

OUR EXPORT TRADE INCREASING

A DECREASE of $93,001,317 in imports and an increase of $91,283,933 in exports for the twelve months ended October is shown in a statement published by the Department of Trade and Commerce on Saturday last. These figures do not take into account the movement of gold, which shows a very heavy increase in the export column.

Imports for the twelve months totalled $421,584,000, of which goods to the value of $72,320 came from Great Britain, a drop of $32,700,000 in the imports of British goods. Imports from the United States amounted to $346,570,000, or $74,505,000 less than in the previous twelve months. Exports of merchandise totalled $550,548,000, including $41,455,829 of foreign produce. Exports to Great Britain amounted to $277,527,000, an increase of $73,000,000. To the United States, Canada sold goods to the value of $314,118,000, a rise of nearly $100,000,000. Imports from France dropped from $11,567,000 to $5,700,000, but exports to France increased from $8,940,000 to $27,620,000. To Belgium, Canada sent supplies of various kinds to the amount of nearly a million dollars.

The statement shows that $20,000,000 worth of hams and bacons, or about three times as much as in the previous year, went to Great Britain. It shows also that imports of tea amounted to $8,346,000, a 30 per cent. increase.

Exports of manufacturers rose to $130,350,000, an increase of $65,000,000.

EXPORTS PROHIBITED

AN ORDER in council prohibiting the export of scrap steel and scrap wrought iron and of oatmeal, rolled oats and hay has been passed by the Dominion Government. The prohibition of hay exports merely carries into effect the embargo recently announced which was placed on hay from Canada, except for the United Kingdom, British possessions and protectorates, France, Italy, Japan and Russia (except Baltic ports). The prohibition of the export of scrap steel applies to all destinations abroad other than the United Kingdom, British possessions and protectorates. The prohibition of rolled oats and oatmeal export is to all foreign ports in Europe and on the Mediterranean and Black seas, other than those of France, Russia (except Baltic ports), Italy, Belgium, Spain and Portugal.

CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

Engineering

Weedon, Que.—The Weedon Chemical Co.'s factory has been destroyed by fire.

Sherbrooke, Que.—The Canadian Ingersoll Rand Co. are building a new machine shop.

Hespeler, Ont.—The A. E. Jardine Co. has completed the addition to the plant, and is installing new machinery.

Redcliff, Alta.—The Redcliff Rolling Mills will be extended, and machinery for making bolts and nuts installed.

Medicine Hat, Alta.—The Lake of the Woods Milling Co. propose installing new equipment in the power plant at the mill here.

Hamilton, Ont.—The Hammant Steel Car Co. are considering the erection of an addition to their factory. Manager, J. Marsella.

Regina, Sask.—The Imperial Oil Co. have decided to make this city a distributing point for the West. A refinery will be built here.

Electrical

Wyoming, Ont.—The installation of an electric light system is contemplated to cost about $6,000.

Palmerston, Ont.—A hydro-electric system will be installed at an approximate cost of $12,000.

Merrickville, Ont.—Work will proceed shortly on the installation of the proposed street lighting system.

Wyoming, Ont.—The ratepayers on January 7 voted in favor of installing hydro-electric power by a vote of 101 to 11. The proposal voted upon was for an expenditure of $5,500 on station and plant. Work will be commenced at once.

Welland, Ont.—The Welland Hydro-Electric Commission have received a request for more power from the Canada Forge Co. and the new zinc smelter. It is estimated that between 2,000 and 3,000 h.p. will be required, and the installation will cost about $30,000.

Municipal

Merrickville, Ont.—The by-law was carried to provide for an electric street lighting system.

Hamilton, Ont.—The erection of a municipal abattoir is contemplated by the City Council.

Cochrane, Ont.—The Town Council has passed a by-law to provide $5,500 for waterworks improvements.

Owen Sound, Ont.—The by-law to authorize a loan of $12,000 to the Owen Sound Shoe Mfg. Co. was carried.

North Vancouver, B.C.—The construction of a new pumping station is contemplated. Plans are being prepared.

Hepworth, Ont.—The by-law to authorize a loan of $12,000 to the Hepworth Pressed Brick Co. was carried on Jan. 3.

Point Grey, B.C.—The City Council are considering the purchase of a motor-driven combination chemical and hose wagon.

Stayner, Ont.—A by-law will be submitted authorizing an expenditure of $5,000 to extend and improve the hydro-electric plant and waterworks.

Calgary, Alta.—Plans have been prepared by the city engineer, G. W. Craig, for the construction of a waterworks system, estimated to cost $3,000,000.

Petrolea, Ont.—At a special meeting of the Town Council held recently a by-law was passed to provide money for current expenditures in connection with the installation of hydro-electric system.

New Toronto, Ont.—The by-law granting the Goodyear Tire & Rubber Co. a fixed assessment carried here on Jan. 8, by a vote of 189 for and 58 against. The company propose spending $500,000 on the new plant.

EQUIPMENT REQUIRED FOR AUSTRALIAN RAILWAY

Specifications and blue prints of drawings have been received from D. H. Ross, Trade Commissioner, Melbourne, for equipment required by the Victorian Railways. These tender forms are open to the inspection of interested Canadian manufacturers at the Department of Trade and Commerce, Ottawa (refer File No. A-1435). Particulars of the requirements, together with the date on which the tenders close at Melbourne are briefly outlined thus:—

No. 29,671. February 23, 1916—2 air pressure blowers and accessories.

No. 29,672. February 23, 1916—1 air pressure blower and accessories.

No. 29,673. March 15, 1916—1 high-speed single spindle sensitive drill with table vise, tools, gears and accessories.

The departure of mails from Vancouver and San Francisco are indicated thus:—

From Vancouver, January 19, due Melbourne on February 12, 1916.

From San Francisco, February 15, due Melbourne on March 7, 1916.

From Vancouver, February 16, due Melbourne on March 10, 1916.

General Industrial

Peterborough, Ont. — The Auburn Woollen Mills will be enlarged.

London, Ont.—The Parnell Baking Co. propose enlarging their plant.

Ottawa, Ont.—The Capital Wire Cloth Co. will build an extension to their factory.

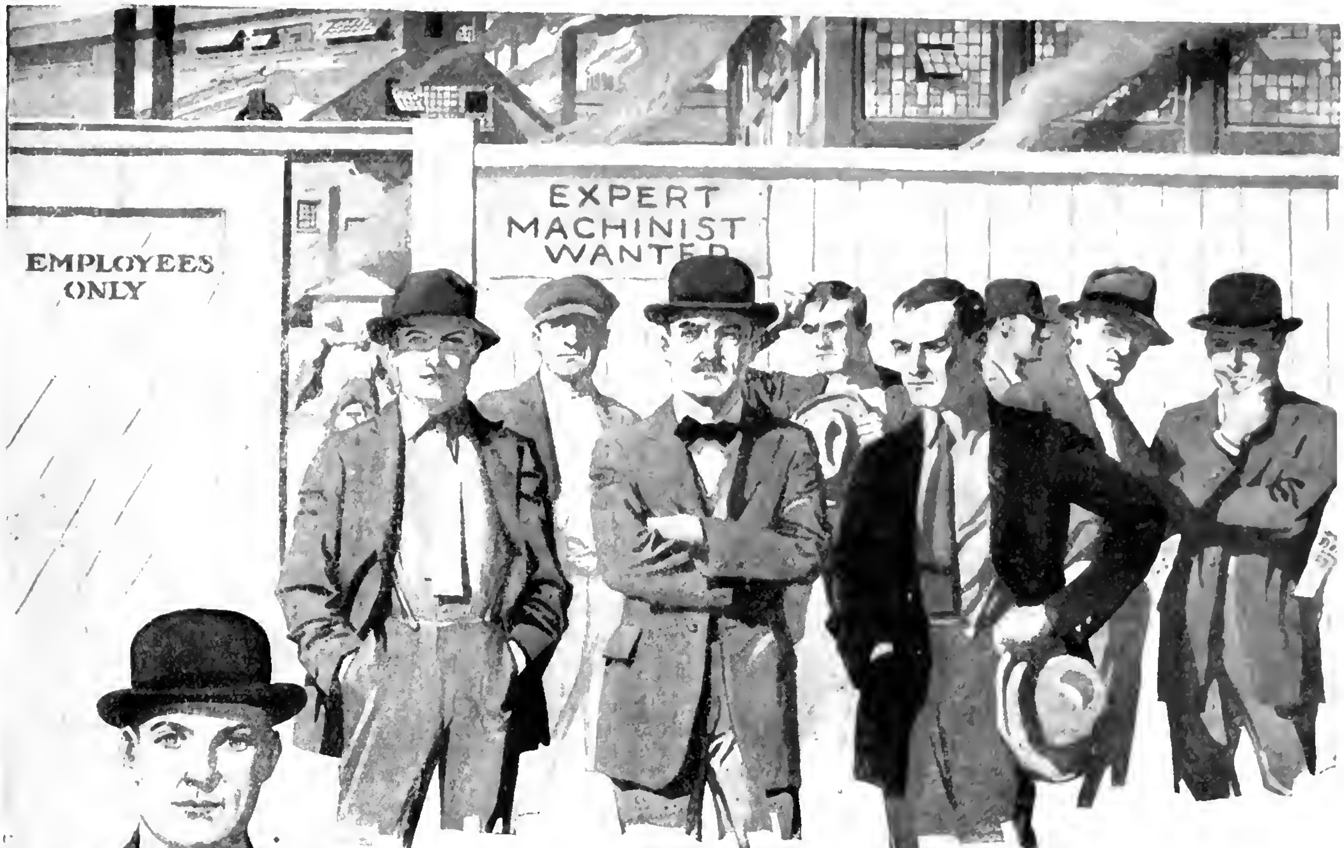
Pembroke, Ont.—It is reported that the Hardware Specialties, Ltd., will erect a factory here.

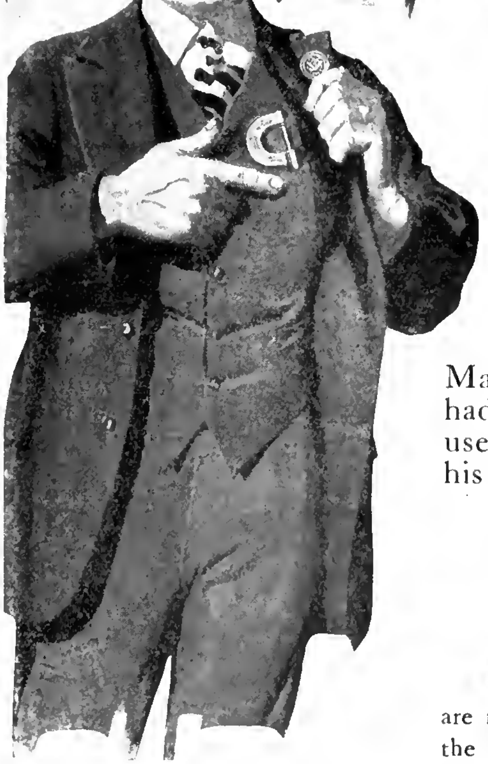
Toronto, Ont.—The Canada Metal Co. will build another extension to their plant, to cost about $10,000.

Kingston, Ont.—The Reliance Moulding Co. has been taken over by W. C. Phillips, of Toronto, and will in future be known as the Frontenac Moulding & Glass Co.

Quebec, Que.—The building of the Rock Shoe Manufacturing Co. was destroyed by fire on January 2. The loss is estimated at $75,000, while the insurance amounts to only $35,000.

Hamilton, Ont.—The Perkins Glue Co., of Lansdale, Pa., have leased the factory formerly occupied by the Climax Road Machinery Co., and will make extensive alterations to suit the requirements of their industry. The company make a special kind of vegetable glue, which is used extensively for veneering purposes.





This is the Man Who Got the Job

THOSE whose duty it is to hire machinists vouch for the old saying—"A workman is known by his tools."

Many a man has been given a job at fine work because he had in his kit tools of great accuracy. No expert artisan uses anything but tools of precision. The best workman does his best work only with perfect tools. And remember this—

Uniformity of measuring instruments throughout your shop means uniformity of accuracy in your product.

Starrett Tools

are recognized by engineers, manufacturers and skilled workmen throughout the world as a standard of accuracy. Starrett Tools include 2,100 styles and sizes of instruments—steel rules, tapes, squares, hack saws, calipers and dividers, micrometers, and many others. We deal direct with hardware stores.

Send for Free Catalogue No. 20-3, Prices and Terms.

THE L. S. STARRETT COMPANY, ATHOL, MASS.

"The World's Greatest Tool Makers"

NEW YORK **LONDON** **CHICAGO**

Trade Gossip

Wool Exporting Stopped—Acting under Imperial instructions, the Government of New Zealand has prohibited the export of wool to neutral countries.

The Canadian Link Belt Co., Toronto, have been awarded a contract for a coal and ash handling plant for the Dominion Government's dry docks at Quebec.

The Turbine Equipment Co., Toronto, have received an order for a 75 h.p. motor-driven De Laval two-stage centrifugal pump from the Riordan Pulp & Paper Co.

The Canadian Steel Foundries, Ltd., of Montreal, has added one 30-ton acid open-hearth furnace at its Longue Pointe Works, and is preparing to erect others in the very near future.

The Dominion Coal Co., Sydney, N.S., have purchased two 75 h.p. direct-current motor-driven De Laval two-stage centrifugal pumps from the Turbine Equipment Co., Toronto, Ont.

U.S. Steel Tonnage—The United States Steel Corporation on Jan. 10 reported unfilled orders on its books December 31 of 7,806,220 tons, as compared with 7,189,487 on November 30 and 3,836,643 on December 31, 1914.

The Canada Cycle & Motor Co., Ltd., will henceforth be conducted as an organization separate from the Russell Motor Car Co. Lloyd Harris will be president, and J. W. Gibson will be general manager. The company will continue to manufacture bicycles, skates, and accessories.

Platinum in Ontario.—An important platinum find is reported in Northern Ontario, in Munro Township, ten miles east of Matheson. It is stated that assays, of which five were made, run $180 to $1,800 a ton. Within a week it is believed development work will be carried on to determine the extent of the ore.

Winnipeg, Man.—The Munro Steel and Wire Works, Ltd., have moved their complete plant to the Elmwood district, and have amalgamated with the Hero Manufacturing Co,. Ltd., and the combined concerns have increased their capital to $100,000, to enable them to meet the ever-increasing demand for their products.

Regulating Copper Trade—With a view to fixing the price of copper and preventing speculation in the metal on the London market, the Ministry of Munitions has notified consumers in Great Britain that they must not purchase more than fifty tons of copper in one lot and must not pay more than £100 per ton for refined copper.

C.P.R. Places Embargo on Grain to Lakes—The C.P.R. has placed an embargo for one week against the loading of grain for Fort William and Port Arthur, Ont. This is occasioned by the large number of loaded cars in transit for these terminals. It is hoped by the officials that at the end of the week it will be possible to remove the embargo.

The Toronto Board of Trade have elected the following officers by acclamation: President, Arthur Hewitt; vice-presidents, Messrs. John G. Kent and C. A. Bogert; treasurer, Charles Marriott; Board of Arbitration, Messrs. John Carrick, Thomas Flynn, F. W. Hay, F. G. Jarvis, J. T. Mathews, W. D. Matthews, D. Plewes, Douglas Ponton, J. B. Reid, F. J. Smith, W. M. Stark, F. W. Tanner.

The Turbine Equipment Co., Toronto, have received an order from the Brockville Water & Light Commission for one 4-million gallon De Laval steam turbine connected to a De Laval centrifugal pump through the medium of double helical reduction gears; also one 3½-million gallon and one 2-million gallon De Laval motor-driven pump. One C. H. Wheeler jet condenser will also be installed.

Sherbrooke, Que., Building.—During 1915 forty-three building permits were issued, the total value amounting to $350,000. The outlook for the present year is, we are informed, very encouraging, erection of buildings to the value of $250,000 being already contemplated; this, with the amount of construction work usually done during the year, promise to give ample employment to all classes of labor.

Shipmasters' Association.—The International Association will hold its annual convention in Toronto in the last week of the present month. Upwards of 100 delegates from outside points will be in attendance, representing some 1,500 members. This is the first time the convention has been held in Canada. The matters to be discussed relate to methods for improving navigation on the Great Lakes and ocean coast, lights, storm signals, etc

Britain's Foreign Trade—The British Board of Trade figures for December show an increase of £3,621,000 in imports and of £7,668,000 in exports. The principal increases in imports were in grain, flour and metals. Dutiable imports of food, drink and tobacco decreased by £4,000,000. The increase in exports was principally in cotton, iron and manufactured steel. For the year 1915, imports increased £157,121,000. Exports decreased £46,076,000.

1916 Hydro-Rates.—The new schedules of rates issued by the Ontario Hydro Electric Commission show that reductions have been recommended for nearly sixty municipalities in the Niagara zone. The recommendations governing domestic and commercial consumption mean an average reduction to the consumer of about ten per cent. These vary considerably, in some places the cut running as low as three per cent., and in others running as high as twenty per cent. Power rates are also generally reduced.

Machine Gun Contract—The British Government, through J. P. Morgan & Co., has just awarded a contract for the manufacture of 10,000 newly patented Lewis light automatic field machine guns with the Savage Arms Company, of Utica, N.Y. The price is $750 each, making the total value of the order $7,500,000. The guns are to be delivered in graduated lots, running up to a maximum of 50 per day. The bankers for the British Government will advance the company $1,875,000 to enable the work to proceed immediately.

Dominion Steel Corporation.—The wide difference in the business of the Dominion Steel Corporation in December of 1914 and last month is shown in the following comparison of the output, in tons, of the several departments of the corporation's plant:

	1915.	1914.
Pig iron	34,768	12,598
Steel ingots	35,767	19,699
Rails	.....	3,349
Wire rods	9,685	3,763
Wire and wire products	5,564	3,836
Coal	436,239	317,117

Nova Scotia Coal for Warships.—For some time past, Nova Scotia has been anxious to obtain an Admiralty test of washed nut coal obtainable in the province. Sir George Perley and Agent-General Howard, who approached the authorities in London, have received an intimation that a telegram has been sent to the Commander-in-Chief of the West Indies Station, instructing him to arrange for the earliest possible test of this coal on Admiralty vessels, and also to consider the possibility of making a similar test on warships on the same station. A quantity of the coal is also to be sent to Portsmouth for testing.

Output at Cobalt Camp.—Ore tonnage from the Cobalt and Kerr Lake silver camps last week showed a decided increase on previous weeks. Twelve cars in all were shipped, of which three were from Kerr Lake, one from the Beaver Mine and two from Timiskaming.

Nipissing and Coniagas each shipped two cars, while a car was sent from each of the following: Penn. Canadian, Buffalo. Peterson Lake, Dominion Reduction and Mining Corporation. The total tonnage was 832,226 pounds. A car of

How to Get the Accurate Cost

is a vital consideration with you, for by this and this only are you able to figure out whether you are actually making a profit or not, each month. No reason why you shouldn't have it during 1916.

The Mechanical Cost Keeper, illustrated, does at least two very important things:

1—It shows the exact amount of productive labor you are able to charge up against any given job.

2—It shows exactly the amount of "non-productive" labor you are paying for but are not able to charge against any job.

When the Mechanical Cost Keeper is used no workman or foreman can force a balance between his productive and his non-productive time. The machine is cold-blooded, accurate and mechanically correct. The Mechanical Cost Keeper throws a searchlight on a very important part of your overhead expenses—that is, the non-productive labor in your plant.

We are the largest makers of Time Recording and Cost Keeping Machinery in the World and shall be glad to send you particulars or advice as to time recording or cost keeping system best suited for your business.

OUR GUARANTEE: We offer $100 reward to anyone who will buy a new International Time or Cost Recorder from the Company or an authorized agent at under list price, less our regular discount.

The Comments of Geometric Customers Are Worth Framing

A Few Are Here

These extracts are not concocted in our Advertising Department, but are from letters on file in our Office.

HANG THIS UP

"That you have the best Die Head that ever cut a thread, has been our opinion for fifteen years."

"Geometric Die Heads have become indispensable to our work."

"Have used Geometric Dies for some time and have also used other makes, but find they do not give the standard of excellence which yours do."

"Your Die Heads are doing most satisfactory work for us."

"We have never been able to get such efficient results from any other Die Head."

THE GEOMETRIC TOOL COMPANY

NEW HAVEN, CONN., U.S.A.

Canadian Agents: WILLIAMS & WILSON, Limited, Montreal.
The A. R. WILLIAMS MACHINERY CO., Limited
Toronto, Winnipeg, St. John, N.B.

copper ore was shipped by the Rond Syndicate, of Latchford.

Lethbridge, Alta., Building.—The year 1915 has been unusually quiet as far as building operations were concerned. There has been a surplus of accommodation both as to residences and business premises throughout the year, and consequently no incentive to do further construction work. Business has improved considerably during the last three months, as indicated by bank clearings and in a number of other ways. The coal mines are all working to capacity, and there are now fewer vacant houses in the city than at any time during the past eighteen months. In view of this it is possible there will be a revival in the spring, although it is not anticipated that a great amount of building will be the rule in Western cities during 1916. The building permits issued in 1915 amounted to $58,420, while those in 1914 amounted to $341,770.

Personal

J. W. Gibson has been appointed general manager of the Canada Cycle & Motor Co., Ltd., Toronto.

W. D. Reid, president of the Reid-Newfoundland Co., has had the honor of knighthood conferred upon him.

Robert Archer, a prominent business man in Montreal and a director of the Northern Electric Co., died on January 7, aged 79.

Paul J. Myler, general manager of Canadian Westinghouse at Hamilton, Ont., has been elected a director of the Bank of Toronto.

F. W. Sumner, of Moncton, N.B., has been elected president of the St. John and Quebec Railway Co., in succession to Irving R. Todd, of St. Stephen, recently resigned.

Frank E. Watkins, formerly associated with the Canadian Fairbanks-Morse Co., Toronto, has been appointed works manager of the East Jersey Pipe Corporation, Paterson, N.J.

T. A. Russell has retired from the Canada Cycle and Motor Co., Toronto, to become vice-president of the Willys-Overland Co. of Canada, Ltd., who have taken over the Russell Motor Car Co.'s automobile business.

Sherman Rogers, K.C., has been appointed a director of Nova Scotia Steel & Coal Co., to fill the vacancy caused by the retirement of Mr. Justice Harris. Mr. Rogers was also last week elected a director of Acadia Sugar Refineries.

Richard Grigg, Canadian Commissioner of Commerce, died suddenly at Ottawa on January 6th. The deceased was born at Plymouth, England, in 1847, and came over to Canada at an early age, returning to England a few years later. After a successful business career in England, Mr. Grigg retired in 1905 to accept a commission from the British Government to investigate and report on economic conditions in Canada. He was appointed Trade Commissioner for Canada in 1909, with headquarters at Montreal, and in 1912 was appointed Commissioner of Commerce. His position had the rank of Deputy Minister under the Minister of Trade and Commerce.

New Incorporations

The Frontenac Moulding Co. has been incorporated at Ottawa, with a capital of $250,000, to carry on a wood-working business at Kingston, Ont. Incorporators: John M. Duff and Kenneth D. McKenzie, of Toronto, Ont.

Wm. Wrigley Jr. Co. Ltd., has been incorporated at Ottawa, with a capital of $2,000,000, to manufacture chewing gum, etc., at Toronto. Incorporators: W. A. J. Case, J. B. Taylor, and G. C. Loveys, all of Toronto.

British Munitions Co., Ltd., has been incorporated at Ottawa, with a capital of $50,000, to manufacture time fuses and other parts of shells. The head office is at Montreal, and the incorporators are F. G. Bush, G. R. Drennan, and H. W. Jackson, all of Montreal.

The Canada Nitro Products, Ltd., has been incorporated at Ottawa, with a capital of $5,000,000, to manufacture munitions and explosives. The head office is at Toronto, and the incorporators are Edmund Hale Austin and Charles Evans-Lewis, of Toronto.

Railways—Bridges

Winnipeg, Man.—Plans are being drawn for a new bridge over the Winnipeg River, which will cost about $30,000.

Calgary, Alta.—The Commissioners will prepare an estimate covering the completion of the Centre Street Bridge.

Moncton, N.B.—The directors of the St. John and Quebec Railway Co. have received four tenders for the completion of the line, but no award has been made.

Wood-Working

Jamestown, Ont. — The Jamestown Tables Co.'s factory has been destroyed by fire. The loss is estimated at $2,000.

Marine

Toronto Harbour Works. The Toronto Board of Harbour Commissioners on Jan. 5, passed their estimates for the year. They will spend in 1916 $2,500,000. The estimates last year amounted to $2,100,000, of which there was spent $1,200,000. Of the estimates this year the sum of $650,000 is for reclamation work, $100,000 for the proposed lift bridge over the Don at Cherry street, and the remainder for different construction work. The work of the commission will depend somewhat on the speed with which the reconstruction of the defective Government work is carried out. A start on this was made in the fall, and it will proceed in earnest in the spring. The commission has to fill in behind the cribwork.

Tenders

Windsor, Ont.—Tenders will be received until January 31 for heating, ventilating and sheet metal work for the new Windsor Collegiate Institute. Particulars may be obtained from the architect, J. C. Pennington, Windsor, Ont.

Toronto, Ont.—Tenders will be received by the Chairman, Board of Control, City Hall, Toronto, up to Tuesday, February 1st, 1916, for the supply and delivery of a number of street cars complete, bodies, trucks, motor equipment, air-brake equipment, copper cables for street car work, and fare boxes. Specifications and forms of tender may be obtained at the Works Department, Room 12, City Hall.

Catalogues

Flexible Grinder.—The Stow Mfg. Co., Binghampton, N.Y., have issued a bulletin No. 33 illustrating and describing the "Stow" Flexible Grinder built for the steel industry and allied trades.

The Morton Mfg. Co., Muskegon Heights, Mich., have issued an illustrated index of draw-out machine tools. The various types of machines are illustrated accompanied by a brief description while tables are included giving sizes of machine keys without heads and with gip heads. The reader is referred to other bulletins for more complete information covering the line of machine tools.

Sand Blast Barrels—Model A. "New Haven" self contained sand-blast barrel is the subject of a bulletin issued by the New Haven Sand Blast Co., New Haven, Conn. The construction and principal features of this sand-blast barrel and method of operation are described

in detail. The illustrations show exterior and interior views and also construction of details.

Steam Traps.—The George W. Cole Co., Toronto, Ont., have issued a new booklet illustrating and describing their line of boiler feed, return feed, lifting and vacuum traps. The illustrations include a diagram of a double trap installation. A table shows fuel losses when using steam pumps instead of return traps while other items include a price list, particulars of the "Cole" oil separator and a list of users of the "Cole" trap. Copies of this booklet may be had on application.

Electric Grinders.—The Standard Electric Tool Co., Cincinnati, Ohio, have issued a bulletin G9 to supersede G8, which deals with their "Standard" high power portable electric grinders fitted with ball bearings. These grinders are designed for various classes of work, and a general specification covers the principal features of this construction. Each type is illustrated and described briefly while the more important particulars as regards capacity, dimensions and current are also included.

Stop and Check Valves.—The Lunkenheimer Company, Cincinnati, Ohio, have issued a bulletin dealing with their non-return safety boiler stop valves, screw down check valves and regulating check valves. Each type of valve is fully described, and the service for which it is best suited stated. The illustrations show the principal constructional features and tables give the price for each size of the different combinations to suit various conditions of pressure, superheat and engineers' specifications.

The Rock Island Mfg. Co., Rock Island, Ill., have issued catalogue "T" dealing with an interesting and extensive line of hardware. The catalogue which is gotten up in an attractive manner is fully illustrated and describes many different lines including sad irons, grinders of various types, cement workers tools, carpenter's tools, grist mills, combination forge, anvil and vise equipments, etc. The various lines are briefly described and in many cases the principal dimensions and prices are included.

Air Compressors.—The "Zin-Ho" portable and semi-portable air compressors made by the Zin-Ho Mfg. Co., Chicago, Ill., are described and illustrated in bulletin No. B5. The portable outfits are first dealt with, the description covering the principal features and a table gives the general dimensions etc. The semi-portable outfits include air compressors, electric lighting plants and pumping outfits, each type being illustrated and briefly described. The "Zin-Ho" portable crane for shops and shipping rooms is also illustrated and described.

Fusion or Autogenous Welding is the title of a bulletin issued by the Prest-O-Lite Co., Inc., Toronto, Ont., for the purpose of dealing with the advantages of using Prest-O-Lite gas for oxy-acetylene welding. Various methods of welding are described in a general manner, considerable space given to the oxy-acetylene process. The "Prest-O-Lite" method is described at length, and its principal features dealt with in detail. Both high and low pressure systems are described as are also the economical features of the system.

Indicators.—James L. Robertson & Sons, Inc., New York, have issued a catalogue dealing mainly with the improved Robertson-Thompson steam engine indicator. The indicator is fully described special reference being made to the more important features of design while the illustrations show these features in detail. Directions for using are included together with a table of springs. The catalogue also contains full particulars covering various indicator attachments and planimeters etc., with instructions for using apparatus which is fully illustrated. The concluding pages are devoted to a description of the "Hine"

steam indicator and various lines of "Eureka" packings.

Psychrometric Tables for Cooling Tower Work published by the Wheeler Condenser & Engineering Co., Cartaret, N.J. This is a companion book to "Steam Tables for Condenser Work" and consists of a handbook of tables giving dry and wet bulb thermometer readings, dew point, humidity and the pounds of water vapor per thousand cubic feet and per hundred pounds of air, together with a discussion of Phsychrometry and the use of the sling psychrometer. The tables were read from an alignment chart specially prepared for the company.

B. C. TIMBER OUTPUT

ACCORDING to the timber returns for the month of September issued by the Minister of Lands, the total output of sawlogs for the Province of British Columbia, as shown by the sealing figures, amounted to 92,080,493 feet board measure, while 361,911 lineal feet of poles, piles and props, together with 29,312 cords of railway ties, fence posts, shingle bolts, etc., were also scaled for royalty during the month under review.

The figures for the Vancouver district were 53,001,924 feet board measure sawlogs, 14,394 lineal feet piles, etc., and 16,264 cords, ties, bolts, etc., the Island district contributing 5,307,218 feet sawlogs, in addition to 2,520 lineal feet piles. In the Prince Rupert district there were scaled 954,135 feet sawlogs, while the totals under the same heading for the Cranbrook, Nelson and Vernon districts were respectively 21,595,575 feet, 7,135,290 feet, and 3,349,603 feet. Poles, piles and props to the total of 328,304 lineal feet were scaled in the Nelson district, and in the Cranbrook division to the total of 15,013 lineal feet. Timber sales recorded during September cover an estimated total of 7,338,000 feet sawlogs, and 3,030 cords of shingle bolts, estimated to produce a total revenue of $12,876

The Germans are preparing to recapture some of their lost trade after the war. Already various articles of utility are being manufactured for men who have lost one or more limbs. The cables tell of Berlin catalogues containing distinct sections of table articles for one-armed men. Already there are indications that when peace is declared there will be a keener competition than ever in the world's business circles.

The propeller efficiency of aeroplanes in practice is about 60 per cent.

INDEX TO ADVERTISERS

Making an Eight Ton Kettle Casting in a Dry Sand Mould

Staff Article

The use of dry sand for moulding a casting of the size and type described is somewhat unusual. The method of production for this special job had to be arranged to suit the existing equipment and while shops with ample fac lities would adopt different methods, the plant in question produced a large number of these special castings with almost negligible loss.

WHEN preparationis were being made for the production of a number of cast iron pots or stills as shown in drawing Fig. 1, careful consideration had to be given to the manner in which the moulding would be done. The size and nature of the casting was quite a departure from the regular line of work turned out, which, while of considerable dimensions, did not present such problems in coring, venting, and pouring. It was decided to mould the job upside down as this would allow the weight of the core to be supported on solid ground, the use of chaplets in any shape or form being strictly forbidden, and by no other method of moulding was it possible to comply with this restriction.

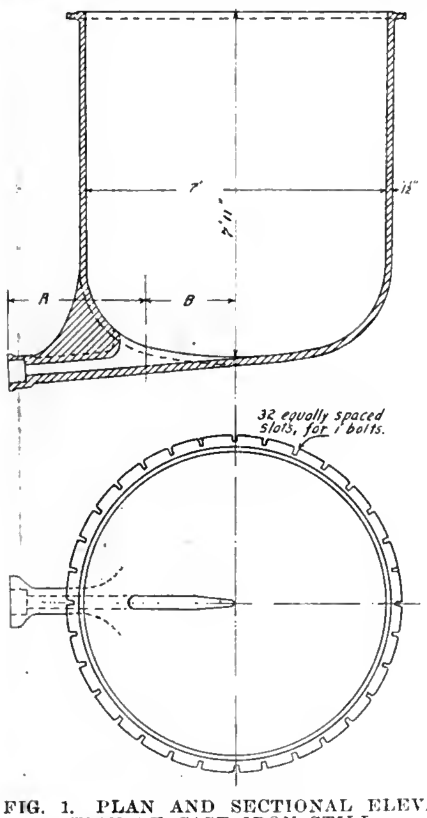

FIG. 1. PLAN AND SECTIONAL ELEVATION OF CAST IRON STILL.

Further discussion resulted in the making of a built-up core with a separate top or cap as the existing core oven was not large enough to accommodate a one-piece core of the required size. By sinking the whole job in the ground, the need of special flasks was overcome, while the pouring of the metal was done at floor level.

The first step in the work was to excavate a hole about fifteen feet square and ten feet deep which was carefully levelled up and packed solid to support the foundation plate, see Fig. 2. A number of tie rods are anchored to this plate, their upper ends being made with an eye into which are hooked other bolts carried up to the top of the mould.

Constructing the Core

The centre of the foundation plate has an opening provided with a grating to support the coke which forms the centre

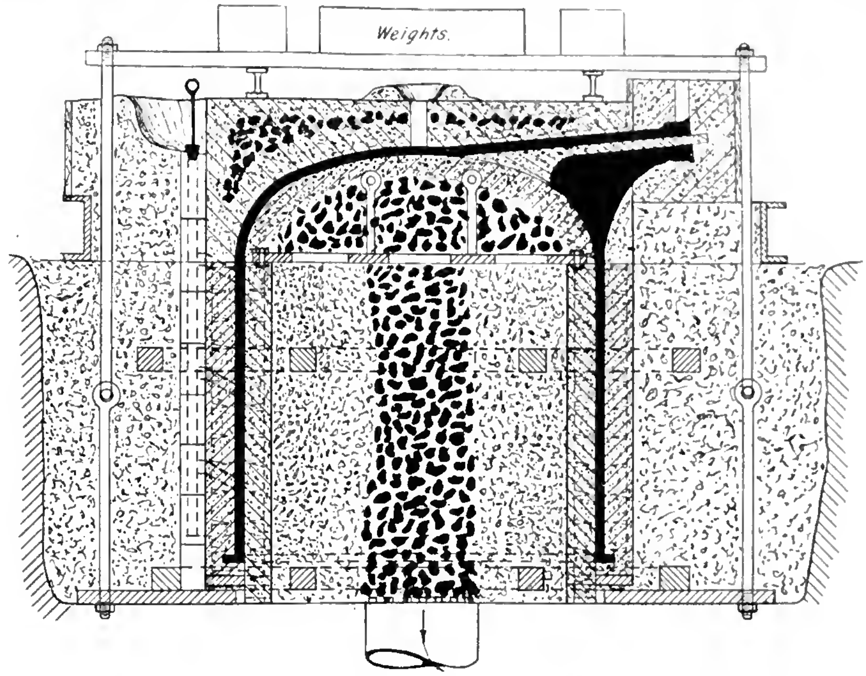

FIG. 2. SECTIONAL ELEVATION OF COMPLETE MOULD.

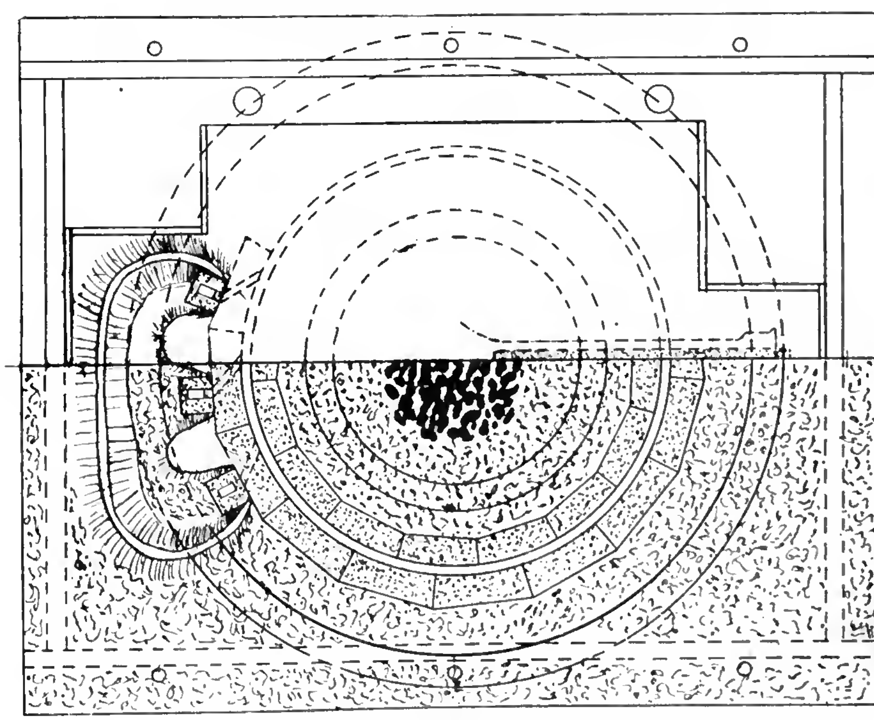

FIG. 3. HALF SECTIONAL PLAN OF MOULD.

of the core, and allows the venting of the gases to take place through a passage below the foundation plate. This passage was found useful as a means of draining off water which made its appearance for a few days after the hole

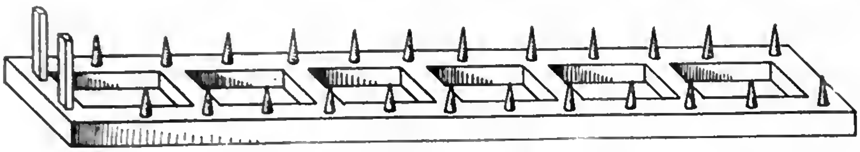

FIG. 4. IRON CORE FRAME FOR SEGMENTS.

was completed. After being covered with a layer of dry sand, the construction of the core is proceeded with.

The straight body of the core is formed of 16 segments shown in plan view of mould, Fig. 3. These segments are made of dry sand, formed on iron frames and baked. One of these frames is shown in sketch Fig. 4, two short bars being cast in position at the lower end. These bars project outward from the bottom of the core, and anchor it in position.

In building up the main core, the segments are assembled in position and bolted back to rings which pull the joints tightly together. The centre of the core is now filled up with coke, a suitable backing of green sand being placed between the dry sand segments and the coke centre. When filled the upper surface is carefully levelled and faced on the top of the segments to make a tight joint with the cap, which is now placed in position.

The cap is a dry sand core with a coke centre, and is made up on a circular frame which allows the gases easy access to the main vent. The frame is bolted to the top of the segments by eight bolts, access to the holes being had by cutting away sufficient material, the holes being afterwards filled up with green sand. The cap is lifted by three eyebolts fixed to the frame, the space around them being filled with dry sand plugs after the

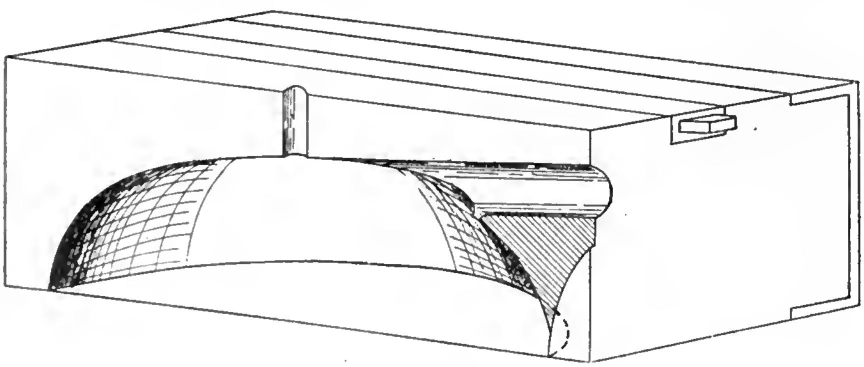

FIG. 5. VIEW OF HALF COPE.

cap is in position. A coating of black wash is now applied to the entire surface of the core, after which the building of the mould is proceeded with.

The Mould

The mould segments which are made on frames similar to those in the core segments, are now placed in position, the first four being accurately located 90 degrees apart on the centre lines shown. The lower ends of these segments rest directly on the toe of the inner segment, and as the cope is held down on top of the mould segments by means of the tie-rods, the core is thus securely fixed in relation to the mould and cope, and the tendency to float or rise when the metal is poured is quite overcome. The lower ends of the mould segments are cored out to form the flange of the casting, two vertical webs in the core forming the slots for the cover bolts.

After the first four segments are accurately located and stayed, the remainder are placed in position: one segment in each quarter being rubbed down to get accurately fitted joints. The lower ends are positioned from an outer ring, Fig. 2, being adjusted by means of bolts and wedges to give the proper thickness of metal in the casting. Green sand is now filled in and rammed behind the segments, a second ring, Fig. 2, being placed about two feet from the top, and the upper end of the segments securely bolted and stayed therefrom.

Runners and Gates

While this filling is in progress the runners are built up as in Figs. 2 and 3. There are three of these formed by means of cored blocks built up from the foundation plate.

Each runner is formed of a separate column of blocks. A hole is cut through the side of one of the blocks which is placed opposite a cored passage in one of the segments. These passages are cored offset so as to enter at a tangent, in order to avoid cutting the face of the core. This arrangement also imparts a circular movement to the metal so that

FIG. 6. SHIPPING THE FINISHED CASTING.

it flows round the core, preventing any excessive local cooling of the metal.

The Cope

The cope is formed in two pieces, the parting being along the line of the drain pipe. As shown in Fig. 5, it includes about two-thirds of the drain pipe, the remaining portion of which is formed in a small two-piece mould as shown in Fig. 2. This small mould supports the outer end of the drain pipe core, and provides a riser at the highest point of the casting. Another riser is also provided in the centre of the casting through which additional metal is poured to take care of shrinkage in cooling.

In order to avoid crushing the cope by tightening the tie rods too much, four stays of heavy tube are placed between the foundation plate and the back staves across the top of the cope. The cope is made of dry sand with coke centres in the thicker portions and vent holes to

allow the escape of steam during the drying.

Pouring

The main runner, Figs. 2 and 3, embraces the three gates which at the commencement of pouring are plugged. When a suitable quantity of metal is in the main runner, the plug is pulled out of the lowest gate, thus giving the first metal the least drop to the bottom of the mould. When a couple of tons have run in, No. 2 plug is pulled, followed by No. 3 plug after a suitable interval.

As the work is special, and the number limited, it was not desirable to go to more expense than necessary to turn out a satisfactory job with existing equipment. The method described meets the requirements of the job, but calls for very careful work in building, as a slight variation in the setting of the mould means a big difference in the weight. So far a limit of two or three hundred pounds has been easily maintained between maximum and minimum weights.

THE ABUSE OF SYSTEM*

By J. Calder

WE organize in order to manage a business undertaking and we manage it through system. It is a weakness in any business if the responsible executives are unable to give on demand a satisfactory account of how it is supposed to function, and we owe a debt of gratitude to those who, during the last decade, have brought to the front the issue that we must always know clearly three things, viz., whom we have to co-operate with, what we have to manage, and how we are supposed to accomplish the work. This knowledge, in proportion, should reach down to the performer of the humblest tasks.

It may be accepted as a general rule that proper selection and instruction of the human factors in organization and management will lead sooner or later to a systematic functioning which will be a natural outgrowth of the needs of the business, while unvitalized red tape will always prove ineffective. System is simply organized common sense. If a system for anything is so involved that its material elements cannot be easily comprehended, have nothing to do with it.

The Earning Value

Set it before you as an axiom that no system is worth any more than it can earn. There are systems of doing things in certain plants to-day which are most ingenious and interesting and yet undesirable from the point of view of profit making. There are systems constructed with rejoicing and lax scrutiny in the years of plenty which are to-day eating off their heads because they have no reducing expense of operation for lean times.

The first question which the experienced investigator usually puts, to himself at least, after all the facts are on the table is not what systems did they have or not have, but "Is the business worth while anyhow?" This is no idle question either. Not a few systematizers have labored valiantly over plants and made sincere promises of betterment which were wholly negatived on the balance sheets because the businesses, irrespective of the systems in use, were inherently unprofitable ventures and could have been readily classified as such with a fraction of the energy spent in spinning the web of a new system.

Tendency to Detail Elaboration

On the whole the tendency has been to over-elaborate detail without regard to profit-making utility in the premises; to construct ornament rather than to ornament construction; to design systems on expensive foundations strong enough to carry a great deal of business that does not exist and never will exist. A decided reaction is now setting in which should not however, be allowed to go too far. Too few people realize to-day on what remarkably small margins many businesses which prosper slowly are carried and could not stand the infliction of new, elaborate and costly plans of operation which guarantee no expansion of trade to justify them.

Undoubtedly we have gained much ground, particularly in specific details of system, but we have also at times been unable to see the forest because of the trees. Take, for instance, the system known as scientific management, which will remain as a monument to its gifted founder. This system has very broad and exclusive claims and insistent detail. It is the best articulated of all the competing systems of business oversight, but it is not the most effective and economical scheme for solving a number of business and industrial problems on which it has been tried. Nor was a trial at all necessary to prove this, and scientific management has suffered because its limitations have not been recognized and its costly functionalization thrust upon small irregular industries not able to take full advantage of it.

In many of our businesses to-day the margin of profit is so small, the labor items so low a factor in the total cost and the work of a few practical executives so economical that it would be folly to inflict upon them in the name of science a more expensive and less efficient routine. Exponents of scientific management have been known to hold that such businesses are inherently weak and should not exist: but science implies action in accordance with the facts, and no system should be permitted to be an end in itself, but should submit at all times to the commercial test of profitableness.

Remedying Unwise Systematization

What is the remedy for unwise systematizing? It is twofold. First, while holding the chief executive of a business wholly responsible for permitting momentous changes in system it is always wise to give his subordinates a chance to offer suggestions on a given plan of outside origin. If this be done the proprietors will be surprised at the number of things they assume about their business which are not so. A passion for facts should override all other considerations, even our most cherished ideas of system detail. The professional systematizer is not guiltless, for, having obtained the ear of the proprietor of a business he has sometimes ridden roughshod over the experienced executives, alienated their support, and pulled up finally a goodly distance along the wrong road to the ultimate discrediting of perfectly sound ideas propagated unfortunately by injudicious and unmannerly agents.

The second aid to correct perspective in applying system is a sound apprehension of what the scientific method essentially is and of its possibilities and relation to the varying factors of business, which is an art rather than a science.

The ability clearly to perceive and avoid inutility in such research is frequently absent in men who are permitted to systematize without thorough business experience. In all such cases wise, capable managements will save time and money by avoiding any attempts to establish a science for irreconcilable variables or infrequent phenomena and will fall back upon an empirical but none the less "common-sense" solution of the problem.

This necessity does not reflect upon the scientific method, which must always face very different conditions in industry and commerce from those met with in nature, and must constantly yield to and be measured solely by considerations of ultimate utility, of available capital and of current product and profit.

In facing the actual problems of industry with full appreciation of what the scientific method might accomplish under certain conditions it is not as a rule necessary or advisable to go into minute details before systematizing actively to some extent. A very comprehensive system takes much time and money to formulate and is rarely born made to order. The responsible executive is called upon to produce rather than to ponder, and if he is wise he will hit the high spots of inefficiency and lack of system at relatively low cost and without delay, leaving the refinements to a later date and probably postponing some of them indefinitely.

*From a paper read before the Efficiency Society recently.

PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

TURNING JIG FOR LARGE SHELL CUTTERS

G. Barrett

IN a series of articles which lately appeared in "Canadian Machinery," on "Large Shells; Production Problems and Possibilities," the design of a contour cutter for inside boring was described. In making these cutters the toolmaker has been faced with the problem

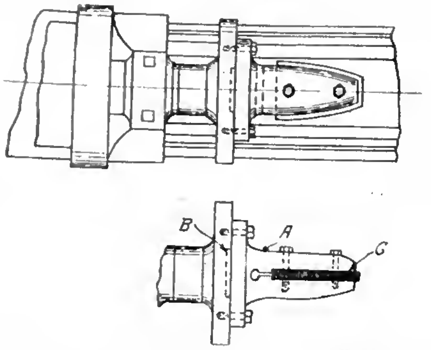

FIG. 1. TURNING JIG FOR LARGE SHELL CUTTERS.

as to the best method to be used in machining them. For this purpose a jig of simple construction has been designed and by referring to the accompanying sketches the reader will be able to judge for himself the results that may be obtained by its use.

The jig proper A, Fig. 1, which is securely bolted to the face-plate, is turned from machine steel, a boss B of sufficient depth being left on the back face, to engage with a corresponding recess in the lathe face plate. A slot C, is milled as shown to take the cutter and a shoulder is left at the back of the slot for the cutter to bear against; a narrower slot, however, being milled from

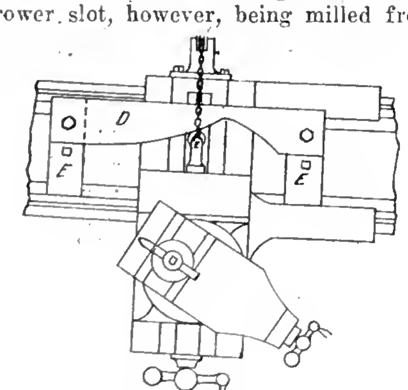

FIG. 2. TURNING JIG FOR LARGE SHELL CUTTERS.

the shoulder to a hole drilled parallel with the back face of the jig, as shown. The cutter is placed in the slot and clamped by the two cap screws, holes being previously drilled in the cutter for this purpose.

The method of turning the profile may be seen by referring to Fig. 2. The camplate D, is bolted in position to the two brackets E, which are secured to the lathe bed. A chain, with weight attached is fastened to the cross-slide and passes over a grooved wheel held in a bracket. By this means the roller, which is also secured to the back of cross-slide in the manner shown, is held in contact with the profile plate. To accomplish this, however, the cross feed screw must be previously removed.

In turning the serrated cutters used for rough boring, it is best to gear up the lathe to cut about eight threads per inch. Allowance must also be left on the cutters for grinding; 1-64 in. being sufficient for this purpose.

APPLICATION OF SPRING PINS TO JIGS AND FIXTURES—II.

By F. Scriber

IN Fig. 6 are shown two types of spring pins suitable for light work, that at the left being simply a pin A, with a groove turned in it, a spring B, and a standard thumb screw pointed to the same angle as the groove in the pin

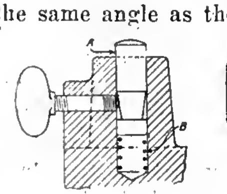

FIG. 6.

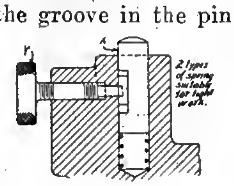

FIG. 6a.

for binding. The pin shown at the right, Fig. 6a, at X, has a knurled screw Y, turned down at the end to fit into the hole in a shoe suitable for coming against a straight flat on the pin. This method is often used when the pin is used as an arbor for locating work. On the foregoing pins, a suitable angle against which to have the binding screw or shoe come for clamping, is found to be from 3° to 5° when these are used for supporting work, and from 8° to 10° when work is clamped on top of them.

Clamping Bushes.

Other very common types of spring pins are clamped by bushings, this being a very convenient way of clamping two pins with one screw as in Fig. 7, where the two pins A, are used for supporting the work shown, by having their top ends beveled. These are rigidly clamped in place by two bushings B. (also shown in the small view) by tightening the screw C, which draws the two bushings towards each other in a manner which is obvious from the illustration. The pin

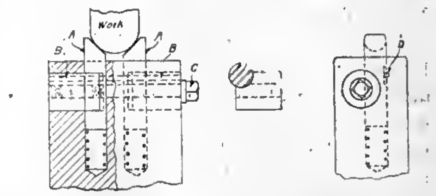

FIG. 7.

D performs the function of keeping the pins A in their proper relation to the work, while interference with their up and down motion is overcome the pins having suitable flats on them.

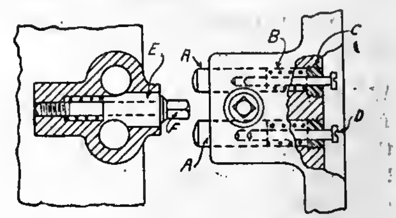

FIG. 8.

Another method of binding by a bushing is shown in Fig. 8 and consists of two pins A which have springs B under them. These latter are held in place by short screws C through which are placed filister head screws D to prevent the pins from springing out. The pins are locked in place when set against the work by a bushing E (made a floating fit in its hole) and the screw F. A spring is placed in front of this bushing to hold it back against the collar on the screw.

Clamping Studs.

The use of studs for clamping spring pins is shown in Fig. 9. The one at the

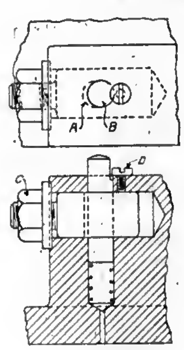

FIG. 9.

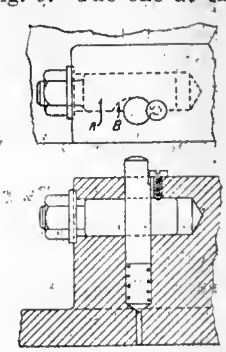

FIG. 9a.

left has an elongated hole in it at A, through which is inserted the spring pin B, the same being clamped by tightening the nut C, thereby pulling out the stud

until it binds the pin while the pin is prevented from springing out of place by the screw D. At the right in Fig. (9a) the stud A is shown set off to one side and therefore a suitable place is cut out at B, for clamping the pin in the same manner as the previous one. At the bottom of these illustrations beneath the

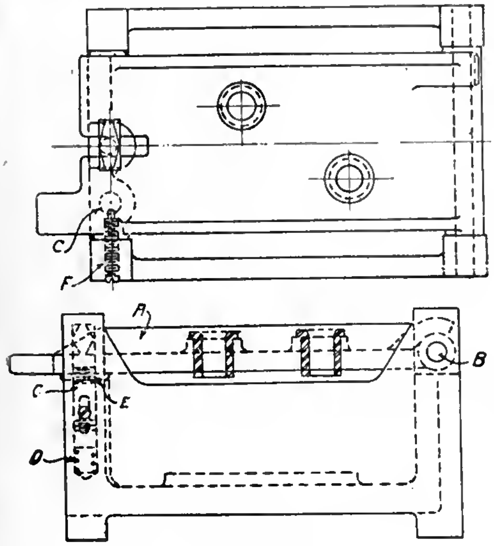

FIG. 10.

springs a small hole is shown and this serves the purpose of an air vent which it is sometimes wise to have as it permits the air to rush out as the pin is forced down. This is often taken care of by a small groove in the pin which can also be used for oil.

Shock Absorbing Spring Pins.

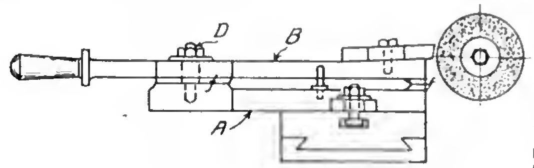
A condition where a spring pin is used as a shock absorber, is shown by the jig Fig. 10. In operating this jig the hinge cover A has to be swung on the pin B, out of the way, in order to remove the work and, as is quite often the case, the loose end is permitted by the operator to drop, when half way down, to its place thus subjecting it to damage, and for this reason the pin C and spring D are used. The pin protrudes above the resting surface E, thus engaging the cover in its descent and breaking its fall, or in other words acting as a shock absorber. This pin is prevented from coming out of place by the screw F.

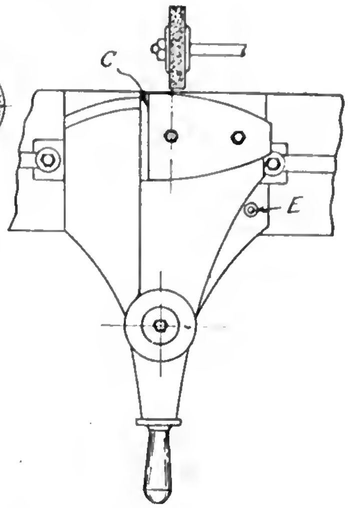
JIG FOR GRINDING LARGE CUTTERS

By P. Simcoe.

A JIG used in grinding large contour cutters consists of a base casting A, which is bolted to the table of the grinder. At the outer end of this casting is placed a stud D, from which the casting B is made to swing the desired radius, this being previously determined so as to be identical with the inside contour of the shell. Casting B is made as shown with a slightly bevelled face, to which the cutter is bolted; the bevel giving the desired clearance to the cutting face of the tool. A tongue C, is also provided, which gives a suitable shoulder for the cutter to draw up against.

In grinding cutters it is best to have them ground straight for a short distance back, as shown, thus when the nose of the cutter is worn down, the same size can be kept by re-grinding the radius. In order to accomplish this a





JIG FOR GRINDING LARGE CUTTERS.

stop pin E, is provided, and is positioned, so as to determine the extent of the curved surface. Thus, when the jig is swung to the pin, the slide of the grinder is turned forward, and a cut fed across the straight face. The cutter is next turned over and similar cuts taken on the other edge. This jig works satisfactorily on all cutters, and is found to be a time-saver and to produce accurately finished work.

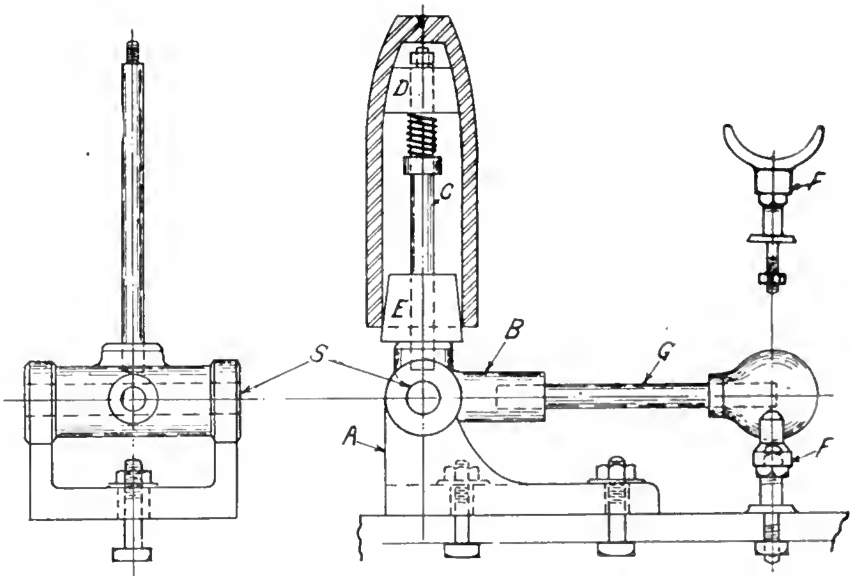
CENTREING JIG FOR H.E. SHELLS

By B. Hamilton

THE accompanying illustration shows a type of centreing jig which is proving efficient on shells of the larger diameters. The base casting A, which is bolted to the drilling machine base has two upright brackets which support the shaft S and the swing block B. The latter has two central bosses, as shown, at right angles to each other, and which are bored to suit the upright spindle C. and the horizontal spindle G. The upright spindle carries two cones D and E, which are made, respectively, a sliding and tight fit. The cone D is supported by means of a suitable collar and a spring of the required tension which allows the forging to seat itself on the bottom cone, while at the same time the bushing D, centres itself with the bore of the forging near the base.

The adjustable bracket F, is also bolted to the machine base, its purpose being to support the counterbalance weight. This bracket is adjusted by the check nut, so that when the weight rests upon it the centre hole is plumb with the drill spindle.

The special purpose of this jig is to lift the shells from the floor. This may be accomplished by raising the weight, thus placing the cone spindle horizontal with the floor. Rolls are provided by means of which the shells may be rolled directly on to the spindle, thus doing away with any lifting while at the same time proving a great time saver.



CENTERING JIG FOR HIGH EXPLOSIVE SHELLS.

REMEDYING A HOT SPINDLE BEARING

By C. T. R.

A LATHE which was used in rough turning shrapnel forgings gave a considerable amount of trouble on account of the heating of one of the bearings. This was accounted for, by the continuous heavy work and the fact that the thrust was all against one bearing. To overcome this it was decided to cut about 1½ in. off the boss shown in Fig. 1, and to place in its stead a fibre washer and a steel collar, which would then enable the thrust to be equally divided between the two bearings.

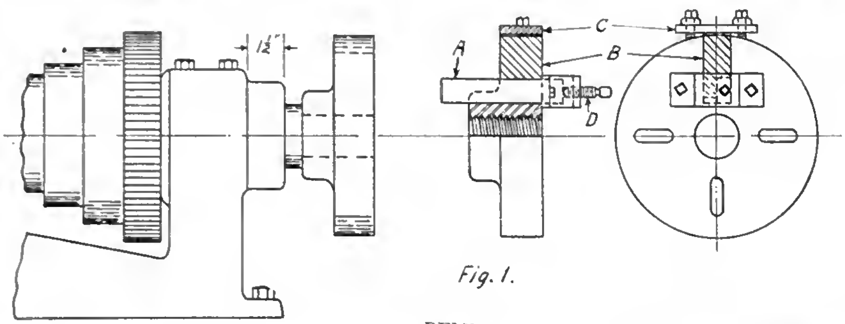


Fig. 1.

REMEDYING A HOT SPINDLE BEARING.

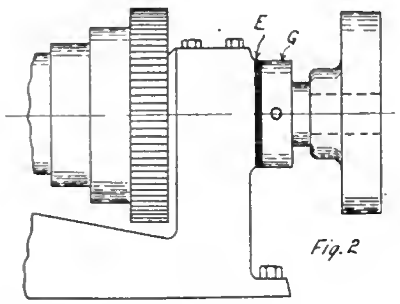

Fig. 2

In order to remove the excess metal it was necessary to have some kind of tool-post, and for this purpose a small face plate was used. The bottom of the face-plate slot was squared to take the tool A, which was wide enough to cover the boss. The tool was held in place by the packing B and the clamp C. A bracket F, was secured to the face plate as shown, and by means of the set screw D, the tool was fed into the work. After the boss was cut away the lathe spindle was threaded to receive the collar and washer; the completed job appearing as shown in Fig. 2.

Questions and Answers

Question—(a).—What is the corresponding reading on the Centigrade thermometer of 200° Fahrenheit?

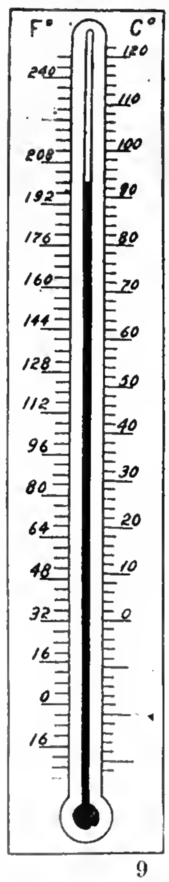
(b)—What is the method used in changing a reading from one scale to the other?

Answer—(a).— 93 1-3 degrees centigrade, see Fig.

(b)—The boiling point on the Fahrenheit scale is 212 degrees, and on the Centigrade scale 100 degrees. The zero reading on the Centigrade thermometer is at the freezing point, while the freezing temperature on the Fahrenheit scale is 32 degrees above zero; therefore the space occupied by 100 degrees on the Centigrade scale is divided into 212—32 = 180 degrees, and the proportional space for each degree is

$$\frac{180}{100} = \frac{9}{5} \text{ or } \frac{100}{180} = \frac{5}{9}$$

Then by taking 9/5 of any Centigrade reading and adding 32 the result will be the same temperature on the Fahrenheit scale; or by subtracting 32 from any Fahrenheit reading and taking 5/9 of the remainder the result will be the corresponding temperature on the Centigrade scale.



By formula $F = \frac{9}{5} C + 32$ or $C = \frac{5}{9} (F—32)$; thus to change 200° F to corresponding temperature on C. scale we have

$$C = \frac{5}{9} (F—32) = \frac{5}{9} (200—32) = \frac{5}{9} \text{ of } \frac{168}{1} = \frac{280}{3} = 93 \text{ 1-3 degrees.}$$

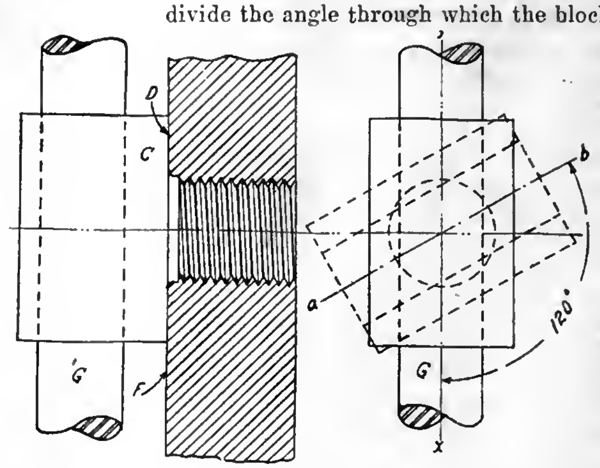
* * *

Question—(a).—The block C with the threaded stem is required to screw into the frame F, so that the bearing for the shaft G will be in a vertical position. If upon trial it is found that the shoulder of the block tightens on the frame, at a point 120 degrees from the required position, what amount of stock should be removed from the shoulder D to allow block to tighten in the desired position, the threads on the stem being 9 to the inch?

(b)—What general rule could be used for problems of a similar nature to determine the approximate amount of stock removal, to tighten a shoulder block in a desired position?

Answer—(a).—As the dotted lines show the trial position of block and the full lines the desired position, sufficient stock must be removed to permit the block to turn through an angle of 120°, or 1/3 of a complete turn. As the pitch of the screw is 1/9 inch, the stock to be taken from the shoulder will be 1-3 of 1-9 = 1-27 inch, or .037 inch.

(b).—A fairly accurate method is to divide the angle through which the block is to be turned by 360, and multiply by the pitch of the screw, or by formula



$$C = \frac{a}{360} \times P, \text{ when}$$

C = amount of stock to be removed from shoulder.

a = angle through which block is to be turned to tighten in desired position.

P = pitch of screw.

Thus from the above question,

$$C = \frac{a}{360} \times P = \frac{120}{360} \times \frac{1}{9} = .037 \text{ inch.}$$

Industrial Safety and the Principles of Management--II.

By W. P. Barba

The leading countries of the Western Hemisphere have been slow in following the examples set by European nations in the matter of workmen's compensation laws. Pennsylvania recently became the twenty-fourth state to adopt a law of this nature, however, and the remarks of the writer indicate the trend of public and private opinion on this subject.

THE works the author is associated with has for years made a physical examination of each man offering for employment, having in mind his condition with reference to health, present and potential, his record as to previous injuries and their results, his eyesight, hearing and whatever condition will affect his value both as an individual and as affecting his fellow-workmen.

Disease Spreaders Rejected

At one works there were offered for employment, practically hired, then turned over to the physicians for this examination 2,569 men during the year 1913; of these, 391, or 20 per cent., were rejected for venereal diseases and consequences, it being deemed most unsafe to turn loose a man possibly syphilitic amongst presumably clean fellow-workers. Of course, a man may pass inspection upon employment, and then find his health go down. He may become the subject of venereal disorder, or some other form of communicable disease. The answer for this is the growing need for periodical examination of each individual worker, and his elimination when his risk becomes too great. This periodical examination of employees has been undertaken to much too small an extent, and needs attention and developing. The benefits are numerous, the first and chief being the aid and assistance to full recovery, and checking in advance of disease which a man unconsciously fights off until he drops—mastered. Beaten by exposure to a blizzard or heavy storm when in a reduced condition, many a good man is lost, who, by a regular, even though cursory, examination might have been saved through timely catching, checking and conquering, through advice and aid, of an ailment creeping up on a man almost without his knowledge of anything going wrong. In this connection arises the demand, a just one, for some form of insurance, preferably mutual, and upon a sliding scale, according to the risk offered by each man. This is but one of the many problems each executive is going to face in the future handling of employees' matters.

Necessity for Instruction

When a man is hired, he should be taken to his foreman for careful instruction in his duties, its dangers and their safeguards pointed out, and every effort made to prevent the new employee from becoming worse than a normal risk. As one concrete illustration of this, in a certain large works much fuel oil is used for heating purposes, and a comprehensive system of storage and distribution is installed. Leakage is impossible to entirely prevent, and numerous explosions and small fires have occurred. It is necessary at times to descend into the pits in which the apparatus is placed, and the explosive fumes of oil and air are frequently present; steam pipes (not air—because of the danger of air) are rigged in all such places and at stated intervals the steam is sent through these chambers entirely and safely displacing all noxious gases.

Again, the burners for fuel oil are merely a combination of jets and valves —some of the jets embodying the injector principle. Each man who is called upon to work with this apparatus is taken into the bureau of Safety First by his foreman, and with the safety engineer (a high-priced executive) is taken through a course in his particular oil burning apparatus. The collected unit is there, it is dissassembled and reassembled by the man, and a partly cut-out section is shown, so that all the functions of the system are fully understood by the workman. Since the introduction of this system of instruction, the number of burns and fires from ignorant handling has been very much reduced.

Safety Inspector

In 1907, in a near-by large works, the safety movement was given a real start, by the appointment of a safety officer, whose whole duty was to report hazardous conditions of plant and equipment and see that the conditions were corrected. It has lately been more generally recognized as the function of the factory inspector of the State to keep every manufacturing establishment in a safe condition, so far as equipment, etc., is concerned. The present incumbent in Pennsylvania, Dr. John Price Jackson, has given real value to this function for the first time, but even he, up-to-date and progressive as he is, recognizes that the correct way is to make each factory safe automatically by having liability laws which properly penalize the lax employers.

Employees' Committee

The attempt of 1907 to effect safety of equipment by the appointment of a safety officer and his staff, in the works mentioned, was soon superseded by a plan to make the worker himself feel his share of the responsibility, and a committee of 70 men was chosen from among the employees, there being upward of 5,000 employees. These men were always on duty while regularly working, and seven of them were chosen each week and with the safety engineer gave up a whole day in the company's time and pay to actual examination of conditions of plant and equipment. Their recommendations were given priority by heads of departments and the works were soon found in such good physical shape that the committees had little or nothing more to report.

The number of accidents was, of course, reduced, but not to a point which was thought commensurate with the efforts put forth. During all of this time (five years) careful study and analysis was given the daily accident reports, with the result that they soon segregated into three groups:

1. Hazards of occupation.
2. Hazards due to faulty equipment.
3. Hazards due to personal carelessness and disregard of safety appliances.

These regularly occurred in almost unchanging proportions, even though the sum total went steadily downward:

The first class—Hazards of occupation, 24 per cent.

The second—Faulty equipment, 3 per cent.

The third—Carelessness and neglect, 73 per cent.

This large proportion, 73 per cent., is purely a result of the operation of the personal equation, and at once suggested itself as the point of attack.

To meet this a total change of programme was inaugurated. The plant was divided into seventeen distinct units or geographical districts, and a committee of three was appointed in each for a term of two months. A datum line for each district was established from history which showed the frequency of accidents in each district. The figures were worked out in units per one hundred men employed for the period of two months, thus affording easy comparison.

The task set was for each district to

*Presented at the Philadelphia local section of the American Society of Mechanical Engineers, Nov. 23, 1915.

equal or beat its previous record. No district was set against another, its record being wholly within itself. This is a vital point. Each sixty days' record is merged into the previous total, and thus a new record automatically set. For a committee which equalled or beat its district record during the committee's sixty-day term, there was established for each man a cash prize of a ten-dollar gold piece, or $30 for each winning district each sixty days (incidentally the amount thus paid during the year 1914 was $3,200, and no sum was ever more cheerfully paid out). In addition, the committee which made the greatest improvement upon its own record was, each period, granted a double prize, or $20 to each of the three men.

Prize Distribution

The experience of the first year was that out of the seventeen districts there were paid prizes all the way from four up to sixteen districts, the four being midway in the year, and the treatment applied by the management when this low score occurred, brought the score right up, so that at the last period fourteen sets of prizes were paid. The personnel of these committees is changed each period, so that the experience gained is accumulated by a large number of men.

The treatment in this case was simply for the general manager to talk to the assembly of the men later referred to, and point out, from knowledge of the accidents occurring during the period when low scores were made, how greater vigilance, less laxness, more attention to the men seen to take hazards carelessly, would result in better scores, more gold pieces, less suffering, to risk of which each of the whole number of employees is subject, whenever vigilance in these particulars is relaxed.

There is also a collateral advantage which is a large part of the value of this new scheme. The management hires a large and convenient hall for a meeting place, provides cigars and light refreshments, invites all the men the hall will contain (about 400) and makes a public occasion of the presenting of the prizes. A free discussion of methods and experience is had, and from 8 o'clock to 9.30 an evening is spent which is most profitable in every way. Stimulation is given the safety movement, the managers are all there, and a great feeling of the community of interest of all concerned is engendered. The spirit of full co-operation is established and fostered, a better and closer acquaintance is had on all sides, and the whole effect is most beneficial.

The net result in figures is curious and interesting. By an accident is meant the state requirement or definition—that a man is away from his work more than two days. The number of accidents during the year just closed was reduced by 59 per cent., the three above classes being represented by 26.8 per cent., 2.23 per cent., and 71 per cent., clearly showing that there is still more work to be done in fully bringing home to the individual his personal share in the responsibility for his injury.

This responsibility is going to be more closely brought home under compensation acts, since it will mean the elimination of men who are thus injured through their own fault too frequently; these men will be compelled to seek other employment. It then becomes a nice point of judgment for the management to determine whether its investment in such a man, i.e., his trained capacity for his work, is a sufficient offset against his increased risk, due to his propensity for acquiring injuries to an undue degree. Some of the compensation laws refuse a man any payment if it be shown that he was injured by his own act for the purpose of going on the benefit list. This provision and the one denying benefit for the first fourteen days are about the only safeguards the employer has against unjust claims for payments.

Reverting to the system suggested of avoiding discharge losses through conviction and fines, the proper channel for restoring fines upon delinquents to circulation through the whole mass of employees is—the recognized need of caring in some way for the reliable employees unavoidably injured slightly, and returning to work within the fourteen days' exemption period provided by recent compensation laws.

A fund could be provided, augmented by the company, especially so in the case of larger employers, this fund to be administered by a mixed board of employees, and a small measure of financial relief afforded the unfortunates who recover within fourteen days. This period, designed by framers of the acts to prevent malingering, does not altogether effect this, and meanwhile works a real hardship on many worthy men whose needs are such that the uncompensated loss of any days becomes a matter of concern.

Federal Legislation Required

If ever there was a subject fit for Federal instead of State legislation it is this one of liability and compensation. Fifty-eight States, working each alone, may produce such wide diversity of legislation as really to put neighboring States into competition for both manufacturers and for workmen. When John P. Neill was Federal Commissioner of Labor he worked assiduously to secure uniform State legislation on this subject because there were statutory difficulties in the way of a Federal Act. This leaves it up to the several States, where too often a subject of this magnitude is taken up by untrained and uninformed legislators who can, quite possibly, be swept into ill-considered action by a wave of hysterical outcry from the newspapers, professional labor leaders, and publicists who treat a situation academically and without close knowledge of the problem.

With especial reference to the Pennsylvania law just enacted, it is fine to recall how this law was prepared. Begun under Governor Tener by a board of broad expert business men, thrown out by the Legislature of 1913, brought up again by a Governor fearless of criticism, worked out modernly upon the basis of the original commission's draft, the Pennsylvania law is, generally speaking, satisfactory to all groups, and there is in it opportunity to co-operate fully, to protect those dependent upon their labor for daily bread, automatic incentive to clean, healthful surroundings, care in safeguarding equipment, and all concerned are compelled to do their utmost to achieve the blessed result desired.

Any employer, or rather fellow-employee, who shall disregard the plain common sense demands for a legitimate, well-considered scheme for automatic compensation for every injury not wilfully incurred, is not alive to his business, to his duties, to his men or to his stockholders, nor to his duties to the progress of humanity at large.

Cause of Industrial Unrest

It is the speaker's firm conviction that the so-called industrial unrest is wholly preventable, is due chiefly to lack of understanding of the problem—lack of patient working in full co-operation with all concerned, and the result of following sound principles with policies based thereon is certain to prevent unrest such as has been all too frequent from just such causes.

In pointing out the dangers of haste in enacting such legislation, all right-thinking people are urged to work for the passage of such laws as will compel the lax, careless, or unwilling employers to secure the co-operation toward safety of workers whose livelihood and lives are in the hands of those who pay wages, and as before mentioned should find it a cheerful duty to work toward the securing through co-operative effort of the maximum of safety, comfort and happiness among all grades of employees. Only thus will the work of the world be furthered. Only thus will there be removed from among us strife, discord, class distinction, unions and non-union, and there will surely come into industrial life the big rewards which result from careful thought along lines which go to promote full co-operation amongst those called to do the work of the world.

Electric Welding Processes: Developments and Applications-II*

By C. B. Auel **

The development of electric welding to its present state of perfection, has been noteworthy not only for the economies effected over previous methods of doing the same work, but also for rendering possible the production of many articles and the performance of numerous operations which were formerly quite impracticable as commercial propositions.

THE incandescent or resistance processes of welding differ from the arc processes, not only in the method of obtaining the heating effect of the electric current, but in the further fact that pressure is also an essential factor. It is the introduction of resistance into the circuit such as is caused by a poor contact (Thomson process) or by a poor conductor (La Grange-Hoho process) that produces the necessary heat for welding.

La Grange-Hoho Process

In the La Grange-Hoho process an electrolytic bath is required. The passage of the current through the bath causes decomposition of the electrolyte, bubbles of hydrogen being deposited on the metals to be welded, thus introducing a gaseous resistance in the region of contact between the metals and the electrolyte, with the consequent heating of the metals to incandescence. When the metals reach the proper fusing temperature and while still continuing in the bath, they are forced together under heavy pressure, thus uniting, or they may be withdrawn from the bath after reaching the fusing temperature and welded together under a hammer in the usual manner. As far as it has been possible to ascertain, the process is not used in this country at all.

Thomson Process

In the Thomson process the welding is effected in the secondary circuit of a single phase (25 to 60 cycle) transformer, which may have a capacity from 1 to 100 kw. or more, the primary being wound for any suitable voltage, the secondary for ½ to 7 volts. The terminals of the secondary circuit generally consist of comparatively large jaws, frequently water-cooled, which clamp the metals to be welded. The power factor of a welding machine of this type will range from 50 to 85 per cent.

In the making of a weld the ends of the two metals are butted together, first being filed flat if necessary, the lengths of each actually in the circuit being so adjusted as to make them equal in resistance, after which the primary circuit is closed. Current immediately flows through the metals, heating them quickly at their point of contact to the temperature of fusion. They are then forced together by hand or automatically. In certain phases of this process, as the spot welding of sheet metals and the equivalent, the metals to be welded are not clamped in jaws but are squeezed together between the electrodes of the secondary circuit.

Since the operation of welding is at all times under control, the weld may be made quickly or slowly and there is, therefore, no waste of current; furthermore, the heat is self-contained, that is it is generated within the metals themselves and is, consequently, confined to the small portions between the jaws or electrodes. It is evident that the quality of the welds made by this process should be uniformly higher than those made by any of the arc processes or by the blacksmith, and it is, in fact, only exceeded by the electro-percussive process. The Thomson process is best adapted for repetition work, while the arc processes are rather the reverse. The energy consumption involved in the making of a weld, and omitting all reference to the apparatus itself and the efficiency of operating it, is dependent upon the thermal and the electrical conductivity of the metals, their shapes, lengths, cross-sections, temperatures of fusion and time consumed in welding.

The Thomson process has a wide range as regards the metals as well as the shapes it is possible to weld, and the following covers the metals and alloys which can be welded:

Alloys.—Various grades of tool steel. Various grades of mild steel. Steel castings. Chrome steel. Mushet steel. Stubs steel. Crescent steel. Bessemer steel. Nickel steel. Wrought brass. Gun mtal. Brass composition. Fuse metal. Type metal. Solder metal. German silver. Aluminum alloyed with iron. Aluminum brass. Aluminum bronze. Phosphor bronze. Silicon bronze. Coin silver. Various grades gold.

Combinations.—Copper to brass. Copper to German silver. Copper to gold. Copper to silver. Brass to wrought iron. Tin to zinc. Tin to brass. Brass to German silver. Brass to platinum. Brass to tin. Brass to mild steel. Wrought iron to cast steel. Wrought iron to mild steel. Steel to platinum. Wrought iron to tool steel. Gold to German silver. Gold to silver. Gold to platinum. Silver to platinum. Wrought iron to mushet steel. Wrought iron to stubs steel. Wrought iron to crescent steel. Wrought iron to cast brass. Wrought iron to German silver. Wrought iron to nickel. Tin to lead. Mild steel to tool steel. Nickel steel to machine steel.

Wires as small as 0.0225 in. diameter can be butt-welded, the strengths of the joints being dependent upon the composition of the materials welded, in general varying from 75 per cent. and upwards of the original stock, although certain investigators place the average as low as 63 per cent. Aluminum wires or rods can be successfully welded in the larger sizes; but, in the smaller sizes, the welds will be unreliable, practically disintegrating if any attempt is made to work them.

Aside from the welding of wires, there is a multiplicity of other work, some large, some small, which can be advantageously performed by this process. Among such may be mentioned the welding of rings, buckles, frames for windows and the like, bars, rods, pipe, automobile parts, wheels, tires, cylinders, rails, bonds chains, band-saws, wire fence, handles to blades, drills, high speed to machine steel for cutting tools, crankshafts, etc. One of the most novel applications is the bonding of street car rails. Similar to this application is that of rail welding, but on a much larger scale. In this, about 30,000 amp. at 5 to 7 volts are applied for 2 to 3 min. with a pressure of 4,000 lb. per square inch on the weld.

Later developments of the incandescent or resistance process of welding include what are known as spot, point, ridge, projection and button welding, etc., much of it serving as a most desirable substitute for riveting. Briefly, it is the welding of materials in spots or at points and may be accomplished either by simply laying the flat materials together and applying both heat and pressure through the medium of the electrodes, as in the case of thin sheets; or, by first forming points, ridges or projections on the materials when thicker, then applying both heat and pressure; or, by laying the materials together when still thicker and placing between or on either side, a small flat metal button, then applying heat and pressure.

Fig. 4 shows two views of sheets clamped between the electrodes of a spot-welding machine preparatory to being welded. In one of the views, the indentations have been made in one sheet only, in the other they have been made in both.

A still further application of the incandescent process is in the lap welding of thin ribbons, especially those of metals like nickel-chromium on which an oxide forms which is not readily removed. By the use of an embossing tool, such as a pair of pliers with faces like a file and between which the ribbons are squeezed before welding, many exceed-

*Abstract of a paper read before the International Engineering Congress, San Francisco, Sept. 20-25, 1915.

**Director of standards, processes and materials, Westinghouse Electric & Manufacturing Co., Pittsburgh, Pa.

inly small points are raised over the surfaces. The scale is thus broken down and good contact secured between the pieces of ribbon when subsequently placed together for welding. The welding may then be readily effected by placing the ribbons between electrodes, also fashioned like pliers, properly insulated and held in the hand during the operation.

Electric Brazing

Electric brazing has received comparatively little attention, yet many materials can be effectively joined in this manner. A spot-welding machine can usually be employed with very little al-

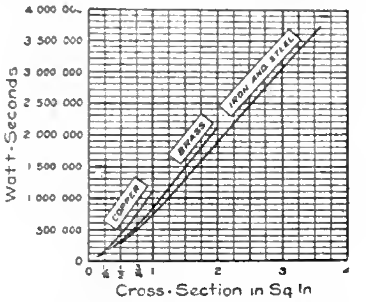


FIG. 3—ENERGY CURVES FOR WELDING DIFFERENT METALS

teration, one or both terminals being of carbon or steel, as circumstance require. The "spelter" may for most purposes be either sheet brass or sheet silver from 0.005 in. to 0.015 in. thick, and the flux, when it is found necessary to use any, may be a saturated solution of borax water. The heat, as in welding, is so perfectly controlled that there is no danger of burning the materials. Furthermore, a spot-welding machine, when it reaches its maximum limit in welding, can do still larger work in brazing owing to the lower degree of heat required. When silver "spelter" is used, the joint is more flexible than a welded joint, and there is little danger from brittleness.

The time for brazing a joint will naturally be rather longer than that required for welding, and care must be taken where brazed joints lie extremely close to one another, that the heat from the joint being brazed, does not react on the joint previously brazed and undo it; or does not extend to the next joint to be brazed and heat it sufficiently to cause an oxide to form thus preventing brazing at all. These are, of course, the two extremes and are, ordinarily, not likely to occur; but where there is any possibility of such conditions, dampened asbestos will prevent the former and borax water the latter.

Electric soldering may be done in much the same manner as electric brazing, though it is perhaps more usual to butt together the metals to be soldered and after heating them to apply the solder by means of a soldering stick, rather than to use sheet spelter as in brazing.

Electro-Percussive Welding

As the electro-percussive method of welding is of more recent origin than any of the other methods, less is known of its ultimate possibilities, more especially with reference to its adaptability. It will weld together any two metals, whether alike or unlike as to their composition, melting point, conductance, in fact, quite regardless of their characteristics, though such combinations as silver and tin, or aluminum and tin, iron or lead will of course not be permanent any more than they will be when welded by any other method, since their alloys disintegrate in time. Thus far, this method has been largely confined to the welding of small wires or the equivalent, aluminum to aluminum or copper, platinum to nickel or copper, thermocouples, spring steel, etc.

The principle involved is that of percussive contact between two metals with a condenser discharge occurring at the instant of such contact. The various items involved include voltage, velocity and force of impact, capacity of condenser, resistance and inductance of circuit, these being, of course, properly proportioned to one another.

Fig. 5 is a schematic diagram of the method. The welder is much on the order of a miniature pile-driver, two grips for holding the metals to be welded being provided, one of these located at the base and corresponding to the pile, except that it is stationary, the other corresponding to the driver and dropping upon the pile. A small direct current generator, G, preferably of 250 volts and about 1 kw. capacity, which is used to charge a condenser C of the electrolytic type, through a high resistance R. Voltage control is secured through variation in the field of the generator, as well as by means of resistances, R and R'. The welding apparatus proper W-W is connected to the condenser through an inductance L, long

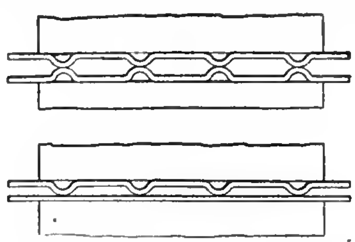

FIG. 4—METAL SHEETS ARRANGED FOR SPOT WELDING

flexible leads being used to permit ready moving of the welder from place to place without the necessity of disturbing the auxiliaries. The terminals of the welder are bridged by the switch S, except in the actual making of a weld when the switch is opened; thus no potential difference exists between the terminals while inserting or removing wires from the welder.

In making a weld either the metals to be welded, or if wires, their ends, are placed in the grips; the switch S is then opened, charging the condenser. A catch is finally released allowing the driver or hammer to fall, bringing the metals in so doing into percussive contact and making the weld which only requires the removal of the burr to complete it.

In explanation of the theory connected with the operation, it may be said that at the instant of contact, the condenser current is so heavy that the ends of the abutting metals are vaporized by the explosive discharge; and, due to the blow delivered by the falling mass, are forged together. The heat produced, though intense, is developed so quickly that it is confined to the extreme sur-

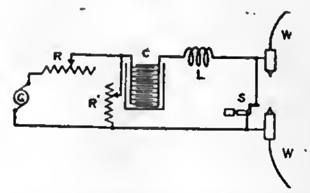

FIG. 5—DIAGRAM OF ELECTRO-PERCUSSIVE WELDER

faces of the metals and there is, therefore, no opportunity for unequal heating; with its possible deleterious effect on the welded materials. This generation of heat is dependent upon there being a certain resistance in circuit at the ends of the metals being welded at the instant of their contact. It is, therefore, necessary to "V" them at right angles to each other with a pair of pliers.

The condenser current vaporizes the extremely small sections of the abutting metals and melts immediately thereafter the approaching surfaces of the two metals. This vaporization must of necessity result in a separation of the metals for an instant, not, however, due to any reversal in the direction of travel of the falling metal but simply because the rate of vaporization is greater than the velocity of the approaching surfaces. Upon the metals coming together again, the arc is extinguished and forging occurs.

The weld takes the form of a sharp dividing line between the two metals, and on each side of it the original materials are found with no change in their physical properties, such as brittleness for example, either at or near the weld, as sometimes occurs in the resistance or incandescent method of welding. Hard drawn materials are not softened, soft materials are not hardened, nor is the temper of springs affected. Several theories have been advanced to account for these apparently irreconcilable statements. The almost instantaneous heating and cooling may not give time for molecular changes; or, if it does, the amount of material affected may be inappreciable.

CAST STEEL GEARING

By T. E. C. H.

THE efficient design of gearing has undoubtedly met with its due share of attention, but most articles the writer has seen have dealt more with the shape and strength of the teeth than with the design of the body of the wheel itself. The following may not therefore be out of place as an attempt to consider wheel body design in the case of cast steel gearing.

Disc Wheels

These are now very seldom employed over two feet diameter, and although of the simplest design, it is not uncommon to find the holes in the web left out, these holes being essential to enable the metal to contract in cooling without leaving a permanent strain. See Figs. 1 and 2. When the rim is rather wide, small webs connecting it and the boss to the web are also advisable, and help when pouring the metal, but for appearance some designers prefer to leave them out.

Arms

The cross or star shape arm for cast steel wheels seems to be passing away, and although to many the appearance is good, the difficulty of obtaining clean castings in steel without extra trouble tells against it.

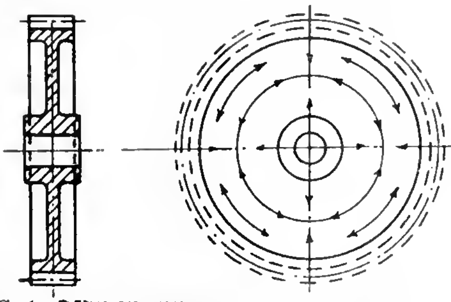

FIG. 1. DISC WHEEL SHOWING STRAINS SET UP WHEN METAL COOLS DOWN AFTER CASTING.

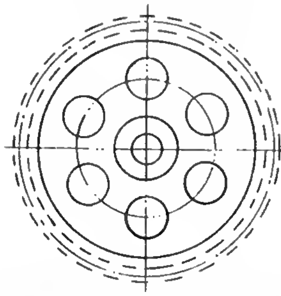

FIG. 2. DISC WHEEL WITH HOLES TO RELIEVE STRAINS DUE TO COOLING AFTER CASTING.

H. Section Arms

This design of arm is now the rule, and the question designers have to ask themselves is not what kind of arm, but how many, and what are the thicknesses. The following rules are suggested:

A—With teeth below thirty in number and of large pitch there generally arises no question of strength of arms. These being, when made the minimum thickness permissible for casting purposes, many times of greater strength than that required to take the load.

B—With teeth above thirty in number and of large pitch, then by dividing the load by the number of arms and assuming that the rim acts as a rigid strut between the arms, the bending moment to be resisted by one arm can be obtained, and the strength of the arm checked. To obtain a greater strength of rim, so as to ensure that the assumption holds true, that the rim will act as a rigid strut, and also to offer a greater resistance to bending when the pinion is engaging with the teeth between the arms, the under web of the rim is increased in depth at the centre as shewn by the arrow marks in Fig. 3. This by many is, however, not considered to give a neat appearance.

C—In the case of teeth being above fifty in number and of large pitch, it should be noted that with every increase in number of teeth the assumption that the rim can act as a strut does not hold, and thus the strength of the arm must be determined by the bending moment which one arm must resist, the load being that on each tooth.

Number of Arms

This should depend upon whether the wheel is to have machine cut or cast teeth. When cast as a blank with the rim more than twice the final thickness, it is advisable to make the arms fewer in number, but of slightly greater thickness for casting purposes; a compromise, however, is necessary, or else, after the teeth are cut, the arms would be a great deal stronger than the rim. By increasing the thickness of the web under the rim this difficulty is overcome.

Sections of H. Arm

The web of the arms are now being made thinner than the flanges, this enables the metal where the rim joins the arm to contract easily. In a large wheel, a space is left between the arm web and the rim for this purpose, as shown in the section rim, Fig. 3. Besides helping cooling, the weight of the wheel is not only reduced by this design, but its strength is at the same time increased by so doing. For instance no structural engineer would increase the thickness of the web of a girder to increase its strength, yet even to-day in many of the designs of gear wheel the web is very often twice the necessary thickness.

Split Wheels

The question of easy access to the clamping bolts of split wheels is now receiving its due share of attention, and the bolts near the boss which have been the greatest offenders in this respect can easily be made to pass through the web of the arms, as shown in Fig. 4. Only with wheels for high speed duty with very wide faces and small pitches do the rings shrunk on the boss seem to be favored. The bolts near the rim are often staggered to ensure greater ease in assembly, and it is now very seldom that they have to be tightened up by the old method of knocking the nuts round with hammer and chisel.—Herbert's Monthly.

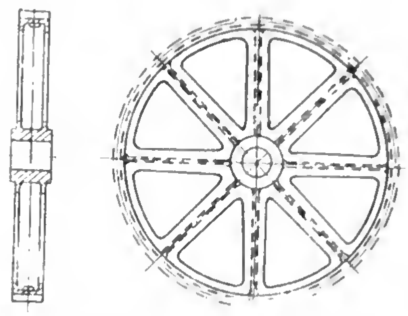

FIG. 3. CAST STEEL WHEEL WITH H-SECTION ARMS.

SERVICE

SOME men go through life like a freight car with a predetermined capacity marked plainly on their countenances—one dollar a day, and these people presume to call it service. This is not service—this is slavery.

The possibility of a man receiving more pay, for giving better service, is vindicated by the splendid roster of men who have fought their way up through the ranks to rare individuality.

Service is not a heritage; service is an advantage conferred or brought about.

When a man gets a larger, a firmer grip on individual effort—when a man discovers that he is not a mere music box, with a limited number of tunes; but that he is a master violin with infinite possibilities; then, not until then, will he fully realize the opportunities that follow good service. There never was a good man without ability for some service. The point is, find your calling.

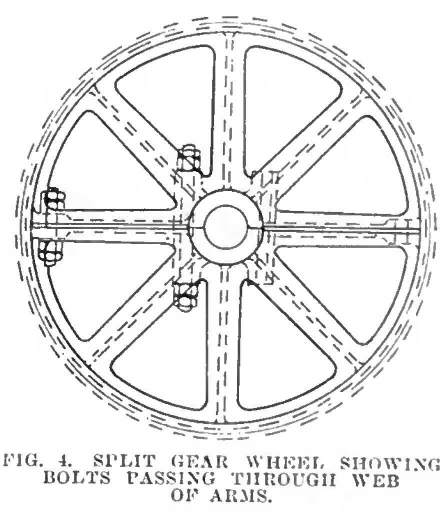

FIG. 4. SPLIT GEAR WHEEL SHOWING BOLTS PASSING THROUGH WEB OF ARMS.

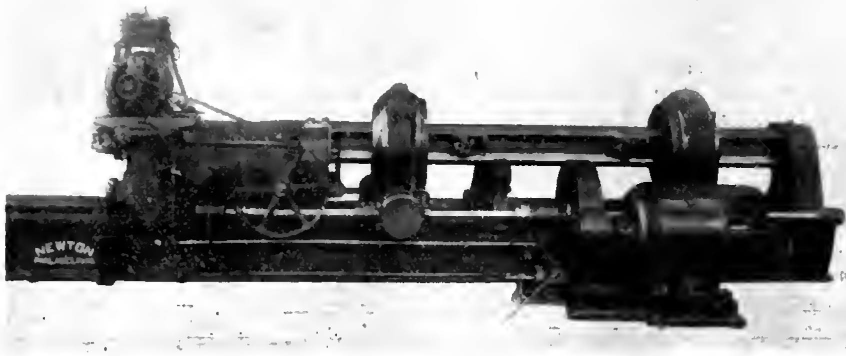
Service makes men victors of their course, not victims of the current.

PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

TORPEDO FLASK BORING MACHINE

A NOVEL type of horizontal boring machine for the finished boring of torpedo flasks, has been developed by the Newton Machine Tool Works, Inc., of Philadelphia. The design embodies several constructional and operating features for which patent rights have been requested, the various improvements resulting in the work being completed in one-quarter of the time formerly required.



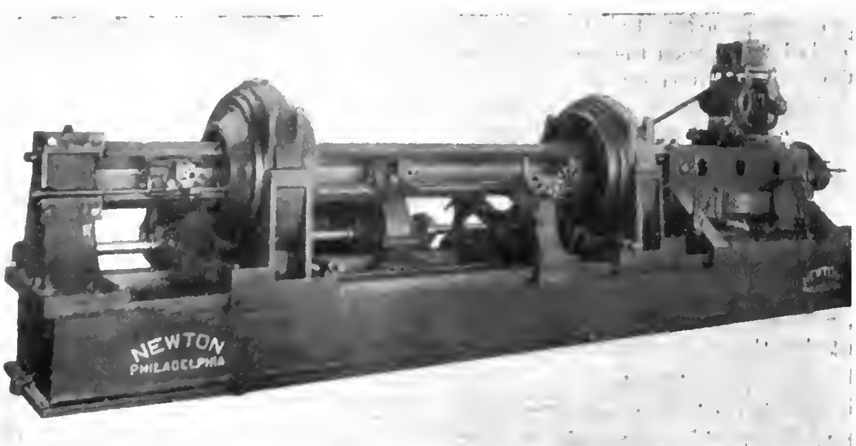
REAR VIEW OF MACHINE SHOWING MAIN DRIVE MOTOR.

A view of the front or operating side of the machine is shown below, the rear being illustrated above.

Provision is made for operating five boring tools, these being carried in individual carriages which are traversed along the length of the stationary bar, while the work is revolved by two annular chucks which grip it near each end. Each tool head has power feed along the bar, with automatic release and adjustment at right angles to the axis of the bar, this latter movement being controlled by formers shaped to suit the interior contour of the flask.

The main head to which one end of the boring bar is permanently attached, is provided with reversing rapid traverse by power, for the purpose of withdrawing the bar when mounting or removing work from the chucks. The motor for this work is placed on the top of the main head, with belt drive to the gearing through which is also operated the feed screws for traversing the tool carriages along the bar, the outer end of the bar being detachably mounted in a rigid support at the end of the bed.

The two annular chucks which support and revolve the work, are driven by wormgears which encircle the chuck body, the worms shafts being located below the chucks and receiving power from the drive motor through a shaft extending along the back of the bed. This shaft is sufficiently long to allow the chuck heads to be separated for a distance greater than the length of the flask, the main head carrying the bar having previously been moved back to the end of the bed. One end of the flask is now passed through the stationary chuck and the other end supported in the steady rest while the adjustable chuck head is slipped back over the flask to the desired position.



OPERATING SIDE OF TORPEDO FLASK BORING MACHINE.

The withdrawal of the bar necessitates a bed of considerable length; the floor space occupied is 40 ft. long by 8 ft. wide, while the weight of the machine exceeds 70,000 lbs.

ALL METAL POWER HAMMER

THE Beaudry peerless power hammer is suitable for general forging work, but is especially adapted for plating and drawing steel, the manufacture of edge tools, shovel and agricultural implement making, and any forging work requiring extreme quickness of blow. This hammer has no beam, coil springs, leather straps, or rubber cushions, all working parts being of steel.

POWER HAMMER WITH ALL METAL SPRING GEAR

The spring arms extend downwards from the connecting rod, and are embraced at their lower end by two horizontal links, whose adjacent ends overlap so as to clasp the upper end of the ram and hold it suspended. Suitable

nuts on the connecting rod enable the tension of the spring arms to be adjusted so that the amount of sag in the horizontal links can be made more or less to give blows of different degrees of sharpness.

The hammer is started, stopped, and regulated by a foot treadle extending around the base, and any desired speed or force of blow is instantly obtained by varying the pressure on the bar. The idler pulley and brake band are reversible and can be attached to either side of driving pulley through lugs provided for that purpose, so that hammer may be run in either direction to suit requirements.

The frame is a one-piece casting of ample stiffness and forms the ram guides, which are of V-shaped section, and carry a steel ram adjustable on its connecting rod for varying heights above the dies. An adjustable composition taper gib is provided to take up wear on the guides

The spring box, which carries the two spring arms, is of steel, while the spring arms are forged from Swedish steel and carefully tempered.

The arrangement of the anvil enables the hammer to be worked to equal advantage from all sides, the anvil clearing the main frame casting so that bars of any length can be worked either way of the dies.

Beaudry & Co., Inc., Boston, Mass., are the builders of this machine, which is built in seven sizes from 25 lbs. to 200 lbs. weight of ram, 5 in. to 8 in. lift, and 1,200 lbs. to 4,400 lbs. weight.

SMALL GAS-FIRED FURNACES.

TWO new furnaces of interesting design have been placed on the market by Tate Jones & Co., Inc., of Pittsburgh, Pa., to supply the demand for small furnaces for intermitent use, burning either artificial or natural gas. They are designed to heat up quickly and be ready for use in a comparatively short time, the maximum normal period of continuous use not exceeding ten hours.

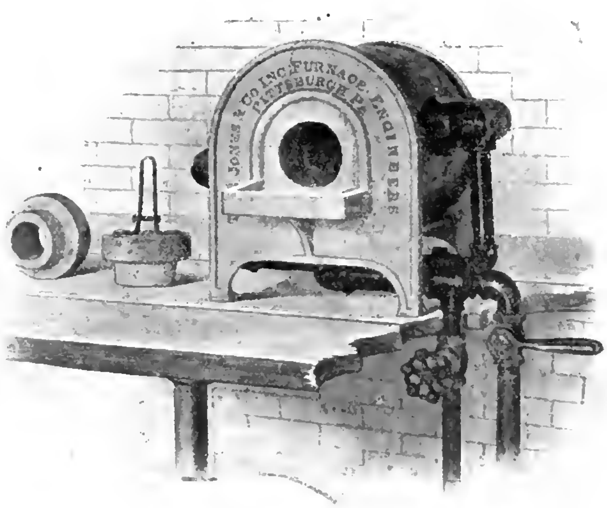


FIG. 1. BENCH FORGE.

The bench forge, Fig. 1, has a circular space extending from the front to the back, suitable plugs being supplied for reducing or closing either end as required. Space is 4 in. dia. x 12 in. long. This apparatus produces a temperature up to 2,300 deg. F., and is specially adapted for cutter hardening, tool dress-

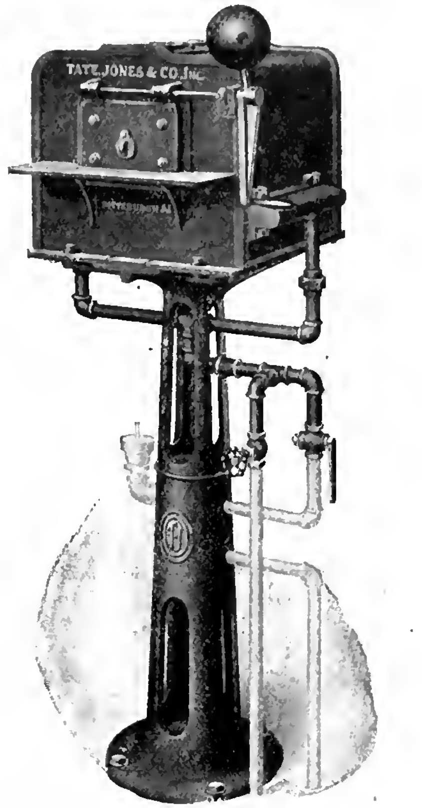

FIG. 2. OVEN FURNACE.

ing, brazing, and local heating on rods or pipes for bending.

The first of series "A" oven furnaces is shown in Fig. 2. These furnaces are made with openings, 6 in. high by 9 in. and 12 in. wide, with lengths of 12 in., 18 in., 24 in. and 30 in. They have flat hearths and are adapted for hardening cutters of all shapes and sizes within their capacity, preheating, annealing and similar work.

The device shown on top of furnace, Fig. 3, is a recuperator which has been developed as the result of considerable research work, and, although adding slightly to the cost, its use has shown

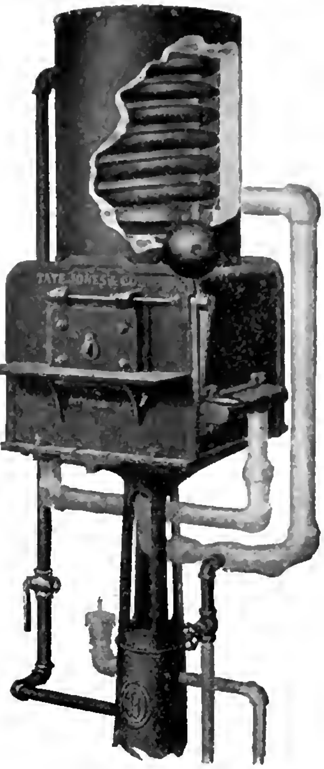

FIG. 3. OVEN FURNACE WITH RECUPERATOR.

very large savings in consumption of fuel.

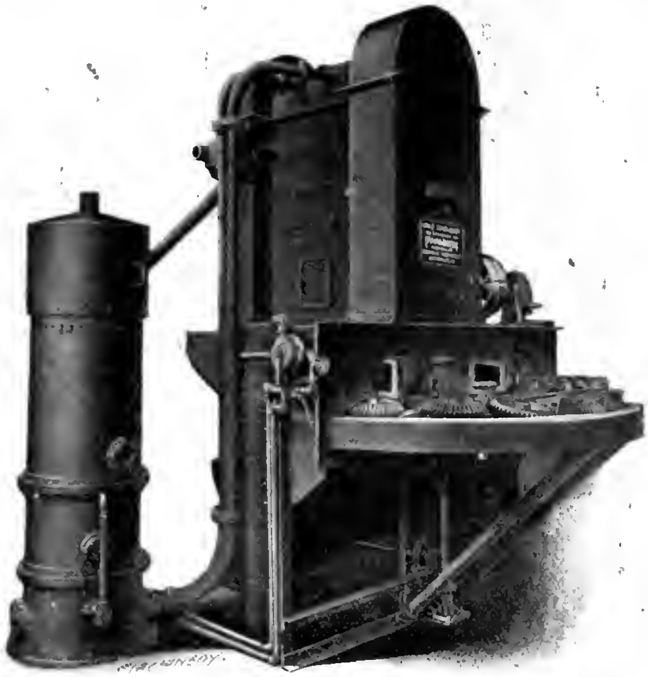
DIRECT HIGH PRESSURE ROTARY TABLE SAND-BLAST

A RECENT product of the Pangborn Corporation, Hagertown, Md., consists of the direct high pressure rotary table sand blast here described and illustrated. This apparatus is built in two sizes — 90-15 and 70-15, for medium and small work, and comprises in its detail a multiple chamber sand-blast, complete rotary table with driving mechanism and housing and belt bucket elevator. The larger machine has two nozzles and the smaller machine one nozzle. The tables the 90 inches and 70 inches diameter respectively and both sizes have the same clearance over the surface of the table. The over-all heights are 12 feet and 9 feet 6 inches respectively.

The equipment is controlled and operated from the front of the machine and the controls are all centralized. The table makes one complete revolution in 5 minutes. With the series of rubber-flap curtains neither dust nor sand comes outside the housing.

The operator starts with a pile of work on the floor or on a truck to his left, and keeps putting a layer of the pieces on the table as it rotates. The nozzles revolve inside the housing and

cover the whole surface of the table. As the pieces come out from under the curtains they are turned over, and when thoroughly sand-blasted, are removed and the vacant space on the table again covered with new work. The sand, after striking the work, falls through the grates of the table to the boot of the elevator, and is returned automatically to the sand-blast.



DIRECT HIGH PRESSURE ROTARY TABLE SAND BLAST.

The refuse is thoroughly separated from the sand each time it is used. With the multiple chamber sand-blast there is no loss of time in refilling the latter. The dust-laden air is exhausted through the openings at the rear of the housing. The rotating of the table and handling of the sand require approximately 4 horse-power. Sand, chilled iron grit, shot, or in fact any abrasive can be successfully and satisfactorily used with this equipment.

NEW ELECTRICAL GRINDERS

THE pedestal grinder shown in Fig. 1 is of compact design, possessing convenience and utility. The integral motor head enables it to be easily moved to any desired location without removing belts or shafts, any accessible lamp socket furnishing current, either alternating or direct.

Two sizes of this machine are marketed by the Standard Electric Tool Co., Cincinnatti, O., the smaller carrying wheels 8 in. X 3/4 in., and having a 1/2 horse-power motor, the larger, of 1 horse-power capacity having wheels 10 in, X 1 in. These tools are suitable for general grinding room work such as castings and tools, and are also adapted for buffing. Ball bearings are employed throughout, being of the double-row, self aligning type, running in grease in dust proof chambers. All insulated motor parts are impregnated with Bakelite reducing all electrical risks to a minimum.

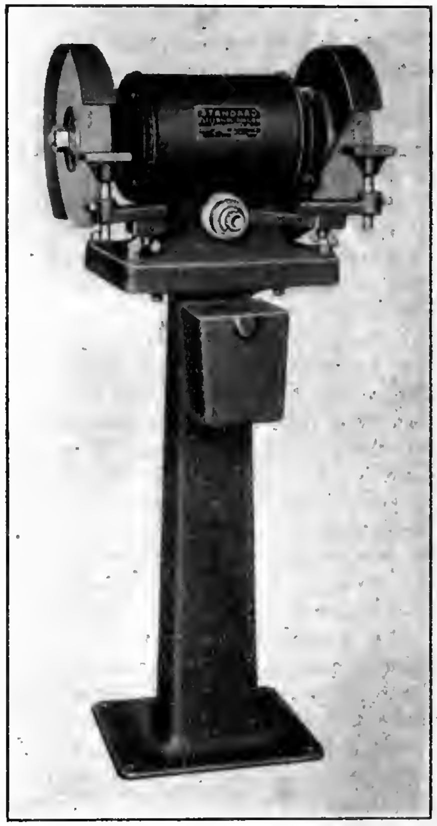


FIG. 1. PEDESTAL GRINDER.

The suspended type of machine, see Fig. 2, known as an Aerial Grinder, is also supplied in 1/2 and 1 horse-power capacities for similar current supply. It is particularly serviceable for grinding rough castings and buffing irregular or bulky work.

The suspension may be from a fixed point, through a spring as illustrated, or it may be suspended on a traveler with a counterbalance. Motor construction and wheel sizes are the same as the corresponding pedestal machines, both styles being designed to work under continuous rigorous conditions.

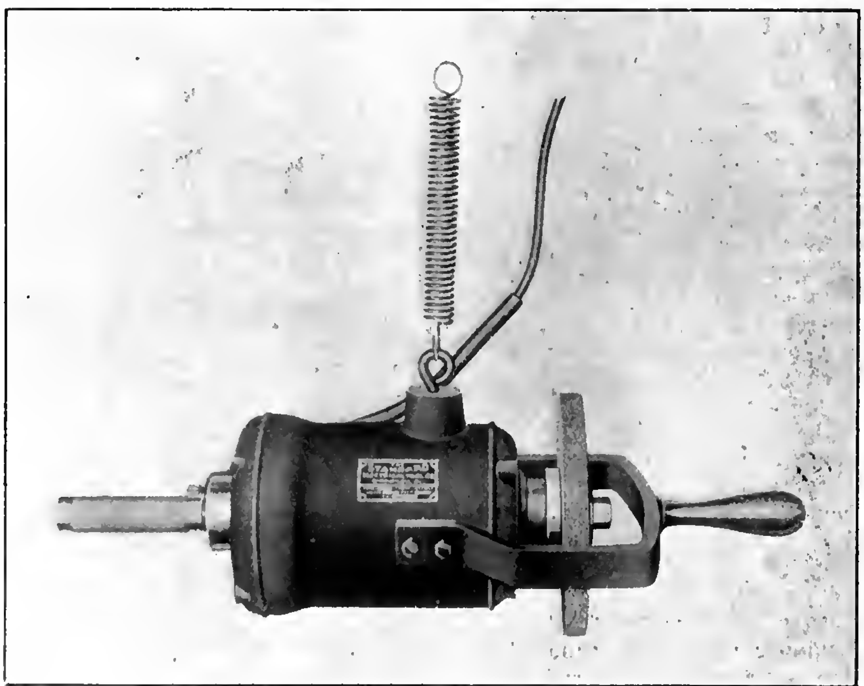

FIG. 2. SUSPENDED TYPE GRINDER.

WORKMEN'S COMPENSATION LAWS

RECENT years have witnessed a gradual recognition by various authorities in widely separated parts of the world of the duty of the State to the individual and the adoption of Workmen's Compensation Laws has become the rule rather than the exception amongst the leading industrial countries.

Like the majority of innovations affecting the relations of capital and labor, early efforts of legislation in this field were viewed with suspicion by both. Employers were loud in their protests against this addition to their many liabilities, and while the attitude of many firms would have been more sympathetic had the question been a personal one between them and their own employees, the great majority accepting the laws as promulgated, proceeded to carry them out to the letter, and having done their legal share, left it up to the men to do theirs.

Three decades have passed since State Insurance was made compulsory in the German Empire, and fully twenty years ago Britain introduced industrial compensation measures. While a period of some years intervened before the justice of this legislation was recognized by other nations, the economic effect of such measures had meanwhile become fully apparent in the countries of their adoption. Greater care was shown in the selection of new employees, and while cases of undoubted hardship arose through the discharge of some work people as unfit under the new conditions, the ultimate results have quite dispelled the gloomy forebodings which heralded the putting into effect of the legislation. A freshening of industrial effort was the immediate and perhaps the most important result; increased interest and care in the performance of their duties increased the efficiency of most employees; in consequence, the employers' attitude to the law changed gradually from sphinx-like indifference to genuinely human co-operation.

While the working out of all industrial legislation and safety-first movements will ultimately result in the survival of the fittest, such a trend of events must be preceded by earnest effort on the part of each individual to render himself fit. The "greatest good for the greatest number" may well be the motto of all industrial effort, and the continued enactment of protective legislation marks progress toward such a goal.

PLANNING FOR A SHELL-LESS TO-MORROW

FROM quite an authoritative source we learn that Britain's great munitions machine is now fully equipped and running as smoothly as it will be possible to make it. Transforming the country into a huge arsenal in order to win the struggle has been accomplished, and popular opinion as a result is becoming so molded as to evidence a premonition that the end of the war is well in sight. In any case it is significant that steps are being taken to organize for the tackling of the hundred and one problems and adjustments that not only will require solution and tactful management when peace has been procured, but which even now are thrusting themselves forward in volume and importance that may not allow of procrastination.

In Great Britain already, commercial questions are engaging the attention of several influential bodies of manufacturers; the technical development of industries is being looked after by an energetic Government Committee—the Advisory Council for Research; and, last, but not least, the House of Lords has taken in hand the question of the re-employment of returned soldiers.

It is pertinent to ask, where does Canada stand relative to all or any of the foregoing activities? Each of those indicated—there are of course others, should be now in process of development by us, for without doubt to the extent that they are matured will our post-bellum, or earlier, economic and industrial fabric be in a position to meet the new situation. A feverish anxiety is being displayed relative to further shell orders, and, as was to be expected, the Munitions Board which superseded the Shell Committee, is being subjected to more or less severe criticism. The old cry for a Minister of Munitions has again been resurrected, and we should not be surprised but that it will do duty right up to the moment that the Kaiser takes the pen in his trembling hand and admits that his ambitions have been frustrated.

Irrespective of the fact that we have made millions of shells, although not complete in every sense as required —a handicap in a very real sense, we believe, as far as future order-placing is concerned, it should not be forgotten that "The Man Behind the Man Behind the Gun" in Great Britain is one immense munitions producing machine and may, in addition, be reckoned as practically equal now to every war supplies requirement.

We went into the munitions business whole-heartedly and purposeful, without regard for the future, a frame of mind without which we could not have accomplished a tithe of the results that stand to our credit. The time, we believe, has come, however, when the concentration on munitions manufacture may well be less exclusive, and as each succeeding opportunity arises to direct our now highly developed energies into other and war-created channels, no hesitation should be displayed in parting with the old and getting on with new.

In recent weeks it has been our privilege to receive many inquiries—particularly from the managements of small machine shops engaged either in the manufacture of munitions or the equipment required for same, as to suitable lines to develop in lieu of the above when the war demand ceases. With a view to stimulating this highly gratifying development, we are, therefore, having prepared for publication in our January 27 issue, an article dealing directly with products that are eminently suitable for both large and small metal-working plants to manufacture, such products having either been imported previously for our own domestic needs or having since become available to us as an export proposition.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents

Montreal, Que., Jan. 17, 1916.—The industrial situation shows little change from that of the past few weeks, and, while the pressure throughout the various branches of the countries' activities is not so pronounced as a few months ago, an optimistic feeling regarding the future is still predominant. The action of the British Government in placing certain restrictions on the delivery and distribution of the various metals used in the manufacture of war munitions will likely—when definitely decided on—have some effect upon the general markets, both here and abroad. The impression is that with the adoption of these restrictions, prices of the various metals will be influenced, and further advances will result. The recent advances in sheets and bars are partly due to the action of mill managements in granting a wages increase of from 5 to 10 per cent. to their employees. It is anticipated that with the continuance of the present prosperity further wages demands may be made upon employees.

Pig Iron

The market continues strong, but inactive. Furnaces are well sold for present and future delivery, and most dealers are very well covered for the first half-year at prices somewhat lower than at present quoted. Third and fourth-quarter orders are being accepted under contract, but little effort is being made by producers to induce dealers to buy. Production is lighter than shipments in most cases, and stock supplies are gradually being reduced. Local conditions remain unchanged, last week's quotations holding firm.

Steel

Unrestricted production fails to meet the present requirements of the steel situation, and predictions of a higher market are everywhere evident. The heavy export demand will be one of the chief factors in determining future prices, and limitations on European purchases will be controlled by conditions prevailing at the producing mills.

Munition requirements still hold first place on the demands on steel mills and foundries, but many lines of domestic supplies are adding their quota of pressure. Bessemer billets and open-hearth billets at Pittsburg show an advance of \$2 per ton, which makes the week's price \$33 for the former and \$35 for the latter. Forging billets are strong at \$55 per gross ton. Boiler plates have advanced to \$3 per 100 lbs., and 3/16 inch tank plates are now quoted at \$3.25. This is an increase over last week of ¼c per pound.

The demand for blue annealed sheets continues, and it is anticipated that prices will advance before long. Premier No. 28 U. S. gauge is quoted at \$5.75, and 10¾ oz. Premier at \$6, being an increase of ¼c per pound. Galvanized sheets are fairly active, with prices firm.

Lapwelded boiler tubes have advanced approximately 10 per cent., and 2-inch is now listed at \$11; 2¼-inch, \$12.10; 2½-inch, \$14.15; 3-inch, \$14.60; 3½-inch, \$18; 4-inch, \$23.

Metals

The situation in the metal market is at present very uncertain and unsettled. The report that Great Britain has, or soon will place certain restrictions upon the trade, has created much excitement among producers and dealers. What effect this step will have upon the local market is not yet certain, but it is quite obvious that some interesting developments may be expected. At present the situation is not much changed, and little activity is noted. Copper has taken on strength during the week, and also tin and lead, with the other metals comparatively firm.

Copper. — Ever since the outbreak of the war, very little reliable information has been available regarding the complete statistics of the copper situation, either in this country or in the United States. What the actual production of copper has been during the past year or eighteen months is only problematical, and it is the opinion of some dealers that producers are withholding particulars as to their stocks on hand, to justify the high prices being asked. Accurate information showing the present condition of the copper industry would aid materially in putting a stop to speculation.

Contradictory reports from various sources keep the market in a tensive condition; and, while many dealers seem unable to make deliveries before the 1st of June, others are quoting reasonable prices for first quarter shipment. An unconfirmed, yet apparently reliable, report comes from Great Britain to the effect that munition plants can purchase from the Government supplies of copper at £100 per ton, in spite of the fact that the prevailing market price is quoted as high as £114.

Local dealers are asking \$10 per ton above last week's price for lake and electrolytic copper and \$20 for castings, or 27½c a pound for lake and electrolytic and 27c for castings.

Tin.—Owing to the absence of cable reports from the London market (upon which almost all this country's quotations are based) the present situation is in a rather paralyzed condition; and, while little trading is evident, there is a feeling of uncertainty regarding the immediate future. A few inquiries are being received, but little is being done in the way of trading, and will likely continue until the policy of the British Government regarding the retaining of a sufficient supply of metals for national needs has been more clearly defined. The accumulation of excess requirements may have a tendency to increase prices; this would have a corresponding effect upon the local situation. Dealers are quoting 45½c per pound, being an advance of \$1 a ton over last week.

Spelter.—The situation in the spelter market shows little change. While it would appear that producers are pretty well sold for first quarter delivery, there seems to be considerable available supply for early delivery. Sellers, however, are not anxious to accept bids, as the firmer market tends to higher prices. Slight disturbances in the Joplin district have temporarily closed down a large percentage of the mines, and this fact has had its effect. This week's quotations remain firm at 21c.

Lead.—Within the past week much trading has been done, with Europe the heaviest buyer. Many of these purchases will be delivered throughout the year. Local dealers report very good business, and are asking 7½c per pound, an advance of \$5 per ton.

Antimony.—The available supply for early shipment seems to be diminishing, and the present market is very firm. However, the scarcity of inquiries for future indicate a weaker market. Dealers are endeavoring to book advance sales, but buyers do not seem anxious to close. Local prices are steady at 45c.

Aluminum. — The present market shows little activity, but prices are holding firm. Recent restrictions put upon the dealings in aluminum throughout the British market are causing some un-

CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion \$100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.

easiness. However, the present quotation of 68c remains firm.

Machine Tools and Supplies

Inquiries for heavy lathes are still reported by dealers, while the large shell-producing plants are busy installing machinery. The advent of the shell industry in this country has been the means of developing many new and interesting designs in various machine tools and the knowledge gained during the past year will aid materially in the solution of future problems in machine tool efficiency.

The demand for supplies shows little abatement, the needs of the munition plants being as persistent as ever. Many of the smaller necessities have increased in price due to the advances in the cost of raw material and the scarcity of labor in certain branches.

High-speed steel, cutters, taps and reamers, also files and many of the machine shop accessories, have very materially advanced. Oils and cutting compounds are in great demand, with higher prices being asked.

Old Materials

The consumption of all classes of scrap material is very great. The market is quite active, and dealers are expecting still higher prices. Heavy melting steel has declined three-quarters of a cent, 9c a pound being the present price. Heavy copper and copper wire show an increase of ½c, each being quoted at 17¾c per pound. No. 1 composition turnings have advanced from $11.25 to $11.75 per hundred. Heavy lead is stronger at 5¾c, and tea lead is bringing 5c per pound. Scrap zinc is now quoted at 13½c, being an advance of ½c a pound.

Toronto, Ont., Jan. 18. — The annual reports of the various Canadian banks recently issued, contain much information of an interesting and encouraging nature and reveal a unanimous spirit of optimism. Financial conditions have improved greatly and the outlook generally is much brighter. The steel works and munition plants continue to work at capacity and factories working on war orders are very active.

The extraordinary activity in the steel trade is unabated and the mills are working at maximum capacity. A scarcity of steel is being felt and there is little prospect of any relief in this regard. The machine tool business is quiet but there is a fair demand for tools for making shell parts. Munition plants are now well supplied with equipment so the demand for tools has naturally fallen off. Gasoline consumers will be well advised to watch the market carefully as higher prices are certain. The shortage of crude oil is becoming serious as the demand for gasoline is increasing all the time. Benzine will be affected also. The extraordinary advance in prices of linseed oil is due to the high cost of flax seed, and opinion varies as to when the top of the market is likely to be reached and at what figure. As regards ingot metals, the copper situation is very strong and higher levels are looked for in the trade.

Steel Market.

The mills continue working at top pressure on both domestic and export business. The consumption of steel products is getting ahead of production and deliveries are falling behind with little prospect of any immediate improvement in this respect. The scarcity of steel is increasing and the situation is becoming acute owing to the large tonnage being used for munitions. The market is very firm and prices for all steel products have an upward tendency. Coil chain, cut nails, black and galvanized sheets, bolts and nuts have advanced and higher prices for wrought iron pipe, boiler plates and tubes, wire nails, wire rods, bar iron and steel are are looked for in the near future. The steady advance of prices in the States is affecting the Canadian market. There is no indication of any recession in the American market, so higher prices may be expected here.

The galvanized sheet market is very strong at the recent advance and there is no improvement in the situation. Conditions in the trade are such that many makers of galvanized sheets have withdrawn from the market. Sheet mills are operating at maximum capacity although galvanizing departments of most plants are not producing more than 50 per cent. of normal output. There is a heavy demand for black sheets and deliveries are being deferred anywhere from 8 to 16 weeks. Prices of black and blue annealed sheets are higher. No. 28 gauge black sheets are held at 2.60c, and No. 10 blue annealed sheets are quoted at 2.40c Pittsburgh.

The steel market in the States is strong and prices are very firm but with few changes. The freight congestion in New York is gradually being relieved and it is reported that the railroads may lift the embargo on export shipments shortly. The strikes at the Youngstown iron and steel plants have disturbed the trade as there is a possibility of similar trouble in other districts. The heavy demand for steel bars for export shipment continues and deliveries are deferred from four to seven months. Enquiries for heavy tonnages of steel bars have been received by the mills but deliveries are so backward that few contracts have been closed. Steel bars are quoted at 1.85c Pittsburgh, but near by deliveries are being quoted as high as 2.25c to 2.50c. The market for billets is very strong with a tendency to higher prices. Bessemer and open-hearth billets have advanced, but forging billets are unchanged. Cut wire rods have advanced to $42,00 f.o.b. Pittsburgh.

The ferro-manganese situation has become acute and prices have advanced to $125 per ton at tidewater. Increased difficulties in the transportation of manganese ore from India on account of the posible trouble at the Suez Canal is believed to be the reason for the advance. The British Government has requested all American manufacturers using ferromanganese to dispose of their products containing this material only to Great Britain and her Allies.

Pig Iron

The situation is unchanged. The demand for steel-making pig iron continues heavy. It is reported that the British Government purpose to fix a maximum price on Cleveland pig iron but this market will hardly be affected as none of this iron is being imported at the present time. Prices of Hamilton and Victoria brands are very firm and unchanged.

Old Materials

The scrap copper market is very strong and prices of all grades have advanced 50c to $1 per 100 lbs. No. 1 machine composition and turnings have also advanced as well as brass clippings and turnings. The situation as regards wrought and steel scrap is unchanged, the embargo on the export of these materials being still in force. The lead market is strong and prices of tea and heavy lead are a little higher. Scrap zinc has advanced 50c per 100 lbs. Business is good, the chief demand being for copper scrap.

ALLIES PURCHASING AGENTS

The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:

International Purchasing Commission, India House, Kingsway, London, Eng.

French.—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendence Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.

Russian. — Col. N. Golejewski, Military Attaché, Room 904 Flat Iron Building, New York City.

Machine Tools

The demand for machine tools recently has been much lighter and business consequently is not so active as a few months since. Small parts for shells such as primers and fuses, etc., are urgently required as the output of these is considerably less than shell cases, and fixed ammunition only is being shipped to Europe. Makers of shell parts are very busy and there is a fair demand for equipment for turning them out. Deliveries are still backward from plants in the States as machine tool makers are well booked up and labour troubles are also causing serious delay in production. A number of enquiries have been sent out to American machine tool makers but not much business has been closed on account of late deliveries. Canadian machine tool builders are very busy and have as much work on hand as they can conveniently take care of.

Supplies

A fair business is being done in supplies but the demand is lighter than it was. Prices on all lines are very firm and in some cases, advances have to be noted. The linseed oil market is wild and prices have advanced sharply to $1.09 for raw, and $1.12 for boiled oil. The flax seed situation is getting more acute, prices are very high and there is a scarcity of seed. The crude oil market is very firm on account of a scarcity. With the present conditions prevailing there is every prospect of considerably higher prices for gasoline. The demand for gasoline is increasing almost daily and the output of crude oil is decreasing gradually. Imported glues are advancing on account of higher cost of production and abnormal freight rates. Plumbers' oakum has advanced 50c and is now quoted at $5 per 100 lbs. The waste market is strong and higher prices may be announced very shortly. Copper rivets have advanced and are now net list, with list plus 20 per cent. for burrs only.

Metals

The general situation in the metal market is unchanged and price levels are being maintained. The copper market is strong at higher levels but business it little quieter. The tin market at New York is unsettled on account of the difference of opinion in the trade as regards the affect of the British Governments policy to keep a good supply of metal in England. The situation in the lead market resembles that of copper as the British Government evidently intend to regulate quantities sold, and to fix maximum prices. The spelter market is quiet and unchanged while antimony and aluminum are both being quoted at last week's figures.

Copper. — The market is strong and higher. No statistics regarding the copper position are available but it is generally thought that the production is being entirely taken up. There is a very heavy consumption of copper and the position is as strong as ever. Local prices have advanced 1c and copper is being quoted at 27c per pound.

Tin.—The market is firmer with an improvement in London. The New York market is unsettled as there is a difference of opinion in London among the trade there as to the effect of the British Government's policy in retaining a good supply of metal. Quotations are unchanged and nominal at 45c per pound.

Spelter. — The market is firm and prices a little higher. There is a good demand for spot and early deliveries and indications point to higher prices. Spelter has advanced ½c locally and is now quoted at 20½c per pound.

Lead.—The market is dull and prices unchanged. It is reported that the British Government intend to regulate quantities of lead sold and also to fix maximum prices. Local quotations are unchanged at 7½c per pound.

Antimony.—The market is firm and unchanged. There is a scarcity of spot antimony and the future supply appears uncertain. The situation is unchanged and quotations are nominal at 40c per pound.

Aluminum.—The situation is unchanged and the market is holding firm. Supplies are scarce but the demand continues heavy. Local quotations are unchanged at 68c per pound.

CANADIAN PURCHASES FOR FRENCH WAR OFFICE

Philippe Roy, General Commissioner for Canada, Paris, advises the Department of Trade and Commerce, Ottawa, that an order has been issued by the War Department of the French Government to the effect that all purchases made by the Supply Branch in Canada will pass through the Hudson Bay Co. Canadian producers should therefore submit their future offers through the office of that company at Montreal. It is further stated in Mr. Roy's communication that Canadian lumber, steel and meat will find in France an important market for years to come, but it is necessary that Canadian firms should have in Paris representatives entrusted with the necessary authority, especially if it is desired to secure Government contracts.

Winnipeg, Man., Jan. 15.—The bright spot on the horizon, as far as the machinery trade is concerned, is an improved demand from the wealthy farmers in the West for equipment of all kinds. The most important feature of this end of the business this year is the small tractor, which appears to be arousing considerable interest among the farmers. It is thought that this type of machine for general use on the farm will now come more into favor. There is a very satisfactory demand just now for small power engines used for crushing, pumping, and for other light work on the farm.

A number of machinery houses in Winnipeg have had a hard time during the past two years, but they all agree that the worst is back of them, and that good times are ahead. However, the machinery business generally continues rather quiet, as there is very little industrial expansion. Apart from orders placed by concerns who have shell contracts, there has been little or no activity in the machinery line during the past year. Whether there is to be an improvement in the demand during 1916 depends upon whether there is any industrial expansion likely to require the installation of new machinery. There are unmistakable signs of improved conditions in trade generally, which will undoubtedly reflect themselves eventually on all branches of business.

Considerable doubt exists as to contracts being placed here for shells. It is known that a contract recently went to Brandon for 20,000 shells, which is helping things out somewhat in that city. The demand still continues good for all kinds of shell machinery, where same can be obtained. The demand for supplies is fair, these being required mostly for saw mills re-opening. There are, however, no new saw mills projected as far as can be learned.

The representative of an Eastern saw manufacturing concern states that, whereas only three or four of the large saw mills were in operation in Manitoba and Saskatchewan last year, he knows of only one this year that will not be operating. The outlook in this line is, therefore, encouraging, as there certainly will be a demand for belting, saws, and other accessories.

HYDRO-ELECTRIC DEVELOPMENT

A CONFERENCE of representatives of Hydro municipalities to approve of the Provincial Hydro-Electric Commission's great development plans for Niagara involving the diversion of Chippewa Creek, will probably be called some time before the Ontario Legislation meets. In order to make a start upon the project, it will, according to Sir Adam Beck, be necessary to secure legislation this ses-

sion. As preliminaries to that will come Government approval and that of the municipal "partners" in the Hydro system. The approval of the Government, which has been taken for granted, will probably be communicated to the commission within the near future.

The endorsation of the municipalities will be given as a matter of course, since the absolute necessity of securing a further supply is recognized. Apart entirely from future consumption by radial railways, the demand of the municipal systems is warrant for pushing the development scheme as rapidly as possible. The commission is already well over the power maximum originally contracted for and paying a higher rate for the additional amount taken from the power companies at the Falls.

GEORGIAN BAY CANAL

IT is a matter for regret that advocates of this scheme should seek to add to the cares of the Government by bringing forward at this time the question of proceeding with this undertaking. While no one is justified in condemning the project as impracticable, the present state of transportation facilities throughout the Dominion justifies the statement that the proposed waterway is economically impossible and financially undesirable. The estimated cost of the entire work is $150,000,000, to be raised by the sale of bonds guaranteed by the Government; failing which the Government could construct it, and meet the cost, as of other public works, with funds from the public treasury. The past history of the Grand Trunk Pacific and the present trials of Canadian Northern will doubtless act as a deterrent to future Government participation in, or encouragement of, such stupendous undertakings.

The question of commercial justification of the Georgian Bay Canal will remain unsettled until it is built and has been in operation for several decades. The great development of the North-West has been made possible by transportation facilities, which in turn have depended on the North-West for a continuance of their existence. The main source of traffic would be the carriage of grain. That, again, would be obtained at the expense of the Transcontinental Railway, and also the enlarged Welland Canal, provided, of course, that the rates were low enough to offer a saving over the expense of the longer trip round the lower lakes. While no such troubles would be experienced as are at present happening in the Panama Canal, the large number of locks would increase the possibility of delay by accidents which are all too frequent in the Welland Canal now, while the greater length of it would cause any tie-up to affect so much more traffic.

One of the arguments advanced in favor of the proposal is the probability of diverting to Canadian channels a portion of the Canadian grain which now reaches the Atlantic via Buffalo and New York. Such diversion could be more completely and permanently accomplished if the estimated cost of the proposed canal were devoted to the improvement of navigation conditions on the St. Lawrence River. The inequality of insurance rates is the principal reason for the preference given the southern route. Remove this handicap from which the St. Lawrence route suffers, and increased shipments would soon result.

If the Georgian Bay Canal were to be constructed and no provision made for equalizing insurance rates, the net results would amount to the saving of a few hours in time. The higher rates and possibility of longer delays might easily offset the time saved over the Lower Lakes route, while the greater certainty of this route would still have many advocates. The interest return on one hundred and fifty million dollars, if applied in the form of insurance rebates, would, with the enlarged Welland Canal, offer sufficient inducement to shippers to keep the grain in the one bottom from Lake Superior to Europe.

Once conditions were equalized, the grain port business would take care of itself. In addition to indefinitely delaying such an event, the Georgian Bay Canal would probably interfere sufficiently with the business of existing waterways to prevent either systems from being efficiently utilized. Better far to have one canal doing business on a healthy basis than two canals struggling for existence at the expense of the country.

CANADA'S TRADE BUOYANT

THAT after fifteen months of war commercial conditions can be said to be in a sound and buoyant condition is the statement made by F. C. T. O'Hara, Deputy Minister of Trade and Commerce, in the annual report of the department just issued.

"It is cheering to note," says the report, "that after fifteen months of war the depression expected by many has not materialized, but, on the contrary, commercial conditions have not only been well maintained, but they can be said now to be in a sound and buoyant condition. In this connection it may be pointed out that the total foreign trade of Canada, excluding coin and bullion, during the twelve months ended October, 1915, amounted to only $1,600,000 less than during the preceding corresponding period. This decrease was due to the great falling off in imports ($92,900,000) and foreign exports ($5,000,000), which was not quite counterbalanced by the splendid expansion in the exports of Canadian produce, which amounted to $96,300,000.

"Statistics of trade during the first seven months of the fiscal year 1915-16 show that commercial conditions are still improving, and seem to justify the most optimistic hopes for the future."

TORONTO CUSTOMS RECEIPTS

THE Customs revenue for the port of Toronto for 1915 totalled $18,901,470, as compared with $16,476,057 in 1914. December, 1915, is not only the largest December so far, but the greatest month for revenue to date. It is the first time Toronto has reached and passed the two-million a month mark. Toronto has had a gain of more than three million in Customs revenue during the past four months.

Comparative figures follow:

	1913.	1914.	1915.
January	$ 1,759,838	$ 1,487,270	$ 1,144,225
February ...	1,827,293	1,532,959	1,387,040
March	1,947,815	1,740,522	1,574,855
April	1,887,289	1,584,895	1,502,797
May	1,767,448	1,462,769	1,485,244
June	1,599,462	1,387,787	1,517,624
July	1,897,489	1,449,422	1,487,829
August	1,853,152	1,684,122	1,611,606
September ..	1,732,528	1,113,865	1,464,342
October .. .	1,656,700	1,086,943	1,668,345
November . .	1,386,976	928,407	1,929,513
December ...	1,397,375	1,017,096	2,128,050
Total	$20,713,365	$16,476,057	$18,901,470

COMMISSION OF CONSERVATION REPORT

THAT the results of the greater production campaign in Canada far exceed even the most sanguine hopes, is the statement made in a report issued on Jan. 7, by the Commission of Conservation.

The idea has generally prevailed that greater production meant an increase only in the wheat crop and other agricultural products, but its effects have been much more far reaching. True, Canada harvested a wheat crop estimated at over 326,000,000 bushels, more than double that of the previous year, and 45 per cent. more than any previous wheat crop in her history. The dairy industry also sent from the port of Montreal butter and cheese valued at $23,705,000, exceeding the exports of 1914, by over $5,000,000.

But the results in other industries were as striking, to quote the report: "In mineral production Canada has made numerous advances. Copper and zinc refining plants have been established at Trail, B.C., and are treating native ores. Improvements have been made in certain steels to enable them to be used for shell purposes. Improvements have also been made in the concentration of molybdenum ores, the mol-

ybdenum being used in the manufacture of big gun linings and high-speed lathe tools. The recovery of benzol from by-product coke ovens has been developed Benzol is used in the manufacture of explosives. In Western Canada the discovery of phosphate of lime in Rocky Mountains Park should prove of great value to the agricultural interests."

The following figures furnish a comparison between the quantities of the different metals used in the manufacture of the 22,000,000 shells for which orders have been placed in Canada, with our production of such metals in 1913:

"Steel used, 400,000 tons. In 1913 it was estimated that the production of iron ore in Canada, 307,634 tons, did not exceed five per cent. of the country's requirements of iron in that year.

"Zinc used contained in brass 11,200,000 pounds. No zinc was refined in Canada in 1913, but the exports of metallic zinc in ore shipped amounted to slightly over 7,000,000 pounds.

"Copper used, 55,000,000 pounds. The total production in 1915 was 77,000,000 pounds, and all of it was exported for refining.

"Lead, 101,760,000 pounds. The production in 1913 was about 37,665,000 pounds, of which over 97 per cent. was recovered as refined lead.

"Canada's fisheries have received especial attention, not only in the production but in the marketing, both on the Atlantic and Pacific Coast advances have been made. Due to conditions brought about by the war, Canada last year placed her fish upon the British market, and it is hoped that some species may be permanently established there."

MARKET FOR COBALT METAL

CANADA is practically the sole producer of cobalt ore; the cobalt content of the ores mined in the Temiskaming district, Ontario, exceeds 2,000,000 lbs. per year. The market for this, at present, depends altogether on its limited use as a blue coloring substance. Hence there is a large accumulation of cobalt oxide at the smelters and at Cobalt.

Under present industrial conditions, the smelters refuse to pay for the cobalt and nickel content, and the miner receives nothing for this valuable constituent of the ore. Yet the metal cobalt resembles nickel in almost all its properties. Its density, malleability, ductility, hardness, tensile strength, and electrical properties are, so far as they are known, very similar to those of nickel. These properties of nickel make it of remarkable industrial value in the composition of a great variety of alloys.

Of these may be mentioned the high-grade steels, where toughness and hardness are desired: for automobile parts, steel tubes, gun steel, cranks and crankshafts, boiler-plates, tires, connecting rods and axles; the nickel-iron wires

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

Engineering

Sarnia, Ont.—The Imperial Oil Co., is completing a large addition to the machine shop.

Hamilton, Ont.—The Burlington Steel Co. will make an addition to their plant, to cost about $5,000.

Dartmouth, N.S.—Contracts are being awarded for the Williston Steel & Foundry Co. new plant.

Chatham, Ont.—The Light Commission has decided to sell some of the equipment at the power plant.

Ottawa, Ont.—The Ottawa Brass Foundry Co. have purchased a property, and will make extensive improvements.

Cornwall, Ont.—In connection with the proposed waterworks system, a boiler plant and pumps will be required.

Montreal, Que.—The Montreal Tramways Co. will increase the capacity of their power plant on Notre Dame Street to 50,000 h.p.

Owen Sound, Ont—The Owen Sound Iron Works which was recently offered for sale will probably remain under the control of local capitalists.

Collingwood, Ont.—The Northern Iron & Steel Co's old plant is being re-fitted and it is expected that the plant will be operating by March. D. I. Kennedy of Owen Sound is interested in the new enterprise.

Electrical

Hensall, Ont.—The ratepayers will vote on a Hydro-Electric by-law on January 24.

Hensall, Ont.—The hydro by-law passed in Zuri h, on Jan. 11, by a vote of 106 for, and 6 against.

Walkerton, Ont.—The Town Council will consider the question of installing a hydro-electric system.

Hamilton, Ont. — The City Council have authorized the installation of a new storage battery signal system at Central Police Station.

Sarnia, Ont. — Preparations are now being made in Petrolea for the construction of a new Hydro line to this city. According to the plans the line will be carried on wooden poles, and will go first to Wyoming, then into Sarnia. It is expected that this city will be using Hydro by the early Summer.

Windsor, Ont.—The Federal Light and Power Co., has at last received a permit from the United States Government to lay cables in the Detroit River for the purpose of transmitting electric current to Detroit and vicinity from Windsor. This is an allied company of the Electric Distributing Co., of Windsor, which has been endeavoring ineffectually for six years to secure this right and has met with every kind of opposition.

Municipal

The Pas, Man.—A telephone system will be installed at an estimated cost of $12,000.

Cooksville, Ont.—The ratepayers are now in favor of adopting the hydro-radial scheme.

Highgate, Ont. — A hydro-electric system will be installed here at an approximate cost of $7,000.

Victoria, B C.—The City Council have received tenders for a proposed bridge, to cost between $300,000 and $400,000.

Calgary, Alta.—The Commissioners are considering an expenditure of $22,500 on equipment for the light and power department.

Hamilton, Ont.—Fire Chief Ten Eyck, in his annual report, urged the purchase of a considerable amount of new equipment, and also recommended that a new alarm system be installed.

General Industrial

Whitby, Ont—A site has been purchased for the proposed silk mill by Mr. Phillips.

Toronto, Ont.—White & Thomas will make an addition to their factory, at a cost of $3,000.

Trenton, Ont.—Early on Jan. 12, fire started in the stock room of the Trenton Cooperage Mills. Damage to stock and property estimated around $1,500.

Sackville, N.B.—Fire on Jan. 10, destroyed the shoe factory owned by A. E. Wry—Standard Ltd. The damage is estimated at $40,000 including machinery with $18,000 insurance.

Toronto, Ont—The Granite Concrete Block Co., and Norwalk Burial Vault Co., have purchased a three acres site on Weston road, close to the Russell Motor Car Factory.

Personal

E. W. Beatty, K.C., general counsel and vice-president of the C. P. R., has been elected to the Board of Directors, in place of David McNicoll, resigned.

Ralph W. Ashcroft, of the Canadian Consolidated Rubber Co., of Montreal, has accepted the appointment of manager of publicity of the United States Rubber Co., of New York.

Alexander Ramsay, head of the firm of A. R. Ramsay & Sons, paint and varnish manufacturers, of Montreal, died there on January 14, aged 76 years.

J. S. Laing, of Essex, recently assistant engineer at Galt, Ont., was named by the Finance Committee of the Town Council as town engineer and assessor for Barrie, Ont., at a salary of $1,200.

Captain T. F. Ahearn, only son of Thomas Ahearn, president of the Ottawa Electric Railway, now with the Canadians in France, has been recalled to Militia Headquarters, Ottawa, to assist in munitions work, in which he has had considerable experience.

Thomas Gibson, president of the Lake Superior Corporation, Sault Ste. Marie, Ont., and head of the legal firm of Gibson & Gibson, of Toronto, has thrown up his business duties to accept a majority in the 168th (Oxford) Overseas Battalion. He is taking a training course at London, Ont.

F. F. Pickard, inspector of hulls for the port of Victoria, B.C., was a passenger aboard the liner Persia when that vessel was sunk in the Mediterranean. He was en route for Mesopotamia, where he was to take charge of machine shops at Basra. Up to the present nothing has been learned of his safety.

J. Kerr Osborne, formerly vice-president of Massey-Harris Co., Toronto, Ont. and for many years conspicuous in the management of a number of large Ontario manufacturing concerns, died on

Jan. 14, at Bournemouth, England. Mr. Osborne was born in Beamsville, Ont., on July 27, 1843. In 1872 he became associated with the Messrs. Harris, and helped to establish in Brantford the firm of A. Harris, Son & Co., in which he became a partner. In 1882 the firm became incorporated under the name of A. Harris, Son & Co., Ltd., of which Mr. Osborne became Vice-president, and held this office until 1892, when the company became merged into the Massey-Harris Co., Ltd.

Trade Gossip

William J. Coates of Halifax, N. S. has opened an electro-plating plant here. Mr. Coates was for many years employed by the Starr Mfg. Co.

Swedish Iron Ore.—Swedish iron ore deposits are estimated at 1,300,000,000 tons. In 1913 6,440,000 tons were exported, mainly to England and Germany.

Sarnia, Ont.—A meeting of the Northern Navigation Co., agents from the different points will be held in this city January 27 to talk over plans and make arrangements for the coming season.

The Canadian Flax Growers' Association at a meeting at Hensall, Ont., on Jan. 11 adopted a resolution asking the Provincial Government to appoint an official to look after the educational interests of the association.

The Canadian Cartridge Co., to-day took out a permit for the erection of another factory building on Sherman avenue north, to cost $15,000. A permit was also granted the Burlington Steel Co., for a factory addition, to cost $4.-800.

Credit Men's Association.—Thos. W. Learie has resigned as secretary-treasurer and manger of the Canadian Credit Men's Association, Toronto, in order to accept a position with W. R. Johnston & Co. A. Stanley Crighton has been appointed as acting manager of the association, while S. E. Stewart has been appointed as acting manager of men's bureau.

Toronto, Ont.—The Board of Control have unanimously approved the suggestion of Mayor Church that a conference be arranged at an early date between representatives of the City Council, Board of Trade, Harbor Commission, Exhibition Board and the District Labor Council to consider the advisability of starting a campaign to increase the number of industries in the city.

Ottawa, Ont.—Col. C. W. Dimick of Boston, Mass., has been in Ottawa for about a week and it is stated on good authority that he is considering several locations for the building of a large plant for the manufacture of rifle powder and dynamite. Col. Dimick was the active spirit in organizing the Standard Explosives, Ltd., and built the plant at Vaudreuil, Que., which was afterwards taken over by the Dominion Explosives Corporation. The new plant, it is understood, will be near Toronto.

Lyons Exhibition Entries.—To facilitate Canadian entries at the Lyons Exhibition, the Hudson Bay Co., have placed at the disposal of the Exporters' Association of Canada 50 tons of free space on a steamer sailing to a French port about January 28th. Free transportation will be granted to those applying to Secretary R. J. Young at Montreal. Arrangements have also been made with the C.P.R. and the Agents- general of all the provinces to utilize all available samples of Canadian products now in London.

Want Farm Boilers Inspected.—The need of placing under provincial inspection during manufacture all boilers used for farming operations was urged upon D. M. Medcalf, chief of the Boiler Inspection Department, recently by a deputation of leading manufacturers. At the present time all boilers used for shops, factories, and other commercial purposes are rigidly inspected during construction, and moreover, must comply with certain uniform specifications laid down by the department, but farm boilers have been left outside.

Iron, Copper and Zinc Ores in 1915.—Iron-ore shipments from the mines of the United States in 1915, according to the usual preliminary estimates of the U. S. Geological Survey, are estimated to have exceeded 55,000,000 gross tons, an increase of more than 38 per cent. over 1914. The pig-iron increase is put at 6,500,000 tons, the output for 1914 having been 23,332,244 tons. The copper mines surpassed all records, the 1915 output having an estimated value of $236,000,000 or $83,000,000 more than the 1914 production. The output of zinc from domestic ores is estimated as larger than ever before, being about 425,-000 tons, worth $120,000,000 as compared with 343,418 tons in 1914.

Tenders

Windsor, Ont.—Tenders will be received until January 31 for heating, ventilating and sheet metal work for the new Windsor Collegiate Institute. Particulars may be obtained from the architect, J. C. Pennington, Windsor, Ont.

Ottawa, Ont.—Tenders, addressed to the Chairman of the Waterworks Committee, will be received up to Monday, January 24th, 1916, for cast iron pipe. Specifications and full information may be obtained on application to the City Engineer's Office.

Toronto, Ont.—Tenders will be received by the Chairman, Board of Control, City Hall, Toronto, up to Tuesday, February 1st, 1916, for the supply and delivery of a number of street cars complete, bodies, trucks, motor equipment, air-brake equipment, copper cables for street car work, and fare boxes. Specifications and forms of tender may be obtained at the Works Department, Room 12, City Hall.

New Incorporations

Molybdenum, Ltd., has been incorporated at Ottawa, with a capital of $100,000, to acquire and develop mineral lands, etc. Head office at Montreal, and the incorporators are George Thompson, E. Dery and Roscoe Murphy, all of Montreal.

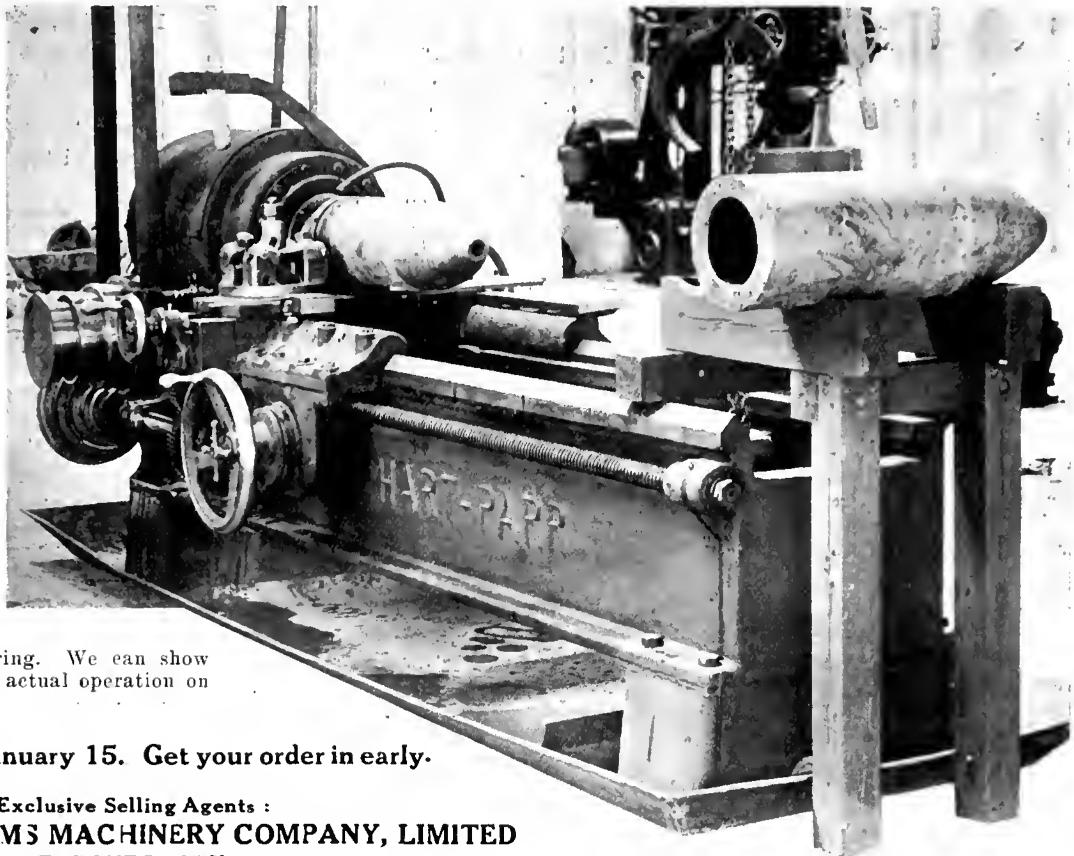
Nobert-Dugre-Arsenault, Ltd., have been incorporated at Ottawa, with a capital of $10,000, to carry on the business of contractors and engineers at Three Rivers, Que. Incorporators: F. X. Nobert, Henry Nobert, and Alphonse Dugre, all of Three Rivers, Que.

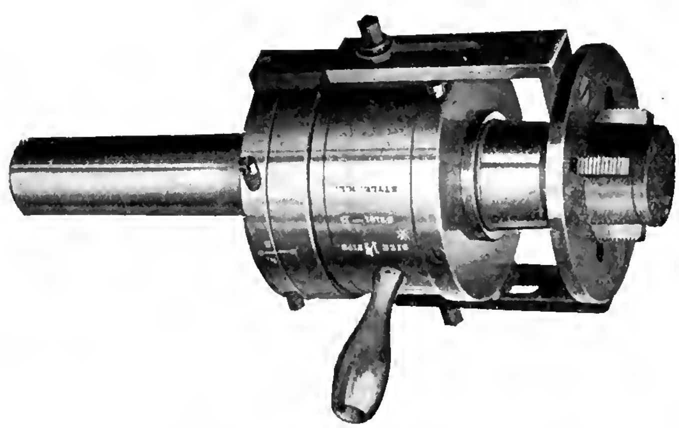
Belgo-Canadian Mines & Timber Lands, Ltd., have been incorporated at Ottawa, with a capital of $40,000, to acquire and develop mining properties. Head office at Montreal, and the incorporators are Gerald J. Barry, Cyrille Laurin and Saul E. Melkman, all of Montreal.

The Laurin and Leitch Engineering & Construction Co. have been incorporated at Ottawa, with a capital of $100,000, to carry on the business of general contractors and engineers. Head office at Montreal, and the incorporators are Arthur Vallee, A. R. Whitney Plimsoll and Reigneur Brodeur, all of Montreal.

The Athabasca Power Co. has been incorporated at Ottawa, with a capital of $100,000, to utilize and develop any of the properties of the company for the production of power. The head office is at Winnipeg, Man., and the incorporators are R. C. McPherson, R. W. Killey and S. L. Goldstine, all of Winnipeg, Man.

Automatic Sprinkler Co. of America, Ltd., has been incorporated at Ottawa, with a capital of $10,000, to manufacture automatic sprinklers and other devices for heating of fire protection. Head office is at Montreal, and the incorporators are Alexander Chase Casgrain, Errold Malcolm McDougall, and Pierre Francois Casgrain, all of Montreal.





Geometric Collapsing Tap, Class "N-L," Equipped with Chasers for Plug Tapping.

Contracts Awarded

Yorkton, Sask.—The Yorkton Creamery Co. have let a contract for a cold storage installation to the Linde Canadian Refrigeration Co., Winnipeg branch.

Hamilton, Ont.—The Canadian Cartridge Co. have awarded the general contract for their new plant to H. G. Christman & Co., of Hamilton.

Hamilton, Ont—The City Council have awarded a contract for a boiler for the city hospital to the Watrous Engine Works, Brantford, Ont., at $1,025.

Building Notes

Toronto, Ont.—Messrs. Long & Co., have decided to build a new four-storey brick warehouse at 727 King street West. The plans have been approved by the City Architect, and the cost is to be $60,000.

Railways—Bridges

Ailsa Craig, Ont—The large steel bridge over the Au Sable River has been completed. Two other bridges will be erected.

Tillsonburg, Ont.—A bridge will be erected over the Ottawa Creek at a cost of about $4,000.

St Thomas, Ont.—Plans have been prepared for a new roundhouse and locomotive shops for the Wabash-Grand Trunk Railroad at St. Thomas to increase the facilities on the line for business from Detroit to Buffalo, and it is expected construction will be started at an early date.

Wood-Working

Buckhorn, Ont.—W. N. Blewitt's saw and planing mill was recently destroyed by fire. The loss is estimated at $4,000, which is partially covered by insurance.

Catalogues

Sand Blast Equipment is the subject of a catalogue being distributed by the American Foundry Equipment Co., New York. The Equipment covered in the catalogue consists chiefly of sand blast tumbling barrels, rotary table sand blast rooms, sand blast cabinets and sand blast outfits. The equipment is fully described and illustrated.

The Diamond Saw and Stamping Works, Buffalo, N.Y., are sending to their friends an attractive wall calendar, 12½ in. by 20 in. The name of the company appears on the top, and also two small engravings of its machines, otherwise the calendar is remarkably free from advertising. The pad is 5 in. x 6 in., and the figures stand out clearly.

Testing Machines.—Catalogue No. 93 superseding No. 76 deals with the Sturke-Watson-Stillman testing machine for cylindrical gas containers. The apparatus and methods of testing cylinders are described in a comprehensive manner followed by a detailed description of the Sturke-Watson-Stillman testing machine with full directions for tests with the results obtained, accompanied by curves and tables. Copies of this catalogue may be obtained from the Watson-Stillman Co., Aldene, Union County, N.J.

Mechanical Rubber Goods made by the Quaker City Rubber Co., Philadelphia, Pa. An interesting and extensive line of mechanical rubber goods including belting, hose for a large variety of purposes, sheet and rod packings, gaskets, valves and tires etc., are described and illustrated in this catalogue. Many of the illustrations are colored giving the catalogue a highly attractive appearance. Several useful tables on belt transmission and pulley diameters are included and the concluding page contains a telegraph cipher code and index.

Grinders.—The Challenge Machine Co., Inc., Philadelphia, Pa., have issued a catalogue, describing a full line of "Challenge" grinders. These grinders are built on the unit plan so that the scope of the machine is limited only by the number of units employed. The class of work for which each unit is best suited is stated and the price is given for each size. Other types of grinder are also illustrated and described as are also emery wheel dressers. A price list of regular wheels is included and formulae are given for calculating speeds.

Chain Hoists—Hoist catalogue No. 7 issued by the Wright Mfg. Co., Lisbon, Ohio, deals with chain hoists, steel trolleys and hand cranes. The essential parts of the hoist are illustrated and described in detail with price list covering all the different parts. A table is included giving particulars and prices of steel hoists of various capacities all of which are illustrated. The catalogue also contains particulars of the "Wright" screw hoist with price list for parts. Plain and geared trolleys are also described with tables of dimensions for the various capacities. The concluding pages are devoted to a description of hand operated traveling crane.

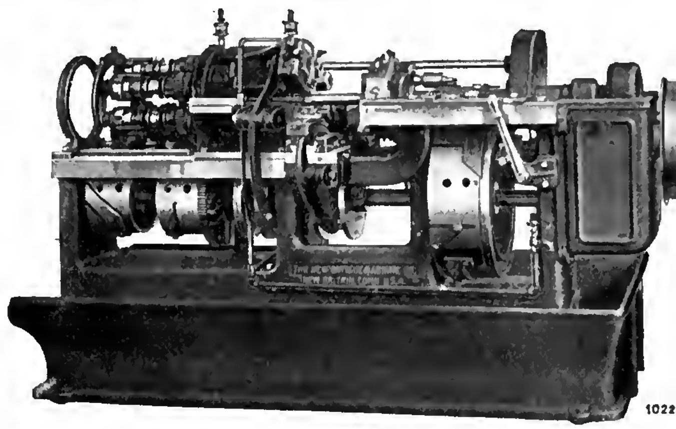
Features of

"New Britain" Six-Spindle Automatic

Screw Machines



CAPACITY:

THE SECRET of the NEW BRITAIN'S supremacy lies in its Six Spindles.

SIX SPINDLES provide for the completion of much work which otherwise would require rehandling.

TO BE SURE not every job demands the number of *different* tools it is possible to operate simultaneously on the "NEW BRITAIN." But on simpler work requiring but three or four end operations this extra capacity becomes equally advantageous, enabling the employment of *duplicate* tools for subdividing the longer operations.

THE consequent result is a materially larger production than would be possible on a machine with fewer spindles.

"NEW BRITAIN" Six-Spindle Automatics are built in following capacities:

5/8" x 3¾"
1" x 5"
1⅝" x 7"
2½" x 9"

Threading Machinery.—The Landis Machine Co., Waynesboro, Pa., have issued a catalogue No. 22 covering an interesting line of threading machinery for bolts, pipes and nipples, etc., also cutting machines, screw cutting die heads and chaser grinders. The opening pages deal fully with the Landis chaser, chaser holder and rotary die head which are carefully illustrated and their mechanism described. Diagrams and specifications are included in this section. Several different styles of bolt cutters are shown with a specification for each while bolt pointers are treated in the same way. The succeeding pages deal with the pipe and nipple threading machines and chaser grinders specifications being included in all cases. The concluding pages contain a telegraph code for all the lines and accessories, and also some useful mechanical tables on cutting speeds and threads.

Book Review

Altitudes in Canada is the title of book compiled by James White for the Dominion Commission of Conservation, Ottawa. This is the second edition of the book which has been considerably enlarged and the elevations have been thoroughly checked, verified and brought up-to-date. It is the most comprehensive compilation of altitudes in Canada yet published. This introduction contains a lot of interesting information covering levels on the great Lakes and sea-level determinations etc. The book is almost entirely a record of altitudes at practically every railway station in Canada on lines in operation or under construction. There are also a large number of sundry altitudes arranged according to the province in which they are situated. Another series of altitudes covers various points on the St. Lawrence river, the Great Lakes and the Canal Systems. The last section of the book contains several tables giving the water levels for the St. Lawrence river and each of the Great Lakes for each year since 1854 and 1860 according to when the records were first registered. A pocket on the inside back cover holds three interesting profiles of the C.P.R., G.T.P., and C.N.R., transcontinental systems. This is a most useful compilation containing as it does a great deal of valuable information for engineers as well as the general public. The book contains 603 pages, is fully indexed and bound in substantial covers.

Making Large Thrust Plates for Ball-Bearing Turntables

Staff Article

Although the comparative accuracy of high-grade machine tools is very great, the fact that such accuracy exists in the tool does not justify an operator in expecting any and every job produced by it to possess corresponding accuracy. That the nature of the material, the size and shape of the job, and subsequent operations to be performed on it determine the degree of accuracy obtainable or desirable in rough machining is shown in following article.

THE thrust plates shown in drawing, Fig. 1, are used in connection with a special design of ball-bearing turn-table. They are of considerable size, and in many respects differ very much from any work of a similar nature previously undertaken by the makers.

Ordinary heavy type thrust bearings of large size are nearly always of considerable thickness, and the manner in which they are assembled allows of considerable variation in the limits of thickness. Consequently, whether made of case-hardened or alloy steel, such thrust plates have not offered any difficulty either in machining, hardening, or grinding.

The production of the plates described herewith was attended by several initial difficulties which in the light of subsequent experience could not have been foreseen. As it was impossible to eliminate the cause of the troubles, attention was given to methods of overcoming them, and satisfactory results were thereby obtained.

Made of Forged Steel

The material specified was forged steel, capable of being tempered to withstand a certain degree of impact without indentation. Under existing market conditions the sources from which such forgings could be obtained were rather limited; arrangements, however, were finally made for the supply of blanks from the American plant of a well-known Sheffield steel maker. The steel contains approximately 0.70 per cent. carbon, with 0.50 to 0.60 per cent. manganese, and when quenched in whale oil at a suitable temperature gives the required hardness without any further treatment.

Preliminary Operations

Machining is done in the usual manner, a rough cut being taken off both sides to relieve all forging strains before machining to finished limits. This work has to be very carefully done, as it is difficult to anneal the plate so thoroughly that all hard spots are removed. After a finishing cut is taken on one side with the plate carefully packed and supported, it is reversed and clamped down on the flat table of the boring mill for the finishing cut on the second side. In spite of this method, high spots would persist, which were of sufficient degree to prevent the accuracy coming within the specified limits. This trouble was further increased by the unavoidable warping which took place in hardening, so that the final work of grinding was fully expected to be quite a proposition.

Previous to hardening, the required boring, drilling and tapping was performed so that when ground the job was complete.

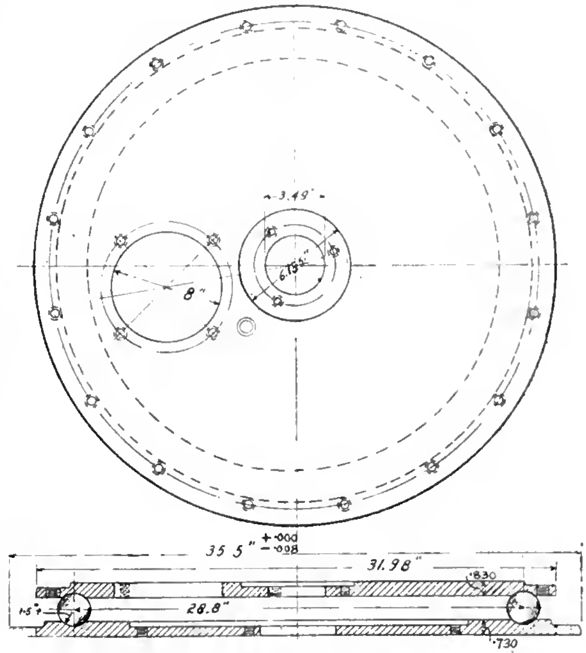

FIG. 1. SECTION OF THRUST PLATES WITH PLAN OF UPPER ONE.

Hardening

The working of hardening and grinding was undertaken by a firm of saw manufacturers, whose facilities were well suited for work of this description. The grinding work done by them did not include the raceways or finishing out the fillets and recesses. They did, however, produce a perfectly plane plate of uniform thickness to the required dimensions.

Heating the plates is done in an oil-fired furnace with a low flat arch, and the oil tank is located immediately in front, so that the plate is quenched with the least possible loss of heat when taken out of the furnace. Great care is taken in raising the plate to a vertical position, as any undue stress may buckle it beyond recovery. The arrangement of furnace, tank, and tackle is shown in sketch Fig. 2. The tilting frame is level with the furnace hearth, and is held in position by a hook while the plate is

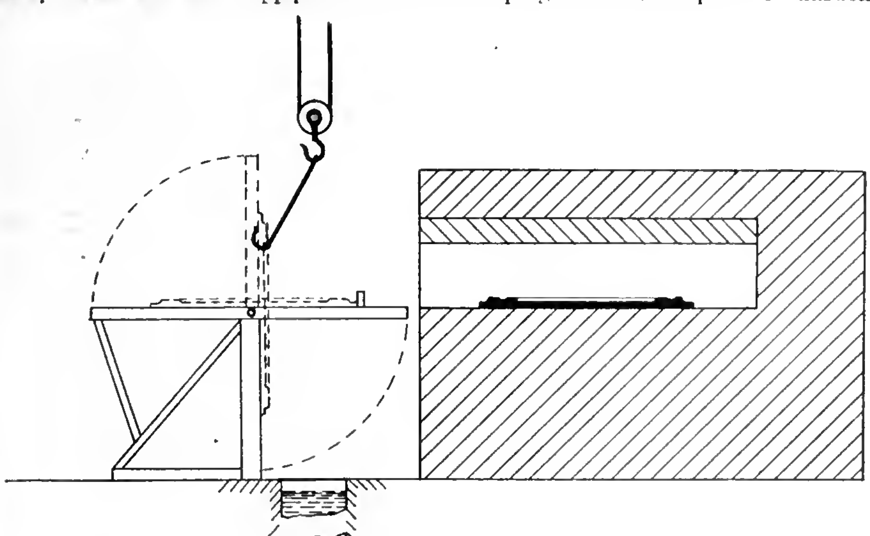

FIG. 2. HARDENING FURNACE WITH TILTING FRAME AND QUENCHING TANK.

being drawn on to the frame. Two stop pins are now placed in holes in the frame so that when tilted towards a vertical position the plate is securely supported while hooks are being slipped through two of the holes in the upper edge.

The plate is then swung clear of the frame and lowered into the oil and agitated till cool, when it is ready for straightening.

Correcting Hardening Troubles

The proper degree of hardness is very necessary so that any excessive warping or bucking may be removed by hammering. This work calls for a high degree of skill possessed by saw makers of long experience, but it was soon found out hammering was limited in its application to these plates, especially the larger one, because the increased thickness at the race-way acted as a stiffener and limited the amount of correction obtainable by hammering.

Warping, on the other hand, was prevented to some extent by this feature, so that after investigation a suitable machining allowance was found, which, with a minimum amount of hammering, produced satisfactory results.

Grinding

There still remained the variations of thickness, due to hard spots in the original forging, and the removal of these in a reasonable time was quite a problem. The first attempts at grinding were made with the existing type of circular saw grinder shown in photograph, Fig. 3. This machine grinds with a large diameter grindstone working on one side of the plate, while a smaller and broader stone running at a much slower rate acts as a support on the other side, and also exerts a braking or retarding effect on the work which enables the large stone to grind away the metal. The plate itself is freely supported on a movable slide, as shown in the picture, the bed on which the slide travels forming a trough of sufficient depth to accommodate the largest saws. This trough is filled with water, into which the work dips as it revolves under the action of the stones.

FIG. 3. SAW GRINDING MACHINE REMOVING EXCESS STOCK ON HARDENED THRUST PLATE.

An Unexpected Difficulty

This machine produced work of uniform thickness, but not perfectly flat, because when any slight warp or twist came around, the whole plate floated with it; consequently, the attainment of a plane surface by this means was impossible.

In the manufacture of saws, this variation is sufficiently corrected by hammering, the thinness and temper of the metal being suited for such treatment. The extreme accuracy, combined with the extra thickness and greater hardness of these thrust plates did not allow this method of correction to yield the desired results, so it was decided to rig up a machine which would allow the use of a regular high abrasive wheel which would enable the high spots to be removed first, after which the greater part of the work was done in the saw grinder and the final grind in the new machine.

Photographs, Figs. 4 and 5, show two views of the arrangement. An old pulley lathe of ample size was fitted with a special chuck mounted on top of the old face plate. A heavy slide with one vee guide was mounted on the bed, and a carriage fitted to it, carrying the grinding wheel and motor. The total weight of cross slide and carriage, exclusive of motor, is about $1\frac{1}{2}$ tons, thus insuring ample rigidity in operation.

FIG. 5. BACK VIEW OF LATHE SHOWING MOTOR DRIVE TO GRINDING HEAD.

The grinding wheel is 16 in. x $1\frac{1}{4}$ in. x $1\frac{1}{2}$ in. hole, and is held between two 10 in. safety flanges. The spindle is exceptionally stiff, having two $3\frac{1}{2}$ in. diameter bearings spaced well apart, and is mounted in a grinding head fitted in flatways and provided with a fine pitch screw for adjustment to or from the work. An extension frame, which is fixed on top of the grinding head, carries a 5-horse power "Lancashire" ball-bearing motor, supported by four adjusting screws, which enable the belt tension to be properly maintained. The use of a high-grade flexible belt, with cemented joint, combined with the even

FIG. 6. GRINDING THE RACEWAYS ON A 54-IN. BORING MILL.

tension, enables a very satisfactory degree of finish to be obtained.

The amount of stock left for finishing

after rough machining is approximately .030 in., of which .020 in. is removed by the grindstone and the remainder by the grinding machine described.

The selection of a suitable wheel was a matter of some experiment, based, of course, on results obtained on previous work. The wheel ultimately adopted was the Carborundum Co.'s "Aloxite," grit 303, grade T, bond D1035.

Grinding the Ball Races.

The grinding of the ball races to the correct radius and depth, the truing up of the periphery, and the grinding of fillets and corners in recesses, are accomplished in a 54-in. Colburn boring mill, as shown in Fig. 6. One of the rams carries a grinding head, with belt drive from a transverse drum behind the cross slide. Formed wheels impart the correct shape to the raceways, while the sharp corners of recesses and the radii of fillets are formed by using suitably-shaped wheels in a swivelling head, shown in sketch, Fig. 7. The regular tool holding head is removed from the ram and the special one fixed in its place. The bracket carrying the spindle bearings is adjustable through a considerable arc. It is mounted between the jaws of a fork piece, as shown, and a series of holes provided for setting at a number of definite angles.

FIG. 4. FRONT VIEW OF PULLEY LATHE USED FOR GRINDING THRUST PLATES.

Testing the Hardness

The hardness testing device is of a special design, which duplicates as far as possible the stresses which are applied to the work in practice. Fig. 8 shows the apparatus, which consists of a small drop hammer weighing 14 lbs., which is allowed to drop through a distance of 12 inches on to the surface of the work. On the under side of the hammer is clamped a $1\frac{1}{4}$ in. hardened steel ball, and the tail of the ball holder projects up through the hammer so that it can be held in the extreme upper position by a small pin arranged to slide through a hole. The hammer is guided by three vertical columns of cold rolled steel, the ends of which are fixed in the upper and lower plates, thus making the device self-contained.

The degree of hardness which just resists indentation by the ball is approximately equal to 60 scleroscope. While this type of machine does not indicate the degree of hardness above the minimum, the possibility of getting the plates too hard is very slight, as the operations are duplicated so closely regarding temperature, etc., that no trouble in this way has been or is likely to be experienced.

TOOL STEEL DEMAND

THE following paragraph relative to the abnormal demand for tool steel appeared in a recent issue of "The Ironmonger":—

"The boom in high-speed and other tool steels which has been in operation during the greater part of the year has lately developed in a sensational fashion. Orders of unprecedented magnitude are literally being flung at the Sheffield, England, makers, and the amount of business rejected by them every week represents a fortune. One order which has just been refused equalled a year's output of the firm to which it was offered. Other makers report that they often turn down in a week requests for supplies which in normal times it would take them two or three years to make. The United States needs high-speed steel so badly that it would be prepared to buy nearly the whole of Sheffield's output. Great quantities are also wanted for Russia, France and Italy, and inquiries are coming from Scandinavia, Holland, Switzerland, Japan, Spain and the British colonies, but no considerable weight of new business can now be accepted in Sheffield, as nearly the whole output is needed at home. Licenses for export are granted only in respect of material the use of which will assist the Allies in maintaining the war. The inflow of orders is so large that few of them are even acknowledged, but some, of special importance, are dealt with jointly by the large firms in part, if not wholly. The possibility of Sheffield appreciably increasing her output of tool steel is remote, owing to the limited supplies of alloys and the limitation of plant for rolling the steel. Several large foreign buyers are now taking the material in billet form".

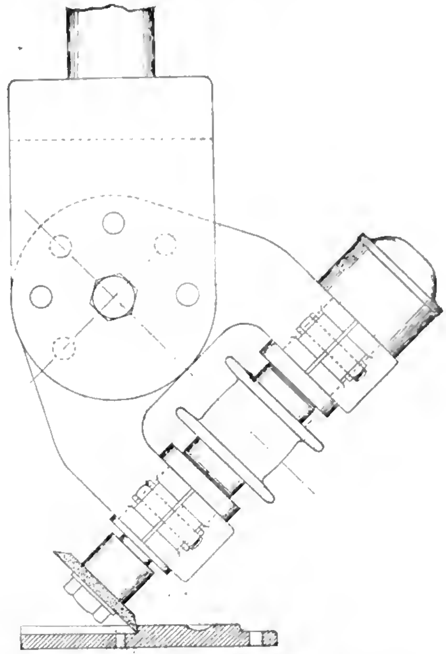

FIG. 7. GRINDING OUT CORNERS OF RECESSES WITH BEVELED WHEEL.

LITTLE KNOWN FACTS ABOUT GRINDING LUBRICANTS

By Howard W. Dunbar.

THE term lubrication may have and does have a number of different meanings, sometimes properly used and sometimes improperly used. Of course, all the running and moving parts on a grinding machine must be properly lubricated,

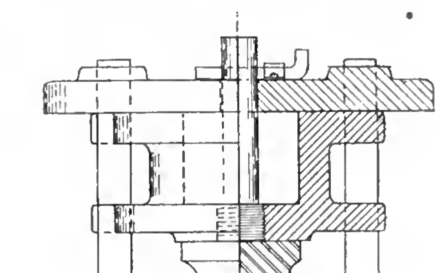

FIG. 8. DROP HAMMER DEVICE FOR TESTING HARDNESS OF PLATES.

but there is one particular practice in grinding which has developed after many years of study and investigation, and

this is known as lubrication of the work. Why do we lubricate anything? Primarily to reduce the friction. Friction on two moving members means heat, and heat means lost power, so in order to reduce the friction, heat and energy, we lubricate moving parts.

The term lubrication of the work may be a misnomer, as the use of grinding compound, oil, soda water or even plain water flowing on the work at the point where the grinding wheel comes in contact with the work being ground, is known as lubrication of the work. It may lubricate in a degree, and reduce the friction of the cutting particles on the wheel, but it also has other functions. It entirely removes the evil brought about by the grinding dust from the ordinary dry grinding operation, as the lubricant carries this dust away as soon as it is made.

It keeps the temperature of the work being ground uniform and even, over the entire surface of the cylinder, and most important of all it carries away the heat generated by the wheel in cutting particles of steel from the cylinder being ground. It dissipates heat, and in this way reduces the power required to grind; permits us to take a deeper cut, and makes it possible to produce large quantities of work, making cylindrical grinding a recognized, commercial machining operation.

Day of Dry Grinding Gone

In the early days of the grinding industry all grinding was dry, but this day has passed. It was considered that the only possibility in grinding was a polishing operation with a dry wheel. This was the conception of engineers thirty years ago. As time went on, a few drops of water per minute were allowed to trickle on the wheel. Improvement was noticed, and then a very small stream was flowed on the wheel. More work was done, and later—to-day—we allow a large stream of compound to flow upon the work at the point where the wheel comes in contact with the work. The results in the productibility of the machine have been astonishing.

Clear water was the first agent tried, and then because of complaints of rust, the soda water was used; the soda in itself being a lubricant, improvement was noticed. Then soapy water was tried, and finally after investigation by chemists, aided by the experience of grinding engineers, compounds have been developed that give the best results. In these compounds there is a certain amount of oil, soda water, soap, etc. They all have their functions to perform, and are successful. No doubt, if one could afford to, greater results might be accomplished if we were to flow clear oil on the work while grinding.

Even to-day we have grinding machines in operation which should be operated as a wet grinding operation instead of dry grinding. There is no reason for factories to grind and snag castings dry, when they should be snagged under a lubricant, and to better advantage, with more economy and greater production. The same is true of the tool room and tool grinding. When grinding dry, very light cuts must be taken, in order that the heat generated will not in any way affect the work being ground.

Primarily, the heat generated in dry grinding causes a certain point on the work to become heated to a greater amount than other points, and since the revolution of the work is so slow as not to allow this point so heated to cool off before it comes in contact with the wheel again, this heat keeps piling up, the work warps, changes it shape by expansion and contraction, and it is impossible, under a heavy cut, to grind anywhere near round or perfect cylinders. This same thing could be true if too little compound flowed on the work. There must be enough to dissipate the heat generated, reduce the friction, and thereby keep the work at a uniform temperature.—Grits and Grinds

WOMEN IN MUNITIONS WORKS

WOMEN have firmly established themselves in several munition works in Sheffield, England, and are proving very successful. A few days ago I had a chat with an official at a firm employing quite a large number of females, says a correspondent of The Engineer, and learnt that this method of filling up vacancies on the smaller lathes and other machines had solved a problem which at one time appeared difficult of solution. Many instances in support of this opinion can be found. In one case of which I happen to be aware, a new shop fitted up with a hundred or so lathes for turning 18-pounder shells was "manned" by youths desirous of being trained as turners for munition purposes. In five months they had made comparatively little progress, and every machine had been broken in some way or another. A few of the more competent, or rather the less incompetent, were retained and the remainder were cleared out, their places being taken by young women. In five weeks they were doing far better work than the youths did after as many months, and of the lathes, which had been repaired or replaced, not one had been damaged. These women—there are about 240 of them in this particular shop, are provided by the firm with khaki overalls and caps, whilst a building adjacent to the works has been converted into a very comfortable dining hall for their accommodation.

WORLD'S LARGEST PLATE MILL

THE largest plate mill in the world is to be constructed by the Lukens Iron & Steel Co., of Coatesville, Pa., U.S.A. The length of the rolls in this mill will be from 200 in. to 204 in., and it will be capable of rolling finished plate about 16 ft. in width. The largest mill in the world at present is at Witkowitz, Hungary, with rolls 178 in. long. This will make the third time in its history that the Lukens Co. has had the largest plate mill in the world. In 1890 it built a mill with rolls 120 in. long, enlarged later to 132 in., which was the argest at that time. In 1902 the company built its present 140 in. mill, which placed it in the lead again, holding this position until the Worth Brothers Co. and later the Otis Steel Co. built mills with rolls 152 in. long.

The contract for the mill has been placed with the United Engineering & Foundry Co., Pittsburg. It will be a four-high mill, of the type used for rolling armour plate in the plant of the Carnegie Steel Co., and will be the first of this kind to be designed for general plate rolling. The two working rolls will be of chilled iron 34 in. in diameter, and the other two of steel, 50 in. in diameter. From the top of the top roll to the bottom of the bottom roll, when all the rolls are set close, will be 168 in., thus presenting a gigantic structure for a plate mill.

THE GRINDING WHEEL TAG

IN many shops too little attention is paid to the wheel tag. A tag is placed on every wheel shipped by manufacturers of grinding wheels to provide the user with a record. This tag contains all the information necessary to re-order, as well as testing and recommend speeds. The record on the tag is an important one and a convenience to the man who orders wheels when the tags are properly taken care of and filed away for future reference. It cannot be too strongly emphasized that preserving the tags and re-ordering according to the order numbers and other records saves time and annoyance on the part both of the customer and the wheel manufacturer, and insures better service.

Notwithstanding the fact that in a few instances it has caused serious trouble, its elimination cannot be considered because it provides the wheel user with such an important and valuable record. The tag is glued to the blotter of the wheel and when torn off sometimes part of the glue is left on the blotter. If the glue happens to be in a location where it comes in contact with the flanges it should be scraped off, otherwise the wheel will run out of true.

PRODUCTION METHODS AND DEVICES

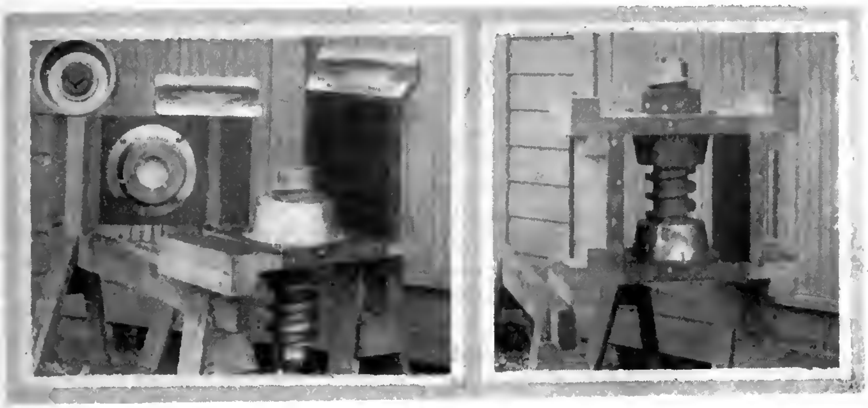
MAKING A CAST STEEL WORM

By D. O. Barrett

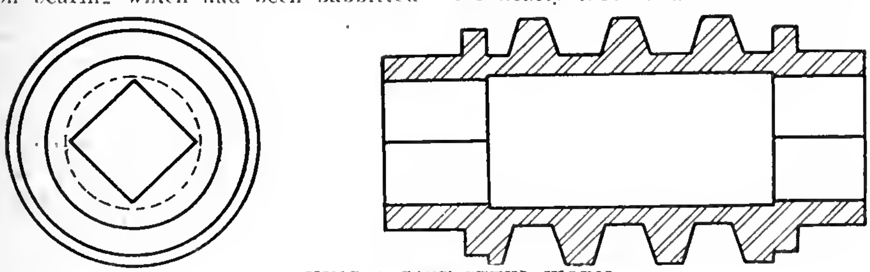
THE worm shown in the drawing was used in bottom dumping coal cars, one at either end, both right and left hand. The worms were 4 13-16 inches in diameter, and 9¼ inches long, and were steel castings cored out as



MAKING A CAST STEEL WORM.

shown. These slipped over a square shaft by means of which they were turned. They were cast in dry sand cores entirely, the core boxes for same being shown in the photo. An assembled view of the core boxes is shown with the worm in position. The box was held together by means of a clamping bolt at each end, and was constructed of oak, and iron bound. The cone-shaped pieces extending into the box at either side were core prints, the core box for which is shown in the upper left hand corner on the dis-assembled box. The box for the square centre core is also shown. There were thus four cores in all.

After the large square core was rammed up, the worm was simply turned out, and the box opened. The worm was provided with an extremely long cast iron bearing which had been babbitted



MAKING A CAST STEEL WORM.

to form a nut. In this manner the action of removing the worm was entirely automatic and there was no danger whatever of crushing the sand.

In order to prevent the feather edge which would otherwise be formed where the thread passed into the nut at one end and the print at the other, a projection was provided in the end core as well as in the main box, so that this was taken care of. These end cores also formed the shroud rings at the ends of the worm. It was, of course, necessary to set the end cores accurately in relation to the main core, and it will be noticed that there is a notch in the upper side of this core for locating same. Two boxes were made, one right and one left hand, and the quality of the work turned out was very satisfactory.

GASOLINE FIRES

by A. R. S.

IN the Jan. 13, issue of Canadian Machinery you answer a question regarding gasoline fires. I should like to add a few words to your answer based on an experience of six years, over a large portion of which time I can safely say that I have seen a gasoline fire twice a month. I have just had one in our factory that was rather bad, as it burned for nearly three hours and there was a tank that contained nearly 5,000 gals. involved. As a general rule I would suggest the following for protection from these fires.

First, I am against the use of ammonia as this bottle might be broken from a small blaze and cause loss of life from breathing the fumes. For a small fire in a can or other receptacle, sawdust is the best thing that can be used. It will float on the liquid and smother the fire where sand or earth will not. Sand will do where there is only a small amount burning on the floor, but, where there is any considerable quantity sawdust is the best. If the fire should spread so that these measures can not be followed, then turn live steam into the room and smother it in that way. The steam will smother it by replacing the air. It is also a good plan to have an asbestos blanket or two around as they also will sometimes smother the fire. Most gasoline fires are caused by the accumulation of vapor, and the room in which it is used should have exhaust fans that will collect this vapor from the floor and also the ceiling. The reason for this is that some days the vapor will rise and at other times it will sink.

WHICH—FIVE CENTS OR FIVE DOLLARS?

By H. W. Benton

FREQUENTLY as we journey through life, we run up against something that seems to be impossible, yet, many impossible things of yesterday are accom-

WHICH—FIVE CENTS OR FIVE DOLLARS.

plished, and almost forgotten to-day in the persistent race to the front. This is true of small things as well as large ones. I once read a statement on the wall of an office which is worth remembering:—"The world moves along so rapidly now-a-days, that, the man who says 'it can't be done,' is frequently interrupted by someone doing it." Let us all aim to keep clear of interruption!

Recently while one of my assistants was inspecting the water end of a duplex pump, he dropped a small wedge down throught the suction valve seat into the suction chamber. It looked like a big job to get that wedge out, for it could not be reached by the hand, or with a long pair of tongs. He made a wire hook and tried to work a slip loop over the end of the wedge, but to no avail. Later he came to me with the statement that the wedge was in the suction chamber of the pump and that the only way to get

it out was to take down the suction line and reach up into the short nipple which was screwed in the pump body.

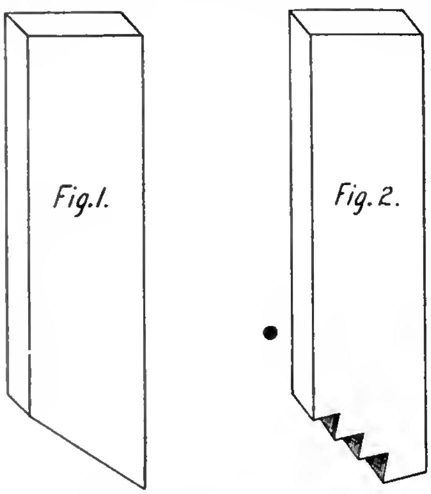
To do this it would have taken some hours on account of the system of piping in connection with the pump.

The wedge was ultimately taken out by the use of the tweezers shown herewith, and without dismantling the piping. These were made of 3-32 inch copper wire; the ends being hammered flat in order to grip the wedge. The tweezers were let down through the valve seat, and placed over the wedge, then by pressing down on the loop wire, they were closed upon the wedge and the latter lifted up to the valve seat where it was easily handled. The job cost about five cents. Taking the pipe line down would cost at least $5.

ONE-PIECE GANG TOOL

By N. G. Near.

IN planing cast iron it is unwise to take too deep a cut with a single-cutting-edge tool on account of the rough corner that results at the end where the cutting tool leaves the surface that is being reduced.



ONE PIECE GANG TOOL.

Breakage to some extent is inevitable. For this reason a gang cutter is a valuable tool to have around; and I succeeded, some time ago, in making one from a ½ in. x 2 in. bar of tool steel that served the purpose very well.

First I annealed the bar and sawed it off on a bevel as indicated in Fig. 1. Then I milled in the notches and ground to shape as shown in Fig. 2, after which I hardened and tempered the cutting edges all at once. With this tool I could take as heavy a cut as the driving belt on an 8 ft. planer would pull.

This was not a satisfactory tool for finishing work, for which a common single edge tool was used, but removes the edge-breaking troubles. After the cutting edges were ground considerably, I had to re-anneal, re-mill, and re-harden and temper as before, but that is not difficult. I find that it makes a good one-piece gang cutter.

CUTTING ODD THREADS

THE following useful suggestion by a correspondent, Mr. Wearing, of Lancaster, appeared in a recent issue of The Engineer:—

When cutting a thread in the lathe of a pitch not a multiple of that of the leading screw, the shop practice is to make a chalk mark on the nose plate and another on the leading screw, then with the saddle brought into a constant position, the screw is put into gear when these two chalk marks occupy the same relative position. As far as my experience goes, it is usual to mark the nose plate on the operating side of the lathe and the leading screw on the top. Then, whenever the leading screw is engaged, these marks must occupy the same positions. The watching of these marks I found very trying to the eyes, especially when running at somewhat high speeds; and I have adopted the following expedient, which I think is new.

In the first place, no matter what pitch is being cut, the leading screw is in a position to engage every (n) revolution, n being an integer. Thus, if on the leading screw a wheel of (x) teeth is mounted, and on a stud carried by a small extension fixed to the banjo plate a wheel with (n x) teeth is mounted, it is clear that the last-named wheel will give a complete revolution between two adjacent points when the leading screw might be thrown into gear, and, thus, if a single line were drawn on this wheel, whenever this was in a constant position, as indicated by, say, a pointer, "the pitch would go in," as turners would express it.

This arrangement, which I have used for cutting the threads of shell base plates, saves the eyes very much, as the index wheel is rotating comparatively slowly, and there is only one point to watch instead of two, and this naturally increases the output. Another advantage is that the arrangement can be fitted to his lathe by any turner.

ROPE TENSION PROBLEM

By "Mechanical Engineer."

REGARDING the question (the January 12 issue of Canadian Machinery) by J. R. H. relative to the strains in the rope (sketch there given), this is a plain case of simple stress, and any elementary treatise on strength of materials will cover the point. First, when any force is applied to a body it tends in a greater or less degree to break it. This would be an external force. There would also be the internal resistance to this force acting in the contrary direction and tending to keep the body together. This force would be the same at any cross section, and in the case under consideration, the stress is the same in both ropes and the same anywhere between the points where the force is applied. If the eyebolt in Fig. 1 were replaced with a spring balance, the balance would register 200 lbs. and not 400 lbs. The same holds good for the eyebolt, as it is exerting a pull of 200 lbs. in the opposite direction to the force A.

INDUSTRIAL EDUCATION BY MOVING PICTURES

By J. H. R.

THE value of moving pictures as a means of education is gradually being impressed upon all classes of society.

When the art of reproducing the actual scenes and movements of life and material upon a screen was in its infancy, the chief thought of the inventor was to entertain and amuse. That the original intention of this invention has been more than realized, must be clearly evident to anyone who has passed a few hours in a moving picture theatre.

The reading of a newspaper and the occasional sight of a certain picture, showing some scene of a notable event or historical pageant is very interesting; but to have the actual scenes pass before one's eyes, leaves a much clearer impression upon the mind, and causes less strain upon the imagination.

One of the features of the movement, which is rapidly attracting interest, is the adoption of the use of moving pictures to the teaching of trades and manufacturing methods. At the January meeting of the Montreal branch of the Canadian Railway Club, a paper, prepared by J. J. Dunn, general superintendent of the Shelby Steel Tube Co., Pittsburg on the "Process of Manufacturing Seamless Steel Tubing," was read by Mr. Chas. R. Barton, of the same company. Following the reading of the paper, the gathering was entertained for over two hours, with moving pictures, showing the methods of manufacture from the cold billet to the finished product; both the welded type process and also the seamless method being clearly and thoroughly depicted. This system of visiting distant plants is only exceeded by personal observation, yet when the opportunity of an actual visit is impossible, no better means of acquiring knowledge has as yet been given to the industrial world.

The moving picture idea of education is to the illustrated method, as the illustrated method is to the mere lecture, and with this in mind, we look for further developments along the lines of industrial education through the medium of the moving picture film.

Opportunities for Canada's Industrial Development--I.

By C.T.R.

In this series of articles prepared in response to numerous inquiries received from the managements of Canadian metal-working plants on the subject of post-bellum employment for their added equipment and enlarged capacity arising from an extended period of shell production, we aim to give prominence to the opportunity to manufacture such products as have previously been imported for our own domestic needs or have since become available to us as an export proposition. The present article is more or less introductory to the series.

THE manner in which industrial efforts should be directed so as to best bring about a resumption and increased scope of pre-bellum activity is a subject which is now occuping the minds of practically all producers in this country. That the decisions arrived at will be numerous and varied there is no doubt, but that they will all be practicable, and being so will also be successful, is a matter regarding which there may be a doubt. From all the numerous viewpoints, however, a broad enough grasp of the situation may be obtained which will admit of the various aspects being summarized and grouped so that the particular features of the situation which apply to any one sphere of industry may be observed by its members, after which it becomes a matter of personal application as to how far they develop the opportunities indicated.

Grabbing Germany's Trade

At the commencement of the war there was much smooth talk and confident assertion regarding the loss of trade which Germany would suffer and the ease with which it would be secured by her enemies. An impartial observer of the war's progress might at the present moment feel inclined to think that the Teutonic powers need not trouble about the loss of their former markets. In spite of the ultimate downfall of the German Empire and its disastrous effects both on herself and her allies, it would be unwise to overlook the fact that a bond of commercial sympathy would remain between Germany and the nations now fighting with her. Such sympathy between brothers in distress would not be lessened by the resultant antipathy to Britain and her allies, and, although the course of years will see a gradual resumption of trade with the Balkan nations in such commodities as tobacco, wheat, maize, currants, etc., the necessary trade balance, which in ordinary times consisted of manufactured goods, will involve gold or securities. Germany, as the greatest manufacturing nation of the Teutonic Alliance, will see that by fair means or foul every possible item of manufactured goods required by these lesser States is purchased from her, and paid for with the gold received from her present enemies.

Such a development, if unconsciously acquiesced in by the Allies, would greatly facilitate Germany's recovery, which will be desirable so far as her ability to pay indemnities is concerned, but it also means a considerable if not a total restriction of Allied exports of machinery and kindred manufactures to most of our present enemies after the war. Most readers will realize that in agricultural implements alone this will represent a serious loss to Canada.

WAR PROFITS

Not all war profits can be footed up in a ledger, this being indicated in the conclusions arrived at by Herbert Corey, war correspondent of a Chicago paper, after extended study and investigation. While the references are particularly addressed to the people of the United States, we in Canada cannot fail to note their equal applicability in our own case.

War has forced us to make use of our own raw resources.

It has made us manufacture things we formerly bought abroad.

It has sent our bankers to other countries to get us trade.

It has taught us to diversify and intensify our crops.

It has opened a thousand avenues for our trade chemists.

It has pushed our goods through doors that once were barred.

It has awakened our manufacturers to export trade possibilities.

It is forcing us to build ships to carry our goods.

It has made us raise our eyes and look at the world.

The question, therefore, of future trade with our present enemies may very well be dismissed as having no bearing on the present situation, which is not "After the war—what?" but "Now—what?"

Metal-working establishments in Canada may, at the present moment, be divided into two groups, viz., munitions plants and manufacturing plants. The former group consists of three classes—first, engineering shops proper, whose entrance into munitions production involved no radical change in the nature of their plant equipment; second, various metal-working plants, such as foundries, bridge and structural works, contractors and others whose machine shop activities were of a special or limited nature, and who practically went into a new line of business when making shells; third, new firms incorporated for the express purpose of handling shell contracts. The latter group, i.e., manufacturing plants, includes all those factories which during the war, have continued in their own line of business. Owing to the non-military nature of their product, many of these have run at a fraction of their capacity, while others whose goods were in demand for army stores have been abnormally busy.

Rebuilding Former Trade

The necessity of accumulating a more than ample reserve of war materials has accounted for the continued activity of certain industries in this country, but economic considerations compel the Allies to conserve their resources, with the result that as their plans mature, and their requirements are more capable of close estimation, they will reduce, as far as consistent with safety, all war expenditure outside of their own borders.

Meantime, while some manufacturers have kept the matter constantly in mind, and have been on the alert for regular business, there are undoubtedly a number who are unwilling to think that the halcyon days of shell contracts will ever cease. No particular sympathy is deserved by such, nor is it likely to be offered.

Granted, then, that people have the means, it becomes a question of ways. Ways might be said to mean time, place, and opportunity, and it is now obvious to many that there is no time like the present. The question of place next arises. The great majority of manufacturers will immediately endeavor to return to known paths, and a little consideration of present conditions may not only strengthen that decision, but in some cases influence them against export trade. Not that export trade is undesirable, but a substantial and well secured

home trade is frequently essential to the successful establishment of a foreign trade.

Assuming, then, that the home market is the most advisable for immediate cultivation, it should not be thought that renewed efforts in this field are simply a return to previous conditions. The three classes of firms in group one have all had their faculties intensified. The third class, at least those of it who have made good, are flushed with success and possess the sinews of commercial warfare. All of these classes are better equipped than ever before, and with many of them the desire for continued activity has become almost an obsession.

Opportunities Here

The prospects of activity in developing the Dominion receive considerable encouragement from a study of similar past phases in the history of other countries. The Department of Trade and Commerce in Weekly Report, No. 572, January, 1915, published a statement of the principal articles imported from the United States during the year ending March 31, 1914. Although the consideration of German trade forms part of this discussion, an immediate attack on such trade with foreign countries does not offer the quick returns which can be had by supplanting imports from Germany to this country with articles of home manufacture, and the same reasoning applies more particularly to imports from the United States. Not only in quantity and quality, but in nature, design, material, and nearly every physical characteristic, the United States products are much more part of our everyday existence than were the German goods.

Our facilities and, if one may judge by munitions production, our resourcefulness, are at least equal to that of our Southern neighbors, and with certain exceptions, such as coal, iron ore, and other materials controlled by nature, there are few products of their factories but what can be duplicated here. The subject of Made-in-Canada opportunities is dealt with in the report referred to, which points out that the present time is a turning point in the life of the Dominion. The theory of cyclical development of civilization is considerably strengthened by the facts quoted in regard to the early stages of commercial activity in the United States, and, at a later date, Japan.

History Repeats Itself

"An analogy is frequently drawn between the economic development of the United States and that which is at present going on in Canada. It is pointed out that whereas manufactured goods in 1870 accounted for about 40 per cent. of the total imports into the United States, in 1912 they formed less than 22 per cent. Similarly the economic transformation of Japan may be instanced. In the thirty years from 1882 to 1911 the percentage of manufactures to total imports into Japan decreased from 42 to 24 per cent., while that of imports of raw materials increased from 4 to 45 per cent. It is, therefore, inferred that a somewhat similar development will take place in Canada in the near future.

It may be pointed out, however, that while the United States in the first half of the nineteenth century was a country importing manufactured goods from across the sea prior to the development of her own industrial resources, Canada at the present time makes up the deficiency in her home production by importing to a large extent from a country contiguous in territory, similar in economic resources, and of a high industrial development. On the other hand, Canadian manufacturers have the advantage of being able to profit from the skill and experience of producers in the United States, as well as the advantage of a valuable and intelligent home market. There is, therefore, every reason to look for a substantial future increase in the consumption of home-made goods and a consequent decrease in the proportion of manufactured imports.

It is natural to expect that in this increase in the consumption of "Made-in-Canada" goods, Canadian producers will follow the lines of least resistance and direct their efforts to the manufacture of those articles for which the natural resources of the country are most fitted. In so doing they come into competition with the longer-established and highly-developed industries of the United States."

B.C. NEEDS COPPER REFINERY

THE HON. LORNE CAMPBELL, Minister of Mines for British Columbia, recently outlined some ideas which he holds respecting what should be the policy of the Mines Department at this time. He laid stress on the necessity of the erection at some point on the coast, at as early a date as possible, of a copper refining plant.

Mr. Campbell explained that at present nearly all the raw material produced in this province is shipped to refineries in New Jersey. The blister copper from the Granby smelter at Anyox, for instance, is shipped overland to New York, to be refined further in American plants. Concentrates from the Britannia mines, Howe Sound, mostly go to the Tacoma smelter, whose product also finds its way to New York markets.

The minister believes that a plant established at a suitable place on the Coast could handle this business and ship its product direct to the order of the British Government for manufacture in Great Britain. There is no present intention of bonusing a refinery, but the Government is collecting all possible data on the matter with the idea of furthering the project of the establishment of such an institution at some point on the Coast.

Mr. Campbell added that the present activity in the mining industry in this province is rapidly developing to a point which will admit of no delay in pushing forward such projects as he mentions. The returns of the last week's business just to hand, show big increases in the ore shipments from the Boundary and Kootenay mining district. A total of 19,300 tons of ore, chiefly copper and silver-lead, was moved last week, as compared with 8,800 tons for the corresponding period last year. The returns indicate an increasing ratio each week.

FILTER FOR PURIFYING CUTTING OILS AND COMPOUNDS

ON account of the great increase in the use of automatic machine tools, the higher speeds at which they are operated, the necessity of greater accuracy and exact duplication of parts, and the increased cost of labor and raw material, manufacturers have had forced upon them the fact that present methods of using cutting oils and compounds on machine tools are inefficient and far from the high standards of efficiency maintained in other parts of the plant. It is indeed surprising that the old method of using the same cutting oil or compound over and over again, without purification, is still being used in some of the best operated shops. Even where attempts are made to purify the cutting oil or compound it is generally carried around in buckets and poured through inefficient filters not designed or suited for the filtration of this kind of oil, and the expense and waste incurred in handling cutting oil in this manner usually offsets its advantages.

There is no reason why methods of handling cutting oil should not be brought up to the present scientific and efficient basis of the modern automatic oiling and filtering systems used on power plant machinery. Power plant oiling and filtering systems have entirely supplanted the old fashion hand and oil cup method of lubrication in all efficiently operated power plants, and, in a like manner, automatic filtering and circulating systems for handling cutting oil are rapidly superseding all other methods. The advantages of this system are more fully pointed out below, but the most important feature is that it usually pays for itself in less than a year. In its simplest form, a modern cutting oil circulating and filtering system operates as follows:

Clean cutting oil or compound flows from an overhead reservoir by gravity

through a system of piping to the various machine tools, affording lubrication not only to the cutting tools themselves but also to the different bearings on the machine. The oil supplied through a flexible metal hose to each machine is regulated by a valve at the latter. The used oil from the various machines drains by gravity into a filter where it is thoroughly purified. The filter is designed so that it removes all scale, sand, metallic chips, etc., and when necessary the oil is sterilized so that it will be free from bacteria.

The use of pure cutting oil undoubtedly pays. It was found in one plant that the cutting tools and drills lasted from one-third to two and a half times longer when lubricated with clean cutting oil than when dirty oil containing metallic dust and scale was used.

In another plant difficulty was experienced because the foreign matter in the oil caused the sides of the drills to wear down making them tapering and causing them to wedge. This in turn generated more heat, interfered with the accuracy of the operation and consumed more power. By using clean cutting oil this difficulty was eliminated.

In another plant working on cast iron, the sand and scale in the oil quickly wore down the sharp cutting edges of the dies and taps, making it necessary to frequently sharpen them. The use of clean, filtered oil kept the tools sharp a much longer time and greatly decreased the power consumption of the machine.

In another plant a large amount of time was lost, because the sediment in the cutting oil interfered greatly with the operation of the self-opening dies, causing them to stick. Using filtered oil eliminated this trouble entirely and greatly increased the output per machine and per operator.

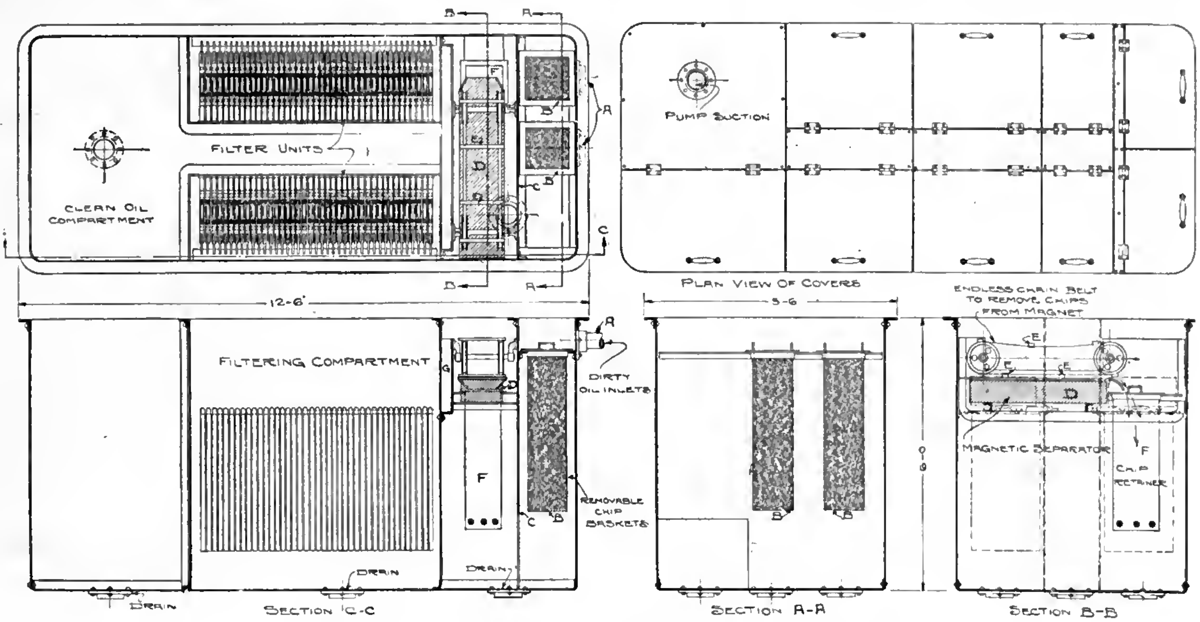
A cutting oil system pays for itself in the reduction of the fire hazard. The disadvantages and danger of having large bodies of cutting oil around a plant are apparent. This hazard is practically eliminated where an automatic circulating system is installed as the oil fed to the various machines instantly passes off into the drain pipe. No oil is kept in the base of the machine and the small quantity adhering to the machines and cuttings is not sufficient to support a fire. The oil storage reservoir and filter can, if desired, be located away from the main building or in a fire proof compartment.

Practically every manufacturer realizes the advantages of using a good oil on machine tools. The matter of expense is not so important when an automatic circulating and filtering system is installed, because the cutting oil really becomes an investment and is used over and over again. The value of using good, clean oil for lubricating the bearings on the tool is obvious.

The Richardson-Phoenix Co., of Milwaukee, Wis., has recently brought out a line of filters designed especially for purifying cutting oils. The illustration shows one of their Peterson type cutting oil filters equipped with a magnetic separator for use on plants working on cast iron or steel. The operation of this filter is as follows:—

Used oil enters the inlets A, passes down through strainer baskets B, which remove large cuttings, flows under baffle C, then up and across the top of the magetic separator D, where iron or steel chips are removed. To remove the accumulation of chips, scrapers E-E, operated by an endless chain belt, travel across the face of the magnet, scraping the chips off into the chip retainer F, which is provided with holes in the bottom, covered by screens, to allow the oil to drain out. Referring to section BB, this chip retainer can be slid to the right and lifted out. After passing over the magnet, the oil flows over dam G, into the the filtering compartment, completesurrounding and flowing through the individual filtering units, where the most minute particles of foreign matter are thoroughly removed. The clean oil collects in the clean oil compartment H, from which it is elevated, by means of a pump, to the overhead reservoir, ready for re-use; or if the use of an overhead reservoir is objectionable, the clean oil can be pumped directly into the oil distributing piping which is equipped with a relief valve to maintain the requisite pressure.

The Peterson cutting filter is built in a number of different designs to meet local conditions and for different kinds of oils. A battery of filters, capable of handling 50,000 gallons of cutting oil per hour is, we understand, now being built for a large machine shop.



FILTER FOR PURIFYING CUTTING OILS AND COMPOUNDS

C. P. R. and New Construction.—Grant Hall, vice-president and general manager of the C. P. R. Western Lines, says that in view of the financial outlook it has not been decided to proceed with the building of any new lines, but this matter will be given further consideration in the spring. There is no possibility of embarking on any ambitious scheme during the war, but over 150 miles of track will be relaid with heavy rails, and there will be a considerable expenditure on ballasting, bank widening, etc.

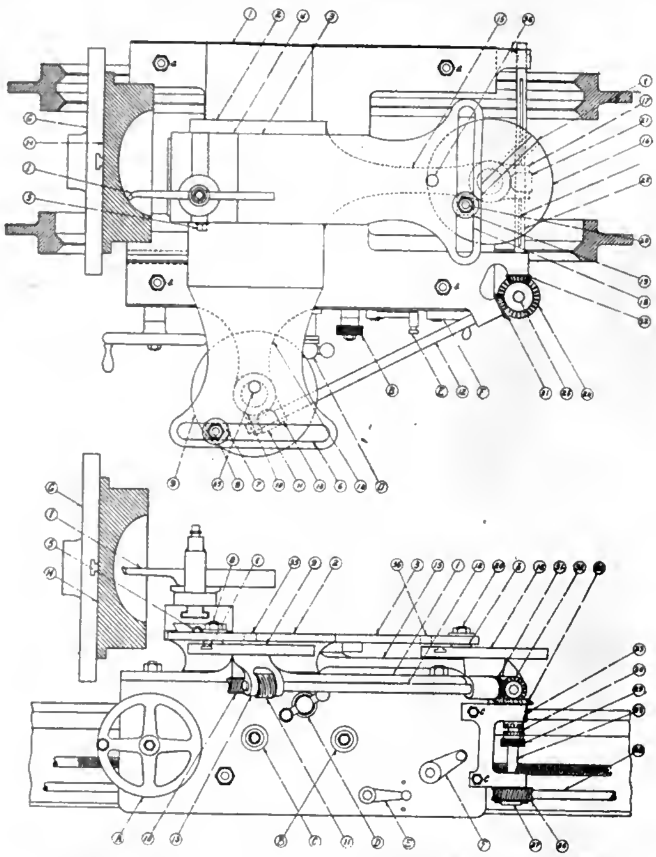
DEVICE FOR IRREGULAR TURNING

By J. H. R.

THE accompanying drawings illustrate a device that may be placed on a lathe, boring-mill, milling machine, planer or shaper with slight changes to suit the various machines. Figs. 1 and 2 show the device placed on the saddle of a lathe and boring an elliptical cup shaped die. The principle upon which the attachment operates is employed in geometry to draw an exact ellipse, the cutting tool making the required outline while the work is in motion.



FIGS. 1 AND 2.—DEVICE FOR IRREGULAR TURNING

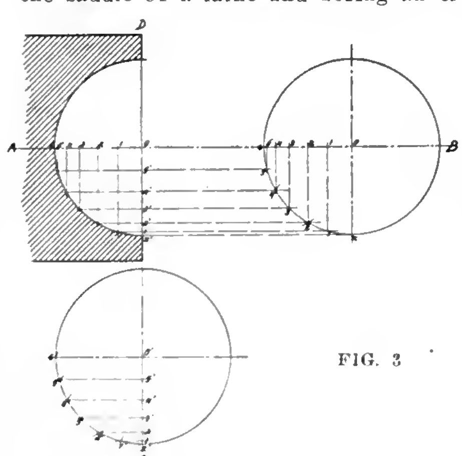


FIG. 3

As shown in Figs. 1 and 2, the compound rest is removed from the saddle and the device placed on and secured by the bolts a, a, a, a. The base (1) carries a slide (2) at right angles to the lathe spindle. The slide (3) moves at right angle to slide (2) and parallel to the lathe spindle. The auxiliary slide (4) which carries the tool post is for adjustment of the cutting tool.

On the outer end of the slide (2) is a parallel slot (6), in which travels the sliding block (7), controlled in its movement by its position in the tee-slot (t) in the disc plate (9). This disc plate, shaft and worm-wheel (10) are supported in the arm extending out from the base 1. The disc 9 and worm-wheel 10 are revolved by the worm 11 secured to the shaft 12, which carries the bevel gear 31. This gear is driven by another bevel gear 24, which is secured to the vertical shaft 25 driven by the worm-wheel 26, and worm 27, which is feathered to the feed shaft 28, and held in position by a fork upon the bracket 23, which carries the shaft 25, and is secured to the apron by the screws C, C.

A similar arrangement is placed at the outer end of the slide 3, with the exception that as the disc plate 16 and its shaft are carried in the extending arm 15 from piece 2, which necessarily must have a lateral movement. The worm 21 is feathered to the shaft 22, which is carried in the brackets upon the brace 1. This shaft derives its motion similar to the shaft 12.

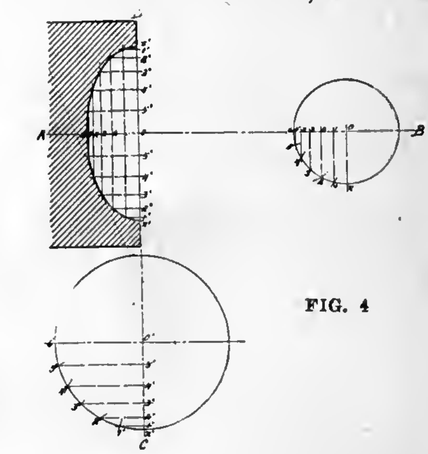

FIG. 4

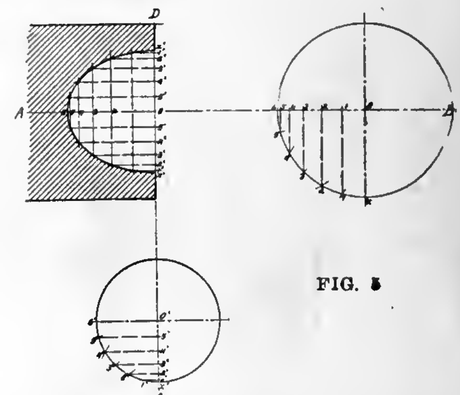

FIG. 5

It will readily be seen that with the crank pins 8 and 20 placed at different distances from their centre of motion, and started from different positions in-

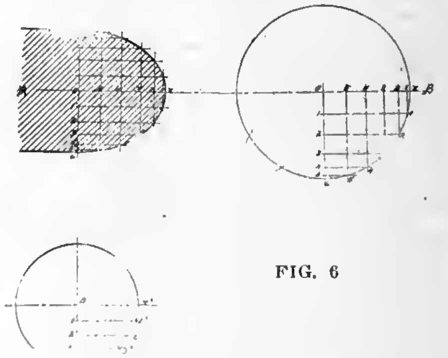

FIG. 6

numeral shapes can be produced. Take for an illustration, the elliptical bowl-shaped die as shown. It must be understood that the plan of this die is circular, but the cross section as shown is an ellipse.

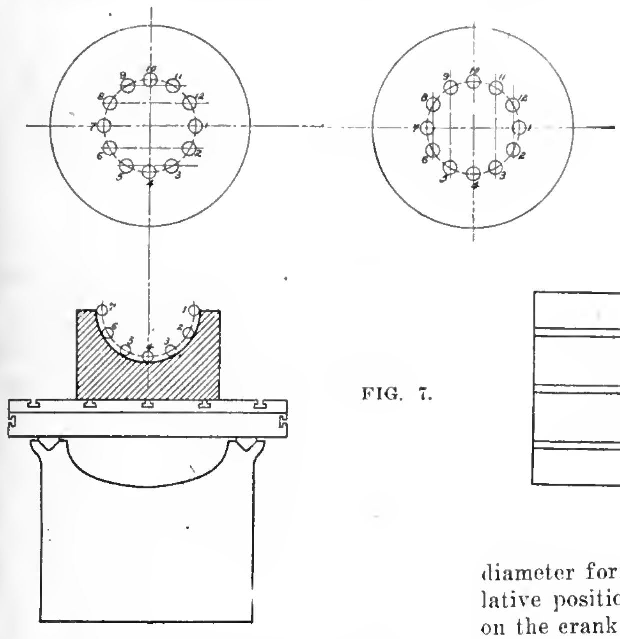

FIG. 7.

The diameter at the mouth of the bowl is to be 12 inches, and the depth 5 inches, and the cross section to be a true ellipse. The diameter or major axis of the ellipse is derived from the cross feed of the cutting tool, therefore, the crank pin 8 must be placed 6 inches from its centre of motion; and, as the depth or minor axis is derived from the traverse motion, the crank pin 20 must

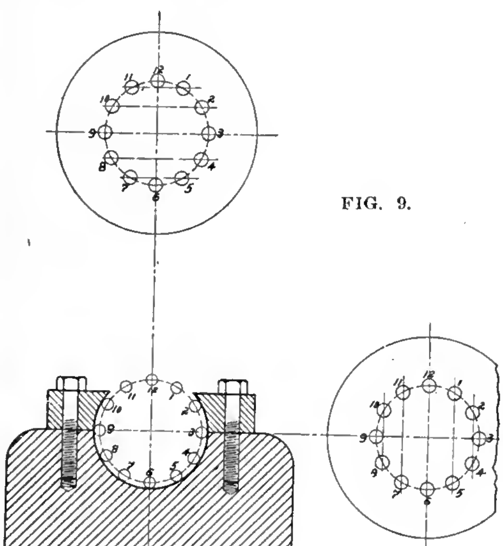

FIG. 9.

be placed 5 inches from its centre of motion. Now, with each crank upon the quarter and the tool in position, the lathe is ready to start by engaging the feed by means of the knurled clutch collar 29.

Fig. 3 shows a skeleton sketch of the relative positions of the two cranks when turning a semi-circular bowl.

Fig. 4 shows a skeleton sketch of the relative positions of the two cranks when turning an elliptical shape, the diameter being the major axis.

Figs. 5 and 6 show the internal and external of an elliptical shape when the

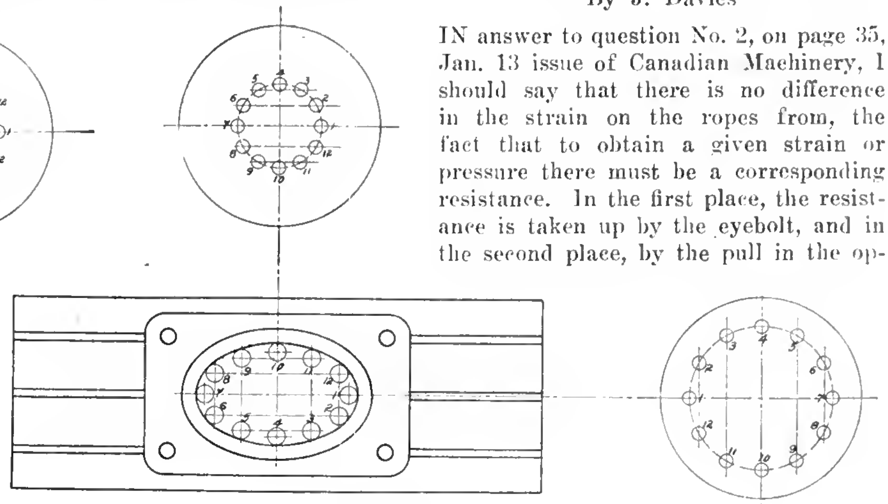

FIG. 8.

diameter forms the minor axis. The relative position of the cranks are shown on the crank circle by the use of similar figures.

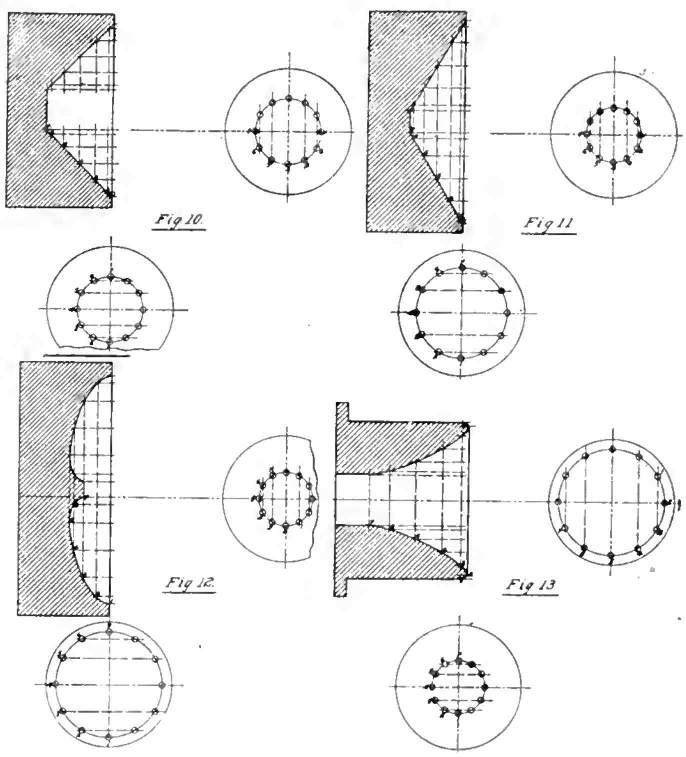

Fig 10. Fig 11 Fig 12. Fig 13

DIAGRAMMATIC FEATURES OF IRREGULAR TURNING DEVICE

Fig. 7 shows a skeleton sketch of the device as operated upon a planer or shaper; Fig. 8 as operated on a vertical milling machine, and Fig. 9 as operated on a lathe or boring-mill, producing a ball joint. Figs. 10 and 11 show it as operated for cutting tapers of any desired angle.

Figs. 12 and 13 are two irregular shapes produced by starting the respective cranks from different positions.

ROPE STRAIN PROBLEM SOLUTION

By J. Davies

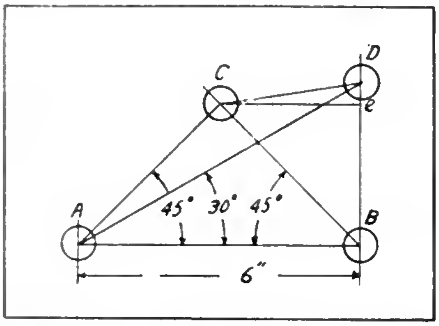
IN answer to question No. 2, on page 35, Jan. 13 issue of Canadian Machinery, I should say that there is no difference in the strain on the ropes from, the fact that to obtain a given strain or pressure there must be a corresponding resistance. In the first place, the resistance is taken up by the eyebolt, and in the second place, by the pull in the opposite direction. If the eyebolt were replaced by a spring balance and a pull of 200 lbs. exerted on the other end, the balance would also record 200 lbs., thus fulfilling the conditions of Fig. 2. It is my opinion the strain would be equally divided.

The New York Continental Jewell Filtration Co., will supply a filtration plant for the Macdonald College at St. Anne de Bellevue, Que.

Series of Practical Questions and Answers for Mechanics

Every care is being taken to include only pertinent practical questions, and give same direct, reliable answers. Catch questions will be avoided. Arithmetic, consisting of simple addition, subtraction, multiplication and division will be found a useful companion study.

Question.—In the sketch of the piercing die shown, the centre distance between the holes A and B is 6 inches; the hole C is to be equidistant from A and B, the centre lines forming angles of 45 degrees. The hole D is to have a position so that the line of centres between A B and B D will be at right



CENTRE DISTANCE OF HOLES QUERY.

angle (90°) and the angle D A B will be of 30 degrees. What will be the various centre distances of the holes?

Answer.—As the angle A C B will be 90 degrees, the centre distance A C or B C will be the square root of one-half the square of the distance A B, or by formula AC =

$$\sqrt{\frac{(AB)^2}{2}} = \sqrt{\frac{6\times6}{2}} =$$

$\sqrt{18} = 4.242 +$ inches.

To find the distance B D, multiply the length A B by the tangent of 30 degrees, and by looking up a table of angle tangents we find this to be .57735. The distance B D will therefore equal $6\times.57735 = 3.464$ inches.

The distance AD can be found by the formula $\sqrt{(6^2+3.464^2)} = 6.929$ inches; or by formula which makes hypotenuse = side adjacent $\div$ cosine $= \frac{6}{.86603} = 6.929$ inches.

To proceed further and find distance C D, it will be necessary to find the length of the line C e, which divides the triangle B C D into two right triangles.

Ce = (BC) $\times$ sine of 45 degrees = $4.242 \times .70711 = 2.999$ inches.

Be and Ce being equal, , De = $3.464 - 2.999 = .465$ inches Then CD = $\sqrt{[(Ce)^2 + (De)^2]} = \sqrt{(2.999^2 + .465)^2} = 3.063$ inches.

* * *

Question.—While boring some deep holes recently with a round boring bar, I had great difficulty in obtaining a smooth cut due to the borings gathering below the bar and at intervals crowding, resulting in the tool digging into the work. Can this trouble be remedied?

Answer.—It is often advisable when circumstances permit to wind a spiral of small wire around the bar, securing the ends by soldering, or inserting in a small drilled hole. This method gradually works the chips to the mouth of the hole and prevents clogging below the bar.

* * *

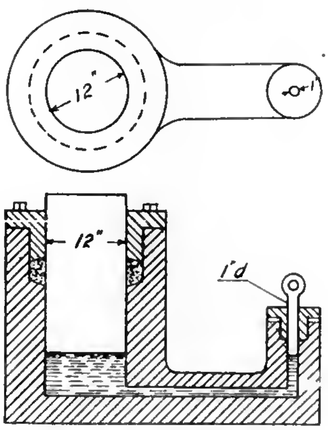
Question—(a).—To exert a pressure of 25 tons on the ram of the hydraulic press here shown what would be the gauge pressure

(b)—What would be the pressure acting upwards on the pump plunger?

(c)—How many strokes of the pump plunger would be required to raise the ram 10 inches, stroke of plunger being 3 inches?

(a)—Gauge pressure would be weight divided by piston area = 25 tons $\div$ $12^2\times.7854 = \frac{25\times2000}{12\times12\times.7854} = 442$ lbs. per sq. in.

(b)—Pressure required on pump plunger to force water into ram cylinder against a weight of 25 tons would be 442 lbs. multiplied by area of pump plunger, or $442\times1^2\times.7854 = 347$ lbs.



HYDRAULIC PRESS QUERY

(c)—Number of strokes required will be volume of water necessary to raise ram 10 inches divided by discharge of plunger at one stroke, or $\frac{12^2\times.7854\times10}{1^2\times.7854\times3} = 480$ strokes.

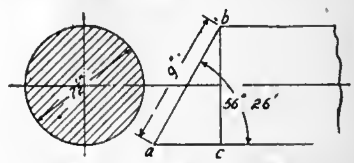
* * *

Question.—What is a good lubricant for machining aluminum?

Answer.—Very good results have been obtained by using kerosene or equal parts of kerosene and lard oil. A satisfactory compound can also be made by mixing soap suds with kerosene.

* * *

Question.—A round shaft, 7½ inches in diameter, is to be shaped at an angle on one end so as to form an ellipse with a major axis of 9 inches and a minor axis equal to the diameter of the shaft. What angle will the face make with the shaft axis?



ROUND SHAFT QUERY.

Answer.—The solution of this and similar problems comes under that of triangles. By forming a right triangle (as shown) with the major axis of the ellipse as the hypotenuse, the diameter of the shaft as one side and the length A C, the remaining side, we can solve the problem.

By formula we have sine of angle b a c $= \frac{\text{side opp.}}{\text{hypotenuse}} = \frac{bc}{ab} = \frac{7.5}{9} =$ .83333.

This corresponds to an angle of 56 degrees, 26 minutes.

* * *

Question.—Should a tool for planing brass have any rake?

Answer.—For smooth work it is advisable to have from 5 to 10 degrees negative rake.

* * *

Question.—What is meant by a cycle of operations?

Answer.—A series of events or movements which are repeated again and again constitutes a cycle of operations. In the case of a four-cycle gas engine, the cycle is completed when the piston has made four single or two return strokes—the intake, compression, firing and exhaust.

In the case of screw-cutting on the lathe, the cycle might be designated as the setting of the tool to depth of cut; engaging lead screw; removing stock; releasing lead screw and backing off cutting tool, and returning tool to first position.

Question.—In the construction of circular shears for thin sheet metal, are the shafts placed in the frame so that the face of the cutters are in the same plane?

Answer.—It is advisable, in some cases necessary, to offset the shafts from

CIRCULAR SHEARS QUERY

1-32 to 1-16 inch per foot of length so as to give shear to the cutters; this throws the face of the latter at a slight angle to each other—somewhat exaggerated in sketch.

* * *

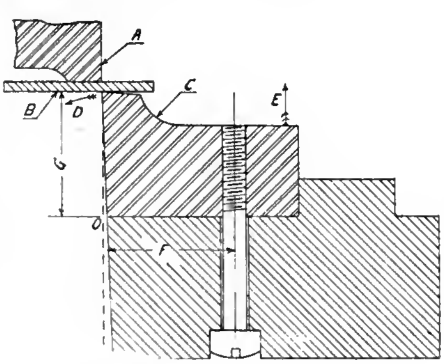
Question.—The remark has often been made that "the car took the corner on two wheels" but when asked which two wheels were off the ground, the answer is usually the outer wheels, or those describing the larger curve. In the case of an auto turning a sharp corner, which wheels would be inclined to lift from the ground?

Answer.—A moving body will always tend to travel in a straight line, unless acted upon by some other force; to follow the same direction, and the sudden change causes the inner side to raise. This is very noticeable if you are on a sleigh or vehicle when turning a corner, the weight of the body is thrown to the inner side, so as to shift the centre of gravity over the edge that has a tendency to rise from the ground.

* * *

Question.—When securing the steels of a large sectional die, to the die bed or bolster; what is the best location for the screws?

Answer.—This would depend largely upon the style of die, shape of section, and also the width of steel used. The screws are for the purpose of holding



SECTIONAL DIE QUERY

the steel sections securely to the bolster. As shown in the sketch, the punch A when cutting the stock B will have a tendency to rock the steel C about the point O, forcing the cutting edge at D and lifting the back as shown by the arrow E. It is therefore advisable when conditions permit to keep the screws somewhat back of a centre position. This will require materially the inclination of the steels to lift when pressure is applied at the cutting edge. If the steels are of sufficient width, increased rigidity is obtained by staggering the screw holes.

* * *

Question.—Sometime ago we had a spiral to cut upon a 3 inch shaft, two ft. long, with journal 1¼ inch. dia. and 3 inches long on each end. The spiral was to form a rib ¼ in wide and ⅜ in. deep, with a pitch of 2¼ inches, or 8 turns in the length of the spiral. After much changing and trying, with different sets of gears, we succeeded in getting those proper for the work.

(a)—What method is used in finding the desired wheels for odd pitches?

(b)—How can I determine the clearance angle of the cutting tool?

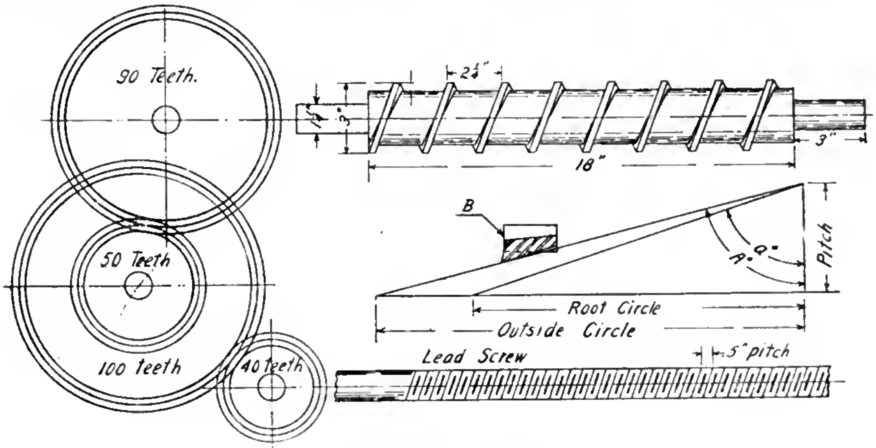
Answer, (a)—With a lead screw of ½ inch pitch, it is obvious that while the work is revolving once, the saddle, with cutting tool, is advancing 2¼ inches. To move the saddle this distance by means of the lead screw, it is necessary that the lead screw revolve 2¼ divided by .5, or 4½ times. The ratio therefore between the speeds of the lead screw and the work is 2.25 to .5 or 4½ to 1, which must also be the ratio between the teeth of the drivers and driven wheels.

By using a gear of 40 teeth on the lead screw, the driving gear would be $40 \times 4\frac{1}{2} = 180$. As gears of this size are never supplied for screw cutting, it is evident that this same ratio must be obtained by compounding the train. Dividing 180 by 2 we obtain 90 for one of the drivers, and the intermediate compound pair must have the ratio of 2 to 1 as 100 and 50. To prove the accuracy of the gear train, the number of threads on the work multiplied by the driving gears should equal number of threads on the lead screw multiplied by the driven wheels or

$$\frac{1 \times 90 \times 100}{4.5 \times 50 \times 40} = \frac{1}{1} = 1$$

Other wheels would give the same result, but the resultant ratio must be the same.

(b)—The angle formed by the short leg and the hypotenuse of a right triangle, of which the pitch and the circumference are the two sides, is the desired clearance angle of the cutting tool. However, as the angle of advance is different at the outside diameter than at the root (as shown in the sketch) allowance for the sharper angle may be necessary.



SPIRAL CUTTING QUERY.

AMERICAN DYES INCREASE

Seventeen months of the European war, according to a report issued on Jan. 20, by Dr. Thomas H. Norton, the United States' Government's dyestuff expert, has seen American manufacture of dyes increase five-fold, and now this country is producing one-half of the colors it normally uses. Hope is held out that by 1917 the great bulk of artificial dyes consumed here will be made by American works from American raw material.

The report shows that under stimulus of high prices American producers have increased their output until, combined with the production of new factories, the country now is manufacturing coal tar dyes at the rate of 15,000 tons annually. Before the war the country manufactured 3,000 tons and imported 25,700, chiefly from Germany. Dr. Norton says, howeved, that the textile industry is bound to suffer until America can produce enough dyes for its needs, and the situation still is serious despite what has been accomplished.

The report emphasizes the desirability of increasing aniline products rather than a varied line of dyes, and declares the public will have to resign itself to fewer color shades.

Proposed legislation to block ruinous foreign competition in dyestuffs at the end of the war is endorsed.

NEW PROCESS DEVELOPMENTS

Inventive Genius and Research Operate to a Dual End — They Aim to Improve What We Now Possess and Bring to Our Service Commodities Before Unknown

MANUFACTURE OF SHELL FORGINGS

THE enormous demand for shell forgings has led to the introduction of improvements in the methods of manufacture whereby the greatest possible number can be obtained in the least space of time. Owing to the wide range of dimensions of shells, different methods of treatment have to be adopted to facilitate handling, but briefly the system most generally used is, first, to pierce or punch the billet and then reduce or elongate it by forcing it through dies until the correct

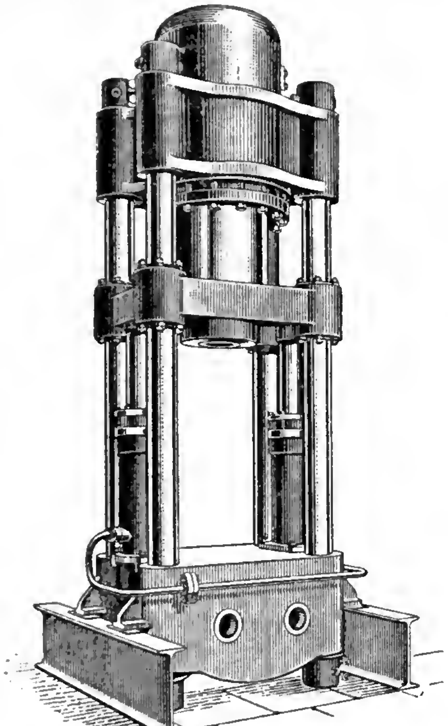


FIG. 1. HYDRAULIC PRESS FOR SHELL FORGINGS.

size and thickness is approximately reached: both operations being carried out on hydraulic presses. If such operations could be carried out with mathematical accuracy, a great reduction in the cost of manufacture of shells would be effected by the elimination of subsequent machining operations, but in practice it is found that this is quite impossible, and as machining is always necessary, it is much less costly to remove more of the surplus steel by cutting tools than to attempt to achieve this end by means of the forging and drawing operations.

Piercing Operation

A method of producing shell forgings which is widely adopted at the present time, and which appears to give very satisfactory results, has been introduced by the firm of John Shaw & Sons (Salford), Ltd., Manchester, England, says The Engineer. It produces the shell bodies by two operations, punching and drawing in one heat, and is illustrated in the accompanying cuts. Fig. 1 is a general view of the type of press employed for piercing shells up to any size, as well as for drawing cases up to 5 in. diameter. For drawing shells of larger diameter a press with the cross-head working upwards instead of downwards is employed, in order to facilitate the removal of the shells when they have passed through the dies.

Figs. 2, 3, 4, 5 and 6 represent sectional views of the punching press for shells of the smaller sizes, and in this machine the cross-head works downwards. In these drawings, A is the punch, which is cooled by a water spray M; B is the receptacle for the billet, which is also water-cooled; C, a loose base somewhat smaller in diameter than B; D a removable guide and stripper for the punch; E an ejector rod for removing the shell operated by means of rods G and yoke piece F from the moving head H, which is raised by the lifting cylinders; K and L are stops for regulating the stroke of the punch, and O is a horse-shoe-shaped cover bolted to the block P. The billet is introduced through the open side of the cover O into the receptacle B. The removable guide and stripper D for the punch is placed in position, and the moving cross-head H is forced down by the main ram. Thus the billet is punched as shown in Fig. 4, the stroke being regulated by the stops K, above mentioned, and the thickness of the base of the shell by the adjusting strips L. When the cross-head is raised by the lifting cylinders, the guide or stripper D comes in contact with the inside of the cover O, so that the punch may be withdrawn from the shell S. The guide and stripper D is taken away and the shell is lifted out by pincers or tongs. This completes the punching or piercing operation.

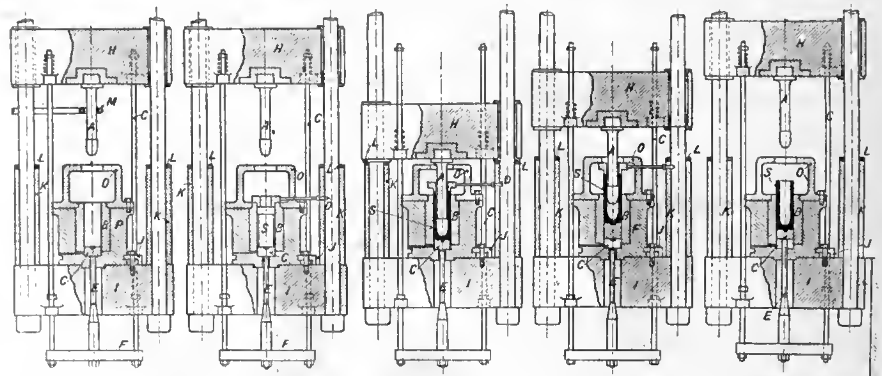

FIG. 2. FIG. 3. FIG. 4. FIG. 5. FIG. 6.

SECTIONAL VIEWS OF VERTICAL SHELL PUNCHING PRESS.

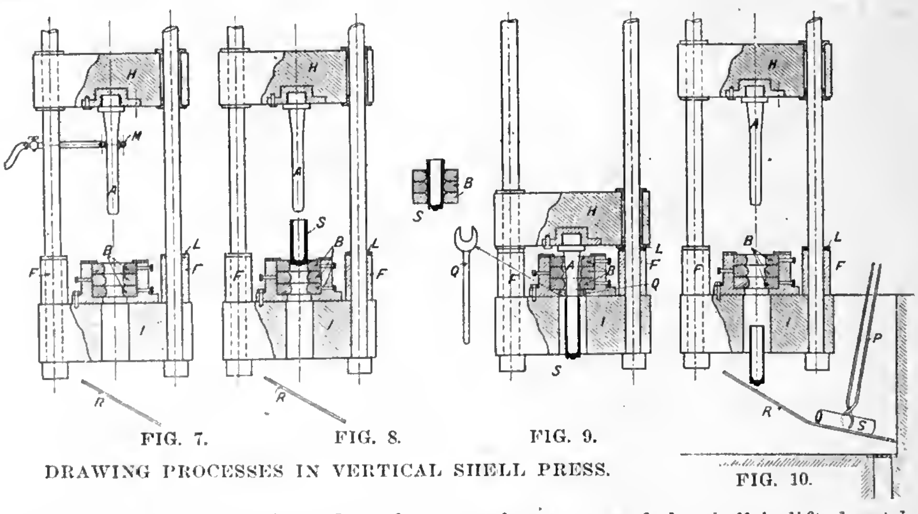

FIG. 7. FIG. 8. FIG. 9. FIG. 10.

DRAWING PROCESSES IN VERTICAL SHELL PRESS.

Drawing Operation

The process of drawing is very clearly shown in the sectional views—Figs. 7, 8, 9 and 10. In this part of the work the moving head also moves downwards, the shell being treated in the same heat after leaving the punching press. The dies B are three in number, secured in a block fixed to the table I. They are of different sizes internally, the largest being at the top. As the dies become worn by constant use the topmost one is removed and the two lower are raised to enable a smaller one to be introduced at the bottom, so that only one new block is required at a time. Fig. 8 shows the shell ready for drawing, the centre view shows it passing through the dies, and Fig. 9 shows the finished shell on the mandrel A. The stripper Q is now placed in position through the gap under the dies, and the moving cross-head is raised by the lifting rams, the shell being thus released from the mandrel A. Fig. 10 shows the moving head returned to its upmost position and the shell dropping into the chute R, from which it is removed by the tongs P. The number of shell bodies which can be punched and finished in this way varies between twenty and fifty per hour, according to their size. The hydraulic pressure employed varies from 150 to 250 tons.

Drawing Operation for Large Shells

Figs. 11 to 15 are sectional drawings showing the process of drawing shells 6 in. diameter and upwards. Fig. 11 shows the base of the shell which has come from the punching press being cooled with a jet of water ready for drawing. The crosshead H of the press in this case moves upwards, delivering the finished shell at the top of the press, from which it is led away by means of a chute, thus economizing manual labor in handling. In Fig. 12 the mandrel A is shown screwed into a sliding table T, and the shell S is placed in position ready for going into the press. The two dies B are separated by an annular ring, so that the shell is nearly through one before entering the second, which is smaller in diameter. In Fig. 13 the sliding table T is shown in its working position; in Fig. 13a the shell is seen passing through the dies; in Fig. 14 the work of drawing is completed and the stripper Q is in position ready for removing the shell when the mandrel is withdrawn by means of push-back rams. In Fig. 15 the shell S is shown stripped after passing through the dies. It is lifted on to the chute R, which delivers it by gravity to any required spot and the stripper Q is withdrawn. The table T is drawn out as shown in Fig. 12, and the mandrel A cooled by means of a water spray in readiness for the next shell.

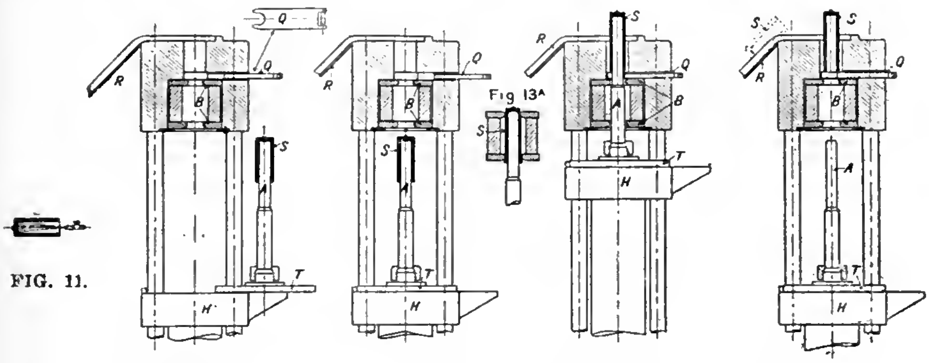

FIG. 11. FIG. 12. FIG. 13. FIG. 14. FIG. 15.

PROCESS OF DRAWING LARGE SHELLS ON VERTICAL PRESS.

ALLOY STEELS—I*

By G. L. Norris

STEEL may be broadly defined as an alloy of iron and carbon that can be forged and rolled. From expediency and necessities of manufacture, certain impurities beneficial or otherwise are present, but not in sufficient amounts to materially alter the characteristics of the pure alloy of iron and carbon. Under this definition, steel, or as it is now often referred to, carbon steel, is usually within the following maximum composition:—Carbon, 1.50 per cent.; manganese, 1.00 per cent.; silicon, 0.35 per cent.; phosphorus, 0.05 per cent.; sulphur, 0.05 per cent.

An alloy steel is steel alloyed with one or more metals, in sufficient amounts to influence or change the characteristics of steel, and still be possible of forging or rolling. The usual steel alloying metals are manganese, silicon, nickel, chromium, tungsten and vanadium. As these metals will all alloy with each other, it is evident that it is possible to obtain a great variety of alloy steels. Steel containing upwards of 1.50 per cent. manganese is not commonly considered an alloy steel, although this percentage of manganese undoubtedly has some effect on the characteristics of steel. This is due no doubt to the fact that manganese is always present in steel.

Alloy Steel Groups

The alloy steels are usually divided into two groups; ternary steels, with one metal alloyed, and quar-ternary steels, with two metals alloyed. The more complex alloy steels are practically limited to high-speed tool steels. The general characteristics of alloy steels are high elastic limit and great strength combined with a high degree of toughness as compared with the carbon steel with which they are alloyed. The strength and hardness can be enormously increased by heat-treatment (quenching and tempering) and still have the steel retain great toughness.

Alloy steels are not as a rule placed in service in the condition as forged or rolled. The forging and rolling temperatures are usually so high that the steel requires heat-treatment to refine the grain and develop the exact combination of strength, hardness and toughness desired. It is frequently necessary to anneal after forging in order to facilitate machining operations. This, of course, necessitates subsequent heat-treatment. Most alloy steels are of medium or low carbon content. The corresponding simple or carbon steels are only slightly or moderately improved in strength by heat-treatment.

ROPE TENSION PROBLEM

by H. Jones

REFERRING to the problem appearing in the January 13 issue of Canadian Machinery, page 35, re the tension on the two ropes illustrated, it is my opinion that the strain upon each rope will be the same. Although it is not so apparent, the pull must be the same at the eyebolt as at the point D in the lower rope. Regarding the tension in the rope, I believe the strain is equal at all points between A and B in the top rope and at C and D in the lower rope.

PROGRESS IN NEW EQUIPMENT

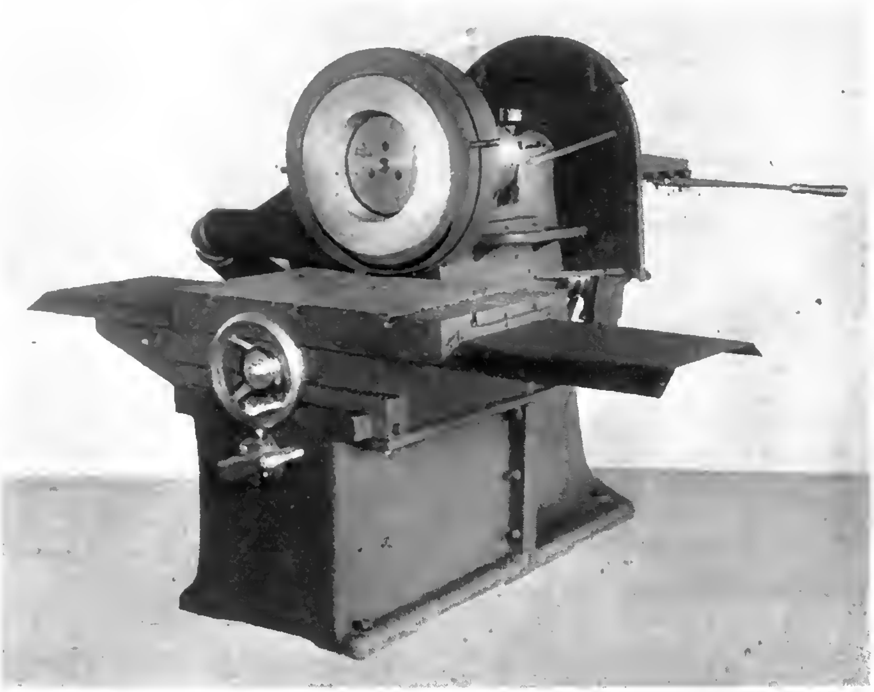
A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

A SPECIAL GRINDER

THE Gardner Machine Co., Beloit, Wis., have developed a special grinder which is an adaptation of their regular No. 6 machine. The special feature is the work table at the left hand end. The top of this table measures 20-inches wide by 30 inches long, and is provided with T-slots for attaching either the work or suitable fixtures. It has longitudinal travel of 20 inches, same being obtained by turning the hand wheel at front. The hand wheel shaft carries a pinion which engages with a rack attached to the under side of the table. The feed towards the table is accomplished through a finely threaded screw provided with a crank as shown. The length of feed travel is 6 inches. All wearing parts are completely protected from dust and grit.

An 18-inch abrasive ring wheel held in a "Perfection" chuck is the grinding member used. The work to surface is suitably attached to the table and fed by this grinding wheel in the usual manner. The right hand end of the spindle carries a 26-inch diameter abrasive disc wheel which is served with a universal lever feed table. Both the disc wheel and the chuck wheel are enclosed with dust hoods and attached to dust exhauster in rear of the machine.

The spindle is 2 inches in diameter and the driving pulley is 8 inches in diameter with $8\frac{1}{2}$ inches face. A 26-inch. disc wheel press, countershaft and extra supplies, are included in the machine equipment.



SPECIAL GRINDER WITH WORK TABLE AT LEFT-HAND END.

1½ in. HAND SCREW MACHINE

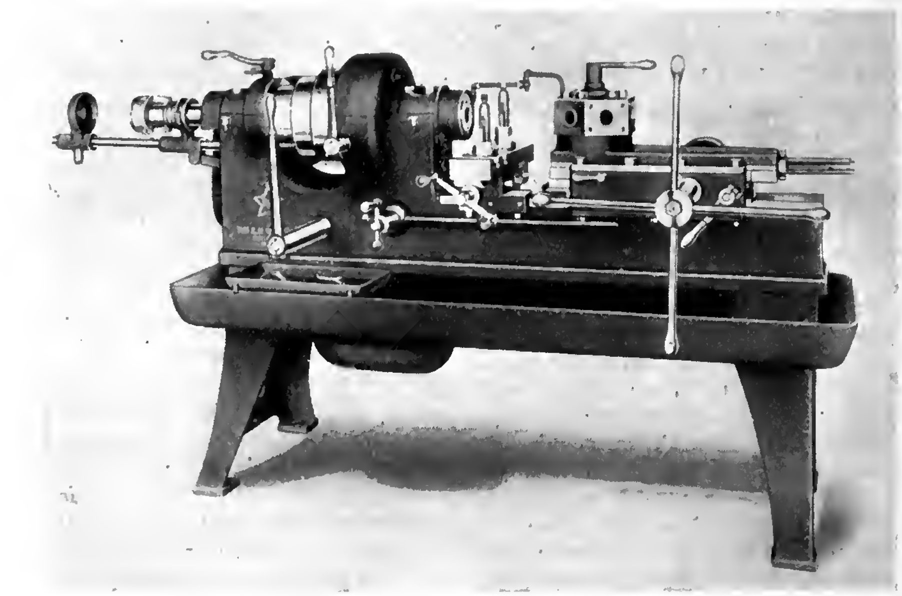
THE description and illustration refer to a recent product of the E. H. Wachs Co., Chicago, Ill., which is known as their 1½ in. "Star" hand screw machine. It is built with friction geared head, positive power feed to the turret slide, independent stops, automatic chuck and wire feed, and is equipped with oil pump and piping.

The entire machine is designed along lines which make for high production, and at the same time accurate work. By reference to the cut it will be observed that all the operating levers are within easy reach of the attendant. The head is of the 3-step cone type, and gives three open belt and three back geared speeds to the spindle. Reverse is obtained through the countershaft. The machine has a capacity through the collet of 1½ in., and turns for a length of 9 inches. Stock of full diameter can pass through the turret. The net weight of the machine complete with countershaft is 2,925 pounds.

In placing this machine on the market the Wachs Co. is not embarking on an entirely new field of endeavor. It is really re-entering the screw machine field, as some years ago it manufactured and sold a machine of much the same general type. The present machine, however, is of entirely new design, made from entirely new patterns and tools and modern in every respect. The machine, we understand, is brought out as a permanent production, and not to satisfy the present abnormal demand, and other sizes will be added as soon as business in hand permits.

ALUMINIUM FURNACE

THE application of aluminium and its alloys to industrial purposes has ex-



1½-INCH HAND SCREW MACHINE.

tended so considerably in recent years, that the subject of their melting is bound to appeal to a large number of manufacturers. Generally, melting has been effected in open crucibles, which allow atmospheric oxygen to attack the molten metal, with the consequent formation of dross. A gas fired furnace on entirely new principles, for melting aluminium and its alloys has been evolved after many experiments by the Monometer Manufacturing Co., Whitehouse street, Aston, Birmingham, and in which the usual difficulties met with, have, it is claimed, been overcome.

Melting pots made of metal are subject to the objection that the reaction which takes place between the molten aluminium and the impurities in the metal of which the pot is composed spoils the aluminium. In the furnace in question, this reaction is eliminated by the employment in the parts subject to attack of a special composition of metal which extended experience has shown to be immune from the action of impurities.

It is well known that a considerable portion of the molten metal goes to waste as oxide, and to prevent this deleterious action the melting pot is installed in a chamber containing inert gases incapable of oxidizing the molten metal. As there is no oxidation, it follows that there is no dross, and hence a considerable saving of material. The method of constantly replenishing the enclosed melting chamber with inert gases consists in causing the products of combustion to traverse the melting chamber on their way to the outlet flue. This sealing of the melting chamber also precludes the ingress of dirt and other foreign matter in the melting pot.

In connection with the heating arrangements, an ingenious device is used in order to take care of the gas supply when the melting point of the metal has been reached. The thermostat of the patented regulator, termed by the makers a "Monometer" controls and governs the quantity of gas supplied to the burners, so that immediately the aluminium is melted the quantity of gas used by the burners is reduced, and the uniform heat essential to the melting of aluminium is automatically maintained.

The Bunsen burners under the melting pot have contracted nozzles of such a design that a proper admixture of the gas and air takes place, resulting in perfect combustion and the full utilization of the heat in the fuel. The heat obtained by these low pressure atmospheric burners, which are coupled to the ordinary town supply, is stated to be comparable with that attained by high pressure gas, but without using compressors or fans.

The equipment of the furnace is completed by a central cone valve seated in the bottom of the melting pot and controlled by a conveniently arranged handwheel, by which the molten metal issuing from the pouring spout can be regulated or entirely shut off. At the top of the furnace are located two doors through which the swarf or metal is introduced into the melting pot, these doors being balanced so that they remain either in the closed or in the open position without being held by the operator. Casting is facilitated by mounting the furnace on a wheeled carriage which can readily be moved on rails from one part of the foundry to another, flexible gaspipes providing the means for allowing for this movement of the furnace.

ELECTRICAL ACCIDENTS IN ENGLAND

THE annual report of His Majesty's Electrical Inspector of Factories for the year 1914, has just been published in England, and besides the usual review and tabulation of the year's events, it gives considerable detail information regarding the more important accidents.

A reduction of 16 per cent. in the number of accidents occurring in factories other than electrical stations, etc., is shown compared with the year 1913, the number being 350 against 418.

The various accidents and their causes are given as under, the figures in brackets indicating fatal accidents:

Portable apparatus, connectors and flexible wires	65	(2)
Miscellaneous accidents in electrical manufacturing and repair works — mostly in testing operations	55	(1)
Working on live electrical apparatus or conductors—unskilled persons	46	(2)
Working on live electrical apparatus or conductors — skilled persons	42	(1)
Arcing of switches	38	...
Unprotected conductors, switches, terminals, fuses, etc.	36	(7)
Miscellaneous	31	(3)
Shocks or burns when replacing fuse wires	22	...
Arcing of fuses	9	...
Adjusting brushes and cleaning commutators, and flashing at commutators	6	...

The most frequent cause of accidents is again seen to be "portable apparatus." Twenty-six of the accidents due to this cause were occasioned by handling the flexible conductor. The report emphasizes the fact that proper examination of flexible conductors is unknown in many works, and a fruitful source of trouble constantly exists in worn out and damaged "flexibles." Various types of armouring come in for criticism, the spiral wire, and wire wove braiding being condemned, while whipcord braiding is recommended. The liability of the two former types of protector to penetrate the cord when damaged, and thus short circuit the entire sheathing, is pointed out as an objectionable feature.

In six cases accidents were caused through adapters being used in lamp sockets and connected with another lamp socket by common twin flexible cord, the connection with the movable lamp socket being carelessly made so that it became live unexpectedly. If the lamp holder cannot be earthed conveniently it should at least be insulated so that moist hands and floors may not form such death traps to unsuspecting workers.

The Dangers of Inexperience

The employment of apprentices and pupils on testing work is considered responsible for the numerous accidents in electrical factories. This work requires a degree of skill and experience which cannot be expected in beginners, and this fact, coupled with the use of equipment of a makeshift nature, contributes largely to these regrettable occurences.

One of the fatal accidents in "miscellaneous," was the outcome of conditions which exist in many workshops to-day and the danger is not realized till too late. It occurred in connection with a "fool-proof" fuse box where the fuses cannot be touched until the switch is off. This apparatus was made for using cartridge type fuses, but these had been replaced by ordinary fuse wire. One end of a fuse had been disconnected for some reason or another, and the box closed. The electrician was not aware that the loose end of the fuse wire was in contact with the box and when he closed the switch some time later he received a fatal shock from the iron case.

BREAKAGE OF DRILLS

Drills that are properly hardened and pointed are often condemned on account of breakage when the trouble should be rightly charged to the drilling machine. If there is any spring, lost motion or backlash between the upper part of the machine and the table, the drill will not begin to cut until the pressure has taken this up, after which the feed will be practically constant until the point of the drill breaks through. As this happens, the resistance to the penetration of the drill is abruptly reduced, and any spring or backlash in the parts of the machine will cause the drill to "hog in." The sudden increase in torsional strain which is thus produced, frequently causes drills to break.—Drill Chips.

FINANCING CANADA'S WAR ORDERS

QUITE a divergence of opinion seems to exist, both among bankers and manufacturers of war munitions as to the means to be employed in solving financial problems arising from the prosecution of contracts. As far as we have gone there does not appear to have arisen a situation so desperate as to have called forth any radical departure from peace-time practice, still there is a growing disposition towards the formulation of some plan whereby the machinery of currency may be made to contribute more effectively to munitions and other war supplies output.

We have been engaged on war contracts for many months now, and these have been in many cases large, both in extent and cash value. No new contracts for the smaller size shells in amount equivalent to those given out in the first half or thereby of 1915 have been recently placed, and other reasons notwithstanding, there is a lurking suspicion abroad that until some more satisfactory scheme of financing munitions and other war supplies is devised and becomes operative, our opportunities to participate to the fullest extent possible in the distribution of war contracts will be less in evidence.

It has been borne in upon us in recent weeks that Great Britain would welcome our taking steps to finance in large part our war contracts to her order, and it surely is nothing short of complimentary to us that we have been so informed, and that such confidence is displayed in our resources and resourcefulness. It is altogether childish to maintain that for our production activities welfare, we must have cash paid "right on the nail," such an attitude being indicative of a lack of grasp and appreciation of the highly abnormal circumstances in which we are placed and of the unprecedented times through which we are passing. It is not a question of what must be done—except of course we regard the lack of recent orders for large quantities of the smaller size shells. It is a question of what should and can be done, but will we allow ourselves to be big enough to tackle the job.

We cannot expect even our most substantial manufacturing corporations to extend credits unduly—until the end of the war as has been suggested, and there is little need that they do so. The Canadian Government is in a position to find the necessary money either by borrowing from its own people through the medium of War Loans or from the United States. At all events, and third in order, there is the possibility of establishing a National Currency, which, despite many reasonable objections, need not, if issued against the collateral of British Exchequer bonds and made redeemable in a short term of years, be accounted as derogatory to our national financial standing.

In spite of the fact that Britain's gigantic war machine has now made her largely self-contained as far as placing contracts abroad is concerned, there is little doubt that in the immediate future months we can participate quite largely in the distribution of shell orders if we but contrive to and succeed in our efforts to finance them. Joint action by our Government, our bankers and our manufacturers is in order.

CONCERNING A SUGGESTED DEPARTMENT OF MANUFACTURES

THE suggestion is made by a correspondent of an American technical publication that a Department of Manufacture be established to so direct the actions of the nation in regard to manufacturing that consumers would be assured of getting the most satisfactory return for their money by regulating their purchases in accordance with the departmental findings.

While the development of such a policy might be desirable and even beneficial in some lines of industry, its activities could very well be confined to the grading or classification of products not in direct comparison with those of a competitor, but with a scale of standards set up by the department. The shipbuilding industry of Great Britain is inseparably linked up with such advisory organizations as Lloyd's Register, British Corporation, etc., and while a prospective purchaser may receive numerous tenders for the construction of a ship, he can rest assured of receiving not less than a certain quality of product irrespective of price, according to whichever classification he decided on when arranging with either of the corporations referred to.

The desirability, indeed, the possibility of developing such a system into a national department is questionable. Engineering is a more or less concrete science. Its theories are capable of demonstration more visibly and convincingly than those of any other field. Its applications affect our lives every hour of the day; our comfort, pleasures, work, all are ultimately subject to the influence of mechanical science. The great majority of civilized people are dependent on its continued development for their livelihood, and their energy and success in any particular branch are due to their individual ability in adapting effort to meet a demand.

The prospect of having a State Department to sit in judgment and issue statements on the relative merits of different harvesters, automobiles, sewing machines, typewriters, electric irons, etc., is not likely to meet with a cordial welcome from manufacturers generally.

Opinions differ in machines as well as in politics and while the adoption of the suggestion might prevent a few novices annually from being imposed upon, the net results would not count for much, especially as many of the parties benefited in some ways might possibly suffer from discrimination in others.

The various aspects of manufacturing are too numerous and too subject to individual influence to allow of Governmental control and direction in the manner suggested by the correspondent referred to. The value of publicity has long been recognized by all important institutions and the records and transactions of Engineering Societies and kindred bodies throughout the world contain accessible information of a variety and value which no Government Department could hope to duplicate.

INDUSTRIAL NOTABILITIES

ROBERT OSBORNE McCULLOCH, Vice-President and Secretary-Treasurer, the Goldie & McCulloch Co., Galt, Ont.; Director, Galt Art Metal Co.; Director Mutual Life Insurance Co. of Canada; Director, Canada Trust Co.; Director, Union Bank of Canada; Director, Millers' & Manufacturers' Insurance Co., was born at Galt, Ont., on April 1, 1864, a son of Hugh and Janet (McCartney) McCulloch.

From being a pupil in Dr. Tassie's School, he went to the University of Toronto, graduating from same in 1885, with the degree of B.A.

On leaving the University he read law with McCarthy, Osler, Hoskin & Creelman, Toronto, and was called to the Ontario Bar in 1888; formed partnership with W. H. P. Clement (now Mr. Justice Clement, Vancouver), under firm name Clement & McCulloch,

ROBERT OSBORNE McCULLOCH
Vice-Pres. and Secy.-Treas. the Goldie & McCulloch Co., Galt. Ont.

Toronto, 1890-1892; practised alone, 1892-1897; came to Galt, 1897, as secretary-treasurer of the Goldie & McCulloch Co., becoming vice-president of that firm on the death of his father, Hugh McCulloch, September, 1910.

Mr. McCulloch is a member of the executive committee of the Canadian Manufacturers' Association; was first chairman of the Parks Commission, Galt; and for seven years the president of Galt Board of Trade. He has been president of the South Waterloo Conservative Association, since 1897.

He married Louise Leslie, daughter of the Rev. Alexander Leslie, Aberdeen, Scotland, on October 14, 1896, his family consisting of two sons and two daughters.

Mr. McCulloch is in religion a Presbyterian, and in politics a Conservative. His clubs are the Toronto, Waterloo County Golf and Country, and the Toronto Golf, while fishing, golf and riding constitute his recreations.

The family residence is Rothienorman, Galt, Ont.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents

Montreal, Que., Jan. 24, 1916.—Recent statistics issued by the Department of Trade and Commerce covering the last nine months of 1915 show enormous expansion. The grand total of trade for this period shows an increase over the corresponding period last year of $265,-476,544. While this is largely due to the present abnormal conditions, it also demonstrates that the industrial resources of the country are capable of very great expansion when circumstances demand it.

Steps are now being taken for the establishment in Canada of a nickel refining industry, and before long it is anticipated that operations will be commenced on this most important work. The project, which is being advanced by private interests, is gaining favor with the Government, as it will provide the means for treating large quantities of ore within the Dominion. The value of this undertaking will be better understood when it is learned that Canada now produces about 85 per cent. of the world's supply of nickel.

Recent reports of Canadian banks show that the financial conditions are constantly improving, giving a much brighter aspect to the general situation.

Pig Iron

Although the market is comparatively quiet at present, the production of steel making iron is continuing with little or no abatement. Very little interest is being manifested by producers as to current prices, as the output of the blast furnaces is, in most cases, sold as far in advance as the end of the second quarter. No advance is quoted for this week, and the local conditions are practically unchanged.

Steel

The tension prevailing throughout all branches of the steel-making industry shows no signs of relaxation. The constant demand of large tonnage for shell making and munition purposes is calling forth every effort of the steel mills to keep up the supply. A feature that may result in serious trouble, both regarding production and price, is the feeling of unrest among the mine workers of America. An increase of 20 per cent. may be demanded, beginning April 1st, to be followed by a general strike, unless the mine operators comply with the demand.

Inquiries for steel billets are lighter, but production continues with unceasing energy, the supply still being below the requirements of shell makers and finishing mills. The market for plates and shapes is very strong, inquiries being large and deliveries uncertain; local quotations are firm at last week's prices.

The requirements of the sheet consumers are enormous, and mills are taxed to the utmost in the effort to supply the increasing demand. Many mills are running at 100 per cent. capacity, with orders running well into the second quarter. Blue annealed sheets are very active, but galvanized trade is a little lighter. From 5 to 10 per cent. advance is noted on all sheet quotations; black No. 28 is now quoted at $3.75; Canada plates, dull, $3.50; bright, strong, at $4.60. All galvanized sheets show a similar increase. Steel wire nails are stronger, showing an increase of 10 cents, advancing the price to $3.10.

CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.

Pressed spikes are now quoted at $3.45 per hundred pounds.

Metals

The general tone of the metal situation remains unchanged. The market is somewhat unsettled, owing to the stand of the British Government in forming a policy of protection along these lines. The strength of copper on foreign markets has not yet affected prices here, but expectations of the dealers are for a further advance.

Lead has shown a slight advance, and all other metals are comparatively firm.

Copper.—No relief is apparent in the copper situation, and producers report that it is impossible to supply dealers on early delivery, and even for future sale buyers are obliged to abide the action of the sellers. The rumors that a supply of copper was being held in stock at the refineries was largely due to the fact that the congested state of shipping facilities at certain points was such that material was accumulating at the plant, awaiting shipment to buyers.

Current rumors that there is a probability of a corner in copper, with prices at 30 cents (New York), has put the market in a very nervous condition. The present state of the market is such that almost any price may be quoted for prompt and early delivery. That the market will be still stronger is generally conceded, as the conditions show no precedent, and dealers must not confuse the present situation with others when the circulation of false reports were responsible for price advances. Foreign prices have advanced, but, while the local market is strong, dealers report quotations as holding firm, with a possible rise before the week-end.

Tin.—The strict censorship by the British authorities upon all foreign messages has delayed cable reports of market conditions. Late reports, however, indicate a strong market, but business remains normal. With a plentiful supply of tin in sight, there is little possibility of any advance. Local quotations are firm at 45½ cents.

Spelter.—With the continued difficulty of securing first quarter delivery, many inquiries are coming in for second quarter supply. As there is every indication that the production of spelter has recently increased, and the demand for galvanized material has slackened, there is a prospect of easier prices for futures. It is, therefore, surprising that quotations for late deliveries should be so strong, although from the apparent condition at present, the price of spelter may show strength before a decline. Local dealers report a fair market, with prices unchanged.

Lead.—The strength of the present market is largely due to the heavy foreign inquiry, and although there has been no report of sales resulting, the feeling that a stronger market is imminent is everywhere evident. The report that British trade in metals would be controlled by the Government has had the effect of disturbing the local market, but recent developments have given a more encouraging tone to the situation. Local quotations show an advance of ¼c per pound, this week's price being 7¾c per pound.

Antimony.—An evident scarcity of antimony has somewhat strengthened the market, and foreign quotations are higher, but local dealers report unchanged conditions. Present prices are firm at 45c per pound.

Aluminum.—The market remains firm at the prices quoted—68c per pound.

Machine Tools and Supplies

The machine tool trade is gradually becoming more normal, and the difficulty of securing delivery is not so pronounced as a few months back. Considerable work is still being done on munitions machinery, especially of the heavier type for large shells. Orders placed many

months ago are still awaiting delivery, much of the delay being due to labor troubles in the States. The demand for supplies, while not as great as some time ago, is still proportional to the business being done. The situation prevailing throughout the entire steel industry has had its effect upon many lines of machine shop necessities. All price lists on twist drills, reamers, files and machinists' small tools have kept pace with the general steel conditions. The lack of flax seed has been the cause of sharp advances in linseed oil, which is now quoted at $1.04 to $1.06 for raw, and $1.07 to $1.09 for boiled. The continued heavy demand and the apparent decrease in production of crude oil has gradually affected the price of gasoline, and further advances are expected.

Old Materials

The trade in scrap metals during the week has been rather quiet, but considerable business is being done in heavy melting steel scrap. Prices are generally firm; heavy lead being the only material showing an advance.

Toronto, Ont., Jan. 25.—The industrial situation is unchanged but the steady advance in prices of raw materials and finished products continues. There is little or no prospect of any decline in prices for some months, but rather a tendency to higher levels than prevail at the present time. This is becoming an important matter for manufacturers to contend with as it means increase in cost of production. The continued strength in the iron and steel and ingot metal markets is reflected in the higher prices for a number of products which have been announced during the week. The following are the more important—Machine screws, wood screws, boiler plates, wire rods, Manila rope, transmission rope and drilling cables, cotton waste, gasoline, benzine, scrap zinc, copper and lead also many lines of mechanics tools. Higher prices in the near future are anticipated for wrought iron pipe, black and galvanized sheets, wire nails, etc.

Steel Market

Great activity continues in the iron and steel trade and the mills are working at capacity in an effort to take care of the demand. Deliveries however, are getting behind and prices have a higher tendency. An advance has been made in boiler plates but otherwise quotations are unchanged. It is reported that the Algoma Steel Co. have booked orders for 30,000 tons of 85-pound section rails from a Canadian railway. The market is strong and the outlook very favorable.

Prices of black and galvanized sheets have advanced again and the market is very firm. Sheets are being sold on the local market below cost of importation, further advances may therefore be expected. Stocks are light, so re-sale prices will have to be based on manufacturers' costs, but profits are not sufficient to make the business worth while. The increasing cost of steel, the scarcity of acid, high labour cost, and advances in production costs generally are diminishing the margin of profit on sheets for the manufacturers.

The high speed tool steel situation is unchanged and prices still range around $3 per pound. The demand is not so heavy but enough to keep the mills working to capacity. Shipments from the States are coming in slowly and deliveries are very backward, owing to the heavy demand there. Some steel is coming through from England but all exports are controlled by the British Government and the requirements of British and French munition plants is taking up almost the entire production.

ALLIES PURCHASING AGENTS

The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:

International Purchasing Commission, India House, Kingsway, London, Eng.

French.—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendence Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.

Russian.—Col. N. Golejewski, Military Attachè, Room 904 Flat Iron Building, New York City.

The steel market in the States continues very strong and prices of bars, plates and shapes have advanced to $2 per 100 lbs. The Pennsylvania Railroad has removed the embargo on export shipments to New York under certain conditions but the embargo to New England points is still on. Although the situation has been relieved, shipments to eastern Canada are still affected. The mills are sold up for three or four months and deliveries are getting more backward than ever. The demand for steel bars continues decidedly heavy, large contracts having been received for rounds for shells. The heavy demand for billets continues but prices are unchanged. Wire rods have advanced $3 and are now quoted at $45 per ton Pittsburgh.

Pig Iron

The pig iron market is a little quieter but the situation is unchanged. Lake Superior charcoal iron has advanced 50c and is now quoted at $19.75 per ton Chicago. Hamilton and Victoria are unchanged.

Old Material

The embargo on shipments of wrought and steel scrap is still on and will most probably remain in force. The Dominion Government has been asked by interests in the West to establish lower rates on cast iron scrap to the steel plants in the East. The market for this material has hitherto been in the States but this has been shut off by an embargo. The present freight rate is practically equivalent to the cost of the scrap. The market is firm with higher prices for scrap zinc, lead, copper and composition. Heavy melting steel is weaker and has declined. Fair business is reported, the principal demand being for copper.

Machine Tools

Conditions in the machine tool market show little change. The demand for shell making equipment has fallen off considerably but some nice orders have been taken for smaller tools for making shell parts. For the next few months this end of the shell industry promises to be very active as there is a good demand for shell parts the production of shell cases having got ahead of the capacity for completing them. Deliveries from machine tool makers in the States are still backward as the domestic demand there has improved considerably.

Supplies

Business continues brisk and prices of many supplies are going up. The L. S. Starret Co. have issued a new and revised price list in which some lines have been advanced. The Brown & Sharp Co. have also revised their price list on machinist's small tools, screw machine tools etc. Makers of wood screws have issued a new price list. Bright flat head screws are unchanged at 85 per cent., but the discount on brass and bronze flathead screws are now 50 per cent. and 45 per cent. respectively. The expected advance in gasoline and benzine has materialized. The oil situation is getting more serious owing to the steady increase in the demand for gasoline and shortage of crude oil. Gasoline is now quoted at 28½c and benzine at 28c per gallon being an advance of 1c per gallon. Indications point to higher prices.

The rope market is strong and prices are higher due to the increase in cost of raw materials, principally sisal and manila. Pure manila rope is now quoted at 17½c., transmission rope at 21½c., and drilling cable at 18½c base, per pound. Cotton waste has also advanced.

Metal Market

The market is considerably stronger and prices are higher for a number of metals, including copper, tin, spelter and lead. The higher prices are due to strength in the primary markets, the situation in London being the principal cause. Prices of copper although higher are really nominal owing to the difference between the prices at which a buyer can be found at different tonnages. Tin is higher in London, the market being apparently influenced by the strong copper and lead markets. A strong demand for spot and nearby spelter caused an advance in the market which is firm. An advance of $4 a ton in lead at New York, has been made by the "Trust" although outside lots have been disposed of at lower figures. Antimony and aluminum are both unchanged while solder is firm at last week's prices.

Copper—The market continues strong and higher. The enormous consumption of copper is absorbing the entire production, hence the position is a very strong one. The demand is unprecedented and will most probably increase during the year, higher prices are therefore anticipated. The market at present is largely nominal as the range of prices varies according to tonnage. Locally copper has advanced ½c per pound and is quoted at 27½c per pound.

Tin.—This market is strong in sympathy with other markets and is higher in London. The demand for tin is light and the trade is apparently well supplied with spot and early delivery metal. Tin has advanced ½c and is being quoted locally at 45½c per pound.

Spelter—The market is strong and higher. There is a heavy demand for spelter for all deliveries up to July and a scarcity of spot metal. In the local market spelter has advanced ½c and is quoted at 21c per pound.

Lead.—The "Trust" have advanced lead $4 per ton making the price 6.10c, New York. This market is firm but the outside market is a little below the "Trust" price. Lead is now quoted at 8c per pound representing an advance of ½c.

Antimony.—The market is firm at unchanged prices for spot and early deliveries. The situation is unchanged and prices nominal at 40c per pound.

Aluminum.—The market is firm and the situation unchanged. Aluminum is quoted at 68c per pound.

Solders.—Prices are firm and unchanged although the strength in the tin market may effect solders. Half-and-Half is quoted at 24½c per pound.

Winnipeg, Man., Jan 24.—The machine tool situation remains about the same. Very few inquiries are coming in, and what machinery is on order is hard to procure. All machine tool makers appear to be filled up with orders. Sawmills in the West continue to buy repair material. Taken on the whole, the outlook is good, indications are that there will be a decided improvement in the Spring. Rolling mills in the West are running full time in many cases, their product in most cases being sold to wholesale hardware dealers, who job it to country merchants and small machine shops.

One hears here and there of factories which have been idle for two years or less, opening up again. It is reported that a glass factory in Redcliffe, Alberta, has started operations again. The Carbondale Machine Co., of Carbondale, Pa. is also said to be preparing to start at Transcona, Man. This is a new concern, and it is believed they have brought much of the equipment they require from the other side. They are, however, in the market for a quantity of supplies. The general supply trade is in fair shape, indicating that firms are fixing up their plants. There is a steady demand for twist drills and belting. Local hardware jobbers have announced advances this week in a large number of lines.

CANADIAN PURCHASES FOR FRENCH WAR OFFICE

Philippe Roy, General Commissioner for Canada, Paris, advises the Department of Trade and Commerce, Ottawa, that an order has been issued by the War Department of the French Government to the effect that all purchases made by the Supply Branch in Canada will pass through the Hudson Bay Co. Canadian producers should therefore submit their future offers through the office of that company at Montreal. It is further stated in Mr. Roy's communication that Canadian lumber, steel and meat will find in France an important market for years to come, but it is necessary that Canadian firms should have in Paris representatives entrusted with the necessary authority, especially if it is desired to secure Government contracts.

FINAL RETURNS ON 1915 CROP YIELD

THE final returns of the yield, quality and value of the grain crops of Canada for the season of 1915, were issued on Jan. 19, from the Census and Statistics Office. "As a result of the returns of the average yield per acre," says the report, "made after threshing, the total yields of the grain crops, in bushels, for the season of 1915, compared with 1914, are as follows:

"Wheat, 376,303,600, as against 161,280,000 in 1914.

"Oats, 520,103,000, as against 313,078,000.

"Barley, 53,331,300, as against 36,301,000.

"Rye, 2,394,100, as against 2,016,800.

"Peas, 3,478,850, as against 3,362,500.

"Beans, 723,400, as against 797,500.

"Buckwheat, 7,865,900, as against 8,626,000.

"Flaxseed, 10,628,000, as against 7,175,200.

"Mixed grains, 17,523,100, as against 16,382,500.

"Corn for husking, 14,368,000, as against 13,924,000.

"The average yields per acre in 1915 are, in bushels, as follows, the figures in brackets representing the yields of 1914 for comparison:

"Fall wheat, 29.41 (21.41); spring wheat, 28.93 (15.07); all wheat, 28.98 (15.67); oats, 45.76 (31.12); barley, 35.32 (24.21); rye, 21.31 (18.12); peas, 17.73 (17.64); beans, 16.70 (18.20); buckwheat, 22.88 (24.34); flaxseed, 13.18 (6.62); mixed grains, 37.54 (35.36); and corn for husking, 56.72 (54.39).

"For the principal grain crops the total yields represent the most abundant harvest in the history of Canada. With regard to wheat and oats, this result is due to a double cause; expansion of the acreage by special effort as a consequence of the war, and an exceptionally favorable season, giving for Canada the highest average returns per acre on record.

"The quality of the grain crops in 1915, as determined by the weight in pound per measured bushel, is, with the exception of one or two crops, superior to that of last year, and also superior to the average of the last five years. Weights per bushel for 1915 are as follows: Fall wheat, 59.71 lb.; spring wheat, 60.31 lb.; all wheat, 60.19 lb.; oats, 36.61 lb.; barley, 48.26 lb.; rye, 56.32 lb.; peas, 60.74 lb.; beans, 59.61 lb.; buckwheat, 48.02 lb.; flax, 55.28 lb.; mixed grains, 44.98 lb.; and corn for husking, 56.32 lb.

The total value of the principal grain crops of 1915 are as follows: Wheat, $312,569,400; oats, $176,894,700; barley, $26,704,700; rye, $1,899,900; peas, $5,730,700; beans, $2,206,800; buckwheat, $5,913,000; flaxseed, $15,965,000; mixed grains, $10,034,700; corn for husking, $10,243,000. Including the root and fodder crops, particulars of which were published last November, the total value of the field crops of Canada in 1915 amounts to nearly $800,000,000, comprising grain crops, $368,161,900; potatoes and sugar beets, $36,739,500; and fodder crops, $192,768,100.

"In the three North-West provinces of Manitoba, Saskatchewan and Alberta, the production of wheat in 1915 is estimated at 342,948,000 bushels, as compared with 140,958,000 bushels in 1914; oats at 334,840,600 bushels, compared with 150,843,000; of barley at 35,317,200 bushels, compared with 19,535,000; and flax at 10,559,000 bushels, compared with 7,083,000."

LAKE CARRIERS' ANNUAL

AFTER a season of navigation, most discouraging at the outset, but a record-breaker at the finish, vessel owners whose ships operate on the Great Lakes met in Detroit, Mich., on January 20, for the annual session of the Lake Carriers' Association. The annual report of William Livingstone, of Detroit, president of the organization, referred to the last season of navigation as "in many ways the most extraordinary year that the association has ever experienced."

"The association faces the year 1916," the report continues, "with lessened membership in point of numbers owing to economic changes which have been going on during the last decade, and which reached a striking fruition in the absorption of vessels during the closing months of 1915. In point of tonnage, however, the loss has been only 12,952 tons, mainly in second-class vessels, but this loss will be far more than made up by the first-class vessels now on the stocks."

Ore movements featured the season's operations. Up to August 1 the ore movement was 5,604,155 tons behind that of 1913. Shortly after August 1, business began to pick up, and every month thereafter was a record-breaker, 25,593,501 tons of ore being moved after that date. Every ship that could possibly be pressed into service was fitted out.

During 1915, 89,195,875 net tons of bulk freight were handled on the Great Lakes, an increase of 16,256 272 tons over 1914. Eleven vessels were lost during the year. The Eastland disaster brought the loss in lite up to 831 persons. Only 19 lives were lost, however, exclusive of the Eastland tragedy. The meeting of the association lasted two days.

CANADIAN CAR & FOUNDRY CO. RUSSIAN SHELL ORDERS

OFFICIAL announcement is made that a commission of five, acting as the directing board of Canadian Car & Foundry Co. agency in New York, has been organized to supervise the carrying out of the company's Russian shell orders.

Col. Dunn, of the U.S. Army, well known as an authority on explosives and the manufacture of ammunition, has been appointed general manager of the agency and given full charge of production, while J. P. Murray, one of the legal advisors of the Russian Shell Commission, has also been named on the board. The other three members are officers or representatives of the Canadian Car & Foundry Co., namely Senator Curry, president; W. W. Butler, vice-president; and C. H. Cahan, legal advisor.

The announcement is a sequel to various negotiations in progress for several months, which have aimed at placing the carrying out and the financing of the huge contracts, totaling approximately $145,000,000 in value, on a more satisfactory basis. In November it was believed that the financing arrangements would be made through important banking interests in New York, but a hitch developed and after dragging into the new year, it was finally stated that this plan was all off. Shortly afterwards announcement was made that the money necessary to finance the work would be forthcoming from the Russian Shell Commission and about two weeks ago the company received its first advance, it being officially stated that further funds would be available as required.

In addition to the board as constituted, it is stated that Brig.-General Ellershaw had been named as a trustee for the agency, presumably to supervise the disbursement of funds as advanced to the agency by the Russian Commission. The entire arrangement removes the last obstacle in the way of a successful carrying out of the contracts. Shipments of shells are said to be going forward satisfactorily and deliveries should be completed within the dates specified in the contracts.

The company's agency at New York was organized some months ago with a nominal capital of $20,000. All the stock is owned by the Canadian Car & Foundry Co., and what profits accrue from the shell business will be paid over to the present concern. The intervention of the agency in the contracts, however, assures a separation of the Russian business from the Canadian and British business of the company in Canada, and in this way facilitates financing through the Russian Shell Commission of the Russian sub-contracts placed in the United States.

EQUIPMENT FOR AUSTRALIAN NAVAL DOCKYARD

Tender forms and specifications have been forwarded by D. H. Ross, Trade Commissioner, Melbourne, for 43 machines of various types required for the equipment of the Commonwealth Naval Dockyard, Cockatoo Island, Sydney, N.S.W. Tenders will be received, subject to the conditions specified, up to May 1, 1916, addressed to the Director of Navy Contracts, Melbourne, Australia. The last mail in time to reach Melbourne on May 1 is that leaving San Francisco on March 22 and due at Melbourne on April 12. The tender forms are open to the inspection of Canadian manufacturers at the Department of Trade and Commerce, Ottawa (refer file No. A-1435). Particulars of the requirements are briefly outlined thus:

Three 50-ton overhead travelling cranes.

One 25-ton overhead travelling crane.

Two 5-ton overhead travelling cranes.

One 10-ton revolving cantilever crane.

Two 5-ton travelling portal jib cranes.

Two 7½-ton jib cranes.

One 5-ton jib crane.

Two 15-ton hydraulic cranes.

One 6-ton hydraulic crane.

One 6-ton wall crane (hydraulic).

Two 3-ton wall cranes (hydraulic).

Two electric passenger elevators.

Two electric goods elevators.

One 2½-ton gauge locomotive with crane attached.

One 2½-ton gauge locomotive without crane attached.

Three electrically-driven air compressors, 1,500 cu. ft.

One 15-ton hydraulic winch.

One 5-ton hydraulic winch.

Nine 10-ton hydraulic capstans.

Two 5-ton hydraulic capstans.

One bar shearing machine.

One double-ended horizontal punching machine.

One 10-ton overhead travelling crane for shipyard fitting shop.

CANADIAN CAR & FOUNDRY CO.

IN addition to the orders placed in Canada and the United States by the Russian Government through the Canadian Car & Foundry Co. New York reports that General Germonius of the Russian buying commission, has placed business for 32,000 machine guns to be manufactured in Canada and the United States. The order is the largest of its kind ever given, and involves $31,500,000. Particulars of the firms securing the business are not yet announced, but it is stated that three American and one Canadian firms will divide the total. It is also reported that Russia is negotiating further shell orders on a big scale, involving 5,000,000 shrapnel and 5,000,000 high explosive.

NICKEL REFINING IN CANADA

STEPS are being taken, we understand, as a result of the recent visit to Ottawa of Ambrose Monell, creater of the International Nickel Co., for the establishment in Canada of a nickel refining plant, for the treatment of nickel ore and matte. The arrangements are as yet incomplete, but it is believed that comparatively little remains to be settled before the new industry becomes an accomplished fact.

The project is being advanced by private interests with large financial backing. The matter has also been taken up with the Government, and is believed to be looked upon by them with favor as providing a means for the treatment within the Dominion of the world's largest nickel output. The present plan is to locate the big plant at Cape Breton, N. S. The industry will probably be operated under some form of Government supervision, and with the definite stipulation that the Imperial Government shall have the first call on as much of the output as it shall require.

Refining Accessories Feature

The establishment of a plant in Canada will be a considerable economic problem, as it will entail increased cost of sulphur, free oils, coke, nitre cake, fire brick, fire clay, magnesite brick, and coal. Until now the refining has been done at Bayonne, New Jersey, adjacent to the great oil refineries and chemical plants. In the ordinary process the ore mined in the Sudbury district is transported to the smelter at Copper Cliff, and is there smelted by successive stages into a product known as copper-nickel matte, containing approximately 55 per cent. nickel 25 per cent. copper, and 20 per cent. sulphur. All of this matte has in the past been shipped to the Bayonne refinery, where the nickel and copper have been separated from each other.

When the war broke out, the Dominion Government took prompt steps to prevent the nickel produced in Canada and refined in the U. S. from reaching enemy destinations. Canada produce about eighty-five per cent. of the nickel supply of the world, chiefly from the Sudbury district of Ontario, the nickel being exported in the form of matte and refined in the United States and Great Britain. The danger that some of this Canadian product might find its way to the armament plants of enemy countries led the Canadian Government to take the matter up with the refining company in the United States, and a representative of the Government was given access to the company's books for the purpose of maintaining a check on exports. This plan had the full approval of the British War Office, and has worked out satisfactorily, but the establishment of a refining plant in Canada, which will take care of the Canadian raw product, will go even farther than such an arrangement.

New York Comment

New York official comment on the proposed refining of Canadian nickel matte within the Dominion indicates that the International Nickel Co., New York, will when the time is ripe undoubtedly acquiesce in the wishes of the Canadian people. However, it does not anticipate, in view of the vast interests involved and the importance to the war trade, that the Government will, for the present, cripple the industry in New Jersey, where plants worth millions have been erected, employing more than 1,000 men.

The International Nickel Co., capitalized at $62,000,000, treats three-fourths of the nickel matte produced in Canada, and 80 per cent. of the world's supply is obtained from Canada. The patented nickel lands of the International Nickel Company in Ontario cover 100,000 acres. The company owns the town of Copper Cliff,where it has eerected an up-to-date smelting plant. It also owns the shares of the Societe Miniere Caledonienne of New Caledonia, which possesses extensive nickel lands. Its output since the war began has increased 25 per cent.

CANADA'S TRADE

TRADE statistics covering the nine months of the fiscal year ended December 31, 1915, issued on January 19, by the Department of Customs, show the commerce of Canada to be expanding enormously.

Taking into account re-exports and the movement of coin and bullion, the grand total of the trade of the Dominion for the nine months reaches the imposing figure of $1,102,486,303, compared with $837,009,759 for the corresponding period of the previous fiscal year. That the volume is increasing is shown by the December returns, the trade of last month having reached a total of $148,-815, 954, compared with $70,382,903 for the same month in the previous year.

The December statement reveals heavy increases in both imports and exports, without taking into account the movement of gold or the export of foreign merchandise. For the nine months' period the imports show a slight shrinkage, amounting to $343,923,323, as against $348,746,920, but the December imports increased from $30,392,913 to $45,690,-721.

Exports of domestic merchandise in December totalled $92,171,402. In the previous December they amounted to the comparatively low figure of $37,193,609. While in the nine months' period they jumped from $306,823,039 to $511,534,-042. The increases in exports were found in nearly every column. Manufactures rose from $53,186,926 to $119,-392,269; agricultural products from $106,608,923 to $202,506,936 and animals and their products from $58,436,712 to $78,559,424.

The inland revenue returns also show a substantial increase, the total for the month of Quebec being $2,416,195, as against $1,897,774 in the corresponding month of the previous year.

AUSTRALIAN COMMONWEALTH INCOME TAX ON OVERSEA FIRMS

UNDER the Income Tax Assessment Act of the Australian Commonwealth, as amended, the position of an agent selling goods for a foreign principal is stated to be as follows:—

Goods are deemed to be sold in Australia if there is an Australian representative who receives commission or salary for obtaining orders, or for influencing the sale of the goods. The absentee principal is taxable on an income equivalent to 5 per cent. of the price at which the goods are sold. The agent is required to make returns on his own behalf as well as on behalf of his principal, and he is required also to pay not only his own tax, but the tax assessed against the principal, out of any of his principal's money coming into his hands. For the first year of tax only the agent is relieved of personal liability in respect of the tax of his principal, but this does not relieve the principal. Before the agent is relieved he must satisfy the commissioner that he has none of his principal's money, and will receive none out of which the tax can be paid, and also that the principal has refused to pay the tax.

It is pointed out by the representatives of British manufacturers that their principals have already to pay a high income tax in the United Kingdom, and that a British manufacturer not represented in Australia would escape the local tax, while those who were represented by agents or travellers were made liable. The obvious difficulty in collect-

ing the income tax, from the Australian representatives of firms in the United Kingdom and other British possessions, is recognized by the Department which has relieved the agent from the responsibility of payment for the first year only, while maintaining the liability of the oversea principal.

In view of the possible development of Canada's export trade to Australia, the foregoing enactment is a matter of special interest.

BRITAIN GETS CONTROL OF FERRO-MANGANESE

AMERICAN manufacturers using ferro-manganese in the manufacture of steel have been asked by representatives of the British Government to dispose of their products containing that constituent only to Great Britain and her allies. The supply of this material is said virtually to be controlled by Great Britain and Russia.

Customers of the Bayonne Steel Casting Co., of Bayonne, N.J., have received from that concern notice that British agents have requested them to have all their customers sign a promise not to export, except to the United Kingdom, France, Russia or Italy, any of the steel products purchased from the Bayonne Co. in which ferro-manganese is employed.

The customers were asked also to agree to notify the British Consul-General in New York of any shipments of steel or steel products containing ferro-manganese to any destination other than Europe or Canada.

A representative of the Bayonne Co. says 95 per cent. of its customers have signed the proposed agreement.

EXPORTS OF LOGWOOD

FORMAL notice has been given the State Department at Washington, D.C., by the British Embassy that the embargo on dyewood exports from Jamaica and British Honduras had been raised, and that the export of the product to the United States would be continued, provided manufacturers there resumed supplying logwood extract to Canadian users on a reasonable scale. A statement from the Embassy announcing this action follows:

"The British Embassy have informed the State Department that the Governor of Jamaica has issued a general license permitting the exportation of logwood chips and extract to the United States as well as to Great Britain, France and Italy, and that the Governor of British Honduras has been instructed to take similar action.

"The export of these materials from British possessions to the United States will, however, only be continued on condition that the supply of extract from the United States to Canada be resumed on a reasonable scale."

CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

Why they like the "Dial" Time Recorder

Thousands of manufacturers have told us at one time or another that they prefer the International "Dial" type of Time Recorder, as pictured above, to all others. Recently we made an exhaustive enquiry as to their reasons, and we publish them below, believing they will interest you.

1. The operation of the employee recording his time on the Dial is the fastest in the world.

2. The time slips taken from the Dial Recorder at the end of the pay period give the pay-roll in complete form, already made up, and easily filed.

3. No employee has an opportunity of losing or mislaying the Dial's Record, as it is kept under lock and key during the whole pay period.

4. The Dial Recorder can be more readily moved about from one part of the building to another.

5. One employee cannot see the record of another.

6. The slips from the Dial Recorder can be referred to, months back, being easily filed or pasted in a book.

7. The mechanism of the Dial Recorder is inaccessible to those of meddlesome mind.

8. The necessary stationery for the Dial costs less than any other Time Recorder—meaning less upkeep expense.

9. The Dial Recorder is clean and sanitary to use and the printed sheet cannot be thumbed and soiled by workmen's hands as with cards.

10. Dail Clocks have a long life, there being less vibration and jar when used.

11. It is unnecessary to have any set hour shifts or any particular set of operating hours. Each employee registers in his proper place any time.

12. You can't overload the Dial. It is so quick to use there is no congestion of operatives at registration time.

13. It is impossible to register in the wrong column.

Remember our Guarantee: "We offer $100 reward to anyone who will buy a new International Time or Cost Recorder from the Company or an authorized agent at under list price less our regular discount."

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

Engineering

West Lorne, Ont.—Fire on Jan. 20, destroyed the Ontario Gas. Co. regulator building here.

Ottawa, Ont.—The Ottawa Brass Mfg. Co., are considering the erection of an addition to their factory.

Calgary, Alta.—An expenditure of $22,500 on equipment for the civic power plant is contemplated.

Guelph, Ont.—A stove factory will be established here. W. A. Mahoney, of this city, is the architect.

Pembroke, Ont.—The Pembroke Iron Works have taken over the Lee Manufacturing Co., and will make stoves.

Montreal, Que.—The Montreal Public Service Corporation contemplate building an important addition to their power plant.

Regina, Sask.—The Imperial Oil Co. will lay a pipe to the proposed refinery here from Plentywood, Montana, a distance of 160 miles.

Hamilton, Ont.—It is reported that the United Gas & Fuel Co., will proceed with the construction of coke oven and gas plant to cost $2,000,000.

Westport, Ont.—The plant of the Electric Light & Milling Co., has been destroyed by fire. The loss is very heavy and only partly covered by insurance.

Fredericton, N.B.—The Fredericton Electric Co. has been incorporated to take over the assets and business of the Fredericton Gas Light Co. The new company will make considerable extensions to the plant.

General Industrial

Stratford, Ont.—The Avon Hosiery Co. may build an extension to their factory.

Peterborough, Ont. — The Auburn Woollen Mills Co. will make an extension to their factory.

Redcliffe, Alta —The Dominion Glass Co. will make an extension and install a plant for making lamp glasses.

Sackville, N.B.—The factory of the Standard Boot & Shoe Co. has been damaged by fire. Some valuable machinery suffered.

Sarnia, Ont.—It is reported that Lockwood, Green & Co., of Boston, Mass., may build a cotton mill at Sarnia.

Three Rivers, Que.—Constant, Monette & Pion Co., of Montreal, are building a factory here for making chemicals.

Toronto, Ont.—The Gold Medal Furniture Co., will rebuild that section of the plant which was recently destroyed by fire.

Winnipeg, Man.—Fire which started in the basement of the Wainwright Milling Co. building on January 20 completely demolished the big flour mill, with an estimated loss of $28,000.

Municipal

Kamloops, B.C.—The City Council has authorized extensive additions to the street lighting system.

Calgary, Alta.—Fire Chief Smart, in his annual report, recommends the purchase of 5,000 feet of 2½ in. fire hose.

Hensall ,Ont.—The vote on the hydro by-law here last Monday resulted in favor of the by-law by a majority of seventy-five.

Highgate, Ont.—A by-law has been passed authorizing an expenditure of $7,000 on the installation of a hydro-electric system.

Gravenhurst, Ont —The ratepayers passed a by-law authorizing an expenditure of $3,500 on changes to the street lighting system.

Guelph, Ont.—Fire Chief Smith has recommended the purchase of new fire-fighting apparatus and the installation of a new fire alarm system.

Toronto, Ont.—Fire Chief Smith has recommended to the Board of Control that the American Le France Fire Engine Co., of Canada, be awarded the contract for the supply of three 6-cylinder tractors for the sum of $18,381.06. The chief also recommended that the same firm be awarded the contract for the combination hose and chemical motor at the prices of $7,850 and $7,981, but the board decided that before awarding this contract the chief should have a test made of the hose and chemical motors of the White Company and the successful tenderer. The American Le France Co., of Canada were awarded the contract for the tractors.

Tenders

Hullett Township, Ont.—The Township Council will receive tenders until February 3rd, for the construction of a steel bridge over Walkerburn Creek.

Windsor, Ont.—Tenders will be received until January 31 for heating, ventilating and sheet metal work for the new Windsor Collegiate Institute. Particulars may be obtained from the architect, J. C. Pennington, Windsor, Ont.

Toronto, Ont.—Tenders will be received by the Board of Control, City Hall, up to Tuesday, February 1st, for the installation of a train signal system; also special track work for St. Clair Avenue barn extension, Toronto Civic Railway. Specifications may be obtained at the Works Department, Room 12, City Hall.

Toronto, Ont.—Tenders addressed to the secretary-treasurer of the board of Education will be received until Friday, January 28th, 1916, for ash hoists, electric wiring, fire doors, steam fittings, at sundry schools. Specifications may be seen and all information obtained at the office of the Superintendent of Buildings, City Hall.

Hamilton, Ont.—Tenders will be received by the chairman Board of Control, up to February 7, 1916, for supplying mechanical rakes and appurtenances and traveling hoist and grab bucket (one-half cu. yd. capacity) and appurtenances for Gage avenue pumping station. Plans, specifications, and further details can be obtained upon application to the city engineer's office.

Toronto, Ont.—Tenders will be received by the chairman of the Board of Control, City Hall, Toronto, up to Tuesday, February 1st, 1916, for the supply and delivery of a number of street cars complete, bodies, trucks, motor equipment, air-brake equipment, copper cables for street car work, and fare boxes. Specifications and forms of tender may be obtained at the Works Department, Room 12, City Hall.

Toronto, Ont —Tenders will be received up to Tuesday, February 1st, 1916, covering the extension of cold storage division at the city abattoir. Specification may be seen and tender form obtained, together with all information relative thereto, at the office of the Department of Property, City Hall, or upon application to D. W. Wright,

JOHNS-MANVILLE SERVICE

JOHNS-MANVILLE SERVICE COVERS THE CONTINENT

YOUR assurance of quality in J-M Products is two-fold; first, the reputation of the concern which sells them—and second, the principle of responsibility, which not only reinforces the quality of the products but assures all responsibility for their performance.

J-M Products involve no experimenting—you run no risks, and therefore there is no waste.

There may be a hundred heat insulators that will cover your pipes—but only one that will insulate them.

It is our business to investigate the problem of heat insulation in your plant and recommend the proper material. We can do this impartially, too, because of the variety of insulations we make and install.

There is another important feature covered by this service that should not be overlooked, and that is the proper application of the insulation.

Probably the best recommendation we can offer the engineer as to our efficiency in this line is to say that we maintain specialists all over the country, whose experience has been the broadest—and that our contract departments are made up of men who are experts in the application of various insulations.

Why not let us talk over your work with an idea of making the thermal efficiency of your plant a record breaker?

J-M Asbestos-Sponge Felted Pipe Covering—One Style of J-M Heat Insulation.

J-M Mastic Flooring—Dustless, Noiseless, Damp-proof

Racking Room, Wacker & Birk's Brewery, Chicago.

J-M Mastic Flooring, besides being waterproof, is entirely unaffected by acids, alkali and brine. It will not create dust and is practically wear-proof. Its resiliency, in addition to obviating footsoreness, deadens sound.

For best results mastic floorings should be modified to meet the special requirements of each installation.

The specialized experience and skill of J-M Service in this respect is largely responsible for the high efficiency developed by many large J-M Mastic Flooring jobs.

J-M Service will gladly co-operate with architects on any flooring proposition. Get complete J-M Mastic Flooring facts—now.

TORONTO WINNIPEG MONTREAL VANCOUVER

manager of the civic abattoir, Tecumseh street.

Toronto, Ont.—Tenders will be received by the Board of Education, up to Friday, January 28th, for ash hoists, electric wiring, fire doors, steam fittings, at sundry schools. Specifications may be seen at the office of the Superintendent of Buildings, City Hall.

Departmental Dredging Plant—Separate sealed tenders addressed to R. C. Desrochers, Sec'y. Department of Public Works, Ottawa, will be received until February 15, 1916, for the supply of Brooms and Brushes, Chain, Coal, Hardware, Hose, Oils and Greases, Packing, Paint and Paint Oils, Manila Rope, Wire Rope, Steam Piping, Valves and Fittings, for the requirements of the Departmental Dredging Plant in Ontario and Quebec during the fiscal year 1916-1917. Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures. These forms can be obtained at the Department of Public Works, Ottawa.

New Incorporations

The Grest Brothers Lumber Co., has been incorporated with head office at Watrous, Sask., with a capitalization of $50,000.

The T. Eaton Co., of Toronto, has been incorporated under Saskatchewan Provincial laws as a limited company, with a capitalization of $1,000,000.

The Welland Gas Co. has been incorporated at Toronto, with a capital of $40,000, to acquire and develop oil and gas lands and deposits. Head office at Welland, Ont. Incorporators: D. M. Burnham, R. Ramsey and H. A. Rose, all of Welland, Ont.

The Algoma Rolling Stock Co. has been incorporated at Toronto, with a capital of $40,000, to manufacture locomotives, cars, rolling stock, etc. Head office at Toronto, Ont. Incorporators: T. Gibson, A. Taylor and J. Gibson, all of Toronto.

The Sable River Copper Co. has been incorporated at Toronto, with a capital of $100,000, to acquire and develop mineral lands and deposits. Head office at Toronto. Incorporators: J. M. Godfrey, T. N. Phelan, and J. E. Corcoran, all of Toronto.

The Garland Manufacturing Co. has been incorporated at Toronto, with a capital of $100,000, to manufacture all kinds of machinery and tools, etc. Head office at Hamilton, Ont. Incorporators: F. Smoke, J. Grayson Smith, and N. Sinclair, all of Toronto.

The Kittinger Gas Co. has been incorporated at Toronto, with a capital of $40,000, to acquire and develop mineral lands and deposits. Head office at Fort Erie, Ont. Incorporators: J. Kittinger, C. McHenry and D. Olsen, all of Buffalo, N.Y.

The Willys-Overland, Ltd., has been incorporated at Toronto with a capital of $6,000,000, to manufacture automobiles, motors, engines at Toronto. Incorporators: James S. Lovell, Charles Delamere Magee, and William Bain, all of Toronto.

The McCooe Rail Anchor Co. has been incorporated at Toronto, with a capital of $40,000, to manufacture mechanical devices of all kinds. Head office at Toronto, Ont. Incorporators: C. Millar, D. McCooe, and J. J. Beck, all of Toronto, Ont.

The Sydenham Mica & Phosphate Mining Co., has been incorporated at Toronto with a capital of $50,000 to acquire and develop mineral lands and deposits at Kingston, Ont. Incorporators John Teas Le Fever and Daniel Francis Dennis, of Kingston, Ont.

The Canadian Bronze Powder Works, Ltd., have been incorporated at Ottawa, with a capital of $500,000, to manufacture bronze powders and other materials at Montreal. Incorporators: R. E. Thorne, E. Coughlan, and T. B. Gould, all of Montreal.

The De Sales Mfg. Co. has been incorporated at Ottawa, with a capital of $10,000, to manufacture cloth, jute and cotton bags, etc. Head office is at Montreal, and the incorporators are Jacob Y. Fortier, A. Wilfred Muhlstock, and J. Charles Duhamel, all of Montreal.

The Eau Claire Water Works Co., has been incorporated at Toronto with a capital of $40,000 to construct and maintain works for supplying water in the Township of Sandwich East at Tecumseh, Ont. Incorporators: Adhelme Jacques, Joseph Alexander Gouin and Fred C. Chadd of Sandwich East, Ont.

The Derby Telephone Co., has been incorporated at Toronto with a capital of $10,000 for the construction and equipment of telephone systems at Kilsyth, Ont. Incorporators, John Henry Moore, William Johnston and Alexander S. Donald, all of the Township of Derby, Ont.

The Precision Tool & Machine Co. has been incorporated at Ottawa, with a capital of $50,000, to manufacture machinery of all kinds, particularly gauges, tools, arms and munitions, etc. The head office is at Montreal, and the incorporators are John J. Meagher, Henry N. Chauvin and James E. Conlin, all of Montreal.

Railways—Bridges

Islington, Ont.—Etobicoke and Toronto Townships vote on Hydro-radial bylaws on February 12.

Brantford, Ont. — The Brantford Municipal Railway Commission will make application to the Dominion Parliament to extend the Grand Valley Railway to the Village or Cainsville, three miles south of the present terminal.

Contracts Awarded

Sherbrooke, Que.—The contract for supply of a turbine has been let by the city council to the Jenckes Machine Co., of Sherbrooke.

Toronto, Ont.—The Board of Control has awarded the contracts for the supply of 7,000 feet of fire hose for the Fire Department to the Gutta Percha and Rubber Co., 2,900 feet; Dunlop Tire & Rubber Goods Co., 2,900 feet; Goodyear Tire & Rubber Co., 1,200 feet.

Toronto, Ont.—The Board of Control have decided to recommend to the City Council that C. J. Townsend be awarded the contract for the erection of the reinforced concrete bridge on Mount Pleasant road at $45,000. The steel contractors withdrew their tenders, the lowest of which was $12,000 less than the tender for reinforced concrete.

Building Notes

London, Ont.—The Oddfellows have bought property on Dundas Street, on which they intend to erect a handsome and up-to-date building.

Toronto, Ont.—The Robert Simpson Co. will build a large warehouse and stables of reinforced concrete at the corner of Wilton avenue, and Dalhousie street. The cost will be approximately $400,000.

Wood-Working

Trenton, Ont.—The Trenton Cooperage Mills were damaged by fire last week to the extent of $15,000.

Calgary, Alta.—The large sawmill at McGillvray, B.C., owned by the Riverside Lumber Co., of this city, has been totally destroyed by fire. The loss is estimated at $65,000.

Personal

F. S. Lewis has been appointed president of the Orillia, Ont., Board of Trade.

Hon. Col. Frederic Nicholls has resigned as acting president of the Dominion Steel Corporation.

John A. Wheaton, a veteran railway contractor, died suddenly on January 21 at St. John, N.B., aged 78.

Walter S. Carter, Vancouver manager for Fittings, Ltd., of Oshawa, Ont., was killed in a railroad wreck recently.

Arthur Hewitt, general manager of the Consumers' Gas Co., Toronto, has been elected president of the Toronto Board of Trade for the ensuing year.

F. J. Sleght has been appointed general manager of the Willys-Overland, Ltd., Toronto. Mr. Sleght was formerly manager of the company's factory at Elyria, Ohio.

H. H. Vaughan, vice-president of the Montreal Ammunition Co., has been elected a director and a vice-president of the Dominion Bridge Co., Lachine, Que., to fill the vacancy caused by the retirement of C. B. Gordon from the Board.

W. S. Forster, of Alexandria, Ont., has been appointed factory inspector for the eastern district, with headquarters at Ottawa. He succeeds Mr. Kielty, who died some months ago. Mr. Forster has been foreman in carriage works at Alexandria for quite a number of years.

Robert Paton Dawson, for some time foundry superintendent with H. R. Ives & Co., and for 18 years machine shop foreman with J. & R. Weir & Son, Montreal, died in that city recently at the age of 67. Mr. Dawson had more recently been engaged in business at St. Hyacinthe, Que.

F. J. McMulkin has been appointed chief engineer at the High Level Pumping Station, Toronto, in succession to the late Thos. J. Walsh. The appointment, we understand, has been made subject to it conforming with the salary grading by-law. The salary is $2,000 per annum and a free house.

Frank D. Lyman has taken over the railway and supply department of the business of John Millen & Sons, Montreal, as from January 1, 1916. Mr. Lyman has been manager of this department since its inception some nine years ago, and purposes conducting same on his own behalf along practically similar lines as heretofore. Meantime the new firm name will be Frank D. Lyman, but as soon as a Dominion charter has been granted, Lyman & Lyman, Ltd., will be the business title. The head office and warehouse will be located at 323 St. James Street, Montreal, while a branch will be established at 90 Adelaide Street, Toronto. Stocks will be carried at both addresses.

John A. Hill, president of the Hill Publishing Co., New York, died suddenly on Jan. 24, while riding in an automobile from his home at East Orange, N.J., to his office on Tenth Avenue, at 36th Street. Mr. Hill, who was 58 years of age, was particularly interested in the metal-working and power plant spheres of industry, his company being the publishers of the widely read journals, "American Machinist" and "Power."

Trade Gossip

Skagway Ships Magnesite.—According to reports from Skagway, Alaska, shipments are being made from large deposits of magnesite in that locality as a result of the European war.

The S. F. Bowser Co., Toronto, has been awarded the contract for the installation of 10 standard gasoline equipments at city fire halls, at a cost of $1,780, by the Toronto Board of Control.

Montreal, Que.—The Board of Trade elected the following officers for the ensuing year: President, H. B. Walker; 1st vice-president, Zeph Herbert; 2nd vice-president, Anson McKim; treasurer, P. D. Gordon.

Welland, Ont.—At the meeting of the Board of Trade, the following were elected by acclamation: President, John Goodwin; vice-president, Blake L. Booth; treasurer, F. H. Pope; secretary, J. D. Payne.

Algoma Steel Co. — According to a New York report, an order for 30,000 tons of 85-pound section rails has been placed by a Canadian railroad with the Algoma Steel Co., the Lake Superior Corporation subsidiary.

Calgary, Alta.—At the annual meeting of the Board of Trade, the following officers were elected: President, F. M. Black; first vice-president, W. G. Fowler; second vice-president, J. H. Walker; third vice-president, T. A. Hornibrook.

Halifax N. S.—The following were the officers elected for the Board of Trade during the coming year.

President, G. W. Hensley; vice-presidents, W. S. Davidson, D. Macgillivray; Council, W. T. Allen, C. J. Burchell, K. C., F. J. Cragg, M. O. Crowell, J. Norwood Duffus, E. J. Murphy, Gavin L. Stairs, I. C. Stewart, H. R. Silver.

Cornwall, Ont. — The annual meeting of the Board of Trade was held recently

when the following officers for the year were elected: President, A. E. Currie; vice-president, J. A. Chisholm; secretary, J. C. Alguire; Treasurer, E. O'Callaghan.

Gananoque, Ont.—The officers of the Board of Trade are as follows: President, A. W. Taylor; first vice-president, C. Sine; second vice-president, M. McParland; secretary, C. A. Watt; hon. presidents, Sir Thomas White, Senator Col. Taylor, Charles MacDonald, C.E., F. J. Skinner and Dr. E. L. Atkinson

Hamilton, Ont.—At the annual meeting of the Board of Trade the following officers were elected and installed: Walder Parke, president; G. C. Martin, vice-president; E. Brown, secretary-treasurer; H. L. Frost, G. C. Coppley, Wm. Gastle, A C. Garden, B. R. Carey, Russell Kelly R L. Smith and H. C. Beckett, councillors.

German Iron Output.—The output of pig iron in Germany in December, 1915 was 1,020,144 tons, as compared with 854,186 in December of 1914. The production in 1915 was 11,790,199, against 14,339,852 in 1914. During the twelve months from August of 1914 to the end of the following July the production was 10,135,329 tons.

Plant for Making Dyestuffs.—The Executive Committee of the Tanners' section of the Toronto Board of Trade advised that all tanning plants in the Dominion get together to discuss the advisability of establishing plants in Canada for making extracts and dyestuffs for tanning purposes, as the war had seriously affected exports.

West St. John, N.B.—Export traffic from West St. John, N.B., during December showed a heavy increase over the corresponding month last year. During December, 1914, twenty steamers cleared, carrying 60,346 tons and 1,262 horses, while in December, 1915, thirty-eight steamers cleared, carrying 181,370 tons and 1,166 horses.

Contracts to Give Out.—The Ross Rifle Co., Quebec, has contracts to give out on small work interesting to manufacturers of sewing machines, tele phones, phonographs, typewriters, etc. Those applying for contracts are asked to furnish number, style and size of machine for which they desire work. The company is desirous of placing the contracts with Canadian firms.

Calgary, Alta.—North American Collieries, Ltd., a syndicate of Eastern capitalists, mostly from Montreal, have bought the property and assets of the Canadian Coal & Coke Co., an Alberta mining concern, for $3,000,000. The Canadian Coal & Coke Co's. properties were sold to satisfy a judgment, and

Thousands of Threaded Pieces Each Day with a

GEOMETRIC THREADING MACHINE

Rapid and Perfect Duplication

Takes floor space 2 ft. x 3 ft., and is complete with countershaft, change speed gear for adapting speed of spindle to diameter to be threaded; adjustable stop for gauging length of work.

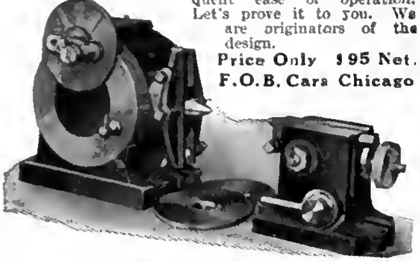
No rough threads with the Geometric. They are as true and clean as can be produced by any screw machine.

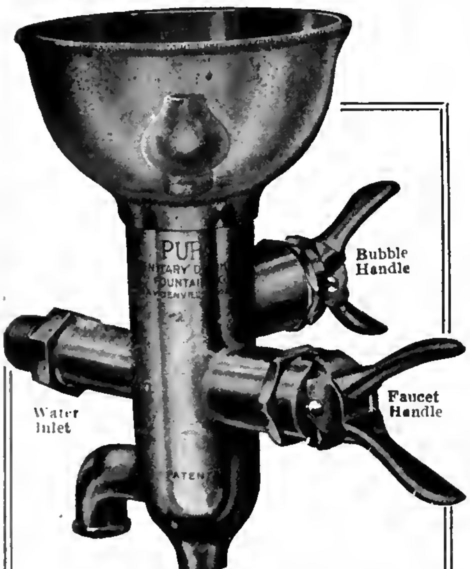
Note the range:—Regularly, $\frac{1}{4}$-in. to $\frac{3}{4}$-in. Specially, $\frac{1}{2}$-in. Std. pipe threads; $\frac{7}{8}$-in. S.A.E. Std. Spark Plug threads, and up to 2-in. Diam. threads where the pitch is fine. Internal threads, $\frac{1}{8}$-in. to 2-in.

Send in your Specifications and learn what we can do for you.

THE GEOMETRIC TOOL COMPANY
NEW HAVEN, CONN., U.S.A.

Canadian Agents: Williams & Wilson, Ltd., Montreal; The A. R. Williams Machinery Co., Ltd., Toronto, Winnipeg and St. John, N.B.





bought in by the bondholders organized as a new company.

Toronto-Hamilton Road—On account of the excess of cost over the original estimate, it is reported that legislation will be introduced at the coming session of the Ontario Legislature for about $300,000 more for the Toronto-Hamilton highway. It is stated the road will cost, when completed, about $850,000 or $900,000.

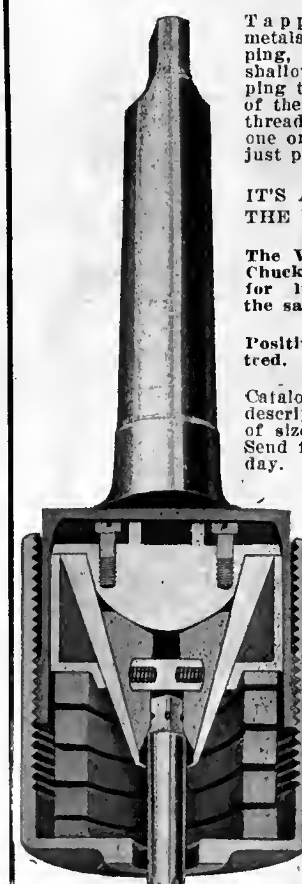
Niagara Falls, Ont.—The Niagara Falls Board of Trade, at its annual meeting on Jan. 18, elected these officers:—President C. C. Cole; vice-president, James Orr; secretary-treasurer, J. A. Newport, councillors, J. J. Bampfield, J. C. Gardner, J. L. Vanstone, Dr. Olmsted, J. L. Dawson, Georg Mayhew, J. R. Wilson, Sidney Burrows and J. Carroll.

Platinum Deposits in Spain—Platinum deposits recently discovered in Spain and said to be among the richest in the world, have been turned over to the government by the discoverer, according to Consul Robertson Honey of Madrid. Chromium and nickel are also present. Concessions to exploit these mines are to be granted to foreigners as well as Spaniards.

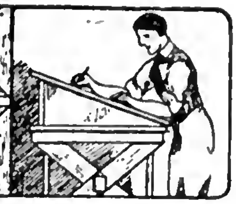
Wire May Advance.—Advices from New York state that another advance in the price of wire products is probable. The plants of the American Wire Co. are operating full, and a large amount of business has been refused. The sales agents have nothing to do owing to the unprecedented demand for wire. Certain wire companies have been forced to refuse foreign business, as they are unable to supply the domestic demand.

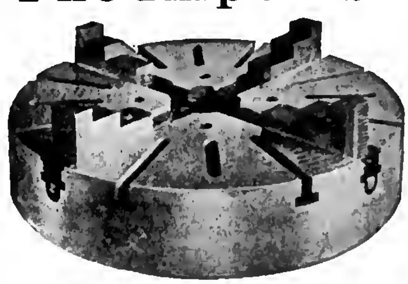
Toronto, Ont.—At a meeting of the Willys-Overland, Ltd., held on Jan. 19, the following officers were elected: John N. Willys, president; C. A. Earl and T. A. Russell, vice-presidents; Walter Stewart, treasurer; F. J. Sleght, secretary and general manager. Directors elected were: John N. Willys, Harry T. Dunn, Walter Stewart, Harry Shepler, F. J. Sleght, C. A. Earl, T. A. Russell, Lloyd Harris, Mr. Scofield.

Restrict Imports and Release Ships—According to The Standard, the Imperial Government is preparing to make sweeping recommendations to the House of Commons for restriction of importations in order to relieve the strain on shipping. The first list of articles to be excluded will include automobiles, building materials and fruit, all of which are bulky in proportion to their weight and, therefore, require much space in ships. If a sufficient number of ships is not released by February 1, the list of prohibitions will be extended.



PROFESSIONAL DIRECTORY





Fancy Prices for Steel.—It is reported from New York that the demand for steel is without a parallel. Consumers are clamoring for material and seem to be willing to pay all kinds of prices for delivery within a reasonable period. Foreign consumers are bidding $10 to $15 a ton above current quotations. A steel manufacturer, who is in close touch with the situation, says the belligerent nations look for another year of war at least.

Low Rates Sought on Scrap.—The Dominion Government has been asked by Western Canadian interests to establish a low rate on scrap iron from points in the West to iron and steel mills in Eastern Canada. The market for this iron has been in the United States, but this has been shut off by the war embargo, and shippers are anxious to find a new market for scrap iron in the Eastern provinces, particularly in Ontario.

Premiums for Steel.—Premiums for steel are larger than they have ever ben in history, says the Wall Street Journal. In certain cases premiums range as high as $25 a ton. For barb wire premiums run from $15 a ton up. Most of the steel companies have sold their possible production of the first half of the current year, and capacity available for the last half of the year is comparatively small, Earnings of the steel companies for the first half of this year, as a result of rising prices, are expected to surpass the most optimistic predictions.

Flax Growers Seek Government Aid.—Western Ontario flax growers are arranging to see the Government this week with a request that the flax growing industry be given some form of special encouragement. It is proposed that the secretary of the Flax Growers Association be given official recognition so that he could go about the various factories, in Ontario, and encourage the use of flax fibre. The deputation of flax growers will be introduced by S. F. Glass, M.P., John Merner, M.P., and other members of the House, and will see Hon. Martin Burrell, Minister of Agriculture.

The Canadian National Clay Products Association recently held its 14th annual convention in Toronto, and elected the following officers for the ensuing years: Past president, Charles A. Miller, Toronto; president, J. Edward Frid, Hamilton; 1st vice-president, A. F. Greaves-Walker, Toronto; 2nd vice-president, Thomas Kennedy, Swansea; 3rd vice-president, William Burgess, Todmorden; secretary-treasurer, Gordon C. Keith, Toronto. Councillors—C. B. Lewis, Milton; A. Lochrie, Toronto; A. Neil, Kingston; John S. McCannell, Milton; Ryland New, Hamilton; T. Desjardins, T. Graham, Inglewood, and W. Clarke, of Sarnia.

CANADIAN MACHINERY

AND MANUFACTURING NEWS

A weekly newspaper devoted to the machinery and manufacturing interests.

INDEX TO ADVERTISERS

Opportunities for Canada's Industrial Development--II.

By C.T.R.

In this series of articles prepared in response to numerous inquiries received from the managements of Canadian metal-working plants on the subject of post-bellum employment for their added equipment and enlarged capacity arising from an extended period of shell production, we aim to give prominence to the opportunity to manufacture such products as were previously imported for our domestic needs or have since become available for export.

WHILE presumptions based on the concluding quotation of the previous article might suggest the probability of a serious reduction in the proportion of imports from the United States, such an event is remote. The immediate efforts of our producers will naturally be confined to those lines which are suited to the recent plant extensions and therefore will be largely in the machinery, hardware, and allied trades. That certain particular imports may decline in course of years is possible, but if the development of this country, as an outcome of present world conditions, takes place on a similar relative scale as on past occasions, the total amount of United States imports may easily show a very considerable increase.

At the present moment the chief desire of ninety per cent. of our manufacturing firms is to know what to start making. The second and third classes of group one* form the great proportion of this number. With some of them circumstances have so developed that to return to their former fields would in a sense be a retrograde movement, and equivalent in a way to throwing up the sponge before the first round had commenced. Many of their employes are men who never handled a machine tool in their lives before circumstances forced them to turn to munitions work. These men have all the enthusiasm of youth, plus the judgment of older heads and the freshness of their viewpoint on manufacturing work generally makes them a valuable asset to the industry of the country. Their employers may well be excused if they betray an anxiety to retain these men in their factories.

Prospects of Home Competition

The formerly established firms referred to as class one* have retained all or part of their sales force in existence prior to the war, and with this as a nucleus have kept in touch with, and in some cases have considerably enlarged their previous business. The utilization of their surplus plant in the approaching future will probably direct their efforts into new channels so that all three classes in group one are probable competitors. That all of these firms will choose identical spheres of activity is hardly probable and the abstract of principal imports from the United States for the year ending March 31st, 1914, will indicate the wide range of manufactures directly connected with the machinery trade.

*See article in previous issue.

Immediately Available Markets

All of the items selected from the complete report call for machinery in their manufacture, many of them require raw materials either unobtainable in this country or whose gradual development would ultimately result in the establishment of allied or interdependent industries. The items have all been selected with a view to an already existing market of sufficient demand to give a start to several plants in some cases, while the amount of trade in other items might easily justify the starting of a new department in other shops.

SELECTED IMPORTS.

(1)	Artificial limbs and parts thereof	$ 40,621
(2)	Asphaltum or asphalt	635,278
(3)	Baking powder	206,390
(4)	Baths, bath tubs, basins, closets, lavatories, urinals, sinks and laundry tubs of any material	288,714
(5)	Braces or suspenders and finished parts thereof	67,248
(6)	Bricks, clays and tiles—	
	Building blocks, partition hollow and fireproof building tile	$ 375,796
	Building bricks	499,596
	China clay	96,251
	Fire bricks	890,146
	Fire clay	100,676
	Paving bricks	98,471
	Drain pipes, sewer pipes and earthenware fittings therefor, chimney linings, etc.	399,830
	Other bricks, clays and tiles	243,660
(7)	Buttons and materials for	$ 465,021
(8)	Carriages, carts, wagons, etc.— *See note.	
	Children's carriages and sleds	$ 402,544
	Farm and freight wagons	417,498
	Scrapers, railway or road	114,830
	Wheelbarrows, trucks and hand carts	119,844
	Other carriages and parts thereof	156,970
	Total items as above	$1,211,686
(9)	Clothes wringers and parts thereof for domestic use	$ 33,999
(10)	Binder twine	3,779,434
(11)	Electric apparatus, total †See note.	7,505,244
(12)	Toys and dolls of all kinds	293,853
(13)	Glass and mfrs. of, total	2,094,459
(14)	Gutta percha, India rubber and mfrs. of total	6,137,122
(15)	Jewellery	1,001,258
	Metals and minerals and mfrs. of	
(16)	Brass—	
	Glove fasteners of metal, shoe eyelets, corset eyelets, shoe eyelet hooks, shoe lace wire fastners	$ 184,562
(17)	Iron—	
	Anvils and vises	43,531
	Butts and hinges	136,006
	Cutlery	246,481
(18)	Machinery—	
	Gasoline and gas engines	2,456,507
	Sewing machines and parts of	450,033
	Washing machines, domestic	83,122
	Pumps, hand	88,560
	Sheets, flat, galvanized	1,018,536
	Stoves of all kinds, for coal, wood, oil, spirits or gas	319,740
	Total items tabulated	$31,991,831

Total value of principal and other articles of merchandise imported from United States—

Fiscal year 1914	$395,565,328
" " 1913	435,770,081
" " 1912	330,428,502
" " 1911	274,844,858
" " 1910	217,502,415

Note: Automobiles and parts thereof, carriages, buggies, etc., and railroad cars, etc., are not referred to here as their manufacture requires large capital outlay, while conditions pertaining to the securing of contracts do not render this work attractive to the small producer.

Note: Although Canadian firms produce a large amount of electrical plant, there is a large import trade in special apparatus, either of large size or for peculiar requirements. The amount stated shows the volume of this extra demand.

Consideration of Separate Items

(Items 1, 2, 3.)—These are mentioned as samples of products which will constantly increase and which by reason of their nature or method of production may appeal to manufacturers.

(Item 4.)—The production of enamelled iron bathware, etc., is somewhat specialized and calls for considerable knowledge, but a great amount of plain cast iron fittings such as sinks for all purposes, troughs, stable and cowshed fittings and the commoner types of closets, etc., for hard service in public use, are well within the scope of many foundry establishments.

(Item 5.)—The number of braces and suspenders required to equal $67,000, calls for an amount of stamped metal work which would keep a fair-sized department quite busy the most of the year. Shops with suitable equipment in the way of presses should secure the widest range of samples, and when certain of their ability to produce, should endeavor to interest a soft goods establishment to combine in supplying the fabric parts and disposing of the product through jobbers or otherwise. These fittings are nearly all well made and finished and new articles should if possible possess some novel feature or slight improvement. In all cases they should be at least equal to existing goods.

(Item 6.)—Several of the products included in this item are already made here but the volume of imports is very large. Special kinds of fancy bricks sold

under a well advertised brand have a strong hold on the market, but the widespread adoption of paving bricks in the States is meeting with a success which if duplicated here should mean good business.

(Item 7.)—The successful production of fancy buttons depends on careful anticipation of fashion demands, and the obtaining of suitable materials. The quantity of any one design which must be made to secure economy of production demands a large market, and export business would have to be figured on in this connection. The cheap grades of metal, bone, and composition buttons which allow of factory methods being employed should offer a fair field of activity.

Children's Requirements Large

(Item 8.)—The amounts included in this item cover a number of lines, which although classified together, represent lines which differ sufficiently in nature to allow of their being treated as separate industries. The first amount covering children's carriages and sleds offers possibilities to woodworkers and metal stampers. The design and manufacture of wooden and wicker bodies would call for additional output from firms already in that line, especially wicker work which requires specially trained workers. The production of wooden bodies could be undertaken with less hesitation, designs and styles being more or less standardized. Running gear for such vehicles is nearly all metal, and if the design of axles, wheels and springs be carefully gone into from a manufacturing point of view, so as to allow of various combinations of size and type, it would seem possible to specialize in producing running gear for assembling by different body makers. With sufficiently large production, costs could be kept well down, and a reasonable proportion of imports of these goods would afford ample business for more than one new comer. Several types of collapsible carriage are practically all metal and include some patented designs. As a manufacturing proposition they should appeal to firms doing light and medium press work and possible improvements on existing designs might result in remunerative patents being evolved by makers whose ideas are fresh. The demand for sleds is a dependable annual occurrence; this is largely a woodworking proposition.

Farm and freight wagon imports amount to a very large sum, while wheelbarrows, trucks, etc., form a considerable proportion also. The increasing use of transfer trucks is proof that the merits of this apparatus are being recognized. Elaborate designs involving motor drives, power elevation, and the use of trailers, have been developed for special work, but a considerable market will always be available for the simpler hand operated trucks of reasonable cost.

Domestic Goods

(Item 9.) These goods are closely allied to domestic washing machines and should really be considered with them. The sum of $117,000 represents a considerable amount of business in imports alone irrespective of similar goods made in this country. Both of these lines should find many willing producers. Recent years have seen the production of all metal washing machines for which certain advantages are claimed.

(Item 10.) The value of binder twine imports would suggest that United States producers have a strong hold on this market. This is no doubt due to the handling of twine by the harvester manufacturers who find this a convenient means of increasing their turnover. These firms are in a position to influence farmers in their purchases of twine and prospective entrants into this field would have to be prepared to give a large proportion of the tariff advantage to the consumer while offering an article fully equal to, if not better than the imported.

(Item 11.) The successful production of many electrical goods, especially accessories has been favored in the States by the great number of users in the large centres of population. While the tendency towards a similar condition in this country may suffer a noticeable check due to possible retrenchments during the continuance of hostilities, the very favorable rates for current which exist in many localities affords a full appreciation of the advantages and convenience of electricity for many purposes. A great factor in the accessory business is the ability to get out novel designs and applications. Stamping work and plating enter largely into much of the work, but a knowledge of trade tendencies and requirements is essential if the producer has to handle sales of the finished article. In some cases it may be that the actual making of the parts or the performing of some special work may be undertaken by small shops suitably equipped, the originating of designs, assembling, and sales being taken care of by a firm already in the business and desirous of increasing its turnover without further capital investment. Such work can be obtained by persistent endeavor, either by personal investigation and following up possibilities for full information, or by continued advertising so that when such work is required the producers' name is immediately associated with it.

Toy Possibilities

(Item 12.) The value of imports in this field is amply large to warrant serious consideration by shops having metal stamping equipment. Toys of a mechanical nature will naturally have first call especially when their manufacture occupies existing machines. National sentiment, of course, will prohibit German goods for years so that dealers and jobbers formerly handling these goods are either out of business or making new connections with other producers. Their advice should be obtained regarding designs and ideas and a collection of former good sellers made so that careful study of the attractive features may help towards producing new models and types.

Doll heads and animal toys calling for press work and autogenous welding indicate a recent tendency which is capable of development by efficient study and effort.

(Item 13.) The available business in this class appeals principally to firms already in the trade. Much of this business is in special material for lighting, etc., where established reputation, high quality of product, and manufacturing skill and experience are important factors. While no new entries are looked for, the amount of trade indicates possibility of extension.

(Items 14 and 15.) These items are of general interest only. The former is in the hands of firms operating on a large scale, whose products are in steady demand in certain branches of engineering activity: belting, packing, jointing, etc. The increased production of certain classes of jewelery might offer openings for die sinking work.

(Item 16.) These goods are of interest to metal stampers who already possess press equipment capable of being adapted to the work. Besides being produced by multiple punches, etc., they require a considerable degree of accuracy so that they may be fixed in the goods by special apparatus without trouble due to variation in size. Building up a connection in this line would call for considerable investment in time, tools, and advertising such as could hardly be expected from very many firms just now. The business is there, however, if it be considered worth trying for.

Machinery Products

(Items 17 and 18.) The various imported manufactures of iron, steel, and machinery are well known to all of our metal working concerns, and that fact alone renders a detail statement unnecessary. The total value of metals, minerals, and many manufacturers thereof amounted to $121,251,081 during the period under review. The few entries given are selected either because of their possible future appeal to munition makers pro tem. or because of obvious simplicity of manufacture or amount of demand. Anvils and vises

vary somewhat, but suitable material in both cases is essential; there is no obvious reason why this material cannot be supplied by foundries or forges in this country. Machine work is absent on anvils, and vises call for flat work on milling machines and planers principally, but in either case substantial articles must be produced with sound materials and reliable workmanship if any increased business is to be obtained.

Engines for gasoline and gas indicate a large annual consumption and their production could be well undertaken by many existing munition plants. It might be well to mention here that the general degree of accuracy called for on shells does not begin to approach that required for first class engine work, and many new firms who found government work irksome had best leave such engine work alone as they will be just as disappointed as some of their ultimate customers. Previously established machine shops doing work to specifications, and building special machines for various trades will, as a result of quantity production of shells, be in possession of most suitable experience for engine production and even in some cases of sewing machines.

The production of galvanized sheets was only recently begun in this country, while the stove industry is already well established.

Making a Choice

Before a definite decision can be made regarding the taking up of new work, all possible information should be obtained regarding the channels through which the output must be disposed. Many shops are now suitably equipped and possess skilled labor and management which would enable them to successfully attack various propositions if production were the only factor in the situation. Even when it is known that a demand exists for a certain article, the firm which has the best knowledge of the market will have the best chance of securing the work even though its production methods may be much inferior to its competitors. This feature is therefore even more important than the producing problem because the present and prospective state of affairs makes the securing of orders a matter of more importance than the extraction of excessive profits.

What then must a typical concern do at the present moment to maintain its present and insure its future existence?

Assuming that a list of suitable articles has been compiled the consumption of which is large enough to offer prospects of business, it becomes a matter of getting orders. Articles such as machine shops produce may be classified thus: First, those which can be sold directly to consumers, thus demanding a sales and advertising department; second, those which can be sold to jobbers or wholesalers who distribute to retail stores; third, those suitable for disposal through the large supply houses, whose selling staff are disposed throughout the country and handle a selection of articles.

While the first class may offer the greatest prospective profits, the line of goods selected must be suited for quick sales, otherwise an extended expenditure in salaries and advertising space must be faced. Chucks, vises, belt fastening devices, tool holders, cutters, lubricant pumps, flexible couplings, universal joints, drill chucks, gauges of all kinds, and the smaller kinds of machine tools, lubricators, belt shifting devices and safety appliances are some of the lines which can be taken up by small shops and marketed to the metal working trades. Class two includes lines of a more specialized nature and acceptable to the public in general such as wrenches, pliers, machinists' tools, scales, and the bulk of small hardware produceable in the average machine shop equipped with presses and welding apparatus. Class three includes such engineering supplies as are handled by the concerns referred to. These would include several of the lines in class one, together with articles which are sold from stock.

The entire situation cannot be reviewed from a standpoint which will apply satisfactorily to all. Each individual manufacturer will form his own ideas as a result of former experience and personal inclination. If this is further qualified by a persistant inquiry and careful study of present conditions and tendencies, and the reasons therefore, such parties will be assured of a reasonable share of this country's trade, and in the near future will be able to approach the question of export work well supported by suitable products, and the knowledge and means for marketing them.

EXPERT FOR DOMINION STEEL

IT is understood that one of Mark Workman's first acts as president of the Dominion Steel Corporation will be to secure a first-class man to assume direction of the practical side of the corporation's operations at Sydney.

Mr. Workman leaves for New York this week, and if he is successful in his mission, the new expert may be nominated to the vacancy now existing on the board, and possibly given a vice-presidency. Mr. Workman proposes to devote practically all his time to the affairs of the corporation, although his headquarters will be in Montreal. He will be concerned with the broader aspects of management, rather than with technical details. The right kind of a technical man at Sydney, it is believed, would do much to advance the interests of the corporation, and a move of this kind will meet very general approval.

The directors in attendance at the meeting, when Mr. Workman was elected to the presidency, were: J. H. Plummer, Mark Workman, George Caverhill, Sir William Mackenzie, Hon. David Mackeen, Senator Mackay, Senator Dandurand, W. G. Ross and William McMaster. The vice-presidents of the corporation now are Col. Frederic Nicholls, William McMaster and Col. Henry M. Pellatt, C.V.O.

MUNITIONS ORDERS IN UNITED STATES

THE Wall Street Journal of January 28 estimates that orders for war munitions placed in America aggregate \$2,000,000,000. It gives the following list based on official statements:

Company. Material	Gross Amt.
Aetna Exp.—Explosives	\$30,000,000
Amer. Can—Shells	41,000,000
Amer. Car & Fdry.—Shells	7,000,000
Amer. Loco.—Shells	50,000,000
Amer. Steel Fds.—Forgings	18,000,000
Amer. Wood—Cloth	30,000,000
Baldwin Loco.—Shells	146,000,000
Bethlehem—Miscellaneous	300,000,000
Can. Car & F.—Shrapnel	146,000,000
Crucible—Miscellaneous	17,000,000
Curtis Aero—Aeroplanes	15,000,000
DuPont—Explosives	200,000,000
Driggs-Sea.—Miscellaneous	40,000,000
Elec. Boat—Boats, etc.	100,000,000
Gen. Elec.—Materials	69,000,000
Hercules Powder—Cordite	25,000,000
Lackawanna Steel—Steel	10,000,000
N.Y.Air Brake—Shrapnel	20,000,000
Pressed S. Car.—Cars, etc.	15,000,000
Studebaker—Harness, etc.	20,000,000
Westing A.B.—Shrapnel, etc.	18,000,000
Westing, Elect.—Rifles, etc.	94,000,000
Total	\$1,408,000,000

In the case of several of the abovementioned, it is believed that the accredited amount falls many millions short of the actual total. Such is the case with the Crucible Steel Co. While the company's last annual report gave \$17,000,000 as the amount of war orders, it is claimed by interests in inside touch with affairs that the aggregate now is about \$90,000,000.

That the list is far from complete can be seen from the fact that the Remington Arms Co. and the Winchester Arms Co., each generally credited with contracts for at least \$100,000,000 gross, are not included.

The Consolidated Mining and Smelting Co. will make considerable extensions to their zinc refinery at Trail, B.C.

PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

APPLICATION OF SPRING PINS TO JIGS AND FIXTURES—III.

Among difficulties met with when designing spring pins is the lack of room which will often necessitate the extension in height of a jig. This can sometimes be overcome by us-

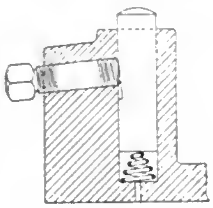

FIG. 11.

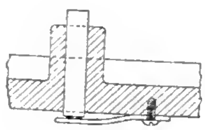

FIG. 11a.

ing a conical spring as shown in Fig. 11, or occasionally a flat spring as shown by Fig. 11a, although the latter will not permit much movement for the pin. In the first the diameter of the pin will largely govern the movement that can be obtained.

Indexing Pins.

While the foregoing illustrations have dealt exclusively with spring pins which are constructed in a manner that causes the spring to force the pin out in order to resist pressure, various pin arrangements are in use where the pins are forced out by screws or other means and a spring is used to force the pin back, or it often happens that the conditions require that the pin be simply held in a slot or hole for an indexing plate as Fig. 12. This arrangement consists of a plate (A) with suitable notches of a number sufficient for the work in hand. A spring plunger (B) is pushed into the notches in the plate by the spring (C) while a fetter screw (D) keeps the pin in its proper relation to the slots in the plate

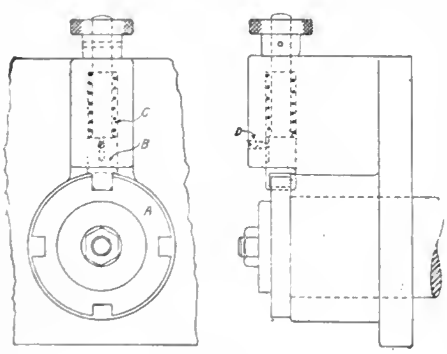

FIG. 12.

and the knurled knob on the end of the spring plunger. This is used to pull the plunger out of the slots when the plate is indexed from one slot to the next as in the drilling of holes or other work that this method might be adapted to.

Compound Arrangement.

Fig. 13 shows another method of arranging spring pins or plungers in which two springs are used, the small pin (A) being made to fit into the holes of an index plate (B) attached to other mechanism for doing the necessary work and is held back against the plunger (C) by a light spring (D) and is forced out into the index plate by the spring (E) on the plunger (C) which is much stronger than the spring (D). Thus when the operator pulls on the knob (F) the plunger C is carried out by the knob and the beveled flat X is kept in the correct relation to the pin (A) by the small guide pin (G), in a notch in the knob. Upon the release of the knob the plunge (C) forces the pin (A) out in the manner previously described which is obvious from the sketch. The purpose of the cap

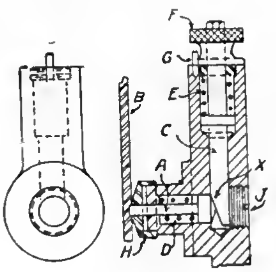

FIG. 13.

(H) is to prevent dirt from entering the holes and the screw (J) plugs the holes after the arrangement is assembled.

Tubing Used as Spring Pins.

In Fig. 14 an illustration of the use of tubing as a spring pin is shown, the arrangement being a simple one. A piece of tubing (A) is split as shown at (X,) and is caused to expand and become locked in its hole by the screw (B) which has a tapered point. The pin is forced up in the usual manner by a spring (E), with a shoe (C) between it and the tubing, while a pin (D) in a slot prevents the pin from jumping out of the hole.

Forcing Pins Into Position.

In Fig. 14a the cut shows a pin (A) being forced up by a pointed screw (B) while it is forced down upon the release of the screw by the spring (C) against the shoulder of the pin and the short screw (D). An arrangement on a similar principle is used to operate the three pins in the pin arbor Fig. 15. This pin arbor is similar to that used for turning pistons and fits on the spindle nose of the lathe in the same manner as a chuck. The body or main part of the arbor (A) is made of cast iron while a steel ring (B) is forced in place on this body and is used for supporting one end of the work

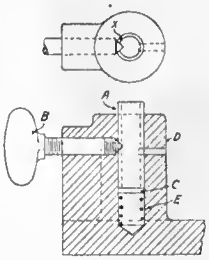

FIG. 14.

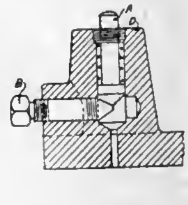

FIG. 14a.

which has previously been bored out to size for a short distance. Now as the other end of the hole is rough, three pins (C) are caused to expand in it to centralize that end. While the principle involved in the operation of these pins is the same as that in Fig. (14a) the construction differs considerably. The three pins are flattened at the sides (X) to fit

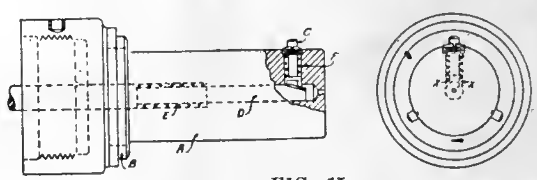

FIG. 15.

into three suitable grooves (beveled to match the pins) in the rod (D), this rod being operated from the back end of the spindle by a suitable hand wheel and bar that pushes it forward and causes the pins to move outward as can be readily seen from the sketch. Upon release of the hand wheel and bar, the spring (E) pushes the rod (D) back, and the springs (F) hold the pins in place against the flats in the rod.

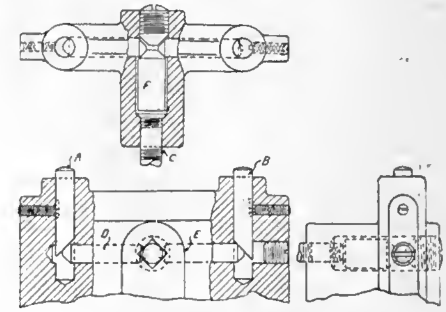

FIG. 16.

Equalizing Arrangement.

The last illustration of this article (Fig. 16) shows an arrangement of pins used as an equalizer which although they

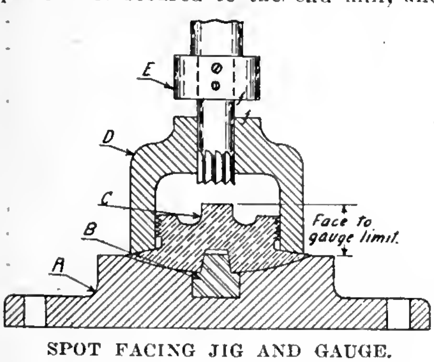
cannot be classed as of the spring variety are nevertheless interesting. The principle of this construction lies in the fact that the two pins A and B must be caused to expand against a rough surface by one square head screw (C) and to do this two pins D and E must be provided. These, by being forced out by the pin F., also in turn force out the pins A and B. The pin F, made considerably smaller than the hole as shown, to permit of it to have sufficient side play in case one of the pins A or B should come up against the work before the other. This permits the pins to equalize or in other words adapt themselves to the rough surface of the work which is very often a necessary condition when supporting work in jigs or fixtures.

As can be seen from the foregoing the application and use of spring pins is vital to the tool and machine design. The simplest and most effective arrangement, yet one which is quick to operate and will not easily get out of order is required, as the pins are usually subjected to very hard usage. This is especially true in jig and fixture applications when the machine operator must be depended on to use his own judgment in the method of handling tools.

SPOT FACING JIG AND GAUGE

By J. Davis.

AN interesting jig for use in facing shrapnel shell plugs consists of a cast iron bar A, which is bolted to the drill press table. On the top of this base a cup-shaped recess is machined, which conforms to the shape of the plug, and in the centre of which is secured a square driving-pin B, which engages with the square hole in the plug. A hardened steel bushing D is made to slip over the threaded portion of the shell plug, and is also bored to fit the end mill, as shown. The bottom face of the bushing is chamfered to correspond with the finished bevelled seat of the plug. A locating piece E is secured to the end mill, and



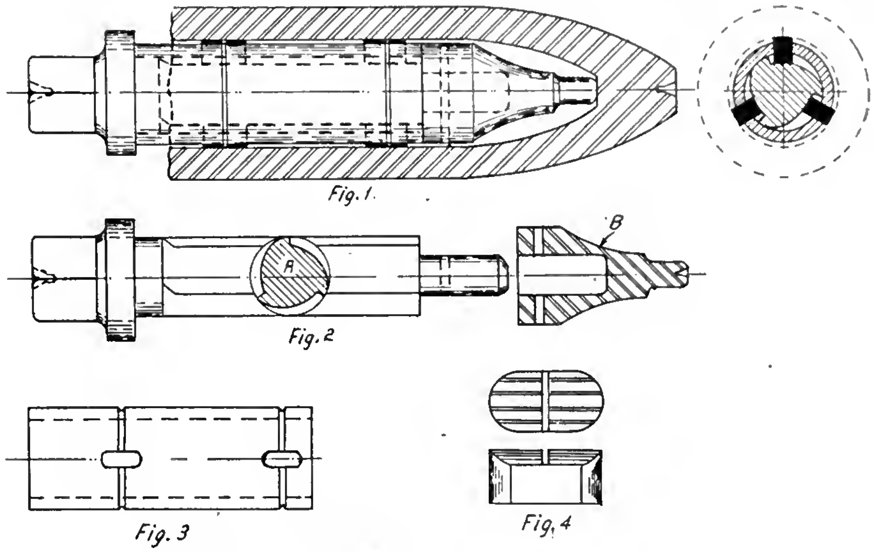
SPOT FACING JIG AND GAUGE.

is so adjusted that when the two finished surfaces of D and E touch, the plug will be faced to the right dimensions. It can be readily seen that with this jig it is impossible to face too much off the plug; and, further, since the location is taken from the machined services, any irregularities in the casting have no effect on the accuracy of the results.

EXPANDING MANDREL FOR HEAVY SHELLS

By G. Barrett.

THE accompanying drawings show a type of expanding mandrel which is somewhat different in constructional features from the usual design. The arbor, Fig. 2, is made from machine steel, the driving end being squared to fit a driver secured to the lathe face-plate. The body of the arbor is milled with a concave cutter, as shown by the cross-section A, and the end is turned down to fit the locating end piece B, the latter being held in place by a taper pin.



DETAILS OF AUTOMATIC EXPANDING ARBOR.

The sleeve, Fig. 3, is bored to slip over the arbor, and has six holes—three at each end, and placed 120° apart, milled to take the grooved driving dogs, Fig. 4. These are held in place by a coil of spring wire, which fits into the recess cut on the outside diameter of the bushing and on the outer surface of the dogs.

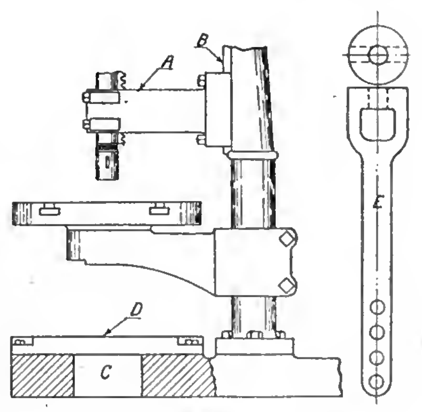
Fig. 1 shows the mandrel in position, as used between the lathe centres, and this gives a clear conception of the operation. The fact that it is driven from the square end causes the eccentric lift on the centre arbor to force the dogs out. This action causes a secure grip, and it can be readily seen that the harder the pressure on the cutting tool the tighter the dogs will grip the forging.

DRILL PRESS SUGGESTION

By J. H. R.

SOME time ago we were faced with a problem that required considerable contriving on the drill press before we could finally arrive at the result desired. It was necessary to drill the hole in the end of the piece E, and the overall length was such that it was necessary to use the shortest drill possible and remove the eye bolt (that connected with the balance weight), also a gear guard, to allow the arm A to be raised to the extreme limit of the slide B.

In almost every make of solid frame drill press the bed of the frame is left solid, with a number of tee slots. To remedy this, and facilitate the operation on work similar to the piece here shown, it might be a profitable move on the part of drill press manufacturers to have the centre of the base plate cored as at C, and, if necessary or desirable, have an auxiliary bolster plate to cover the cored hole.



A DRILL PRESS SUGGESTION.

Galt, Ont.—The Grand River overflowed last Friday and did considerable damage to the plants located along its banks. The factories of C. Turnbull Co., Galt Knitting Co. and the foundries of Cowan Co., Perfect Machinery Co and Canada Machinery Corporation were partially flooded, the damage in each case being $400 to $1,000.

IMPORTANCE OF SMALL TOOLS TO ENGINEERING

from "Herbert's Monthly"

THE strength of a chain is that of its weakest link; hang a weight on the chain and unless every link is able to support the load, it will break. Each link must also bear, in addition to the load, the weight of the links below it.

A number of factors, which may be likened to the links of a chain, enter into the administration of every engineering business. Management, organization, supervision, workmen and plant must each be capable of bearing a due share of the load, or the business will suffer; the weak link will impair the efficiency of the whole system. The strongest links must necessarily be at the top, where the strain is greatest.

The plant will consist mainly of machine tools and their equipment, the latter comprising chucks, vices, drills, reamers, milling cutters, and a number of other accessories, all of which come under the heading of small tools. These small tools in themselves constitute a link in our chain, a link which must be strong enough for the work it has to perform. No matter how good the machines included in the plant may be, unless they are equipped with a sufficient quantity of good, small tools, they cannot be run to the best advantage.

The Small Tool Dealer

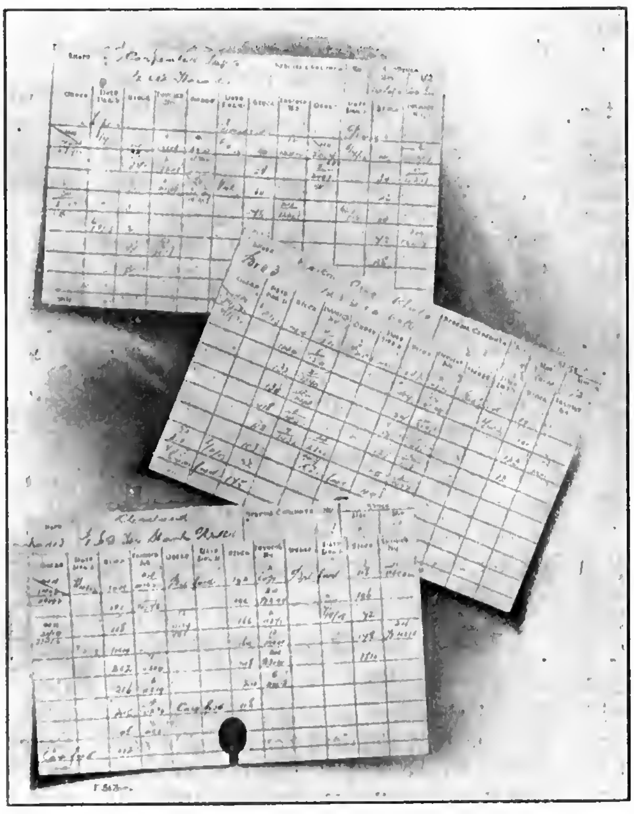
Those engaged in supplying small tools may fairly claim to serve a useful purpose by enabling their customers to obtain the articles which are needed for the proper equipment of their plant. A small tool business can only be successfully developed so long as it offers efficient service to the buyer. Efficient service means prompt delivery of goods of the right quality at competitive price; it requires enterprise, technical knowledge and commercial ability.

The small tool dealer must be enterprising in his search for new and improved appliances, which will be of service to his customers. Technical knowledge is required for the selection and testing of those which appear to possess desirable features. Commercial ability is necessary when dealing with the multitudinous problems which daily arise in the purchase, shipping, storage, and delivery of the vast numbers of articles that are included in a stock of small tools.

To turn now from the abstract to the concrete, what follows describes briefly the system followed in the small tool department of Alfred Herbert Ltd., Coventry, England, and the hope is expressed by the management of that concern that it may be of some interest, and may possibly give rise to criticism and suggestions which will result in better service.

The Small Tool Department

This branch of the business has passed through many vicissitudes during the eight years it has been in existence. Its rapid growth has necessitated considerable additions to the personnel and to the warehouse accommodation. This has naturally involved occasional revisions of the systems in use, and has made considerable demands on those responsible for running the department. The most important duty is to deliver promptly the goods ordered. This means that the goods must be in stock when ordered, and that there must be in existence the proper machinery for attending to the despatch of the orders.



CARDS USED IN KEEPING A SMALL TOOL STOCK RECORD

Maintenance of Stock

At the head works in Coventry, the storage of small tools occupies a floor space of approximately three and a half thousand square feet. The multitude of orders dealt with every week keeps the stock continually on the move, and it is no easy matter to ensure it being at all times equal to the demand.

It is undertaken to furnish anything and everything in the accessory line for the machine, fitting and erecting shops, from a split pin to a portable crane. The question of what to stock and in what quantities is all important.

The first essential is quality; this is put before every other consideration, when deciding on what to offer. Prices, of course, must be reasonable, and it is also important that makers should be able to make prompt deliveries. This last point is a sore one with all concerned in this class of business, and the writer can say from experience that it has caused him more worry than almost anything else.

The maintenance of a stock requisite for the amount of business to be done necessitates a systematic record of the coming and goings of hundreds and thousands of small articles. The recording system used by the storekeeper provides theoretically for every contingency. It is a card system, three sample cards being shown in the accompanying illustration. A separate card is made out for each different size of every kind of article. In one column is entered the number of articles ordered from the maker, Alfred Herbert, Ltd., order number and the date. In the next column the date when the goods are received. The third column indicates the number of articles in stock after each transaction, while the fourth column gives the number of articles ordered by the customer and the invoice number.

For purposes of stock keeping the third column is most important. It shows the state of the stock at any moment, and as soon as the figure reaches a predetermined minimum a new order is sent to the makers to bring the stock up to its normal level again. The advan-

tages of this system will be obvious, as the information it gives is invaluable to the storekeeper. It also shows when the stock is not selling, a point not to be overlooked.

The maximum and minimum quantities to be stocked are shown on the card; these, however, must only be taken as a general guide, the experience and discretion of the storekeeper deciding each case on its merits when the time comes to re-order for stock. When the predetermined minimum is reached the man in charge of the card index record notes the fact by fixing a small metal clip or "tickler" to the card. At the end of the day the "tickled" cards are gone through, and the requisitions for replacements sent to the head of the department.

Theoretically, of course, nothing could go wrong with such a system, but you can organize and systemize as you like, "the best laid schemes o' mice and men gang aft agley." There may have been an unusual run on a certain article, so that your stock is diminished faster than it can be replenished; manufacturers may be late in despatching; there may be delays in transit; all causes entirely beyond the control of the not-to-be-envied storekeeper. Although every care is taken, there must be times, alas, when you have to shamefacedly admit to your customer that you cannot supply him from stock with a ½ in. drill, or some such every-day tool.

Customers' Orders.

The method adopted for dealing with customers' orders are based on the assumption that when an order is received for small tools those tools are wanted and wanted quickly. This is clearly understood, and worked upon by the whole of the staff.

Each morning the orders are sorted out from the day's correspondence and sent to the warehouse. The storekeeper then goes through them, sorting out those for goods which he happens to know are in stock. These are then dealt with promptly, while the stock record cards are consulted for the remainder. A second sorting then takes place, as the cards shew which of the required goods are in stock and which are not.

The orders for goods in stock are handed over to the storekeeper's men, who get the articles from their bins or shelves and deliver them to the packers, at the same time checking them by the customer's original order. The order is then given to the invoicing clerks, who type out simultaneously the invoice, advice note, packer's note and copies for the accounts department, thereby obviating the risk of mistakes. As the goods are packed they are checked by the packer's note, which is then initialled by the responsible person and sent to the stock record keeper to be noted on his cards. Thus the goods are twice checked before being despatched. When goods are not in stock, it is first ascertained if they are on order. If so, references are made on our copy of the order to the manufacturer. When such goods are received, the customer's original order is then treated exactly as before mentioned.

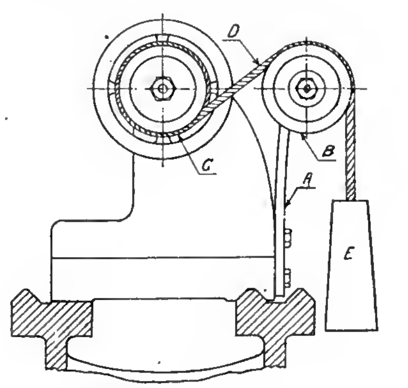
From the above it will be noted that the customers' original orders are used throughout, thus eliminating errors in making copies and saving valuable time. Mistakes do occur sometimes, as the human species is prone to error, but every endeavour is made to avoid them. It will be seen that the object particularly timed at in organizing the work of the staff is quick delivery, all other considerations being secondary to that end.

The foregoing notes on the work and place of the small tool dealer may perhaps help others to realize that he has problems peculiarly his own to solve. The success of his business depends entirely on the good-will of his customers, and this can only be secured and retained by unremitting, reliable and efficient service.

POWER DRILLING DEVICE

By J. G.

THE process of drilling holes in the ends of pieces held in the chuck on a lathe by means of the tailstock is often a tiresome operation. The method here shown of using a weight E, supported from a rope D, which passes over the pulley B and on to the pulley C, relieves the lathe hand of considerable labor. The pulley B is carried on a pin secured to the bracket A, which is fastened to the tailstock as shown.



POWER FEED TO LATHE TAIL STOCK FOR DRILLING.

Calgary, Alta.—By means of economies effected, and reduction in the cost of power, Calgary's street lighting, which is among the best on the continent, cost $10,000 less in 1915 than in 1914.

SUDBURY CONSTRUCTION AND MACHINERY CO.

THE expansion of the diversified industries of New Ontario is reflected in the additions and alterations which the Sudbury Construction & Machinery Co., are having made on their plant in Sudbury, and which are to be rushed to early completion. These include extensions to the present foundry building, the erection of a new cupola house, a new and much larger cupola and a cleaning shed, giving some 2,600 square feet additional manufacturing space, all of which when completed will give a total of 27,336 square feet of manufacturing area.

The new cupola house, 30 x 40 ft., to be built, and the installation of a new and much larger cupola, will give the company a fifty per cent. increase, from 100 to 150 tons, of castings a month. An addition, 30 x 40 ft., to the present foundry will be devoted entirely to the casting of brass, and the removal of the cupola to a new and separate structure will give greatly increased facilities for casting. A cleaning house where all castings will be finally finished and prepared for shipment will leave the foundries free and clear of impediments in the handling of their work. A new 7½ ton crane is to be installed to handle the heavier loads expeditiously.

The new buildings are to be erected in close proximity to the present structures and when complete will make the industry one of the most imposing in Sudbury.

At present, and for some time past, the Sudbury Construction & Machinery Co., have been working to full capacity, with a force of some seventy mechanics and a monthly pay-roll of $4,500. A large portion of the company's business comes from the northern mining district of Cobalt, Timmins, Porcupine and adjacent area, with the nickel and lumbering industries also contributing heavily. A close study of the needs of these industries of the north has put them in an enviable position to handle not only the manufacture, but the repair work of mining, smelting and lumbering machinery. This is also true of railway contractor's plant, repairs and alterations to which for years passed to Eastern points. The company is at the present time working on an order for equipment for two munition factories in the East, engaged in the manufacture of high explosives.

From a small but healthy beginning in 1909, the Sudbury Construction & Machinery Co., has rapidly reached proportions which to-day make it Sudbury's foremost industry, and this development has not only been rapid but permanent All buildings are substantial, of brick and steel, and equipped with the most modern machinery.

NEW PROCESS DEVELOPMENTS

Inventive Genius and Research Operate to a Dual End — They Aim to Improve What We Now Possess and Bring to Our Service Commodities Before Unknown

ALLOY STEELS—II.*

By G. L. Norris

THE use of alloy steels in cutting tools dates back nearly 100 years, although it was not until after 1850 or 1860 that alloy steel for this purpose became firmly established. With the advent of iron-clad warships began the struggle for supremacy between projectile and armor plate that has been so fruitful in the development of alloy steels. Chromium, nickel and nickel-chromium steels are largely the result of this struggle.

The publication in 1888 by Hadfield of the results of an extensive research of the alloys of manganese and steel, which resulted in the discovery of a remarkable new alloy steel marked a period of active investigation into the effect of other metals on steel. The most important of these were the investigations on nickel steels by James Riley in 1889, which demonstrated that a mild open-hearth steel, such as used for structural, general forging and machinery purposes, when alloyed with 3 to 4 per cent. nickel had considerably higher elastic limit and tensile strength, with practically the same or greater ductility. One of the earliest and most extensive applications of nickel steel was for armor plate. For many years nickel steel was the principal alloy steel in use.

During this same period, Hadfield made investigation of the effects of silicon on steel, and also a very complete study of chromium steels, which for some time had been used in a small way for springs and special forgings, but principally for tools and armor piercing projectiles. The development of high-speed steel about 1900, made it possible to readily machine heat-treated alloy steels, and the advent of the automobile with its demand for superior steel, have brought about the present extensive use and development of alloy steels.

Effect of Automobile Industry

The automobile industry, with its demand for steel of high strength and durability, has been undoubtedly the most important factor in the development of commercial alloy steels, and the largest consumer. Alloy steels are used extensively for transmission gears and shafting, axles, steering levers and spindles, springs, chassis frames, crank shaft, cam shaft, connecting rods, valves and many other parts of automobiles.

They are also extensively employed in forgings for high-speed engines, marine engines, locomotives, electrical machinery, mining machinery and other mechanical engineering structures. The use of alloy steels in bridge construction has been limited, but there is undoubtedly a field in long-span bridges for an alloy steel of high strength that can be used in the condition as rolled, preferably, or at most with a simple annealing.

Coincident and having a marked influence on the development of alloy steels, was the discovery of large deposits of vanadium ore in Peru, thus assuring a source of supply at a reasonable cost of this rare metal, which is the most powerful yet discovered for alloying with steel, that is, in small amounts.

The most important of the engineering or constructural alloy steels are those containing nickel, chromium and vanadium, singly or in combination. With all these steels it is possible, through heat-treatment, to obtain a tremendous range in strength, in round numbers varying from 100,000 to 250,000 pounds per square inch, depending also, of course, upon the size of the section.

Manganese Steel

This steel usually contains 10 to 13 per cent. of manganese and approximately 1 per cent. of carbon. It is practically non-magnetic and has a peculiar hardness to which it owes a remarkable resistance to abrasion. It is extremely difficult to machine. It has high strength and toughness, but relatively low elastic limit. With care it can be forged and rolled. It has found its principal application in castings for crushing and grinding machinery and railroad crossings. Manganese steel has the peculiar property of being toughened and softened by quenching in water, resembling copper in this respect. All manganese steel castings are subjected to this treatment to remove brittleness.

Silicon Steel

There are two types of silicon steel, one of which has found some application as an engineering steel. This steel, frequently called silico-manganese steel, is generally covered by the following limits of composition: Carbon, 0.45 to 0.65 per cent.; silicon, 1.50 to 2.00 per cent.; manganese, 0.50 to 0.80 per cent.; the manganese is normal, contrary to what is indicated by the name The principal application of this steel is for automobile springs, and to some extent for gears. It fibres readily through heat-treatment, and is very brittle in the direction at right angles to rolling. It is very sensitive to heat-treatment, and a relatively small variation in annealing temperature after quenching has a strong effect on the results obtained. The other type of silicon steel contains 3 to 5 per cent. silicon, is low in carbon and manganese and is extensively used for electrical transformer sheets on account of its high permeability and electrical resistance. It is weak and has no constructural value.

Nickel Steel

Nickel alloys with steel in all proportions, but by far the most important nickel steel, from an engineering standpoint, is the low and medium-carbon steel with 3 to 4 per cent. of nickel, commonly known as 3½ per cent. nickel steel. The presence of manganese in nickel steel is very essential, as it has a marked effect on the mechanical properties. The amount of manganese should range from 0.50 to 0.80 per cent. This steel has been extensively used since its introduction in 1889, and is a good all-round engineering and structural steel with considerably higher elastic limit and tensile strength than the corresponding carbon steel, and with practically the same degree of ductility. The low-carbon steel, 0.10 to 0.20 per cent. carbon, is used extensively for case-hardening parts. It case-hardens more readily than carbon steel and gives a harder casing with a strong, tough, fibrous core.

A great deal of nickel steel with carbon from 0.20 to 0.35 per cent. has been used in shapes and plates as rolled, and in annealed eye-bars for bridge construction. In this condition, which is not to be recommended for forgings, the following are typical physical properties: Elastic limit, 45,000 to 60,000 lbs. per sq. in.; tensile strength, 80,000 to 100,000 lbs. per sq. in.; elongation in 2 inches, 20 to 15 per cent.; reduction of area, 40 to 25 per cent. Annealed nickel steel forgings have only slight advantage in strength over carbon steel, and consequently are not advantageous either from an engineering standpoint or commercially unless heat-treated. With heat-treatment it gives considerably higher strength than carbon steel, combined with greater ductility or toughness. It does not give as high values as

*From a paper presented at the International Engineering Congress, San Francisco, Cal.

the nickel-chromium and chromium-vanadium steels.

Nickel steel rolls and forges readily and machines easily. It develops a very thick, hard scale which is apt to give considerable trouble in drop-forging and is hard on the dies. Nickel steel is also very liable to develop seaminess, especially when made in large heats and cast into large ingots, as is now customary. It requires a larger discard to ensure soundness. The use of nickel steel in forgings, and particularly drop-forgings, is falling off in favor of other alloy steels with greater values.

Chromium Steel

The use of this steel is confined principally to a few specialties and it is not in general use as an all-round engineering steel. One of the principal uses is for balls and ball races. The great mineralogical hardness obtained by quenching is very desirable for this purpose. The steel for this application contains approximately 1 per cent. each of carbon and chromium.

Chromium steel is also used for stamp-mill shoes, and in combination with soft steel in laminated plates for construction of burglar-proof safes, and in the same combination for bars in jails. The low and medium-carbon types containing 0.80 per cent. or less of chromium, have somewhat higher mechanical properties than the corresponding carbon steel. It is not used to any great extent, other alloy steels being superior, both in static and dynamic strength. Chromium steel is also very liable to crack and check in heat-treatment.

Nickel-Chromium Steel

The addition of chromium to nickel steel has a marked effect, greatly increasing the strength and resistance to shock and particularly the mineralogical hardness. It is more difficult to forge and heat-treat, and harder to machine, and is also liable to the seaminess frequently present in nickel steel. There are three types of this steel, differing both in the percentage of nickel and chromium, and all with low or medium carbon:

	Nickel	Chromium	Carbon
1	3.5%	1.50%	0.25 to 0.45%
2	2.0%	1.00%	0.10 to 0.45%
3	1.5%	0.50%	0.10 to 0.45%

The first type is used principally for armor plate and armor-piercing projectiles and came into use about 1895, superseding the nickel plates and chromium projectiles. The other two types were developed by the automobile industry. The second type is largely for automobile forgings. It gives high strength with heat treatment, has great hardness and good shock and fatigue resisting qualities. The third type is a largely used all-round engineering steel. It is used for automobile forgings and for a variety of miscellaneous drop-forgings and machine parts. It is an excellent case-hardened steel, carbonizing readily. This type is more tractable in working, heat-treating and machining than the other two. It is also somewhat lower in tensile strength.

Vanadium Steel

The addition of small amounts of vanadium, generally under 0.25 per cent., to simple carbon steel or any of the alloy steels increases very considerably—about 30 per cent. or more—the elastic limit and breaking strength, without materially affecting the ductility. To an even greater extent it increases the resistance to shock and fatigue. The vanadium steel which has been up to now most generally used is a chromium-vanadium steel of the following typical composition: Carbon, 0.10 to 0.55 per cent.; manganese, 0.50 to 0.80 per cent.; chromium, 0.80 to 1.00 per cent.; vanadium, over 0.15 per cent.

The lower carbon type, 0.10 to 0.20 per cent., is used mainly for case-hardening and is the best steel for this purpose. It carbonizes readily, gives the highest maximum carbon and finest grain. The casing is very strongly coherent to the core, very hard, tough and strong and practically free from any tendency to flake or powder. The core is remarkably strong and tough.

The higher limits of carbon 0.45 to 0.55 per cent., are extensively used for automobile and locomotive springs, giving remarkable resiliency and endurance. It is also extensively used for oil-tempered gears. The range in carbon from 0.35 to 0.45 per cent. is largely employed for crank shafts, locomotive axles, crank pins connecting rods, hammer piston rods, automobile transmissions and rear axle shafts. The range from 0.25 to 0.35 per cent. carbon is used for automobile forgings of all kinds and a great variety of miscellaneous work requiring the best combination of static and dynamic strength. As illustrating the wonderful shock and fatigue enduring qualities of chrome-vanadium steel, drop hammer piston rods of this material are giving many times the length of service of carbon, nickel and chromium-nickel steel rods.

Vanadium steels have a much wider heat-treatment range than other steels. The desired physical properties can be obtained with a higher draw-back or annealing temperature, which is very advantageous as more completely removing quenching strains, and also as a manufacturing proposition. Chromium-vanadium steel forges and machines better than nickel-chromium steel, is not as liable to injury in heating for forging, is not so liable to crack or check in heat-treatment and is free from the seamy tendency of steel containing nickel.

Carbon steel with a small percentage of vanadium, from 0.15 to 0.20 per cent., has been used extensively for locomotive frame castings with great success. The failures of these frames from all causes over a period of nearly ten years has been only a fraction of one per cent. In tool steel grades, this steel has better cutting qualities, hardens deeper and more uniformly, and has remarkable toughness. In what are termed battering tools, chisels, cutters, dies, etc., it gives several times the length of service of ordinary carbon tool steel.

Vanadium Cost

The handicap of high cost of vanadium has almost disappeared, and simple carbon-vanadium steel in the ordinary forging grades will undoubtedly soon become very widely used as an all-round engineering steel, when a better steel than carbon is required. It is remarkably clean and is as easily worked as carbon steel. It is free from the seaminess and ugly scale of nickel steels and the tendency to check and crack of the chromium steels, particularly nickel-chromium.

Tests of carbon-vanadium steel rails in curves are showing about 20 per cent. less wear than rails with 0.15 to 0.20 per cent. higher carbon, and are also considerably stronger. This difference in wear will doubtless be much greater when the carbon percentage in the vanadium rails is increased to that of the standard rails. In simple annealed forgings, plain vanadium steel has physical properties well above those specified for heat-treated (quenched and tempered) carbon steel.

This type of vanadium steel has a wider range of quenching temperature than nickel or nickel-chromium steels; and for mechanical properties after heat treatment is practically on an equality with $3\frac{1}{2}$ per cent. nickel or the low nickel-chromium steels in general use, and apparently has higher fatigue resisting qualities. While nickel and chromium interfere seriously with the welding quality of steel, vanadium does not, but on the contrary improves this quality. Vanadium steel wire is in common use for autogenous welding.

Tungsten Steel

This is principally used for magnets for magnetos and to some extent in hack saws and special tool steels. Tungsten is seldom used in engineering constructional steels, and then usually in combination with chromium.

Complex Alloy Steel

Practically none of the constructional steels contain three or more alloy metals. The only steel in this class to be considered is what is commonly known as

high-speed steel. Robert Mushet developed and patented about 1860 an air-hardening steel that was very much superior to carbon tool steel for machining hard material. Mushet steel, as it was known, had about the following composition: Carbon, 2.00 per cent.; manganese, 1.75 per cent.; silicon, 0.75 per cent.; chromium, 0.40 per cent.; tungsten, 5.50 per cent.

At the Paris Exposition in 1900, the Bethlehem Steel Co., exhibited a new tool steel that took wonderfully heavy cuts at high speeds, the point of the tool heating up to a strong blue color without losing its edge. This steel, which immediately became known as high-speed steel, was the culmination of the research work carried on for many years by Mr. F. W. Taylor and later published in his monograph "The Art of Cutting Metals." The difference between this steel and Mushet steel is apparent from the following typical composition; Carbon, 0.60 per cent.; manganese, 0.20 per cent.; silicon, 0.10 per cent.; chromium, 4.00 per cent.; tungsten, 18.00 per cent. With this steel, cutting speeds of over 90 feet per minute were obtained.

Within three or four years it was found that the addition of vanadium to high-speed steel made is possible to still greatly increase the speed and size of cut. At first only about 0.30 per cent. vanadium was added, but this has been increased until now 1.00 per cent. is practically the standard amount in most high-speed steels, and speeds of 140 feet and upward per minute have been attained.

Lately the addition of cobalt to high-speed steel has been meeting with favor as still further improving the endurance of the steel. The amount of cobalt generally used is 3 to 4 per cent., with no change in the percentage of the other metals—tungsten, chromium and vanadium.

CONCERNING ELECTRICAL MACHINERY

THE voltage which a dynamo produces depends upon three things:—The strength of the field in which the armature rotates; the construction of the armature; the speed at which the armature rotates. The current depends upon two things:—The voltage produced, and the total resistance of the circuit.

The strength of the current which can be taken from any dynamo is limited by the heating effect of the armature wires. The temperature of the armature should not exceed 70 deg. F. over that of surrounding air. The armature has two parallel circuits through each of which half the total current would flow.

The output of a dynamo is determined by the product—volts × amperes. We may, for instance, wind an armature to get 20 amperes at 250 volts, or 10 amperes at 500 volts. The output remains the same in both cases, provided the other factors are kept constant. Generally, to increase the output of a machine, we must increase the speed. This is limited by the temperature rise and the mechanical strength of the armature. Before increasing the speed it is necessary to make certain that the conductors are so wound or secured as to prevent loosening by centrifugal force. If a machine be run at 1,000 instead of 2,000 revolutions per minute we get half the voltage, and hence only half the output.

Regulation of Dynamo Output

By means of a resistance and regulating switch the current in the field coils of a shunt dynamo can be varied, and the pressure at the dynamo terminals regulated. Shunt machines can be designed to give a practically flat "characteristic" at constant speed.

If we run a dynamo at constant speed, and measure the current in the external circuit and the voltage at the dynamo terminals, then increase the load, adjust the speed to its former value and take fresh readings, we get a series of readings which show the relation between the varying quantities of "current" and "pressure."

By plotting the volts as ordinates, and the amperes as abscissae, we get what is called the "characteristic" curve for our machine. Much information can be obtained from the "characteristic" curve of a dynamo since from it the behavior of the machine under varying conditions of load can be studied.

Commercial Efficiency Feature

One important point in connection with dynamo electric machinery is the determination of its commercial efficiency: in the case of a generator, the ratio of the useful electrical activity (external activity) to the total mechanical activity applied in driving the machine; and in the case of a motor, the ratio of the useful mechanical power obtained on the armature shaft, to the electrical power absorbed. The electrical power should be measured at the terminals of the apparatus. Mechanical power should be measured at the pulley or coupling.

The electrical power can be measured with extreme accuracy, but the accurate measurement of the mechanical power in either case presents considerable difficulty. Where the dynamo is directly coupled to a steam set, the power indicated in the engine cylinders, less the portion wasted in the engine itself, gives the brake horse power supplied to the dynamo. The results obtained from this calculation cannot be regarded as very accurate, owing to the uncertainty of obtaining the exact waste in the prime mover. A transmission dynamometer, or a friction brake, is generally used to determine the horse power expended or obtained.

To determine the electrical power take the potential difference at the terminals of the external circuit, and the current flowing through a motor with the potential difference at its terminals; the product of the two quantities in either case gives the power in watts.

The efficiency could also be obtained by adding the sum of all the individual losses to the output to derive the input, or by subtracting their sum from the input to derive the output. The ratio of the useful electrical activity to the total electrical activity is known as the electrical efficiency. It should be noted that a small increase of the armature resistance would lower the figure considerably, because the armature carries such heavy currents. The electrical efficiency would, on the other hand, be increased if more turns of wire were wound on the field magnets, because the added resistance would diminish the current strength.—Herberts Monthly.

A HANDY LEVEL

By R. F. G.

THE sketch here shown illustrates a very serviceable and convenient method of constructing a level, and, while not very substantial, it may, with careful usage, be made to answer a very useful purpose.

A HANDY LEVEL.

A piece of gauge glass (b) of a suitable length is filled with water, and a small cork (a) inserted in each end; by adjustment of the cork any desired size air bubble may be obtained.

France Buying Copper.—A New York despatch of January 28 states that a million pounds of copper, part March and part April delivery, sold in New York two days previously for 26½ cents a pound. The sales of nearby copper at higher figures have not resulted in any change in the quotations of the larger interests, who continue to ask 25½ cents for May and forward months. Domestic inquiry is steady from day to day, and the foreign demand is far from being satisfied. France is buying as far ahead as June and paying 25½ cents.

PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

HIGH SPEED POWER HACK SAW MACHINE

THE high speed power hack saw machine shown in the accompanying photographs has been designed to embody all possible labor saving features and mechanical improvements while avoiding complicated mechanism or delicate construction. It is designed to operate at a speed of 250 revs. per min., at which speed it will cut low-carbon steel and other soft metals, fibre, hard rubber, etc., at an almost unsurpassed speed. A record of cutting a 3 in. bar in less than 2 min. at the above speed is claimed for this machine by the makers, the Peerless Machine Company, Inc., of Racine, Wis.

Full cabinet bed construction is provided which enables the machine to be used for heavy work without risk of springing the working parts and avoids the annoyance of small supporting feet sinking into floors, etc. The cabinet forms a tank for the cutting compound which is circulated by a pump located inside of the rear end. A trough surrounds the work table, collecting the compound and returning it through suitable straining devices to the bottom of the cabinet.

Tee slots are provided on each side of the vise so that irregularly-shaped metal can be clamped down if required. The vise is quick acting by means of an adjustable block which carries the tightening screw. A special quick-acting attachment prevents the jaws from tilting when cutting short pieces.

The saw frame travels in vee-shaped slides, the bearing of the frame being $11\frac{1}{2}$ in. long. Wear is taken up by adjusting the upper slide.

The feeding mechanism is operated by a spring which gives a uniform pressure on blade throughout the entire cut, the pressure being controlled by the lever shown on left hand side of machine. When raised to the top notch this device exerts a pressure of 125 lbs. on the blade, and dispenses entirely with the use of weights.

Automatic lifting mechanism is provided for raising the saw frame on the return stroke. This is accomplished by means of a spring which raises the saw frame clear of the work. By means of a cam on the main shaft the powerful main feed spring is allowed to act on the cutting stroke only.

A feature of the feeding mechanism is the arrangement whereby the feed does not come into action till the belt has traveled over three-quarters of its distance when starting. Besides allowing the compound to get on to the blade before the feed pressure is applied it allows the operator to apply a gentle pressure on the blade during the first few strokes avoiding the stripping of teeth when starting a cut on sharp edges

When a cut is finished or a blade brakes, the feed increases during the remaining portion of the stroke when the machine is automatically stopped, and the frame raised to any previously adjusted height. A depth gauge which stops the machine at any desired depth is fitted.

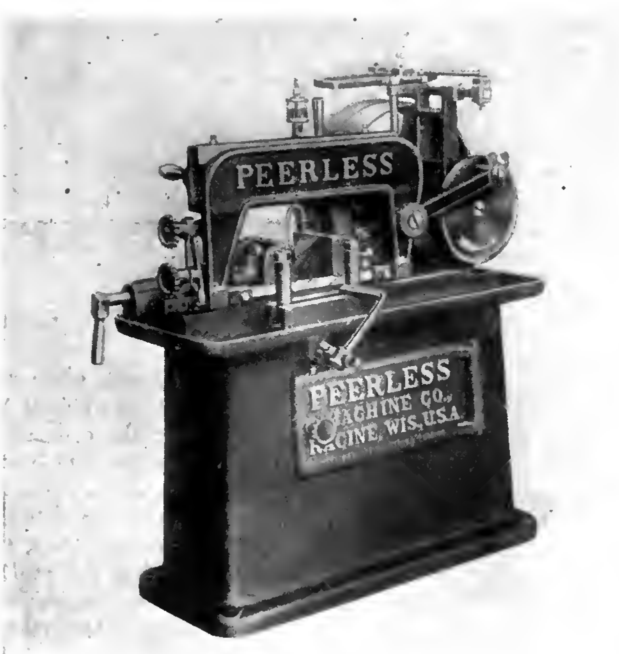
Tight and loose pulleys are 16 in. x 3 in. Crank pin and wrist pin are hardened steel 1 in. dia. x $1\frac{1}{4}$ in. long, a cap for taking up wear being fitted on crank pin end of connecting rod. Ample provision has been made for efficient lubrication of the wearing parts.

SHELL CUTTING OFF MACHINE WITH REVOLVING CUTTERS

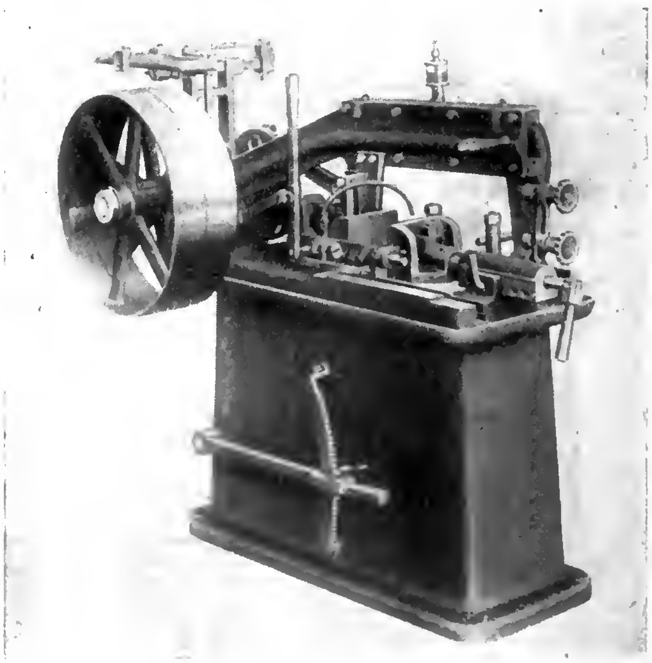
AN interesting type of cutting-off machine for shrapnel shell forgings has been developed by the Curtis & Curtis Co., Bridgeport, Conn., and is being placed on the Canadian market by Watson, Jack & Co., Montreal.

The principle of rotating the cutter head around the shell has been adopted in these machines, enabling four cutting tools to be brought into action by means of an automatic continuous feed mechanism of simple design.

Illustration Fig. 1 shows the working side of the machine, the forging being held in a two-jaw self-centering vise on



RIGHT-HAND SIDE OF HIGH-SPEED HACK SAW.



LEFT-HAND SIDE OF HIGH-SPEED HACK SAW.

the side next the operator. The cutters, which are shown in Fig. 2, are alternately square and pointed for chip breaking purposes, and are driven round by a driving plate encased by the housing. This plate has gear teeth around its rim which engage with a driving pinion at the left of the machine, this pinion in turn being driven from a two-speed cone by suitable reduction gears.

FIG. 1. WORKING SIDE OF CUTTING-OFF MACHINE.

The feed cam, Fig. 3, is of approximately the same diameter as the driving plate, and engages its groove D on the pins H. A separate pinion is mounted beside the driving plate pinion, the ratio of it being such that the cam plate is revolved slightly quicker than the driving plate, this advance in relative position causing the cam groove to feed the cutters into the work. At the termination of this travel the cam groove is arranged to give a quick return to the cutters as will be observed in Fig. 3.

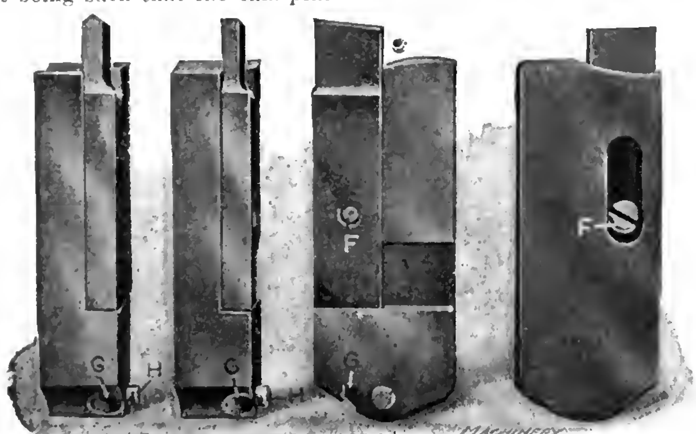


FIG. 2. CUTTER HOLDERS WITH ADJUSTABLE BLADES SHOWING PIN FOR ENGAGING FEED CAM.

The cutter holders carry high-speed blades, which can be adjusted for wear by screw G, after loosening binding screw F; the cutter holders are removed singly through groove E, Fig, 3, without disturbing any parts of the machine. A stop bar is provided, as shown in Fig. 1, for locating the shell in position from the inside of the base.

Regular equipment includes a countershaft, oil pump and one set of tools. Approximate weight is 1,200 pounds and floor space required is 36 by 24 inches. In addition to its application to shrapnel work, the machine is suited for all classes of tubular work.

DOMINION STEEL CORPORATION MANAGEMENT

OWING to continued ill health, and in order that he may take an extended holiday abroad, J. H. Plummer for the past six years president of the Dominion Steel Corporation, and president of the Dominion Iron & Steel Co., for upwards of ten years, retired from active management of the corporation on January 28. Mark Workman, of Montreal, also a director of the company for many years, was unanimously chosen to succeed Mr. Plummer as president. Mr. Plummer remains a director of the corporation and will in future fill a new post, that of chairman of the board. After his return from abroad he will take part in the management of the company's affairs as a director only. Hector McInnes of Halifax was appointed to the directorate.

The retirement of Mr. Plummer had been expected for some time and will not therefore be received with surprise. For many months the president's health has been poor, and this chiefly owing to the strenuous efforts he put forth in readjusting the organization of the corporation to meet the changed conditions brought about by the war. Mr. Plummer was almost solely responsible for the company's new high explosive enterprise and he worked hard for months in bringing it to its present state of efficiency.

FIG. 3. FEED CAM FOR AUTOMATIC CONTINUOUS FEED AND QUICK RETURN.

Mr. Workman announced after the meeting that he would devote almost his entire time to managing the company's affairs, and that his headquarters would be in Montreal.

There had been no improvement in the domestic demand for steel products, the new president asserted, but the continued slowness of trade in Canada was not causing any anxiety. At present, and for some time to come, export business was expected to occupy fully all branches of the company's plants. Mr. Workman said that the toluol plant was fulfilling all expectations and that active operations on shell work continued.

Mr. Plummer has booked passage and was expected to leave New York for England on February 1, as a passenger on the Rotterdam.

Vol. XV. FEBRUARY 3, 1916 No. 5

FAIR PLAY FOR THE IMPERIAL MUNITIONS BOARD

IN our issue of January 20, in an editorial entitled "Planning for a Shell-less To-morrow," we stated that in our opinion 'the time had come when the concentration on munitions manufacture in Canada might well be less exclusive, and that as opportunity arises to direct our now highly developed energies into other and war-created channels, no hesitation should be displayed in parting with the old and getting on with the new.' It is quite evident that our views do not in any sense commend themselves to certain interests as was to be expected, and while of course the latter are the victims of circumstance and in consequence merit sympathy rather than anything else, there is always the possibility that the extravagance of statement and absurdity of propositions put forward by them may have an unsettling effect on some at least of our metal-working plant executive aims and ideals. Let us say here that since our last writing we have had no cause even to modify, much less change our opinion, developments of the past few days giving, as a matter of fact, added strength to our convictions.

Criticism of Munitions Board

As far as Canada's metal-working plants are concerned, we are possibly in more direct touch than is any other interest—individual or collective, and while cold facts are not always palatable, once in a while they must needs be served. Criticism of the Imperial Munitions Board as of the original Shell Committee is developing both prominence and vindictiveness, although from an entirely different standpoint to that to which the latter body was subjected, and in meeting this situation let us just indicate what is involved, and where the Imperial Munitions Board stand relative to it.

One reason for the present dissatisfaction is due to the fact that the Board have had to cut out the making of 18-pdr. H. E. shells in Canada on definite instructions from the British Government. Orders for this type of shell were placed for the most part in Western Canada. Those concerned are kicking and to pacify them somewhat, the Imperial Munitions Board have placed some orders on their own responsibility, asking the firms to appreciate the situation.

In this matter of further manufacture in Canada of 18-pdr. H.E. shells, pressure of the most persuasive type and influence of the most powerful available was brought to bear on the Imperial authorities, but to no purpose. In view of this why, except through ignorance, or for the venting of personal spleen should the Imperial Munitions Board be denounced?

Another occasion for fault-finding has been because of the Board's business-like action in bringing unfilled contracts, made many months ago, under the penalty provision that the work must now be completed at several dollars less per shell or else the contract will be withdrawn. This is obviously a move which should receive public approval.

Russian Shell Contracts Being Acquired

A further evidence of the Board's desire to maintain plant activity in shell-making as far as lies in its power, is to be noted in the acquirement of a contract for half a million Russian 18-pdr. H.E. shells from the Canadian Car & Foundry Co., for distribution among Canadian firms who are prepared to undertake the work in varying quantities. The Russian 18-pdr. H.E. shell differs somewhat from that of the British, in that a ground finish is required; a lower price per shell comparatively is also offered, and a strict delivery time limit is set. Irrespective of these drawbacks, if they may be so termed, there is profit to be earned, even allowing for the necessary additional equipment, and there is several months' activity ahead for firms undertaking the work.

As an indication of the future policy of the Imperial Munitions Board, shell manufacture will be concentrated as far as possible in districts thickly set with machine shops, in consequence there is little likelihood of further orders going West of the St. Clair River. So far as the plants making 6-in., 8-in. and 9.2-in. shells are concerned, the orders placed will keep them going until February, 1917. Shrapnel and 4.5 H.E. shells now on order will last till this fall, and it is expected that further orders will be placed for these, although nothing additional is meantime in sight.

Manufacture of Fuses

Up till quite recently nothing had been done relative to the manufacture of shell fuses in Canada. This the Imperial Munitions Board have made it their business to attend to, with the result that contracts have been placed with three firms for a total of three million time and impact fuses, delivery in quantity being expected to materialize in mid-summer or early fall this year. Steps have also been taken to establish two shell-loading factories, one of these being established in Montreal and the other in Toronto.

The Imperial Munitions Board is attending to its business both in the securing of further orders from the Imperial Government and in the administration of contracts in process, and while additional shell contracts may be placed in the ensuing months, present conditions should be regarded as sufficiently ominous of an impending reduction in future quantity orders, if not of their altogether cessation as that "Planning for a Shell-less To-morrow" may not be longer postponed.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents

Montreal, Que., Jan. 3, 1916.—Very little change is noted in the irregular and complicated conditions that still prevail in the various markets. The abnormal situation on all sides is apparently not fully comprehended by many of those vitally interested at the present time, and the prospects for the future seem clouded with doubt and uncertainty. It is with some feeling of anxiety that the trade is looking forward to the future developments.

Pig Iron

The capacities of most foundries are still taxed to the utmost, the output in many instances being sold for the first and second quarters. Many selling agents report that orders booked to date will ensure them very good business without further effort. The market at present is quiet and inactive, as most consumers are well supplied for immediate and early future needs. However, some indications of further buying have recently developed and third and fourth quarter inquiries are gradually increasing. Heavy inquiries for foreign tonnage are creating a stir among the Bessemer iron producers, as a shortage is apparent and it is expected that prices on steel-making iron may shortly be advanced.

No change is quoted in the local prices.

Steel

No cessation of activity is evident throughout the steel industry, and producers are using every facility to meet the requirements of the enormous demand, which is and has been for some time, greater than at any previous time in the country's history. Owing to difficulty experienced in shipping facilities, both by rail and water, considerable delay in delivery is reported from many points. Owing to the increased freight on ocean traffic and the scarcity of tonnage, no definite time of delivery is possible for export shipment. The demand for semi-finished steel is not heavy, but mills are busy filling orders, and every lull is welcomed by producers as it enables them some prospect of catching up with the requirements of the consumers. Mills are loth to accept second quarter delivery for steel bars. Billets are strong at last week's prices. Boiler plates are still in great demand, car builders' and marine requirements calling for large supplies. Many of the large plate mills are sold out for the first six months and are booking third quarter orders; 1/4 to 1/2-inch plates are firm at $3.00. Tank plates are strong at $3.25, and heads are quoted at $3.20, the latter being an advance of 10 cents per hundred lbs. Trade in blue annealed sheets is very active, the mills working to capacity in order to supply the demand. Very little booking is available for first or second quarter and dealers are anxious to place orders for advanced periods, but the makers are reluctant in their acceptance.

The market in nuts and bolts is very strong and indications of a further advance are apparent.

Metals

The metal market is practically unchanged and while foreign reports indicate strength along certain lines, local dealers are refraining from changing prices in the hope or expectation that the near future may see a steadier market. London prices on copper have advanced, also lead and spelter, while other metals are quiet, but firm. Local conditions show little change over last week, with trade reasonably good.

> **CANADIAN GOVERNMENT PURCHASING COMMISSION**
>
> **The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.**

Copper—The irregular situation which has prevailed for the past month or so still has the effect of keeping the market in a state of uncertainty, and no definite information is available as to the exact conditions. Much anxiety is shown among a large number of buyers regarding the future outlook.

The action of the British Government in stating a fixed figure to be paid for copper has given little relief to the London market, as many consumers are unable to secure satisfactory replies to their requests for material. Continued reports of large inquiries from foreign agents with orders pending, has a tendency to strengthen the market. Recent rumors of 30-cent copper were apparently unfounded, but had the effect of raising quotations. A certain feeling is abroad that producers are witholding facts that might throw a better light upon the situation.

The market here, while showing the tension of foreign conditions, remains unchanged. Dealers report fair inquiries for future; little or no requests for immediate delivery noted, as local consumers appear well supplied for present needs. Quotations are firm at $27.50 for lake and electrolytic, and $27.00 for castings.

Tin—London reports that permits for foreign shipments are becoming more general, and are giving considerable relief to an otherwise uncertain condition. Considerable tin is at present available, both for spot and early future, as much of the metal now afloat remains unsold, but buyers are anxious to cover their requirements for the coming half year, and prices are expected to remain firm, as the future supply shows signs of uncertainty. Local prices are unchanged at 45 1/2 cents a pound.

Spelter—The present market is quiet, but firm. Inquiries for spelter have been light, but the past few days have shown increased interest, and several bids for February and March delivery are reported. The galvanized trade is comparatively light and little business is recorded along these lines. Foreign quotations indicate a stronger market, but local prices remain firm, with dealers asking 21 cents per pound.

Lead—Owing to the apparent speculation recently among the large dealers, the British munitions department are considering the advisability of placing further restrictions upon the sale of lead, following a report that quantities of metal were being witheld from the market. However, regular reports of available lead are now being furnished, and the anxiety now shown may only be of a temporary nature, as the authorities are using every means to obtain a clear understanding of the present situation. The recent advance quoted on the London market was immediately followed by a similar advance on the New York market. However, Montreal dealers are holding firm at last week's quotation of 7 3/4c per pound.

Antimony—Quotations on early delivery are strong and firm, with few inquiries for futures. The local situation is unchanged, with dealers quoting 45 cents per pound.

Aluminum—Quiet and unchanged at 68 cents a lb.

Machine Tools and Supplies

Inquiries for machine tools are not so numerous now, as the requirements of shell-makers have almost been filled. However, the machine tool builders are busy with orders placed last year and also with the heavier tools required for large shells. These machines are gradu-

ally being delivered to various plants. A large quantity of shell fuses are still required, and developments are under way to establish suitable factories for these parts.

The prices on supplies are constantly increasing; owing to the steel situation, many of the dealers and makers of small tools have been forced to revise their price lists, many lines showing substantial increases. The increased cost of high-speed steel has developed many changes in the prices of drills, taps, reamers and cutters, steel of this quality being now quoted at about $3 per pound. Coupled with the unusual condition in steel, is the constantly increasing cost of oils and other manufacturing accessories. Added to the increased demand for domestic purposes, large foreign enquiries for tools and supplies are keeping both the American and Canadian manufacturer busy figuring on the possibilities of future trade developments.

Old Materials

The abnormal situation at present prevailing in the copper market has resulted in a further advance of scrap copper, and light is now quoted at $15.75; crucible $19.00; heavy, $18.75; and copper wire, $18.75. No. 1 machine composition has advanced to 14½ cents a lb. and composition turnings are now quoted at 12½ cents. No. 1 brass turnings show an increase of ¼ cent, this week's price being 10 cents per pound. Aluminum is stronger at 32 cents per pound. General trade is good, with dealers reporting fair business.

Toronto, Ont., Feb. 1.—Industrial conditions generally continue to improve, the volume of business for the month just closed being considerably greater than for the coresponding month of last year. The financial situation has also improved as a result of war orders and the more economical tendency generally. There is much less speculation than formerly and business is being conducted on more conservative lines. Machinery houses report that business is much quieter than it was a few months ago and is becoming more nearly normal. The steel trade is as active as ever and the situation is unchanged. Coal and coke are rising in price and shipments are being delayed owing to congestion on the railways and shortage of labour at the mines and coke ovens. The ingot metal market is firm and prices for most metals have been maintained at last week's levels, with the exception of antimony which is higher. Prices generally are very firm with an upward tendency. Prices of some products have advanced, such as coal and coke, seamless boiler tubes, dry red lead, ropes, wrought iron pipe.

Steel Market.

The situation in the steel trade is unchanged and the market is very strong. Prices of all iron and steel products are very firm with an upward tendency. Chicago warehouse prices for steel bars plates and shapes have advanced 10c and bars are now quoted at $2.50, with plates and shapes $2.60 per 100 lbs. Higher prices for seamless boiler tubes have been announced, new prices being about $3 per 100 feet higher than the previous level. Cost of production has increased and considerable difficulty is being experienced in getting delivery. The anticipated advance in wrought iron pipe is now in effect and the market is very firm. The new list affects both black and galvanized pipe. There has been no change in cold rolled steel shafting, but discounts are purely nominal as makers say that they have no shafting to sell in the open market for the first half of the year. Quotations on wire rods are also nominal as makers have their output sold up for some months ahead. Higher prices for wire nails are anticipated as the cost of wire rods continues to increase.

ALLIES PURCHASING AGENTS

The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:

International Purchasing Commission, India House, Kingsway, London, Eng.

French.—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendence Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.

Russian. — Col. N. Golejewski, Military Attachè, Room 904 Flat Iron Building, New York City.

The galvanized sheet market is very firm and higher prices may be expected any time. There is no improvement in the situation as regards raw materials which are steadily getting more costly. Some makers of galvanized sheets in the States are practically out of the market owing to the high cost of raw materials. The market for black sheets is also very firm and higher prices are looked for.

The steel market in the States continues very strong and still higher prices on all steel products are expected. The outlook in the trade is very bright as it is apparent that the mills will operate at full capacity throughout the year; in addition it is very probable that the present buying movement will continue well into 1917. Steel bars are now being quoted at 2.10c and iron bars at 2.00c f. o. b. Pittsburgh. Prices of billets are firm but unchanged. A shortage in the supply of ferro-manganese has developed and buyers are paying all kinds of fancy prices for prompt delivery. The nominal price for ferromanganese is $125 with no guarantee as to deliveries but prompt shipments would readily bring $150 per ton tidewater.

Pig Iron.

The market is quieter but the demand for steel-making grades of pig iron is as strong as ever. There has been some improvement in the demand for foundry iron but conditions in this regard are below normal. Prices of all brands of pig iron are unchanged.

Coal and Coke.

The situation in the coal and coke trade is unsettled and prices are advancing. Supplies are very difficult to obtain on account of the congestion of traffic on the railroads and labour shortage at the mines. Prices of solvay foundry coke have been withdrawn, it being impossible to quote firm prices owing to the conditions prevailing and difficulty of getting shipments. The higher prices have affected soft coal more than anthracite although the latter has also advanced.

Machine Tools.

The machine tool market is practically normal again, the demand having fallen off considerably as compared with the boom of last year. Fair business is being done in lighter tools for making shell parts and the demand should improve when the plants for making time fuses are being equipped. Makers of machine tools in the States are raising their prices and on this account it is difficult to get firm quotations unless for prompt delivery. Owing however to the improved domestic demand in the States for machinery, deliveries are still backward, making it difficult to do business. Russian interests are buying heavily in the States which is also helping to keep the makers busy. A local machinery house has met with considerable success in the States with a special line of machinery.

Supplies

The market continues very firm and prices on some supplies have advanced. Ropes have advanced on account of the increase in cost of raw materials. Stocks of manila in the hands of importers are light. High freight rates and scarcity of tonnage are also important factors influencing the market. Pure manila has advanced 1c and is now quoted at

18½c per pound. Transmission rope and drilling cables have advanced 2c and are quoted at 23½c and 21½c per pound respectively. Dry red lead is higher due to the steady advance in pig lead, and is now quoted at $9.87½ per 100 lbs. in keg. The linseed oil market is weaker but prices are unchanged although there is a possibility of lower prices prevailing temporarily. Gasoline and benzine are unchanged but higher prices are anticipated owing to the continued strength in the crude oil market. Prices of crude oil have recently advanced 10c in the States. Pennsylvania crude being now quoted at $2.35.

Old Material.

Conditions in the market for old materials are unchanged. There is a good demand for scrap copper and lead and quotations are very firm. Wrought iron and steel scrap are quieter and prices unchanged.

Metals

The metal markets are steady and prices unchanged except for antimony which has advanced. The copper situation is the most interesting feature as the question of supply and demand has become very important and a scarcity of copper is now likely. The tin situation in New York is easier as abundant supplies of this metal are coming over notwithstanding the so-called restrictions placed on the export of tin by the British Government. At one time it was thought that the trade would be inconvenienced but apparently the expected has not happened. The spelter situation is unchanged but the high prices are seriously affecting the galvanized sheet trade. The lead market is firm and unchanged. Antimony is higher and prices nominal, while the aluminum situation is unchanged.

Copper.—The market is very strong but the position is extremely complicated due to the recent regulations issued by the British Government to fix the price of copper. The position of copper however, is a very strong one on account of the enormous demand for this metal for munitions. This demand will exist while the war lasts and the end of the war will probably find world's supplies of copper practically exhausted and which will have to be replenished. The heavy demand therefore will no doubt continue for some time after the war stops, indications thus point to higher prices. Copper is unchanged and nominal at 27½c per pound.

Tin.—The market is active and prices unchanged. The situation is easier in New York as considerable supplies of tin are being imported, it being at one time expected that the regulations issued by the British Government would inconvenience the trade. Quotations are unchanged at 45½c per pound.

Spelter.—The market is dull and situation unchanged. There is a heavy demand for brass mill spelter but the price is too high to interest the galvanizing trade. Spelter is quoted at 21½c per pound.

Lead.—The market is firm and unchanged. The "Trust" price of 6.10c. New York is being firmly held. The lead market in London is weak owing to the announcement that the British Government propose controlling prices to prevent speculation. Locally quotations are unchanged at 8c per pound.

Antimony.—The market is strong and higher. There is a good demand for prompt and early deliveries but futures are neglected. Antimony has advanced 3c and is now quoted at 43c per pound.

Aluminum.—The situation is unchanged and market firm. Aluminum is quoted at 68c per pound.

Solder.—Prices are firm and unchanged, with half-and-half quoted at 24½c per pound.

CANADIAN PURCHASES FOR FRENCH WAR OFFICE

Philippe Roy, General Commissioner for Canada, Paris, advises the Department of Trade and Commerce, Ottawa, that an order has been issued by the War Department of the French Government to the effect that all purchases made by the Supply Branch in Canada will pass through the Hudson Bay Co. Canadian producers should therefore submit their future offers through the office of that company at Montreal. It is further stated in Mr. Roy's communication that Canadian lumber, steel and meat will find in France an important market for years to come, but it is necessary that Canadian firms should have in Paris representatives entrusted with the necessary authority, especially if it is desired to secure Government contracts.

CANADIAN RAILWAY CLUB DINNER

RAILWAYS and their share in war work, from manufacturing ammunition to the movement of troops, constituted the keynote of the annual dinner of the Canadian Railway Club at the Windsor Hotel, Montreal, on Saturday evening, January 29. This warlike spirit was further emphasized by the presence of Major-General Sir Sam Hughes, Brig.-General E. W. Wilson and other officers.

Further evidence that the railway companies were interested in war work was given by the decorations, the lamps at the head table being made from two 18-pounder shrapnel shells, which proved such effective decorations that they called for warm praise from General Hughes, who will be presented with one of these unique lamps. The menus also were in the form of shrapnel shells, with every detail complete, even to the copper bands.

The president, L. C. Orde, is absent on active service, and his place was taken by the vice-president, R. M. Hannaford, assistant chief engineer of the Montreal Tramways Co. Amongst the guests were Messrs. E. F. Gutelius, general manager of Canadian Government Railways; R. C. Wilkins, president of the Dominion Commercial Travellers' Association; J. Coleman, superintendent of the Car Department of the Grand Trunk; Prof. Bancroft, of McGill; F. Barbery, J. Cade, secretary of the New England Railway Club, Boston; Wm. McNab, valuation engineer, Grand Trunk; T. C. Hudson, master mechanic, C.N.R.; T. McHattie, master mechanic, Grand Trunk and C. Manning, mayor of Verdun; W. Manning, B. & M. Ry.

There were nearly two hundred guests present, these including a number of prominent railway men from New York, Boston, Philadelphia, Chicago and other United States points.

After "The King" had been duly honored, the chairman presented another national toast, "Our Members at the Front." This was proposed by Wm. McNab, and responded to by Major-General Sir Sam Hughes, who was given a most enthusiastic reception. The Minister of Militia paid a warm tribute to the manner in which the Canadian Railways and their employees had met the war emergency, both by their work and by sending men to the front. Many good railway men, he said, were included in the ranks of those already in the trenches, and many more had joined other battalions to be sent.

Sir Sam also pointed out the splendid work that had been done by the Canadian railways in the transportation of troops, which had made the first hurried mobilization of men at Valcartier possible. Not only were the railways, he said, doing patriotic and valuable service in regard to the movement of troops, but they had achieved wonders in the production of munitions of war at a time when they were very badly needed. Canada, said Sir Sam, was doing magnificent work in connection with the war, and the Canadian railroads were taking a leading part in this work in every way. The Minister especially complimented the Government railways on the manner in which they had risen to the emergency.

During the evening an excellent musi-

cal programme was carried out, songs being rendered by Mme. Lea Choiseul and Messrs. Bissett, Dumbrille and "Jock" Hunter, and recitations given by Bevans Giles.

SHIPMASTERS' ASSOCIATION

THE Shipmasters' Association in session at the Carls-Rite Hotel, Toronto, last week, elected officers as follows: Grand president, W. J. Crosby, Detroit; grand first vice-president, A. W. Stalker, Toledo; grand second vice-president, J. B. Mann, Toronto; grand secretary, Walter Hamilton, Chicago; grand treasurer, J. H. McDonald, Toledo; grand marshal, J. W. Kelley, Port Huron; grand chaplain, Chas. Nelson, Ogdensburg; grand warden, S. H. Kenworthy; grand sentinel, W. A. Lavigne, Midland, Ont. It was decided that the next annual convention should be in Cleveland, Ohio. Members expressed themselves as very well pleased with Toronto, and the feeling was unanimous that the convention should be brought back to that city in the near future.

Trade Gossip

C.P.R. Curtail Extensions — Grant Hall, vice-president and general manager of the C.P.R.'s Western lines, has returned to Winnipeg from Montreal, where he was in consultation with vice-president George Bury, regarding appropriations for 1916. In view of the financial outlook it has not been decided to proceed with the building of any new lines, but this matter will be given further consideration in the spring should conditions then warrant it. There is no possibility of the Company embarking on any ambitious scheme during the continuation of the war. The necessary money for the completion of Rogers Pass Tunnel has been allotted, and that work will be finished this year. With a view to maintaining the roadbed in good condition, more than one hundred and fifty miles of track will be relaid with heavy rails, and there will be a considerable expenditure on ballasting, bank widening and other work of that character.

C.N.R. Western Lines — M. H. McLeod, general manager of the C.N.R., who has just returned to Winnipeg from Toronto, where the appropriations for the year were under discussion, states that the programme for the lines in the West during the ensuing year would be marked by that progressiveness which has characterized the policy of the company in the past. The road would be maintained in the highest standard of efficiency and improvements would be made where necessary. Rails would be laid on all branch lines that have been graded as well as the extensions, so as to enable the railway to take advantage of the anticipated improved conditions throughout the West.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

Engineering

Toronto, Ont.—Wright & Co., 30 Mutual Street, is in the market for an electro-plating dynamo.

Montreal, Que.—The G. T. R. is rebuilding its machine shop at Point St. Charles, which was recently destroyed by fire.

Toronto, Ont.—The Canada Metal Co. have been granted a permit to build a $4,000 shot-tower at their factory on Fraser Avenue.

London, Ont.—The Perkins Gasoline Engine Co., of Mishawaka, Ind., have started operations at their plant recently established here.

Toronto, Ont.—The Canada Pipe & Steel Co. ask permit to make a substantial addition to their machine shop on Atlantic Avenue.

Toronto, Ont.—The Dunlop Tire and Rubber Co. have made application for a permit to build an addition to their factory on Booth Avenue.

Gananoque, Ont.—The Steel Company of Canada have taken over factory of the Gananoque Bolt Co., and will install a drop forging equipment.

Toronto, Ont.—The Universal Tool Steel Co. will construct a one-storey brick addition to its plant on Dufferin Street. Estimated cost, $7,000.

Ottawa, Ont.—The C. N. R. plans to construct repair and car shops and round house at Rideau, near here. A. J. Hills, Toronto, general superintendent.

Toronto, Ont.—The Hamilton Gear Machine Co. have been granted a permit to erect a one-storey steel and concrete addition to their present building at the south-east corner of Concord avenue and Van Horne street. The improvement is estimated to cost $4,500.

Municipal

Maisonneuve, Que.—The City council are considering installing an incinerator.

Wellesley, Ont.—The Town Council will install an electric light distribution system.

Gravenhurst, Ont.—The by-law has carried to authorize an expenditure of $3,500 on changes to the street lighting system.

Amherstburg, Ont.—The Town Council are considering the question of installing an improved street lighting system.

Kingston, Ont.—The Utilities Commission are negotiating with the Seymour Electric Co., for the sale of 1,000 to 3,000 h.p. at $25 per h.p. per annum.

Chatham, Ont.—The city is negotiating with a company who contemplate establishing a shoe factory here. The old Wolverine Co. plant may be taken over.

Toronto, Ont.—It is proposed to build a subway on Ashdale Avenue at an estimated cost of $33,000. The plans have been passed by the Dominion Railway Board.

New Toronto, Ont.—As the result of the increased supplies of water required by several local industries it will be necessary to enlarge the local waterworks system.

Collingwood, Ont.—The Town Council propose making improvements to the waterworks system which include the installation of a motor-driven turbine pump and a water tank. Chipman & Power of Toronto, are the consulting engineers.

General Industrial

Windsor, Ont.—The Universal Stove & Furnace Co. contemplate erecting a plant here or in Walkerville.

PortArthur, Ont.—The Davidson & Smith Co., are considering building an addition to their elevator here.

Woodbridge, Ont.—Edwards & Co., of Toronto, have leased the old American-Abel Co. factory and will manufacture leather products.

Toronto, Ont.—Fire in the three-storey brick building belonging to the Gold Medal Furniture Co., corner Bartlett and Van Horne streets, did $800 damage recently. Insurance covers the loss.

Electrical

Guelph, Ont.—Machinery is being installed in the transformer station, here and the last of the poles for the transmission line have been erected.

Tenders

Hamilton, Ont.—Tenders will be received by the chairman Board of Control, up to February 7, 1916, for supplying mechanical rakes and appurtenances and travelling hoist and grab bucket (one-half cu. yd. capacity), and appurtenances for Gage Avenue pumping station. Plans, specifications, and further details can be obtained upon application to the city engineer's office.

Ottawa, Ont.—Tenders will be received until Monday, February 28, 1916, for the construction of timber lock gates and their equipment for the East River Lock, near New Glasgow, Pictou County, N.S. Plans and forms of contract can be seen and specification and forms of tender obtained at the Department of Public Works, Ottawa, and at the offices of the district engineers at Antigonish, N.S.; Halifax, N.S.; Shaughnessy Building, Montreal, P.Q.; Confederation Life Building, Toronto, Ont., and on application to the Postmaster at New Glasgow, N.S.

Departmental Dredging Plant.—Separate sealed tenders addressed to R. C. Desrochers, secretary Department of Public Works, Ottawa, will be received until February 15, 1916, for the supply of brooms and brushes, chain, coal, hardware, hose, oils and greases, packing, paint and paint oils, Manila rope, wire rope, steam piping, valves and fittings, for the requirements of the Departmental Dredging Plant in Ontario and Quebec during the fiscal year 1916-1917. Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures. These forms can be obtained at the Department of Public Works, Ottawa.

Building Notes

Renfrew, Ont.—The South Renfrew Agricultural Society have decided to erect a machinery hall at a cost of about $3,000.

Dundas, Ont.—The Board of Education will erect a school building. estimated to cost $6,000. Oborn & Ellis are the architects.

St. John, N.B.—The Dominion Government will, it is reported, erect a sub-

stantial building here for the use of the Immigration Department.

London, Ont.—The Board of Education have appointed Watts & Blackwell and A. E. Nutter as architects for the proposed technical school.

Toronto, Ont.—Preparations are being made to proceed with the erection of the new Princess Theatre. Charles J. Read, of Toronto, is the architect.

Hamilton, Ont.—The Royal Hamilton Yacht Club will build a new club house near the old site. McPhie, Kelly & Darling, of this city, are the architects.

Sarnia, Ont.—Watt & Blackwell, architects, of London, Ont., are preparing plans for a new school for the Separate School Board, to cost $15,000.

Ottawa, Ont.—The Toronto, Niagara and Western Railway is applying to Parliament for authority to increase the bonding powers of the road to $75,000 a mile.

St. Boniface, Man.—It is proposed to erect an addition to the Provencher School at an approximate cost of $65,000. A by-law will be submitted to the ratepayers.

Brantford, Ont.—The City Council have passed the third reading of the by-law authorizing the sale of the Paris-Galt and of the Grand Valley line to the Lake Erie & Northern Railway for the sum of $30,000, and the electrification of the L. E. & N. Railway from Galt to Port Dover, Ont.

Personal

C. D. Campbell, city engineer of Galt, Ont., has resigned.

James English, consulting engineer of Winnipeg, Man., has been appointed manager of the Port Arthur Street Railway Co.

Wilford Phillips, manager Winnipeg Electric Railway Co. has left for California on a vacation of several months on account of his health.

Capt. Paul F. Sise, vice-president and general manager of the Northern Electric Co., Montreal, has been appointed adjutant of the 148th Battalion, Montreal.

J. C. Breckon, formerly waterworks engineer for the city of Vancouver, B.C., is now associated with the engineering firm of Du Cane, Dutcher & Co., Vancouver.

Mark Workman a prominent financier of Montreal, Que., has been appointed president of the Dominion Steel Corporation in succession to J. H. Plummer who has resigned.

George Hogarth, of the engineering staff of the Department of Public Works, has been appointed Chief Engineer of Highways for Ontario, succeeding W. A. McLean, now Deputy Minister of Highways.

J. H. Plummer for the past six years president of the Dominion Steel Corporation has retired from the active management of the company in order to take an extended holiday in Europe for the benefit of his health.

John B. McDonald, who conducted a foundry at Tiverton, Ont., for many years, died there on January 31. The deceased was born at Ross Mull, Argyleshire, Scotland, 78 years ago, and settled in Tiverton at the age of 18.

George Patterson, who has been general superintendent of the John Goodison Thresher Co., Sarnia, Ont., has accepted a position as general superintendent for the National Manufacturing Co., of Ottawa and Brockville, Ont.

A. W. Wheatley, vice-president and general manager of the Canadian Locomotive Co., Kingston, Ont., has resigned to assume the presidency of the Lima Locomotive Co., Lima, Ohio. Mr. Wheatley will leave Kingston about April 1.

Angus B. McColl, founder of McColl Bros. & Co., Toronto, died last Saturday at his residence, 289 Carlton Street. The deceased was born in Kilmelfort, Argyleshire, Scotland, in 1834, and when about ten years of age came to Canada. In 1878 he founded a large lubricating oil business in Toronto, Ont.

EQUIPMENT FOR AUSTRALIAN NAVAL DOCKYARD

Tender forms and specifications have been forwarded by D. H. Ross, Trade Commissioner, Melbourne, for 43 machines of various types required for the equipment of the Commonwealth Naval Dockyard, Cockatoo Island, Sydney, N.S.W. Tenders will be received, subject to the conditions specified, up to May 1, 1916, addressed to the Director of Navy Contracts, Melbourne, Australia. The last mail in time to reach Melbourne on May 1 is that leaving San Francisco on March 22 and due at Melbourne on April 12. The tender forms are open to the inspection of Canadian manufacturers at the Department of Trade and Commerce, Ottawa (refer file No. A-1435). Particulars of the requirements are briefly outlined thus:

Three 50-ton overhead travelling cranes.

One 25-ton overhead travelling crane.

Two 5-ton overhead travelling cranes.

One 10-ton revolving cantilever crane.

Two 5-ton travelling portal jib cranes.

Two 7½-ton jib cranes.

One 5-ton jib crane.

Two 15-ton hydraulic cranes.

One 6-ton hydraulic crane.

One 6-ton wall crane (hydraulic).

Two 3-ton wall cranes (hydraulic).

Two electric passenger elevators.

Two electric goods elevators.

One 2½-ton gauge locomotive with crane attached.

One 2½-ton gauge locomotive without crane attached.

Three electrically-driven air compressors, 1,500 cu. ft.

One 15-ton hydraulic winch.

One 5-ton hydraulic winch.

Nine 10-ton hydraulic capstans.

Two 5-ton hydraulic capstans.

One bar shearing machine.

One double-ended horizontal punching machine.

One 10-ton overhead travelling crane for shipyard fitting shop.

Contracts Awarded

St. Thomas, Ont.—At a meeting of the St. Thomas Hydro-Electric Commission recently, the contract for the erection of the new sub-station, which is to be built at the corner of Gas and St. Catharine Streets, was awarded to A. E. Ponsford, Ltd., for the sum of $16,279, this being the lowest bid received.

Trade Gossip

The McClary Mfg. Co., of London, Ont., has received a $100,000 order for field kitchens.

The Maxwell Motor Co., of Detroit, Mich., propose to establish a branch plant at Windsor, Ont.

The Consolidated Mining and Smelting Co. of Canada, Ltd., has increased its capital stock to $15,000,000.

Trail, B.C.—It is reported that the Consolidated Mining and Smelting Co. will establish a copper refining plant here.

The Canadian Steel Foundries, Ltd., have completed the installation of a 30-ton open-hearth furnace at Longue Pointe, Montreal.

E. Laurie, of the E. Laurie Co., Montreal, agents of the DeLaval Steam Turbine Co., is now in England, having joined the Aviation Corps there.

The Canadian General Electric Co., Montreal, Que., have been awarded a contract for electric equipment by the Grand Mere, Que., Town Council.

Hamilton, Ont.—It is announced that an item of $250,000 will be placed in estimates at this session of Parliament for improvement work at Stipes inlet.

The Main Belting Co. have reopened their office at 32 Front Street, Toronto, where they will carry a full line of all sizes of their belting to ensure prompt delivery. S. R. Walsh will be local manager.

Montreal, Que.—It is announced that the Willys-Overland Co., of Canada, will maintain the branch at No. 5 Park Ave., formerly occupied by the Russell Motor Co., whose business has been taken over by the former.

The Chalmers Motor Car Co. of Detroit, Mich., was incorporated under the laws of Ontario last week with $100,000 capital as the first step towards the erection of a branch plant in either Windsor or Walkerville, Ont.

Shell Box Orders.—The Imperial Munitions Board recently placed an order for 50,000 boxes for 4.5 brass cartridge cases. Tenders were called, and these ranged from $1.22½ to $4 per box. The order was placed at the lowest price quoted.

Russian Shell Orders.—The Imperial Munitions Board is officially informed that there is no truth in the statements which have appeared recently to the effect that the Russian Government is negotiating the placing of orders for ten million shrapnel and high explosive shells in the United States.

Kingston, Ont.—Mayor Richardson and T. J. Rigney, representing the Kingston Utilities Commission, have been in Toronto attending Eastern Ontario municipalities representatives' conference with Sir Adam Beck regarding power development for this district.

Toronto, Ont.—The proposed warehouse for the Robert Simpson Co. will cost about $500,000. The building will be 155 feet high, with a frontage of 279 feet and a depth of 115 feet. Burke, Horwood & White, of Toronto, are the architects, and Wells Bros of Canada., Ltd., are the general contractors.

Grain Elevator Contracts.—Robert F. Durham, vice-president of John Metcalf, Montreal, who has been in Australia for some months, has signed agreements with several State Governments to design and construct a number of grain elevators. The contracts are estimated to total between four and five million pounds sterling.

Mineral Output of British Columbia.—The annual mineral output of British Columbia is valued at approximately $30,000,000. The figures for 1913 exceeded that amount, while the product last year was some $4,000,000 short of that of the previous year. The decrease in the value of minerals produced in the province last year, as compared with 1913, was due to the European war, which disturbed the metal markets throughout the world, producing a depressing effect on the industry in British Columbia.

New Incorporations

The Semans Electric Light Co. has been incorporated, with a capital of $10,000, to carry on business at Semans, Sask.

The Granville Vulcanizing Co. has been incorporated at Victoria, B.C., with a capital of $10,000, to carry on business at Vancouver, B.C.

Munitions and Machinery Co. has been incorporated with a capital of $100,000, to manufacture munitions at Sorel, Que. Incorporators: W. P. O'Connor, A. P. O'Connor and W. B. McLean.

The Canada Soaps, Ltd., has been incorporated at Toronto, with a capital of $100,000, to manufacture soaps. Head office at Toronto. Incorporators: Leopold Macaulay and William Thomas Sinclair, of Toronto.

The Prescott Mfg. Co. has been incorporated at Ottawa, with a capital of $200,000, to manufacture all kinds of abrasive wheels, etc., at Prescott, Ont. Incorporators: J. P. Dunne, J. B. White and M. J. Coffey, all of Prescott, Ont.

The Pine Grove Milling Co. has been incorporated at Toronto, with a capital of $40,000, to carry on the business of millers. Head office at Pine Grove, Ont. Incorporators: William John McCallum and Harvey Lorne McCallum, of Toronto.

The Chalmers Motor Co. of Canada, Ltd., has been incorporated at Ottawa, with a capital of $100,000, to manufacture motor cars at Windsor, Ont. Incorporators: Hugh Chalmers, Clarence A. Pfeffer and S. H. Humphrey, all of Detroit, Mich.

Canadian Steelwork, Ltd., has been incorporated at Ottawa, with a capital of $5,000, to manufacture structural steel, etc., at Welland, Ont. Incorporators are: R. W. Knight and J. A. Cowan, of Welland, Ont.; also F. R. Schneider, of Pittsburgh, Pa.

The Burton-Munro Mines, Ltd., has been incorporated at Toronto, with a capital of $1,000,000, to acquire and develop mines and mineral lands. Head office at Toronto, Ont. Incorporators: George R. Sproat and Franklin Metcalfe McDowell, of Toronto.

The Perfection Tire & Motor Co. has been incorporated at Toronto, with a capital of $1,500,000, to manufacture automobiles and accessories, at Hamilton, Ont. Incorporators: Charles Rufus Cole, James Hallett Christian and Larkin A. Rockwell, of Hamilton, Ont.

Munitions and Machinery, Ltd., has been incorporated at Ottawa, with a capital of $100,000, to manufacture shells, bombs, cartridge cases, etc., at Lorel, Que. Incorporators are A. P. O'Connor, W. P. O'Connor, of Huntingdon, Que., and W. B. McLean, of Lachine, Que.

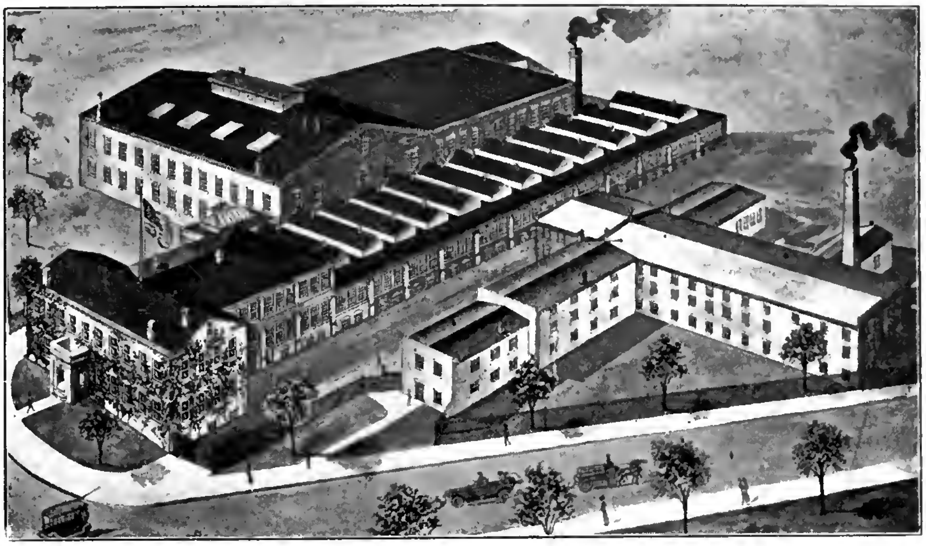
Wilson Munitions, Ltd., has been incorporated at Ottawa, with a capital of $50,000, to carry on business as mechanical engineers and build all kinds of machinery and munitions. The head office is at Toronto, and the incorporators are Robert McKay, David Grant and Mervil MacDonald, all of Toronto.

The Canadian Meter Co. has been incorporated at Ottawa, with a capital of $200,000, to manufacture meters of every description, also all kinds of measuring devices for water, gas and electricity, etc. Head office is at Hamilton, Ont., and the incorporators are J. B. McNary, E. H. Ambrose and J. P. Marshall, all of Hamilton, Ont.

Refrigeration

Windsor, Ont.—The Essex Provision Co. which has recently been incorporated are building a cold storage plant here.

Knock at our Door with an Inquiry or an Order, and you will find yourself Well Served



Geometric Tools are furnished in many sizes and types for all classes of internal and external thread-cutting, and to suit all makes of Screw Machines.
We make nothing but Thread-Cutting Tools, and thus maintain in them our standard:—"Finest Quality, Greatest Quantity, at Least Outlay."

—laces a 6-inch Belt in THREE minutes

CLIPPER BELT LACER

Laces any width or thickness. You don't have to remove belt from shaft, as this small 19-lb. machine is carried to the belt and the work done on the floor.

Saves man-time, machine-time, and money, and you get a better joint.

Adapted to all makes of belting.
33,000 now in use all over the world.
Sent on 30 days' free trial.
Here's your opportunity to prove for yourself, or your own plant — that the "Clipper" is the **only** belt lacer you can afford to use.
FOR SALE BY ALL LEADING SUPPLY HOUSES IN CANADA.

Clipper Belt Lacer Company

Marine

Port Arthur, Ont.—James Whalen, president and manager of the Western Drydock & Shipbuilding Co., of this city, states that he has secured contracts for two ocean-going freight steamers to be built here at once.

Catalogues

McKim Gaskets, is the title of Catalogue No. 16, issued by the McCord Mfg. Co., Detroit, Mich. The essential features of the McKim copper asbestos gaskets are described fully and dimensions and prices given for the various sizes The wide range of service is dealt with accompanied by illustrations showing a variety of joints where the gaskets are used.

Graphite Products. — The Joseph Dixon Crucible Co., Jersey City, N.J., are distributing a booklet entitled "Valuable Graphite Products," which deals with the company's well known and extensive line of graphite products. The class of work for which each product is intended is stated and its principal features dealt with fully. Price lists are included for the various lines.

F. Reddaway & Co., of Montreal, have issued a useful pocket diary and memorandum for 1916. Embodied in the diary proper are sectional maps of Canada and the United States. A lot of interesting general information is given in addition to the pages devoted to matter relating to the company's products such as "Camel Hair," and "Black Duck Belting," and "Reddaway" linen fire hose.

Recording Thermometers made by the Bristol Company, Waterbury Conn., are described and illustrated in catalogue No. 120. In addition to the matter dealing with the various types of thermometer are a number of specimen sections of the different sizes of charts for use with the thermometers. The catalogue also describes different styles of connecting tubes for various purposes and contains in the same section price lists for the various recording thermometers described in the preceding pages. A partial list of users of the "Bristol" recording thermometers is included.

Air Tools.—The Cleveland Pneumatic Tool Co., Cleveland, Ohio, has issued a new catalogue No. 12 describing an extensive line of air tools. The catalogue contains information of value for the selection of air tools also photographic illustrations of machines and appliances for every general and detailed purpose. Each type of tool is illustrated and is accompanied by a specification and table of capacity for the various sizes. Particulars of rivet sets and chisel shanks are included with dimensions for the various air tools with a list of parts for each.

Ball Bearings. — The Norma Co., of America, New York, have issued a catalogue No. 105 just off the press dealing with the "Norma" precision bearings. The catalogue contains 123 pages and endeavor has been made to present the subject in a way that will be interesting and helpful to engineers and also of some permanent text book value. The first 18 pages contain all the essential

facts about "Norma" roller and ball bearings covering the principal features embodied in their construction. The succeeding 20 pages deal with the principles of anti-friction efficiency as applied to "Norma" bearings covering the various types and explaining the facts in relation to bearing principles. Following the text matter comes 60 pages of tabular data giving the principal dimensions of the various types accompanied by diagrams and revealing the wide scope of the "Norma" line of bearings. Pages 102 to 115 contain a large variety of application drawings as suggestions for the draughtsman engineer while the concluding pages contain notes and suggestions on the selection of anti-friction bearings.

Book Review

The Testing of Machine Tools, by George W. Burley, 231 pages, 4¼ x 7⅛ in., 110 illustrations. Published by Scott, Greenwood & Son, London, England. Price $1 net. This publication is the eighteenth volume of the Broadway Series of Engineering Handbooks. The book deals with the various aspects of machine tool testing in such a way as to make the book suitable for engineer apprentices and students as well as responsible engineers. This subject has not heretofore been given the close consideration that its importance deserves, as a high degree of efficiency and accuracy is now demanded for modern machine tools. By the use of methods of testing the designer of machine tools is able to obtain the necessary data to enable him to produce a machine that will give the best possible results. The book contains eight chapters and an appendix. Chapter 1 covers the introduction and chapter 2 describes a number of tests on machine tool elements to determine their accuracy. Machine tool speed and feed tests are described in chapter 3, and mechanical efficiency tests in chapter 4. The next chapter deals with cutting force tests and the apparatus used while chapter 6 describes output and power consumption tests. Comparative tool testing is the subject of chapter 7, and commercial machine tool testing is described in the last chapter. The appendix covers one page and gives an inspector's report of lathe tests. The illustrations which are numerous show the different apparatus used for the various tests and also include a number of curves. The book is written in a comprehensive style and contains a considerable amount of useful information for students not easily obtained except through a medium such as this.

Interesting Products of an Optical Factory Tool Room

Staff Article

The evolution of a successful thread-rolling machine for making very small screws such as are used in spectacleware was accompanied by many difficulties, the successful overcoming of which is testimony to the skill and resourcefulness displayed in its production. Machines of this nature, in various lines of manufacture, are sound evidence of the modern machinists' craft which has rendered so many discoveries of science available to the bulk of mankind.

THE wearing of glasses and spectacles has become such a regular part of the everyday life of many people that their interest in such articles does not extend beyond the act of purchasing them over a store counter. The moderate cost of optical goods combined with excellence of workmanship and material has been due largely to quantity production on special machinery. Other factors have also helped to develop the industry to its present state of efficiency, but to the modern tool designer and tool maker must be given a large share of the credit for producing goods of such remarkable excellence as are in daily use by so many people.

The present factory of the Consolidated Optical Co., Ltd., at 400 Richmond Street, west, Toronto, has been occupied by that company for several years, and the concentration which they have brought to bear on their product, has resulted in many interesting examples of the tool makers' and machine builders' art and skill. The manufacture of spectacleware forms a considerable portion of their business, and all of the special machinery used in this work has been designed and built by their own tool room staff.

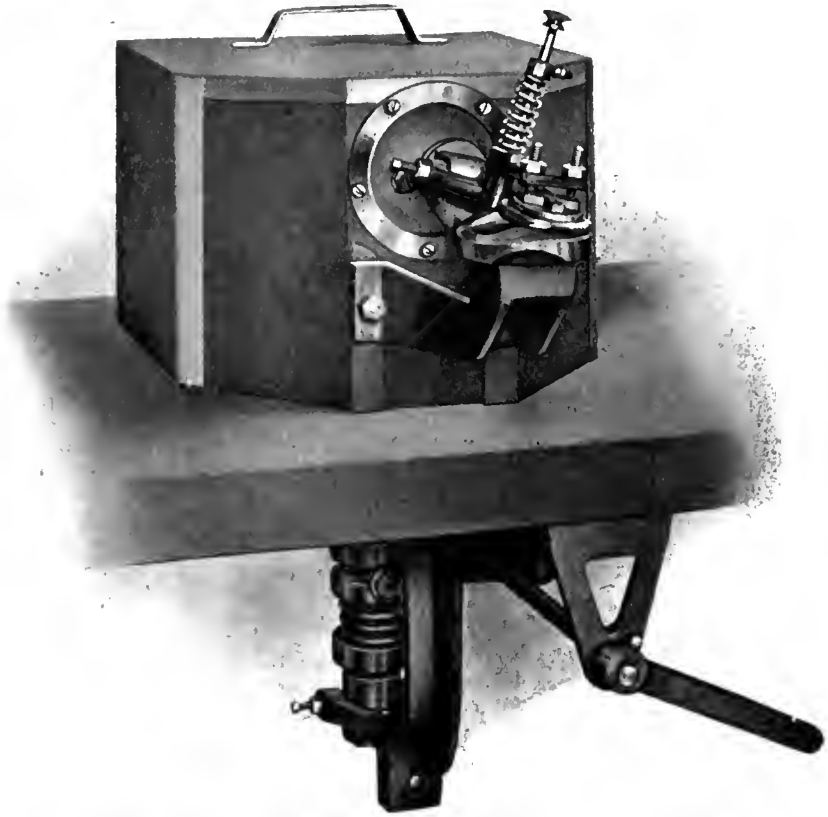

FIG. 2. LENS GRINDER MACHINE IN OPERATION ON TORIC LENS.

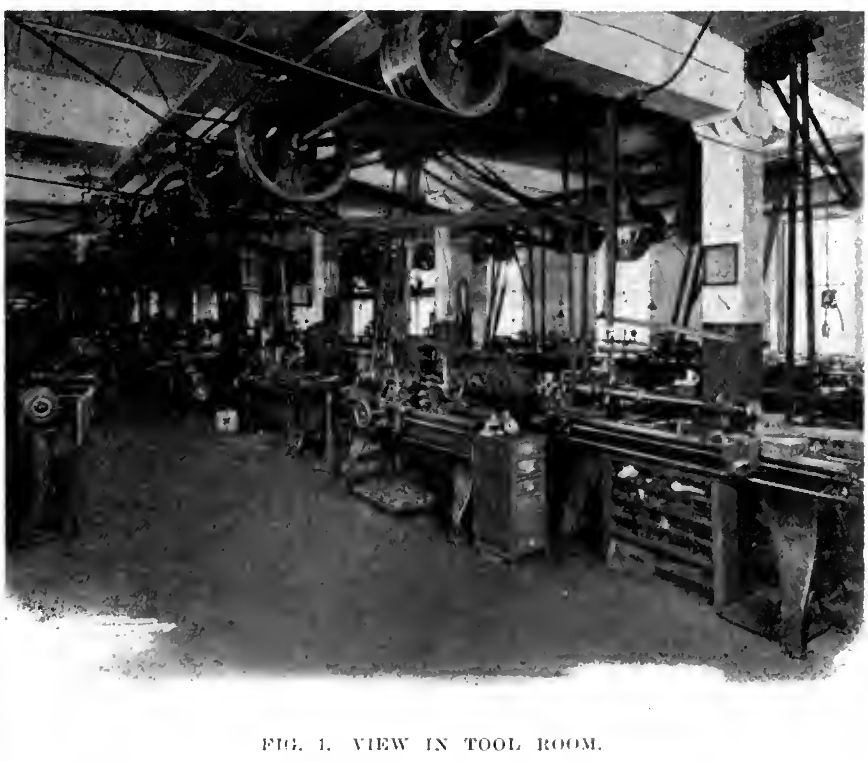

FIG. 1. VIEW IN TOOL ROOM.

A Lens Grinding Machine

The building of lens-grinding machinery for the trade calls for considerable work of an interesting nature, and illustrations Figs. 2, 3 and 4, show a machine which grinds toric and plano-cylindrical lenses quickly and accurately without expert knowledge or handling. Fig. 2 is a view of the machine mounted on the work bench with a lens in place on the top of the lapping block. Fig. 3 is a view of the interior from the back, with the casing removed, and Fig. 4 shows the construction of the clutch through which the driving belt operates the machine.

Referring to Fig. 2, the lap in use here is for a toric lens the surface of which is ovoid in form, that is to say, similar to an egg in which both ends are the same size. The lens is attached to a small crosspiece or chuck, in which are countersunk spots to receive the points of two small set screws. These set screws are carried in the front end

of a rod, the back end of which is hinged on rod E (Fig. 3), where it projects through the leather shield J. This hinge allows the front end of the lever to rise and fall as it is reciprocated across the lap block, the pointed ends of the set screws allowing the lens to adjust itself to the curve as it approaches the edge of the lap.

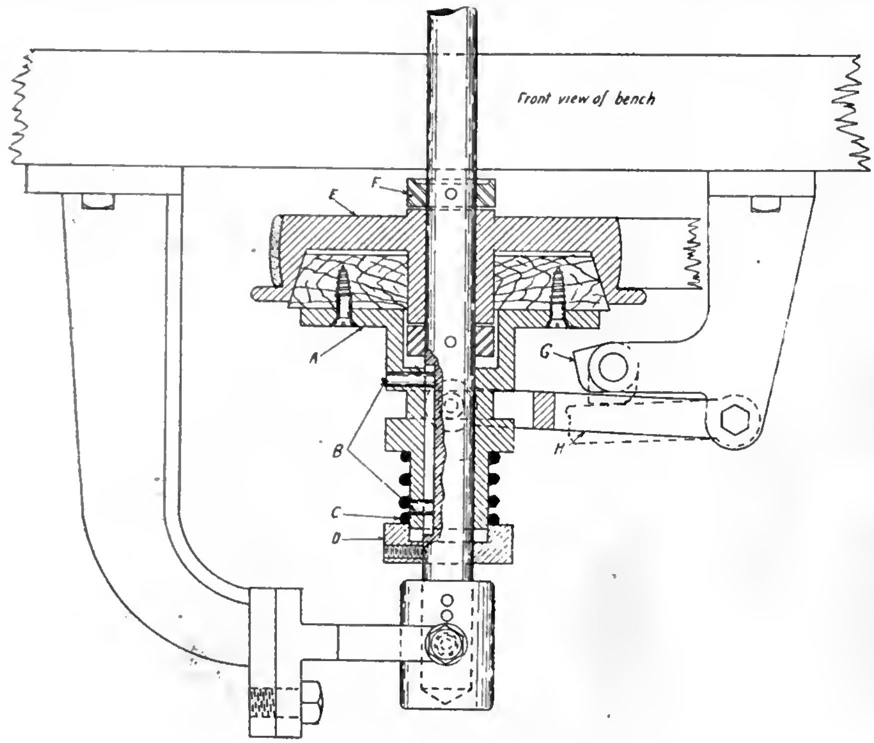

FIG. 4—DETAIL OF DRIVING CLUTCH

Nature of Movement

While this movement is taking place, the rod E, which imparts the motion, is being moved sideways so that the lens gradually works over the entire surface of the lap, from back to front, and side to side. The manner in which this is accomplished will be understood from Figs 2 and 3. The drive shaft A passes through the base plate and is supported in bearings formed in the two cross members. Immediately above the upper bearing is a small pinion B which meshes with the large gear H. Shaft A projects through pinion B, and carries a crank disc C, which, by means of connecting rod D, imparts a reciprocating motion to rod E which passes through leather dust shield J, as already mentioned. Rod E is carried in two bearings F, which form part of a frame which slides crosswise on rods G. The large gear H is connected by a rod I to the right hand end of this frame, thus moving it and rod E from side to side while crank disc C moves rod E back and forth. The connecting rod D is attached to rod E in such a way that the latter is free to revolve, thus allowing the mechanism on the other side of the shield to adjust itself to the curvature of the lap as it approaches the ends of its travel in either direction.

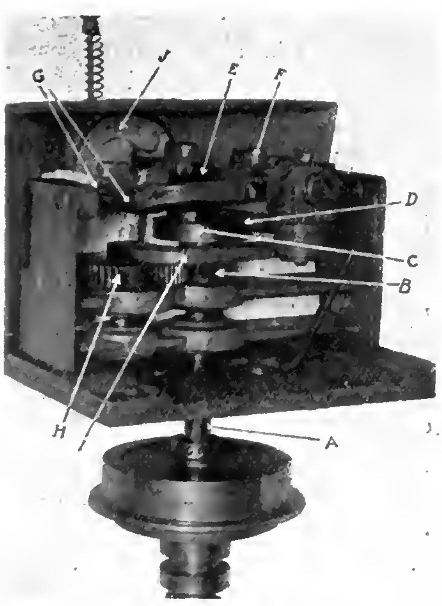

FIG. 3—MECHANISM OF LENS GRINDING MACHINE

The gear ratio between pinion B and gear H is such that a hunting tooth occurs, thus preventing the lens from passing over the same portion of the lap except at long intervals, avoiding any possibility of grooving.

The pressure on the lens is controlled by a tension screw which exerts its pressure exactly in the centre of the lens. This tension can be varied by raising or lowering the thumb screw.

A Simple Clutch

The clutch, Fig. 4, is of simple and efficient construction, and is so designed that all stresses are self-contained when engaged. Clutch sleeve A slides on the vertical shaft which it drives through pins B working in a keyway. On the lower end of this sleeve is a coil spring C, one end resting on collar D, while the other end forces the sleeve A upward so that the wooden cone is forced into belt-driven pulley E, which thereby imparts motion to the whole arrangement. Upward movement of pulley E is prevented by collar F, while a similar collar below, holds up the pulley while the clutch is being pulled out by cam G acting on lever H. When the clutch is disengaged the spring C is compressed against collar D but as the motion ceases right away there are no parts in motion while under stress.

Making Laps for Lenses

The general run of optical work calls for the production of lens surfaces of various forms, chief of which are plano or flat, cylindrical, spherical, and toric,

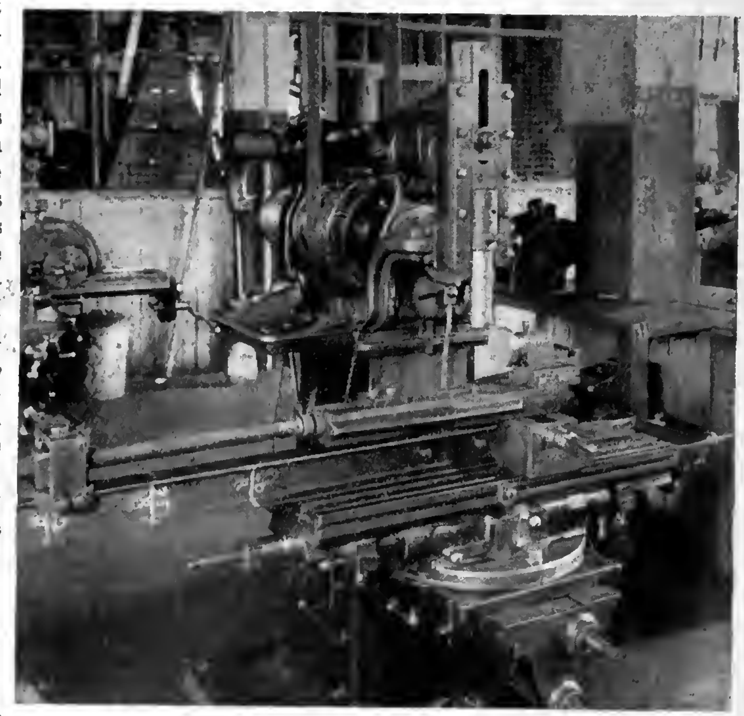

FIG. 5—VIEW OF MILLING MACHINE WITH SLOTTING ATTACHMENT FOR CUTTING CYLINDRICAL LAPS

various combinations of these being used as required. The necessary laps for forming these surfaces have to be accurately machined and the method used

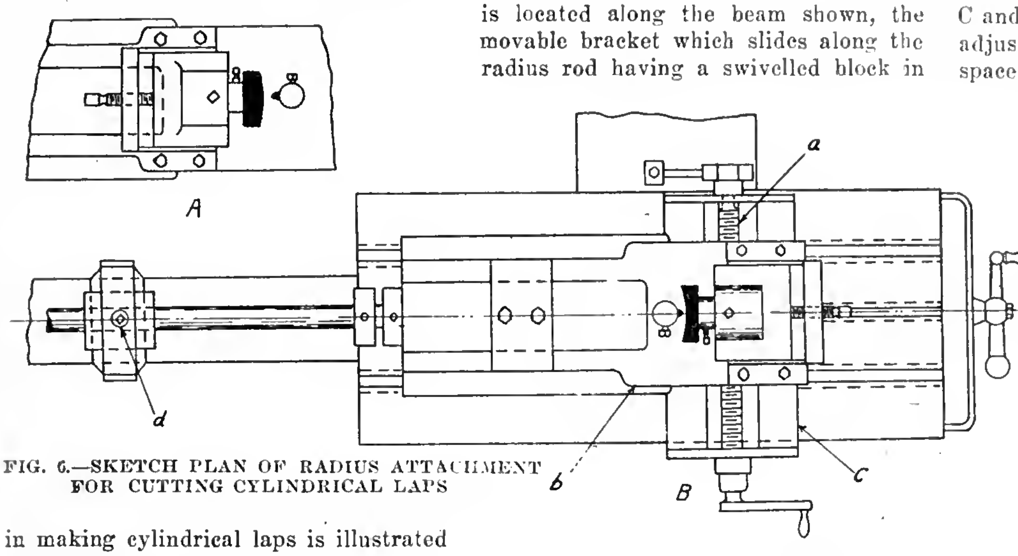

FIG. 6.—SKETCH PLAN OF RADIUS ATTACHMENT FOR CUTTING CYLINDRICAL LAPS

in making cylindrical laps is illustrated in Figs. 5 and 6. Sketches of concave and convex cylindrical laps are shown at A and B respectively. Fig. 7.

The faces of these laps are straight in one direction and curved in the cross direction, the radius of the curve being made according to the length of focus required. A milling machine fitted with a substantial slotting attachment, Fig. 5, and having a radial movement for the work table, produces laps of any desired radius either concave or convex. The ram slides in a guide bracket, the upper end of which is clamped on the supporting arm and the lower end bolted to the sides of the main frame.

A crank disc is mounted on the nose of the spindle from which a connecting rod goes to the top end of the ram. The slot in the top of the ram allows for varying the location of the stroke. Back of the crank disc is a couple of gears, one of which is on the spindle while the other, which can be observed in the photograph is provided with a slot

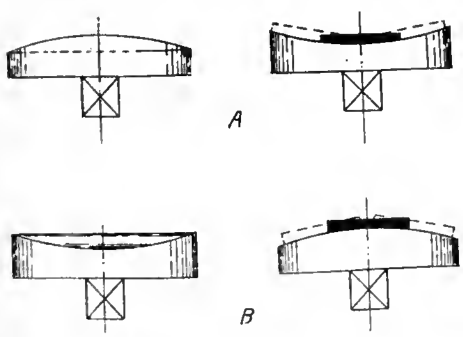

FIG. 7—CONCAVE AND CONVEX CYLINDRICAL LAPS

which carries an adjustable crank pin. This crank pin is connected by a rod to a ratchet on the back end of feed screw (a) which moves the radial slide (b) across block (c). This block is secured to the main work table, and the nut on screw (a) is so connected to slide (b) that the latter can swing through an arc with point (d) as the centre. Point (d) is located along the beam shown, the movable bracket which slides along the radius rod having a swivelled block in which the radius rod is fixed. The photograph shows a concave lap just completed.

When machining convex laps, the work chuck is reversed so as to be between the cutting tool and the point (d). Fig. 6 shows a plan of the arrangement, in which convex laps are being cut at A and concave laps at B. The production of spherical laps is similar in principle to ball turning and is done on a specially fitted engine lathe.

Rolling Threads on Small Screws

The production of small screws used in assembling spectacle parts is one of the most interesting pieces of work to be observed here. These screws are $\frac{1}{4}$ in. long overall x .047 in. dia., with ninety threads per inch, and have to be perfect in finish and accurate in size. In order to produce these in quantities and at reasonable cost, a thread rolling machine has been developed which takes the screw blanks in bulk from the automatics, and feeds them, rolls the thread and delivers them through a spout without any attention whatever from the operator beyond shovelling in blank screws.

Photographs of this machine are reproduced in Figs. 8 and 9, and constructional details are shown in Figs. 10, 11 and 12. Reference letters on the various views correspond:—A, feed hopper; B, feed chute; C, threading roll; D felt pad; E, delivery chute; F, feed plunger; G, feed lever; H, feed cam; I, threading die. By means of the mechanism illustrated, the screw blanks are fed in at suitable intervals between threading roll C and die-block I, the two surfaces being adjusted to such a distance, that the space between the top of the threads of the roll and the block is equal to the diameter of the screw at the bottom of the thread.

The vertical spindle on the upper end of which the die roll is mounted, is supported in two tapered bushes and carries a bevel gear meshing with a pinion on the end of the main drive shaft, which in turn is driven through worm gear from the grooved belt pulley shown. A clutch is provided on the main drive shaft so that the worm gear may be disengaged, and the machine revolved by hand when adjustments are being made.

When the machine is in operation, feed hopper A is filled with blank screws which are lifted one at a time by feed plunger F. The two extreme positions of this plunger are shown in Fig. 11, from which it will be seen that the plunger with its sleeve sinks down to the bottom of the hopper, allowing the mass of blanks to close over it. As it rises up, the blanks roll off with the exception of one which is held in the recess formed by the extension of the sleeve above the end of the plunger. The upward movement continues till the lower end of the sleeve reaches its limit of travel when the plunger continues to the end of its stroke, compressing the spring, and extending the point beyond the end of the sleeve. The point is sloped and grooved as shown so that the blank screw slides off on to the feed chute B. A small hammer at the side of

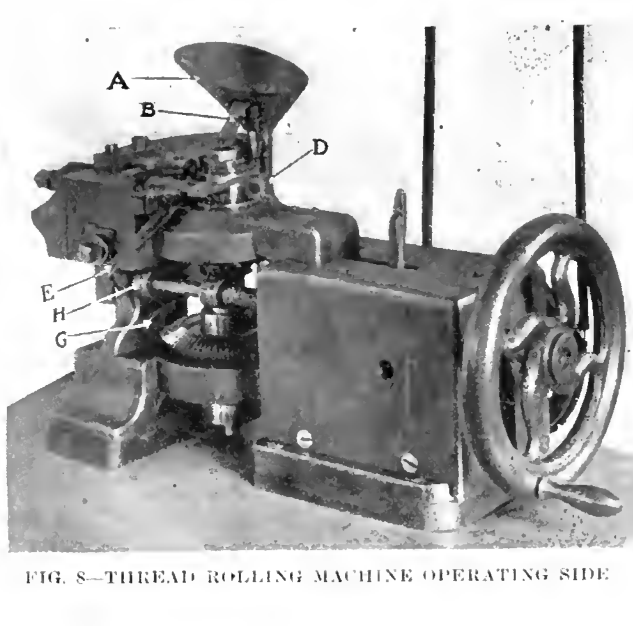

FIG. 8—THREAD ROLLING MACHINE OPERATING SIDE

the hopper, Fig. 11, taps the chute gently, so that the blank screw moves forward from the edge until it reaches a slot which allows the body of the blank to fall through, leaving it suspended by the head, see Fig. 11. The blanks pass down the chute, by gravity till they reach the roll.

Although the roll is revolving continually, the screw blanks must not enter except at certain points when the thread on the roll is immediately opposite the thread on the die, otherwise the thread rolled on the screw would be entirely distorted. The proportions of the roll are such that at four points on its periphery the thread matches the thread on the die block I. Fig. 12 shows the mechanism controlling this intermittent feed. The lever L is free on the roll spindle, but is held back in position shown by a spring. Part of this lever overhangs the face of the roll forming the finger K. The pawl N is swiveled on top of this finger and has one end shaped to suit the cam faces of M, while the other end is shaped to contact with roll O. Cam M is fixed to the main spindle in a definite relation to the thread.

The blanks, having reached the end of the chute, are held back by retaining plunger J, until cam M engages pawl N. When this happens, lever L is revolved so that finger K presses the first blank against plunger J, forcing it back and carrying the blank forward till it engages between the roll and the die. By this time, pawl N is tripped by the roll O, and lever L with finger K and pawl N is returned to its position as shown in Fig. 12. Plunger J springs forward as finger K passes back, and holds the next blank in position for the next movement of the mechanism.

The surface of the die block I is set to gradually approach roll C, so that

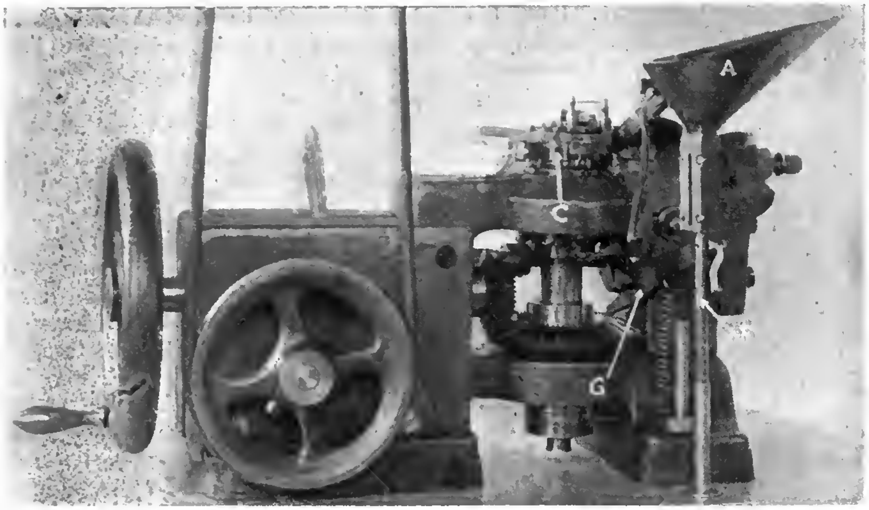

FIG. 9—REAR VIEW SHOWING FEED MECHANISM

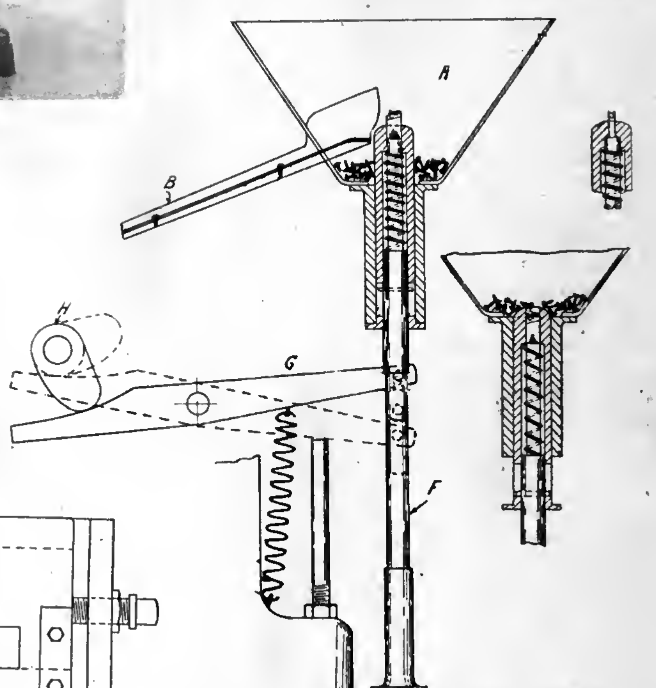

FIG. 11—DETAIL OF HOPPER FEED

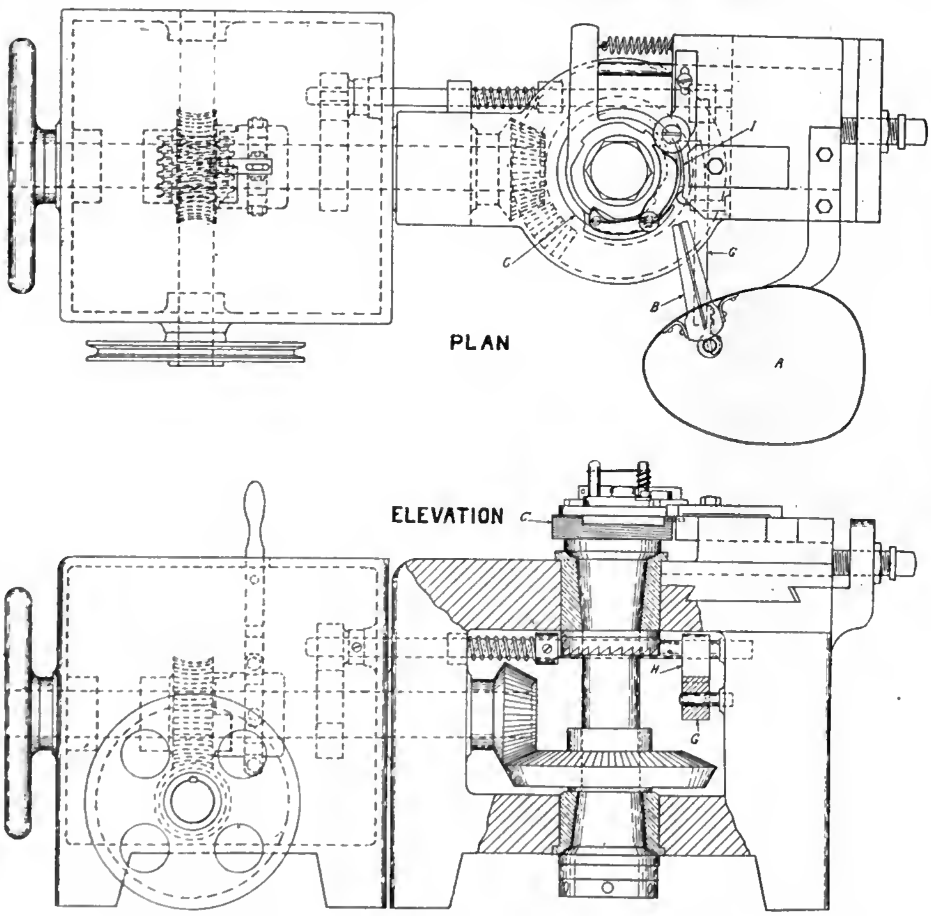

FIG. 10—GENERAL ARRANGEMENT OF THREAD ROLLING MACHINE

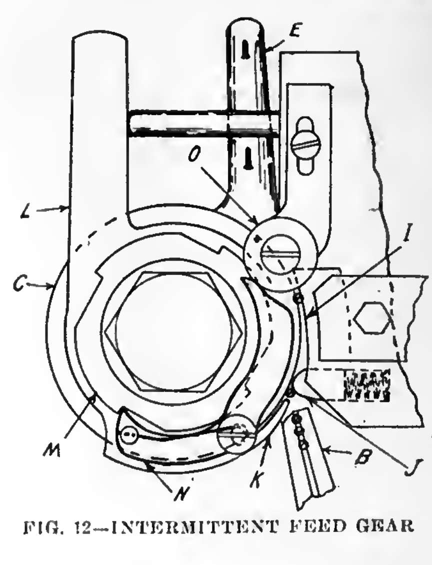

FIG. 12—INTERMITTENT FEED GEAR

the thread is gradually pressed into shape. The thread on the roll is made left hand, and the die is right hand. The setting and adjusting of the parts calls

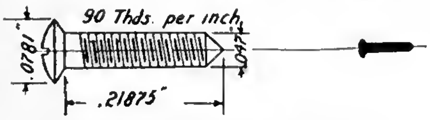

FIG. 13—LEFT, ENLARGED VIEW. RIGHT, ACTUAL SIZE OF SCREW.

for great accuracy and full provision has been made for this in the design. Fig. 15 gives the actual dimensions of the screw on an enlarged scale, the actual size of screw being shown in solid black.

LAWN MOWER ADJUSTMENT, SHARPENING AND REPAIR

By James R. Tate

MORE money is often made out of small jobs properly handled than is made out of many of the difficult and particular jobs which come into the regular repair shop. It is a fact that there are men making more money out of the manufacture of collar buttons than other men are making from the manufacture of locomotives.

Some time ago I was managing a manufacturing business. We had a very complete plant, and could handle almost any ordinary repair work as a side line. I was surprised to learn that per hour we really made more money out of sharpening lawn mowers and plow shares than we made from the manufacture of the article to which we were devoting almost all our energy. If it were possible to keep fifty men going steadily sharpening lawn mowers at fifty cents each, there would be no better business of its size in America.

However, we cannot keep fifty men going, but in many localities a good big boy or a man can be kept busy on this work. Like almost anything else, there is a right and a wrong way of doing it. If the system as follows is adopted, there is no reason why a man should not sharpen four mowers per hour. If repairs are required they must be charged for accordingly.

Lawn Mower Cutting Troubles

There are usually three causes for a lawn mower not cutting. Sometimes it is one, sometimes two and sometimes all three. On starting to locate the trouble or to sharpen a mower, the first move is to see if the shaft to the revolving knives is held snugly by the bearings. After you have fixed a few mowers you will be able to tell one with a loose shaft, even when passing a lawn where an attempt is being made to cut grass. You will hear the knives clatter and strike the knife bar. Sometimes it will cut, and sometimes it will miss doing so for two or three revolutions. We must, therefore first see to it that this shaft is held snugly. This can be done by taking the end of frame and giving it an up and down shaking motion. Should it be loose, a screw-driver will adjust the bearing to the proper place; use the screw-driver with one hand and determine the proper tension with the other. Some mowers have ball bearings, and with them it is an easy matter to tighten up the bearings. Simply turn collar with the prong of a file and take up the slack with the set screw provided for that purpose.

Being sure the shaft is held snugly by the bearings, the knife bar must be brought up so that it only touches the revolving blades. This is done by simply loosening the forward screw and running the hind one down. You will notice the bar tilt toward the blades. The common mistake here is that of bringing the knife bar up so that the revolving blades cannot possibly turn, therefore bring the knife bar up until it touches very lightly on the revolving blades.

In order to cause the mower to run backwards, the small rachet pinions are changed from one end to the other, and the mower turned upside down. The revolving knives will then turn the wrong way. The method of grinding the blades is such that they will each touch to their full length.

The emery used should be of about the same grain as table salt, powdered emery or flour-of-emery is too fine and will take too long to cut the blades down. Having procured emery as stated, spread a layer of it along knife bar and keep mower in such a position that when oil is applied, it will naturally run down the knife bar towards the cutting edge, thus carrying the emery with it, and supplying same to complete the grinding as the mower is pushed along.

After running the mower for, say, 300 feet, stop and apply more emery and oil and if necessary tighten up the knife bar a little more. Continue this process of grinding until all the revolving knives touch evenly to their full length on the knife bar, occasionally trying the bearings to see that they are not coming loose again.

When the grinding is completed, change the small pinions back to their proper sides, run the mower through some grass, when the results will be found satisfactory.

LICENSES TO IMPORT WAR MATERIALS

The British Minister of Munitions gives notice that all persons who desire to import from France, Italy or Russia materials required in connection with the manufacture of munitions of war, being materials of which the export from the country in question is prohibited or restricted, should submit their applications to the Director-General of Munitions Supply, B.M. 3, Armament Buildings, Whitehall Place, S.W. The application must contain:

(a)—A precise description of the nature and quantity of the goods which it is desired to import.

(b)—A statement of the use to which they are to be put, and any evidence, such as references to direct or indirect Government contracts, tending to show that they are required for the manufacture of munitions of war.

(c)—The name of the firm or firms to whom they are to be consigned, as well as that of the firm or firms on whose behalf they are purchased. The Minister of Munitions will then, in approved cases, take all the necessary steps with a view to obtaining from the Government concerned a license to export the goods in question.

British Controlled Factories. — The British Minister of Munitions announces that he has made an order under Section 4 of the Munitions of War Act, 1915, declaring 396 additional factories as controlled establishments under the Act, as from January 1st, 1916. A total of 2,422 establishments have now been declared as controlled under the Act, from the date of the first order, July 12th, 1915, to January 1st, 1916, inclusive.

Crank Shaft Failures.—The investigation of crank shaft failures is rendered difficult owing to complications which may be introduced by their being out of line and by the stresses set up when the bearings are drenched with water for the purposes of cooling after overheating. From the study of a large number of failures which have occurred in practice, Mr. C. E. Stromeyer concludes that when crank shafts are subjected to pure alternating stresses their endurances can be estimated if the fatigue properties of the material are known. Modern crank shafts should be much stronger than old ones owing to the substitution of steel for wrought iron. Apparently small fillets have a material weakening effect on crank shafts, and it appears probable that crank shafts showing a tendency to crack in service might be improved by increasing the size of the fillets.

PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

COMBINING PARTS FOR PRODUCTIVE MANUFACTURE

by F. Scriber

MULTIPLE manufacture has brought out a great many ingenious methods of holding work with the object of putting as many

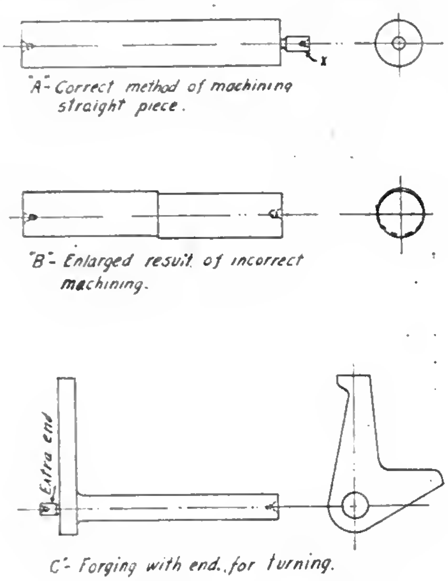

FIG. 1. METHODS OF STRAIGHT TURNING.

cutting tools to work on a part at one time as possible. This practice of course saves time in handling and often produces a better class of work by cutting down the responsibilities of the operator.

While this article will show tools for handling the work described the principal object is to forcibly bring out the

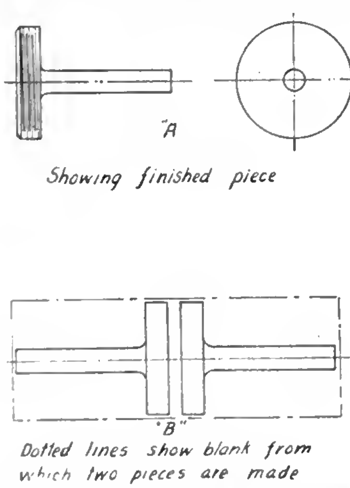

FIG. 2. MACHINING TWO PIECES IN COMBINED FORM.

advantages to be derived from combining parts and machining them together. Sometimes this is best done by combining parts of the same kind and then again, parts entirely foreign to each other may be effectively combined.

Useful Suggestions

Referring to Fig. 1 a few conveniences are shown which materially aid a workman, the first of which, A, is the practice of leaving a rod long enough so that the centre may be cut off after

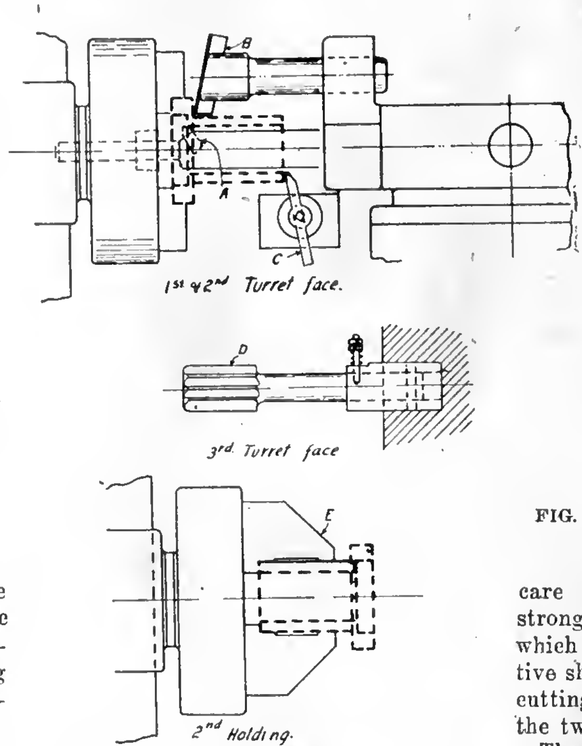

FIG. 4. METHOD OF MACHINING COMBINED BUSHINGS SHOWN IN FIG. 3.

grinding. By this method it will not be necessary to turn the rod around when partly ground, as the portion X with the centre, may be used for dogging and the grinding wheel may be run across the entire surface. At B the same bar is shown in its probable condition when ground by reversing the dog and grinding from each end to the centre only. The last example C, is a forging with a centre which is to be cut off after the shank is turned.

A simple method of combined turning is shown in Fig. 2. It may be seen that the part illustrated consists of a shank with a short threaded portion, the latter being too short to conveniently hold a dog. In order to overcome this difficulty, two parts were turned in combined form as shown at B. The piece to be machined. is driven from one end and the large diameter and shank rough turned. It is then reversed and the shank on the opposite end turned to the rough diameter, leaving the portion to be threaded in the centre. A cutting-off tool is next used to separate the two pieces, it being fed in to a suitable depth,

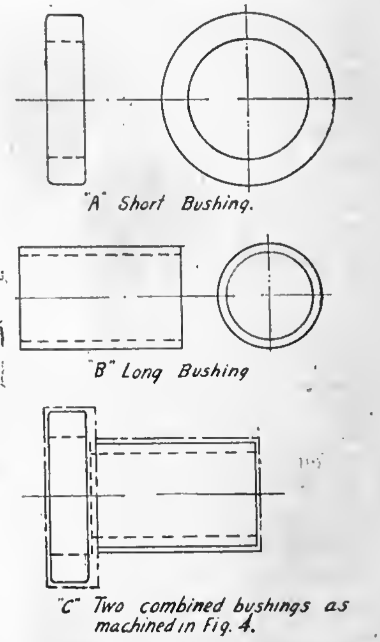

FIG. 3. COMBINATION CASTINGS FOR MACHINING.

care being taken to leave the work strong enough for the next operations, which include finishing the two respective shanks and threads. After this, the cutting-off tool is again inserted and the two pieces are separated.

The principal advantage in handling two parts together in this case is the

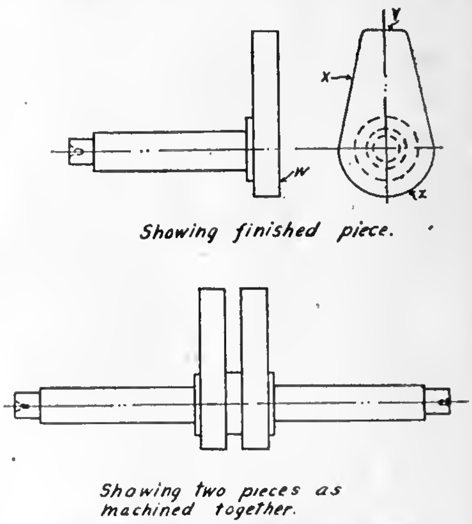

FIG. 5. PARTS COMBINED FOR CONVENIENCE IN MILLING.

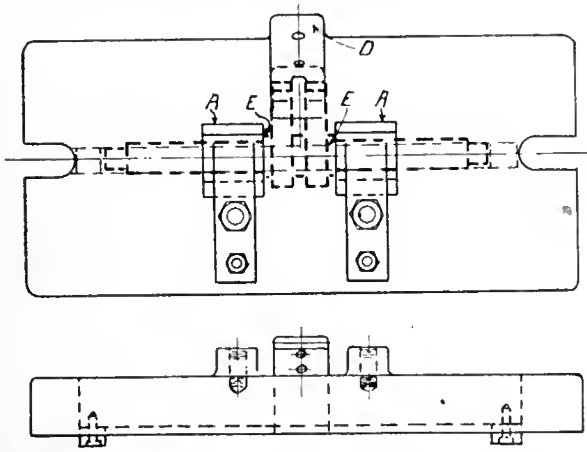
convenience in driving as the short thread when dogged on would seriously interfere with turning the shank if

machined separately. This method is quite often used for making special screws with short heads.

Combination Castings

The manufacture of various castings often furnishes examples which warrant consideration as shown by the bronze casting Fig. 3. This is a combination of two bushings, the short bushing A, and the long bushing B, and as it would mean two operations on each piece if handled separately the two are combined as at C. The casting is gripped in a chuck by the large diameter and machined on a turret lathe with the tools arranged as shown in Fig. 4. The small bushing is first rough and finish-bored, turned, faced and reamed by means of the respective tools, A, B, and C; and the floating reamer D, which is attached to the third turret face. It is next gripped in a soft-jawed chuck E, by the finished diameter, and the larger end is similarly machined, the tools for this operation being practically the same as used in the previous operation. In the last operation a cutting-off tool is used and the casting cut in two parts thus making the bushings.



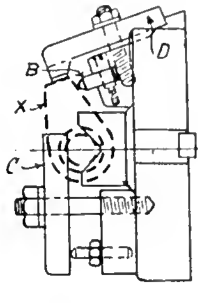


FIG. 6. FIXTURE FOR MILLING SIDE "X" ON PART SHOWN BY FIG. 5.

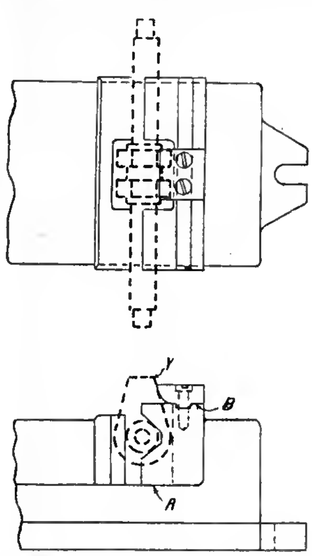

FIG. 7. VISE JAWS FOR HOLDING WORK WHILE MILLING END "Y."

Milling Duplicate Parts

Parts to be milled are often handled more satisfactorily by combining them and Fig. 5 is an example of this type of work. As is obvious from the illustration the two parts are combined, while the ends or shanks are turned in a lathe in much the same manner as described in Fig. 2, following which they are gripped in the fixture, Fig. 6, and the side X is milled. This is accomplished by locating the work in two vee blocks A, and against the equalizing block B. By clamping the part with straps C, the work is securely located while as an additional precaution against the strain of the cut a strap D is used to clamp over the ends of the forging. In this fixture the location endways is taken care of by the face E against the ends of the vee blocks. To mill the opposite edge a similar fixture is employed, the work being simply turned end for end and instead of the equalizing block a solid locating block is used for the obvious reason that the edges located from are finished and will come alike in each case.

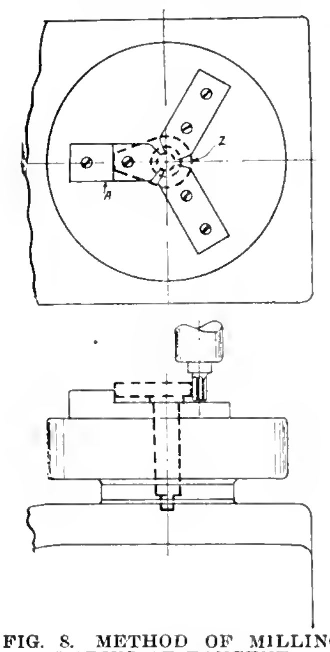

FIG. 8. METHOD OF MILLING RADIUS AT TANGENT TO SIDES.

To mill the end Y, Fig. 5, the work is gripped in vise jaws, Fig. 7, and is located in the vee jaw A, and is held by the plain jaw opposite; the block B is used for squaring up. In addition to the convenience of handling two parts as one in this particular instance there is the additional advantage of milling two pieces in the time otherwise required for milling one. The two pieces thus machined are now cut apart for the final operations, which include machining the radius Z, as shown by Fig. 8. Briefly stated, the work is gripped in a chuck on the dividing head of a milling machine, and with an end mill in vertical spindle the radius is machined by revolving the index head with the machine table locked the correct distance from the centre of the milling spindle. For locating the work in the chuck a special stepped jaw A is used. The final operation on this piece is to mill the end W, which is done by holding the work in a chuck, as in Fig. 8, and using a surface mill in the spindle while the table is fed under the cutter in the usual manner.

ROUGHING AND FINISHING WITH SAME GRINDING WHEEL

By C. W. Blakeslee

A FEW years back, and in many cases even at the present time, the general impression is that to obtain a fine finish it becomes necessary to use a fine grain wheel. This practice and belief, however, is practically done away with. demonstrating the rapid and improved methods employed by the wheel manufacturers who have educated the users of wheels that the desired finish on a piece of work can be had through the changes of work and wheel speeds, together with the traverse of the grinding-machine bed. In a great majority of cases roughing and finishing can be accomplished with the same wheel through the many change feeds provided on the modern cylindrical grinding machine.

Often where a satisfactory wheel is furnished to conform to a set feed, the changing of the work speed will change the action of the wheel in such a decided manner as to render it worthless for the work it was intended. It is also true that many times where a wheel is apparently unsuitable for a certain class of work, through the manipulation of change feeds and wheel speeds, very satisfactory results may be brought about.

F. T. Leversuch, general manager of the London & Port Stanley Railway, has resigned.

Processes of Manufacturing Seamless Steel Tubes*

By J. J. Dunn **

Since the beginning of the use of metal tubes, a long list of inventors has sought a means of eliminating the inherent weakness of a joint. The search goes on still, for, as yet no method of making seamless tubes can compete in cost of manufacture with methods of producing seamed tubes. In spite of this handicap, the use of seamless tubes has increased rapidly on account of certain advantages due to their peculiar method of production.

As it seems probable that the cost of seamless tubes will gradually approach the cost of welded tubes, and each improvement made will open up a wider field for their use, it will doubtless be of general interest to describe the various processes employed for making seamless tubes of steel. It is as important to understand the advantages and limitations of the seamless tube as it is of any other engineering material; for indiscriminate use of this material tends to discourage its use in those places where by its character it is fitted to give economical service. The advantages of the seamless tube are almost self evident, but its limitations are most surely comprehended only when the manufacturing methods employed in its making are clearly understood.

Seamless tubes are made to-day by two general processes; the piercing process and the cupping process. As the piercing process is used for by far the larger portion of seamless products it will be first described. The cupping process will be but briefly referred to.

There are two general methods of piercing, first rotary piercing, and second, punching. The punching method is used for special classes of work, but it is the rotary piercing process that produces the larger tonnage and is the most widely used. The possibility of rotary piercing was discovered by Mannesman, who devised practically all of the many combinations of rolls that have been successfully used. There is, however, one notable exception which is the arrangement proposed and used by R. C. Stiefel.

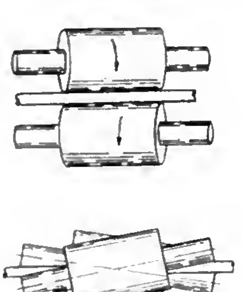

FIG. 1.

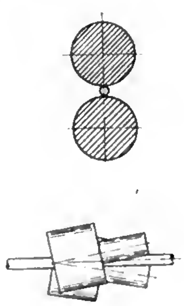

FIG. 2.

Rotary Piercing

The essential features of a machine for rotary piercing are revolving surfaces so arranged that their contact with the cylindrical piece of metal which is to be pierced will impart to it a simultaneous motion of rotation and translation; and a mandrel for controlling the flow of the metal. To accomplish this it is sufficient that the axes of the rolls and of the cylinder of metal be neither parallel nor intersecting lines. Practically the departure from the condition of parallel or intersecting axes must be wide enough to overcome the frictional resistance to motion in translation and not so wide as to prevent rotation.

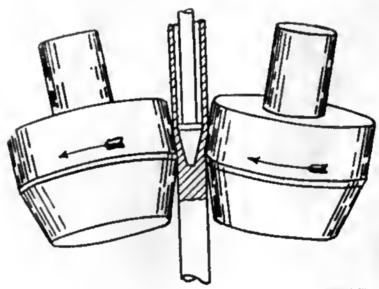

FIG. 4.

Figure 1 shows in elevation and plan, cylindrical rolls which will impart the desired motion to a cylindrical blank between the rolls and in contact with them. Figure 2 is an elevation and plan of sections of the rolls by planes at right angles to the axes of the rolls and makes clear how the rolls impart the two motions to the blank between them. These rolls are not a suitable arrangement for piercing as they can have only a small area of contact with the blank unless it be greatly deformed.

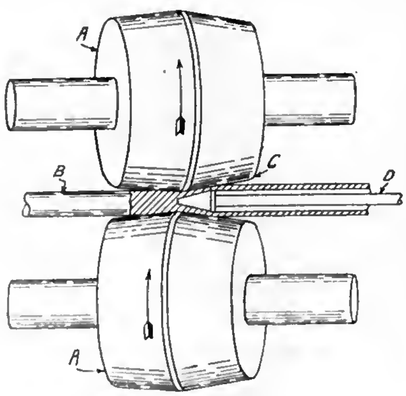

FIG. 3.

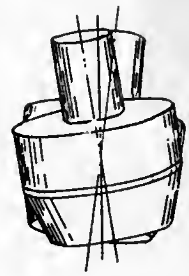
Figure 3 shows a practicable arrangement. In this figure the solid blank B, is shown between the rolls and partly pierced. The piercing mandrel C, is in its working position supported by a bar D. The rolls A, are truncated cones so proportioned as to properly distribute the work of reducing the metal of the solid blank as it passes over the piercing mandrel and is formed into a tubular section.



Roll Operation.

In operation the rolls are adjusted to the proper distance apart and the mandrel is placed in position. The rolls being in motion, the heated blank is pushed into the entrance angle and coming in contact with the rolls, takes motion from them of rotation and longitudinal travel. The first work of the rolls is to reduce the diameter of the blank giving it a conical form and increasing its contact with the rolls as it encounters the piercing mandrel. Then the reduction of cross sectional area of the blank takes place very rapidly as it passes over the mandrel. The diverging angle of the exit side of the rolls permits equalizing the work along the length of the mandrel and also gives room for the expansion in diameter that is an effect of the rolling contact. Further it permits of such a relation of the surfaces of the rolls and the mandrel as to produce a comparatively smooth pierced billet.

It must be evident that the angles of entrance and exit passes of the rolls; the diameter and angles of the mandrel; the relation of the position of the mandrel to the roll passes; the diameter of the blank; and the distance between the rolls influence profoundly the size and character of the tube produced. Besides these factors, the heat of the metal being worked; the speed of the rolls; the relative rate of longitudinal travel to rotation, all have a decided effect. Indeed, it is only within the last 10 years that the relations of these various factors were well enough understood to

*From a paper read recently before the Canadian Railway Club, Montreal.

**General Superintendent, Shelby Steel Tube Co., Pittsburg, Pa.

permit of producing a given size tube without a trial and error adjustment of the machine.

The divergence from the desired result occurred in the diameter and wall thickness of the hollow billet produced; in the concentricity of the bore and in unnecessary working of the metal. In the efforts made to minimize these variations many designs of piercing machines were worked out and not a few of them were actually constructed.

Figures 4 and 5 show variations made from the type of roll shown in Figure 3, by changing the angles of the roll axes. All sorts of angles were tried, from axes in planes parallel to the axes of the blank to axes in planes at angles of 85° to that axis. Also with all these variations was combined a travel of the billet in the reverse direction to that shown in the figures together with a wide range of entrance and exit angles, as well as variations in the shape of the piercing mandrel. Practically all these various arrangements will pierce a solid blank and with each type of machine there is a combination of roll or disc diameter, entrance and exit angles, mandrel angles and feed which will produce good work on at least a limited range of sizes.

Minimum Displacement of Metal Requirement

One of the most important requirements in a piercing machine is that the tube be formed with a minimum displacement of metal. Looking again at Figures 3, 4 and 5, it is evident that the rolls tend to impart different speeds of rotation to the blank at different points of contact along the axis of the blank. This results in a twisting of the tubes as the piercing proceeds, so that a line on the surface of the solid blank, parallel to its axfiis becomes a helixfi on the surface of the tube. One of the earlier patents claimed this feature as an advantage on the assumption that a tube is usually subjected to a greater stress circumferentially than longitudinally, but practically it has been found that this unnecessary displacement of material tended to rupture the metal in the piercing operation should there exist any defect in the solid blank.

A line on the surface of the solid blank, parallel to its axis becomes a helix on the surface of the tube. One of the earlier patents claimed this feature as an advantage on the assumption that a tube is usually subjected to a greater stress circumferentially than longitudinally, but practically it has been found that this unnecessary displacement of material tended to rupture the metal in the piercing operation should there exist any defect in the solid blank.

R. C. Stiefel designed and patented a type of piercing machine which reduced this twisting of the metal in regular practice to such an extent that the helix was right or left hand depending upon the setting of the discs

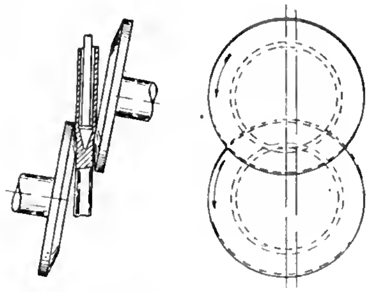


FIG. 6.

and mandrel position. Mr. Stiefel's arrangement is shown in Figure 6. From the figure it is seen that at any cross section of the blank the sum of the radii of the circles of the discs that impart rotation to the blank is exactly equal to the sum of the radii at any other section; hence, except as the motion is modified by the action of the piercing mandrel, the blank, solid or pierced, is revolving at a uniform rate at every section.

It will be noticed that there is a very considerable slip between the billet and the discs, varying from zero at a point midway between the disc axes to a maximum at the points where contact between discs and blank ceases. This slip has no very important influence on the work. However, it causes a waste of power, a disadvantage that is more than

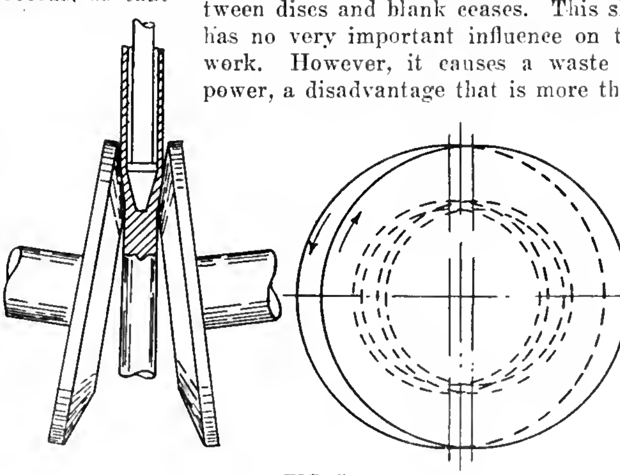

FIG. 5.

offset by the other good features of the design.

These points of the rotary piercing operation have been dwelt on at some length, as it is this operation alone that is peculiar to the making of seamless tubes and an understanding of the numerous factors that modify the results is necessary to an understanding of succeeding operations and to resulting variations in the finished product.

The Erhardt Punching Process

For certain classes of work a process of piercing is used that consists of simply punching the hole in the solid blank. This method is generally known as the Erhardt process. A heated blank, preferably square in section, is placed in a die somewhat longer than the blank end of a diameter corresponding to the

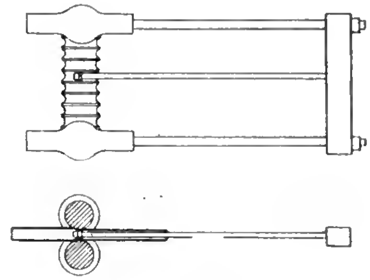

FIG. 7.

desired diameter of the blank after piercing. Thus confined to prevent lateral flow of the metal, a punch of desired size is forced into the blank, displacing it laterally to the limit of the die after which the metal flows along the punch as it penetrates to the bottom of the blank. Usually this method is confined to the production of tubes with one end closed and integral with the tube. It is economical only for the larger diameters and comparatively short lengths.

Cupping Process

A third method of making seamless tubes is that called the cupping process. In this method the raw material is in the form of a plate. The first operation is to trim the plate to a circle by which at the very beginning a loss in scrap of 25% occurs. After trimming, the plate while hot is pushed through a circular die and formed into a cup approximately hemispherical in section. Successive passes through dies of decreasing diameters elongates the cup into a tube with one end closed. The economical application of the cupping process is to tubes of large diameters and heavy wall. The only limit seems to be the size of the presses required for the work. Tubes of 24 inches in diameter or even larger, weighing 6000 pounds each, can be produced on existing equipment.

The blank after piercing varies so greatly in dimensions of both the diameter and wall thickness that additional operations are required to bring it within the variations required by most uses. For many purposes the required accuracy can be attained by a hot operation. but for others requiring still closer limits resort is had to cold working. Succeeding operations are required for

production of sizes which cannot be accomplished by piercing alone.

Many schemes have been devised for the hot finishing of the pierced tube, rolling on long solid mandrels in various ways, extracting the mandrel after the operation; drawing through dies and over long mandrels, and rolling on short mandrels have all been thoroughly tried out more or less successfully, but it is rolling on a short mandrel that has had the widest application, on account of the accuracy of the product and the comparatively low cost of the operation. Figure 7 shows diagramatically a machine for this method.

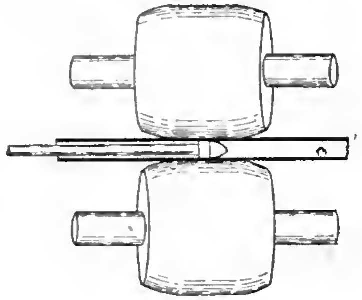

FIG. 8.

A stand of two high rolls with circular grooves is used. A short mandrel is supported in the groove of the rolls by a long mandrel abutted against a yoke which is tied by long rods to the roll housing. In operation the pierced billet at a proper temperature is presented to the rolls which seize it and force it through the groove and over the mandrel. As the annular area between the mandrel and roll groove is less than the area of the cross section of the pierced billet, a reduction in area and corresponding elongation takes place. After the tube has passed the rolls and is on the long mandrel, the mandrel is pulled forward free from the tube. The tube is then raised and the mandrel is passed back again into the rolling position while the tube passes over the top of the rolls for the next pass. Successive passes are made in this manner until the desired wall thickness and diameter is obtained, reheating the billet as may be required.

This is the old hand method of rolling and is still used to some extent as it is easy to handle the tube to grooves of successively decreasing diameter using several mandrels. The method is slow and laborious and has been largely superseded by a mill in which all hand handling is eliminated. To accomplish this some slight changes were necessary in the rolling method. These changes consist principally in the use of but a single groove and mandrel. The varying area of the pass is obtained by simply raising rolls for the earlier passes and using a slightly smaller mandrel. The finishing passes are taken with the rolls in a fixed position, and with the required size mandrel for the finished inside diameter. The long mandrel is fixed permanently in position and the short mandrel only is removed after the passes.

To return the tube to the entering side of the rolls for the next pass, the top roll is elevated and the tube stripped from the long mandrel by an auxiliary set of rolls. On the entering side of the rolls the tube is received in a V shaped trough in which it is moved to the rolls by a pusher operated by compressed air. All these operations are mechanical except the removal of the short mandrel.

Hot Finished Seamless Boiler Tubes

The successful introduction of this mechanically operated mill made possible the "hot finished" seamless tube in the boiler tube sizes. Hand handling was too slow to allow the required thickness of wall to be obtained in one heat which is an essential requirement on account of finish. Rolling reduces the wall thickness of the pierced billet to gauges lighter than can be obtained by the piercing operation and gives the accuracy required for boiler tubes and other similar work. The sliding of the hot tube over the stationary mandrel however, causes scratches on the interior walls of the tube that are objectionable for some purposes and in all cases spoil the appearance of the finished tube. These scratches are removed by a following operation, which has come to be called "Reeling."

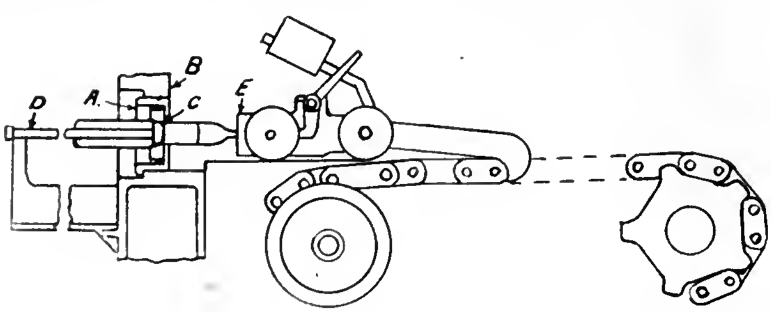

FIG. 9.

The reeling machine is very similar to a piercing mill of the roll type with axes in parallel planes, such as shown in Figure 1, but the rolls of the reeling machine are shaped to give contact over a considerable length of tube usually not less than a length somewhat greater than the tube diameter. The mandrel for reeling is cylindrical instead of conical as for piercing. The action of the rolls in giving the tube rotation and longitudinal travel is the same. Figure 8 shows the arrangement.

After the tube has been brought to required diameter and wall thickness by the rolling mill, it is conveyed to the reeling machine. Here the surfaces interior and exterior, are rolled in a direction approximately at right angles with the direction of rolling on the two high mill, resulting in the practical elimination of any scratches caused by the rolling mandrel. At the same time the tube is rounded up and the outside burnished. The reeling machine introduces a variation in diameter occasioned by variation in the pressure of the reeling rolls and in the heat, and this variation is corrected by passing the tube after reeling through a set of rolls with circular grooves of a diameter the same as the required finished diameter plus an allowance for shrinking in cooling.

Recapitulation

These are the standard hot operations in making a seamless steel tube. The piercing operation forms a tube from the solid blank. This tube varies greatly in diameter and wall not only from tube to tube but in the same tube at different points of its length. The rolling operation reduces the rough pierced tube to accurate circumference and wall thickness, but the rolled tube is not round nor is it smooth on the interior wall. The reeling machine smoothes the walls and rounds the tube but introduces a slight variation in the circumference which is removed by the final sizing operation.

Thus it is seen that each operation, after the piercing, is for the purpose of correcting and perfecting the preceeding operation. It is not essential that these operations be separated and placed on different machines in this way as it is entirely possible to complete the work in the piercing operations, but such a nicety of adjustment would be required to control simultaneously all the different factors, that it has been found simpler and cheaper to make a separation as described.

There is one variation occurring in the piercing operation that is not removed to any appreciable extent by the succeeding operations, that is, the eccentricity of the bore of the tube with the outside surface. The eccentricity varies directly as the wall thickness and is influenced by a number of factors; the heat of the blank; the ratio of longitudinal feed to rotation; the form of the rolls and mandrel and of the supporting guides, all have an effect. Even when

all these factors are as constant as it is possible to maintain them, a variation in eccentricity occurs. Under good conditions howeverr, about 50% of the product will be not more than 5% eccentric. The established limit for inspection is 10% eccentricity. This tendency to eccentricity must be taken into consideration in applying seamlesss tubes. Fortunately for most uses the maximum variation causes no serious inconvenience.

Drawing Bench Features

There are numerous uses to which seamless steel tubes are applied that require smaller variations from size, and a better surface than can be obtained by hot work. Also the practical limit for hot work is a tube not less than 1½ inches in the diameter and even that at this time is too small for economical production. Cold drawing is resorted to in order to obtain the smaller diameters and lighter walls, and to reduce variations in dimensions. The process is as old as the industry and simple in details, although these require a surprising amount of skill to obtain good work.

Figure 9 illustrates the essential features of a "drawing bench." A die A of the required size is supported in a die head B. This die controls the outside dimensions of the tube. Within the die is placed a mandrel C which controls the inside dimensions. The mandrel is anchored to the rear end of the bench by the rod D to prevent longitudinal movement. In front of the die is a gripping mechanism E by which the tube is pulled through the die. This gripping mechanism is moved by attaching it to a moving chain or to the piston of a hydraulic cylinder.

For cold drawing the hot rolled tube is prepared by reducing the diameter of one end by a forging operation. This is for the purpose of allowing the tube to pass through the die far enough to be seized by the gripping mechanism. After thus "pointing," the tube is pickled in diluted acid to remove all mill scale. It is then washed and lubricated.

Going to the drawing bench the mandrel rod with the drawing mandrel secured to it is inserted into the tube and the tube is placed on the bench with the pointed end projecting through the die to be gripped by the pulling mechanism. On attaching the gripper to the moving chain, the tube is drawn through the die and over the mandrel reducing the diameter and wall. The average reduction made at a single pass varies from about 18% for small tubes up to 25% for larger ones. Any number of passes can be taken but after each pass the tube must be annealed and again "pickled" and lubricated.

These are the standard operations in the production of seamless tubes. No mention has been made of finishing operations as there is little in these that is peculiar to the seamless tube; nor have the operations for forming and finishing the tubes producted by the cupping process been described, as, while of great interest, the tonnage produced by this process is comparatively small.

GRINDING WHEEL FLANGES

By C. W. Blakeslee*

THE flange plays a very important part in the protection and support of the grinding wheel. Opinions differ somewhat as to the diameter of flanges relative to the diameter of the wheel. However, my opinion is that the minimum diameter of flanges should not be less than one-half the diameter of the wheel and as much larger as possible consistent with grinding conditions. If possible use more than one set of flanges so that changes can be made as the wheel wears down.

Objections are somtimes made against st large-diameter flanges on account of interfering with the grinding on the side of the wheel. If it becomes necessary to do much of this class of grinding, it is advisable to equip the floor machine with a cylinder to carry ring wheels, which are made especially for side grinding, or the cup wheel with a protection hood. However, if the straight wheel is used for this purpose, do not forget that an unusual strain is put on the wheel and the greatest of judgment should be used in this operation. Side grinding on a straight wheel should be discouraged wherever possible and cylinder wheels recommended.

Grinding on the top of the wheel is a very dangerous operation. Many serious accidents have resulted in this method of grinding. If the work is allowed to ride over the wheel to the front it is likely to catch on the wheel and be carried rapidly to the hand-rest. The crash usually results in a broken wheel. While this class of grinding is extremely dangerous and should be discouraged, yet if such method becomes absolutely necessary, the operator should by all means place himself back of the machine so that the wheel will revolve from him rather than toward him as is the case when standing in front of the machine. This would prevent the wheel from at least catching the work and snapping it down to the hand-rest.

A CONVENIENT GEAR FORMULA

By H. R. S.

AS a reader of your instructive magazine, and one who takes a special interest in the section reserved for the answering of questions I would like to draw your attention to a formulae which I find very useful and would no doubt be of interest to readers of the paper.

The formulae would be of especial value to draftsmen as all dimensions are shown on the blue print. The formulae I refer to is used in the cutting of spur gears. It is very simply applied and could be used very readily.

In finding the diameter of a spur gear if the number of teeth and the pitch are known the rule of adding two (2) to the number of teeth and the sum divided by the pitch will give the required diameter to be turned on the lathe. Thus the diameter equals the number of teeth in the gear, plus two, divided by the pitch. And by reversing the formulae we can find the number of teeth if the diameter and pitch are given, similarly the pitch can be found by substituting the known values in the formulae.

Thus if:

T = the number of teeth.

D = the diameter.

P = the pitch of the finished gear.

We can write the formulae as follows and substitute the knowns and eliminate finding the required dimension:

(i) $D = \dfrac{T+2}{P}$, (ii) $T = DP - 2$,

(iii) $P = \dfrac{T+2}{D}$

Trusting that the above may be of use to your valuable paper, and wishing you continued success.

Shipbuilder's Offer to Women Workers.—Speaking at the opening of a munition works canteen provided for the women and girls employed at the Arrol-Johnston Works, Paisley, Scotland, Sir William Beardmore said that the firm were desirous of doing all they could to make the women comfortable and to encourage them. As an inducement, he promised all the female workers a bonus of 10 per cent. on the wages earned by them from January 1 of this year till the close of the war, on condition that they kept regular time, gave satisfaction to the manager, and that there would be no abstention from work unless through illness. The sum would be paid to the workers at the termination of the war.

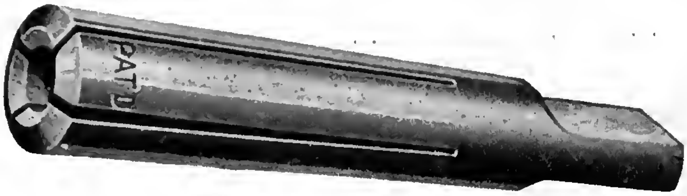
TRUE DRIVE TAP CHUCK

A DEVICE which possesses great simplicity and efficiency is being put on the market under the name of "True Drive," Tap Chuck, by Scully-Jones & Co., Chicago.

It is made of a single piece of hardened steel, and its use involves no screws, pins, frictions or other accessories. As will be seen from the illustration the article is of the same external shape as a drill socket, the differences being the provision of a parallel hole, and the slitting of the body at four points.



TAP CHUCK FOR USE IN DRILL PRESS

When the chuck, with a tap in position is inserted in a drill spindle, the sections are compressed on the shank of the tap and take hold firmly. Actual usage has shown that taps varying as much as 1-32 in. from a given size are driven satisfactorily, and although taking up less room than a common drill chuck, it holds taps perfectly true. No dependence is placed on the square of the tap as many otherwise good taps are not perfectly made in this respect.

This tap driver is made with a standard Morse taper and can be used in any drill with a hole of corresponding taper. regular adaptor sockets or sleeves being used according to size when necessary.

VERTICAL MILLING MACHINE FOR SHELL FUSE TIMING RINGS

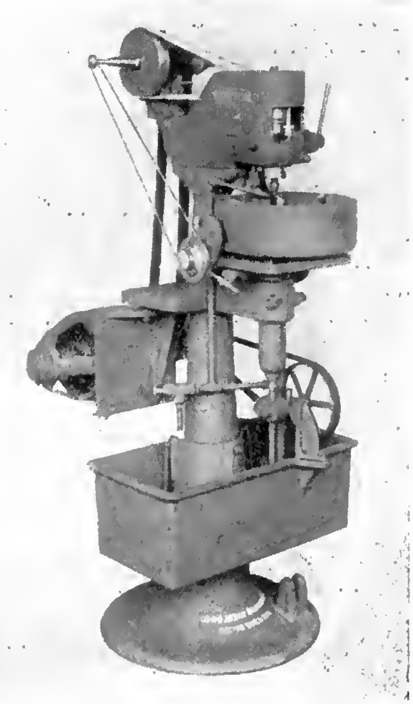
THE accompanying illustration shows a vertical milling machine which as been developed for grooving the timing rings of shell fuses. The work is held in a rotary holder which is driven from an extension on the countershaft by a round belt and is surrounded by a pan secured to the table. The drive is through spur gearing and worm and worm wheel. Suitable stops are provided which gauge the length of the groove very accurately.

As shown in the photograph the fixture makes one revolution per minute, which can be increased or diminished by changing the size of the pulleys. When the timing ring is in position on the work holder, the feed lever at the right of the cutter head is swung down, feeding the cutter into the work until the spindle sleeve flange is in contact with the micrometer collar. The mechanism is so arranged that the cutter will remain in this position without any further attention from the operator, until the fixture strikes the stop, when the lever is swung up, lock handle thrown back and work removed.

The spindle is made of hardened tool steel, runs in ball bearings, and has a vertical feed by hand of two inches. A micrometer stop reading in thousandths is provided, which insures the same depth of cut on all pieces to be grooved.

Countershaft should run 2,000 revs. per min. This speed is subject to variation according to the nature of the work. Tight and loose pulleys $3\frac{1}{8}$ in. x $1\frac{5}{8}$ in. are mounted on countershaft so that it can be driven directly from line shaft or by motor.

This machine is the product of the George Gorton Machine Co., Racine, Wis., who designed it solely for routing timing rings for shells. The net weight without motor is 900 lbs.



FUSE RING GROOVING MACHINE.

EXPANSIBLE BORING CUTTERS FOR ECONOMIZING HIGH SPEED STEEL

THE upkeep, expense and ultimate waste of tool steel when used in the form of double-ended boring cutters has been brought very forcibly to the notice of users of machine tools by reason of the excessively high cost of high speed steel.

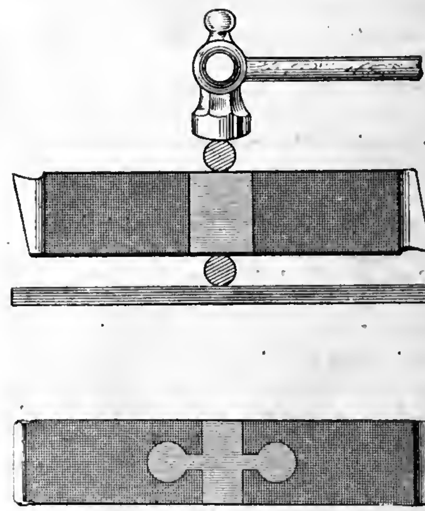


FIG. 1

Cutters of the type referred to are particularly wasteful of metal, while the cost of a smith's time in expanding the cutter, followed by grinding time, make each dressing of the tool a costly operation.

"Gauge-All" is the name given to a method of constructing these tools so that they may be expanded repeatedly, quickly, accurately, and cheaply, which has been perfected by an English mechanic, and has been placed on the market by Vislok, Ltd., of London, Eng. The principle of the invention which is fully protected by patents, consists of the connection of two pieces of high speed steel by means of a centre section of special metal alloy. After a few cuts have been taken and the cutter is worn undersize, it is expanded up to size again by hammering the relatively soft centre which causes the cutter to expand lengthwise.

The details of construction are shown in Fig. 1, which gives two views of a boring cutter. The upper one shows the cutter held between the arms of a wire clip while being struck with a hammer. The lower view shows the special metal

key which is the feature of the device. Fig. 2 shows the shape of clip used and also a tool which finished more than 200 holes 3 in. dia. x 10 in. deep, to a limit of .0002 in. Owing to the wear on the cutters, readjustment by the old method of heating and rehardening caused the scrapping of solid cutters so soon, that the number of holes machined by them were a mere fraction of those finished by the expansible cutters.

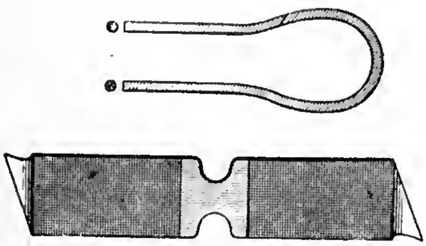

FIG. 2

Expansion by hammering can be repeated as often as necessary until the edges of the slots A, A, reach the edges of the bar, see Fig. 3, after which new centres can be inserted by the makers at a moderate cost.

More than a year's use on steel casting work has shown there is no tendency for the soft centre to bend or break, and as it is expanded it acquires hammer hardness which counteracts the reduction of size.

Gauge boxes are easily made which enable operators to set up tools to accurate sizes. One of these is shown in Fig. 3. Machine steel can be used to advantage in making these if the inside of the ends be case hardened, while provision

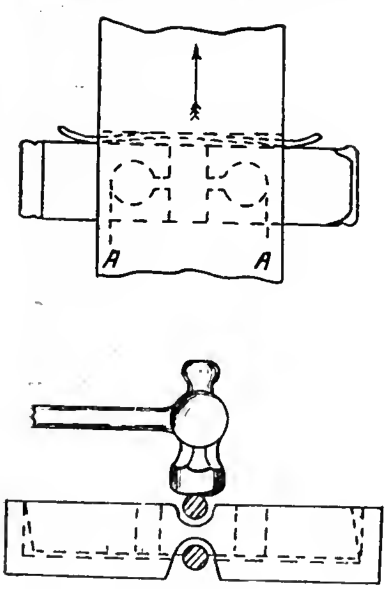

FIG. 3

for adjusting one end makes it possible to use one box for a number of sizes.

These cutters are sold under the trade name of "Gauge-All" and are now in use by the Admiralty and several leading engineering firms in Britain.

CONCERNING MANILA ROPE

By F. E. Weiss

POSSIBLY there is no article in the outfit of a railroad construction organization or of a contractor that suffers more neglect and abuse than Manila rope. In nine cases out of ten, this condition is due more to a lack of knowledge than to wilful neglect. The best rope for all purposes is made from Manila hemp, and little rope over one inch in diameter is made from anything else.

EQUIPMENT FOR VICTORIAN RAILWAYS

Tender forms, specifications, indents and drawings have been forwarded by Commissioner D. H. Ross, Melbourne, for equipment required by the Victorian Railways, Melbourne. These tender forms, etc., are open to the inspection of Canadian manufacturers at the Department of Trade and Commerce, Ottawa (refer File No. A-1435). Particulars of the requirements of the Victorian Railways, together with the date on which the tenders close at Melbourne, are briefly outlined thus:

One 10-inch gap lathe, tools, gears, etc., March 29, 1916.

300 yards Morquette cloth (sample at Department of Trade and Commerce, Ottawa), March 29, 1916.

One 1-ton electrically-operated hoist, April 12, 1916.

5,600 pounds wool waste, April 19, 1916.

Mails leave San Francisco, February 29, Vancouver, March 15, and San Francisco, March 21, and are due to reach Melbourne on March 22, April 8, and April 12 respectively.

Purity Test

A test for ascertaining the purity of Manila hemp rope consists in forming balls of loose fiber from the ropes to be tested and burning them completely to ashes; pure Manila burns to a dull grayish-black ash; sisal leaves a whitish-gray ash; a combination of Manila and sisal yields a mixed ash resembling the beard of a man turning from black to gray. Manila hemp is frequently adulterated with New Zealand flax and Russian hemp, both of which are much inferior in strength.

It is not always true that the highest priced material is the best, and there are no doubt many cases where from lack of knowledge or time for investigation, a better grade of material is purchased and used than is necessary. The price of this material is governed largely by its quality, but the selection of the quality should be governed by its suitability to the work in hand.

Ropes in Service

Ropes in service deteriorate in two ways. There is the wear on the outer surface that can readily be seen, and the stretching, bending, crushing and breaking of the inner fibers that cannot be discovered without a careful examination. Should these conditions develop more rapidly than the service in which the rope is used seems to warrant, they may be due to the following causes:

The first may be caused by chafing, resulting from ropes rubbing against each other or dragging across hard materials, or by running over sheaves having too small a groove. The latter may be due to overload or to running over sheaves or pulleys of much too small diameter. Ropes do not give out all at once, and therefore need much care and attention.

Manila hemp is a vegetable fibre and is susceptible to the action of water and air the same as an unprotected piece of wood. In fact, the hardest wear on a rope is exposure to all kinds of weather. This cannot be avoided in construction work; therefore, when a rope has become wet and muddy, it should be cleaned, dried and stored in a well ventilated place. Wet rope placed in a box or unventilated storeroom is likely to rot or ferment and will become worthless in a very short time. Ropes that must necessarily be constantly exposed to the weather are tarred frequently, but as the tar affects the tensile strength, it cannot be used on ropes that are subject to hard use on derricks and cranes. Tarred ropes may be used for guy lines, the rigging of ships or similar work.

It is generally conceded that moisture will not injure a rope in storage, provided the storeroom is well ventilated, and in fact some dealers advocate a damp storeroom. On the other hand, a rope may become seriously injured by becoming too dry, because the fibres become brittle. A rope should not be allowed to freeze after becoming very wet, or if frozen, should not be used, because the frozen fibres will break and thus make it useless. Neither should rope be piled against radiators or steam pipes for obvious reasons.

Rope Failures From Overloading

The failure of ropes is more likely to be due to overloading than to any other cause. Should a rope be subjected to an overload, it may be shown by the twist coming out of it, or by one of the strands slipping out of its proper place. In the handling of heavy loads with a derrick or crane, the load should never be applied suddenly or with a jerk, not only because the stress will be many times

that of the weight to be lifted, but it will cause deformations in the rope that start deterioration.

Should there be a kink in the rope, the damage may be serious enough to cause failure, and in any event the rope will have lost a good deal of its strength and value. Ropes used on derrick cranes and pile drivers wear out very rapidly. It is said that a rope $1\frac{1}{2}$ inches in diameter will wear out in handling from 7,000 to 10,000 tons of coal, while a transmission rope of the same size, running 5,000 feet per minute and carrying 1,000 horse-power over sheaves 5 feet and 17 feet in diameter, will last for years.

Small Sheave Effects

The rapid wear of ropes used on derricks and pile drivers is due to their passing over comparatively small sheaves under load. When passing over a small sheave, the rope is subject to sharp bending, which causes the fibers to slide lightly on each other, and, as they are somewhat rough, the friction ultimately causes the fibers to break. Frequently upon opening up ropes of this kind, it is found that some of the inner fibers have been ground to a fine powder.

Manufacturers aim to overcome this difficulty by treating the fibers with tallow or graphite, or both, but there seems to be considerable difference of opinion as to the value of such treatment. Tallow-laid rope is not affected as much by weather conditions as rope not so treated. Should it be necessary for a rope to run over two sheaves, bending first in one direction and then in another, the difficulty last described is much exaggerated, and is much like bending a pliable wire first one way and then the other. It will soon break.

Rope Splices and Slings

It is frequently necessary to splice the ends of two ropes together in order to make one long rope. Either a short splice or a long splice may be used. If properly made, the short splice will develop the full strength of the rope, but it cannot be used over a sheave because it is considerably thicker than the original rope. The long splice can be used over a sheave, but it cannot be expected to give as good service as an unspliced rope. The short splice is more quickly made.

Slings made from Manila rope for handling and hoisting heavy materials do not always receive the care and attention that they should, largely because of a lack of knowledge of what a sling will stand. Many advocate the use of new rope, and this is without doubt the safe plan. A new rope, however, is too stiff and it is better, where possible, to use parts of a rope that have been limbered up by a day's service. There are others that advocate the use of old rope for this purpose. If this is done, care should be taken to select pieces that have not been overstressed or that have not been working over sheaves. An examination can easily be made by opening up the strands, and if the inner fibers show deterioration, the rope should not be used for slings. Slings are made by splicing the two ends of a rope together, using generally what is known as the short splice.

On construction work and during wet weather, slings are subject to severe usage. When muddy, they should be thoroughly cleaned, preferably with a hose, before the mud has been allowed to dry. They should then be allowed to dry under shelter, but never in the hot sun. When slings are sent to the tool car or toolroom for storage, they should be inspected carefully and such as are not fit for continued use should be discarded. Those in good conditions should be hung on suitable pegs. Slings are frequently called for in a hurry and under such conditions there is not always time to make an examination, or it may be overlooked. It is well to be on the safe side because the failure of a sling may result in serious injury to the workman or a fall of only a few feet may damage or utterly ruin a piece of machinery.

Slinging a Load

The method of attaching a sling to a load should always be delegated to a reliable and experienced man, and whether one or more slings are to be used will depend not only on the weight of the load to be lifted, but also on its shape. In placing a sling on a load, care should be used to see that the load is evenly distributed on the two sides of the hoisting hook and also that the turns of the sling do not overlap, thereby throwing an excessive stress upon one part of it.

The stresses that are thrown upon slings and ropes vary a great deal with conditions, and they are often influenced to a marked degree by circumstances, which the casual observer might consider trivial and unimportant. In particular the inclination or obliquity of the sling, in those parts which lie between the supporting hook and the points at which the sling first touches the load, must be carefully considered, as it is a highly important feature in connection with safety.—From an article in the Railway Age Gazette.

Calgary, Alta.—Although the exact figures are not yet available, the Provincial Department of Mines estimates the coal production of Alberta for 1915 at approximately 3,500,000 tons, of which about 1,000,000 tons were produced in Edmonton district.

FURTHER SHRAPNEL ORDERS

IT is announced from Ottawa that an order for 800,000 eighteen-pounder shrapnel shells has been received by the Imperial Munitions Board from the British Ministry of Munitions. This is the first large order which has come to Canada since the present Imperial Munitions Board succeeded the old Shell Committee, the board's energies having been directed chiefly towards hastening deliveries on orders placed some time ago. It is probable that the new orders will be allotted in the form of renewals to firms which are already engaged in the manufacture of shrapnel shells.

The munitions industry in Canada has developed a greater capacity for turning out eighteen-pounder shrapnel shells than for the manufacture of any other and is well able to take care of the large order which has just been received. The value of the order is not stated, but based on prices reported for orders placed during last year, it should be worth between $10,000,000 and $12,000,000.

The news of the order will be welcomed by munition manufacturers, many of whom have been somewhat uneasy over the prolonged lull in the placing of new business. A good many of them have their capacity taken up for some months to come on old orders, but have been waiting for news that would assure them against a sudden stoppage of operations late in the year.

This most recent shell order is believed to be merely the precursor of others and it has also been rumored recently that new business of an important kind is about to be placed in Canada by the Allies for supplies other than shells. Such business may involve arrangements for banking credits, and these will no doubt take care of at least part of the business. Apart from that, Europe is averse to parting with more gold to the United States, and on economic as well as national grounds, payment in Canada will be increasingly favored, provided Canada can supply in quantities the class of supplies required. The prospects that the already large volume of war orders will be materially increased in the next few months are considered excellent.

Tool Steel Price Regulation.—Terms have been arranged between the British Minister of Munitions and the makers of high-speed steel in the Sheffield district whereby 14 per cent. tungsten high-speed steel is to be quoted at 70 cents per lb., and 18 per cent. tungsten at 95 cents per lb. net. cash, at customers' works. These refer to the home trade only. Makers are full up with orders, the majority having contracts which will keep them actively employed for eighteen months to two years.

Vol. XV. FEBRUARY 10, 1916 No. 6

SHIPBUILDING IN CANADA

AS was to be expected, the wholesale destruction of the merchant marine of Great Britain and her Allies, and the practical cessation of merchant shipbuilding in those countries have turned attention to Canada's possibilities for the establishment and development of a gigantic shipbuilding industry. It is hinted that even now her opportunity is available, and relative to this we might say that the meantime opportunity can be stated as fact in one respect. Orders for the construction of ocean going vessels are simply being showered upon Canadian shipbuilders at the present time, but in every case they are being turned down. The lack of steel is, of course, one reason, the lack of skilled help another reason, and arising out of a phase of the war situation which we may not here disclose, are to be found the elements constituting the third reason.

Steel for shipbuilding purposes has, of course, to be imported into Canada, and even with the end of hostilities and the advent of a boom in shipbuilding the world over, it is a moot point on that account whether we will feel any abnormal activity effects. Steel will continue to be for many months subsequent to the war a scarce commodity, even scarcer than at present so far as ship plates and shapes are concerned. Unless, therefore, some steps are taken now to meet the situation when the real opportune moment arrives, little better than prolonged normal activity is likely to be experienced.

The labor situation may, however, affect our shipbuilding possibilities to their detriment to an even greater extent than will the steel situation in the matter of the cost of the former. It is generally assumed that steel and labor costs will each be considerably higher than those existent in pre-war days, notwithstanding, their comparative costs as between Canada, Great Britain and the United States will have a determining effect in placing contracts here.

The shipbuilding industry in Canada may be said to be on the eve of being established on a foundation never before available and of being developed to a degree of importance hitherto undreamt of. The cost of steel may possibly be beyond the power of our Government, our shipbuilders, or their employees to control, but the latter will undoubtedly have a large say in the matter of labor cost.

With labor, therefore, there rests largely the future of shipbuilding in Canada. If its demands are extravagant, then a world boom in shipbuilding will give no evidence of its existence here, and an industry which contributes so much to the commercial success of other countries will continue to be reckoned as having to eke out within our borders the like precarious existence as formerly.

Ship repairing plants on our lake, river and ocean shores are recognized necessities of our national existence, but real, up-to-date shipbuilding and marine engineering plants should be even more so. We are possessed of the latter, yet their maintenance in the past has been one continuous struggle against almost insuperable odds. If we may not be able to modify the steel situation, community of effort by employer and employee can offset largely its handicap.

CANADIAN NATIONAL EXHIBITION

PLANS are already being formulated for this year's Canadian National Exhibition, and strange to say, little attention is apparently being given the all-important matter of stimulating our manufacturing and industrial enterprise relative to both our own domestic needs and the export opportunities that the war continues to open up and lay to our hand. We learn that this year's exhibition will assume largely a military aspect. Modern methods of warfare will be played-up, and an attempt be made to feature war in its actuality—casualties excepted. The midway shows are also to be hand-picked, if you please.

We had thought that the war was already in our midst in a very real sense, so much so that a caricature of it might be reckoned both ill-timed and ill-conceived. Again, why should so important an undertaking be allowed to develop a tendency towards becoming a gigantic picture show. The policy that appeals only to the senses of our people, and makes its platform a record-breaking attendance and a huge, immediate profit, whether in peace or war time, is both short-sighted and narrow, and courts disaster ultimately.

The exhibition of 1916, more so than any of its predecessors, calls for a broad and comprehensive display of our manufacturing capacity and enterprise. Our metal-working plants — to take but one branch of the above—have during the past eighteen months in the sphere of munitions production, earned for themselves high distinction for grappling with and solving successfully problems hitherto foreign to their experience and training. A lull is now evident in munitions manufacture and attention is being directed to channels in which the wealth of experience acquired may be equally fruitful of results. Our metal-working plant managements, large and small, are casting about for commodities to manufacture, either for domestic or foreign consumption, and the knowledge that our exhibition authorities are prepared to foster and encourage the efforts put forth in these directions, by specially featuring such products, will not only be an additional incentive, but act as a powerful agent in achieving results.

War is grim and sordid; it is with us every day and every hour of the day, and we are very much in earnest about it. We can afford, however, to abate it as a ruling passion, and all the more so when it leads to neglect of our economic responsibilities. The year 1916 calls for a manufacturing propaganda, intensive, broad and educative by our exhibition executive, and only by the latter rising to the opportunity and making the most possible out of it, will the institution continue to justify its existence as a factor in our national, industrial and commercial upbuilding.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents

Montreal, Que., Feb. 5, 1915.—The general situation throughout the industrial field shows signs of continued activity. The impending distribution of further shrapnel contracts by the Imperial Munitions Board has strengthened the outlook, which has been further stimulated by expectations regarding additional orders for certain necessities other than shells.

Steps have been taken by the Montreal Board of Trade to approach the Dominion Government in connection with the advisability of sending a commission of qualified business men to France, Russia, and other European countries, to secure information that would be of value to this country in the gaining of foreign trade at the conclusion of the war. The possibilities in this direction are great, and the time seems opportune for such action.

Pig Iron

The present production of pig iron is taxing the blast furnaces to the limit, and increased facilities are constantly being added, but the demand is still in excess of the supply, and with the forced output that is being maintained, it is not to be expected that the furnaces can be operated much longer without overhauling. However, the gradual increase in available furnaces will materially relax the high tension at which existing plants are being worked. Prospects indicate an increased production of foundry iron during the coming months.

Steel

The situation remains unchanged, as production is at its height, and it would seem impossible to make any changes likely to increase the present output. The heavy demand for munition steel and the constant rise in price has caused many of the small consumers much anxiety as to where they will be able to secure their future requirements, and in many instances users assert that the high prices are getting beyond their reach. Construction work, where considerable steel is necessary, is feeling the pinch, especially when there is a competition with other materials.

The export trade, while very heavy, seems to have little to do with prices. Even with ocean rates at a reasonable figure, it would be next to impossible to accept all the export trade offered.

The placing of further orders for shrapnel shell in Canada will make increased demands upon the steel producers. Added to the abnormal demand for all kinds of steel the cost of production has materially increased, and it is anticipated that further advances will come in the near future. The requirements of the sheet steel users are still excessive, and the mills are unable to keep pace with the demand. Many of the producers refuse to quote on galvanized sheets, owing to the irregular price of the raw materials. The general situation in steel is gradually becoming acute, and little prospect of relief seems evident at the present writing.

Local dealers have made no changes in last week's quotation, but intimate that some changes are possible before the close of the week.

CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.

Metals

The general tone of the metal market is very strong, and advances are shown on many sides. The local market in copper, which remained firm during the past week, has become stronger with higher prices. Tin remains quiet and inactive Increased demand by brass manufacturers has given strength to spelter, and higher prices are quoted, but indications point to a weaker market within a short period. Lead has advanced during the week, and antimony has jumped, following cable reports from the far East. The present situation is very unsettled, and the outlook for the future is rather clouded, as international developments may completely upset all previous calculations.

Copper.—The foreign market is stronger and prices have again advanced. Prompt and also February and March electrolytic is in demand, but consumers are having much difficulty in securing delivery. Producers intimate that they have very little for sale, and it is almost impossible to have early delivery, even at the advanced prices. Many orders have been placed for April, May and June at present prices, and in some instances even higher.

Diplomatic conditions in the States may, at any time, have a serious effect upon the market, any untoward developments being likely to accelerate the "preparedness" campaign with possible restrictions on the export of munitions materials.

Local dealers report very good business at the advanced prices. This week's quotations are: Lake, $28; electrolytic, $28, and castings, $27; the two former being an advance of ½c per pound.

Tin.—The present market is very quiet and featureless, but prices are firm. Considerable metal is in sight; in fact, the amount of tin afloat, en route from the Straits to America, is very great, and in the event of a favorable passage there is a possibility of a decline on present prices. However, the confirmed report that the "Takata Maru," with 50 tons aboard, has been sunk, is keeping the market very unsettled, and dealers are showing some anxiety in making sales.

The accumulation of large quantities of tin at Liverpool is causing a feeling of unrest, and if the present Government restrictions are removed it is expected that a weaker market will result. Local quotations remain firm and unchanged at 45½c per pound.

Spelter.—The recent strong demand for spot and early delivery has resulted in strengthening the market. Freight embargo on several of the Eastern roads has caused a shortage in certain districts in the States, creating a demand for immediate supply, which makes it very difficult to place orders for first quarter shipment, as producers are unable to guarantee delivery.

The sensational activity shown in the production of the brass mills has created an exceptionally heavy demand for spelter, and this will likely absorb the increased production during the immediate future, but the indications of a still greater supply may make the advance one of short duration.

Following the advance on the foreign markets, local dealers are quoting 22c, which is an advance of 1c over last week's prices.

Lead.—The regulations of the British Government controlling the trade of lead and other metals has had no material effect upon the United States or local markets. When the restrictions were first suggested, the market was inclined to weaken, but considerable improvement has since been evident, and present conditions are of a better tone. The situation prevailing in Government circles across the line, however, may affect the metal market at any time. The market here has grown stronger during the week, and dealers are asking an ad-

vance of quarter of a cent per pound. Montreal dealers are quoting $8 per hundred.

Antimony.—Cable reports from the Far East indicate a very strong market, with higher prices, and buyers are very active covering their early requirements. Some difficulty is being experienced by consumers and dealers, as sellers are shy on taking orders. The local quotation of 50c shows an advance of 5c a pound.

Aluminum.—The action of the British authorities to prevent aluminum from reaching the enemy is causing shippers some uneasiness, as they do not like to risk seizure of shipments. This has had the effect of making prices somewhat lower and the market weak. However, local quotations remain unchanged at 68c a pound.

Machine Tools and Supplies

The general demand for machine tools is lighter than for some time past, but it is expected that when the recent order for additional shells has been given out there will be increased inquiries for some new equipment. Many of the firms who have been making the 18-pounder high explosive shell are contemplating changing their equipment so as to handle larger sizes, as no further orders for the former shell will be placed in this country. However, the possibility of orders for 3-inch Russian and French ammunition will somewhat counteract the withdrawal of the British orders, and in any case it is expected that the machine tool industry will receive new impetus when the decision of the British Government in connection with additional important business is definitely known.

The demand for supplies still continues, and prices are constantly advancing owing to the higher cost of the raw materials. It is very difficult to quote prices, as many lists have practically been withdrawn. Babbitt is quoted as high as 60c per pound. Benzine is selling at 26c to 28c. Files are listed at from 65 to 75 per cent. off. Gasoline, 26c to 29c per gallon. Machine screws, iron, are quoted at 25 to 35 per cent., and brass 5 to 12 per cent. off list price. All quotations are nominal and subject to change at any time.

Old Materials

Considerable activity is noted in the handling of scrap metals, and dealers report very good business in many lines; many of the iron mills are using large quantities of old material, and trade in heavy melting steel scrap is still very brisk. Old copper has advanced ½c a pound, light being quoted at $16.25; crucible, $19.50; heavy, $19.25; and copper wire, $19.25 per 100 lbs. No. 1 machine composition is ½c stronger, being quoted at 15c per pound. New brass clippings are now 12¼c, which is an increase of ½c per lb.

Toronto, Ont., Feb. 8.—The news that an order for eight hundred thousand 18-pound shrapnel shells has been placed with the Imperial Munitions Board by the British Ministry of Munitions will be received with considerable satisfaction in machinery circles. This will allay fears expressed in some quarters that no more orders for shells were probable. While this is true of 18-pdr. H. E. shells it does not apply to shrapnel as enough orders for the latter have already been distributed to keep the shell plants busy until the fall, if not longer. This order will revive interest in the shell industry and also stimulate the machine tool business.

The Dominion revenue from customs in January showed an increase of more than 100 per cent. over the corresponding month of last year while for the ten months of the fiscal year the Customs collections decreased by nearly 18 million dollars. These figures confirm the expectation that the special war taxation will be sufficient to bring the revenue up to the required total. The estimates tabled in the House recently by the Minister of Finance show that heavy reductions have been made in both ordinary and capital expenditure on public works, and in capital expenditure on railways and canals. The policy of retrenchment inaugurated at the outbreak of the war will be continued this year for public works. Appropriations for works already under construction have been made but no expenditures on new works have been authorized.

ALLIES PURCHASING AGENTS

The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:

International Purchasing Commission, India House, Kingsway, London, Eng.

French.—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendence Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.

Russian. — Col. N. Golejewski, Military Attachè, Room 904 Flat Iron Building, New York City.

Steel Market

The market continues strong and price very firm with an upward tendency. As was anticipated last week, prices of cold rolled steel shafting have advanced, the new discounts being 20 per cent. at mill and 10 per cent. at warehouse. There is no abatement in the heavy demand in the primary market for shafting, the mills being sold up for several months ahead. Specifications are running much beyond the capacity of the makers to supply their customers.

The new prices on wrought iron pipe in connection with the advance announced last week are given in the selected market quotations. A change has been made in the arrangement, resale prices being now given instead of discounts as formerly. Wire nails have advanced 10c and are now quoted at $3.15 base per keg, while cut nails are 20c higher, being quoted at $3.20. The advance in wire nails is due to the scarcity and high price of wire rods which are being quoted at $50 to $55, four to six weeks delivery. Stove bolts have advanced, the new discount being 75 per cent. The extraordinary activity at the mills shows no sign of abatement, and the recent order for shrapnel shells will give additional tonnage for the mills to take care of and keep the forging plants busy.

The galvanized sheet market is very firm and higher prices are looked for in the near future. There is no improvement in the situation, and less than 50 per cent. of the galvanized plants in the States are in operation. Black sheets are higher and deliveries getting more backward, while spelter is also higher in price. The high-speed tool steel situation shows no improvement and future prices are very uncertain. All prices are subject to change without notice and higher levels are very probable. The British Government have fixed the maximum price of 18 per cent. tungsten steel at 75c per pound for home trade with slightly higher prices for export. Extras are allowed for certain shapes and sizes. The demand for tool steel has outstripped the output to such an extent that almost fabulous prices are being paid in England for prompt delivery.

The market in the States is strong as ever and prices continue to advance. Orders for bars for munitions show no signs of diminishing, large export orders having being booked recently. Steel bars are now being quoted at 2.25c; tank plates 2.40c and shapes 2.00c Pittsburgh. Billets are scarce and higher. Bessemer billets are now quoted at $33.00 and open hearth billets at $34.00 per ton, Pittsburgh. The ferro-manganese situation is acute and extraordinary prices are being paid for spot ship-

ments, as high as $200 per ton seabord has been offered for prompt delivery ferro-manganese.

Pig Iron

The pig iron situation is unchanged and the market is strong with prices firmly held. There has been an increase in the demand for foundry iron from agricultural implement makers, the prospects for this industry being considerably brighter.

Old Metals

The market is firm with higher prices for all grades of copper and brass. The demand is fairly good for scrap copper but the strength of the copper market is affecting prices of scrap. Prices now range from 1c to 1½c per pound higher. Aluminum is strong and a little higher but lead and zinc are stationary. There is no change in heavy melting steel and wrought iron scrap.

Machine Tools

The announcement that an order for 800,000 shrapnel shells will be at the disposal of the Imperial Munitions Board for distribution among the munition plants has been received with considerable satisfaction in machine tool circles. It is hardly probable that any new plants will be equipped for making shells but a number of new tools will be required from time to time at the munition plants to replace worn out equipment. The depreciation in machinery will be fairly heavy as the plants have been running at high pressure for many months and in the first instance second-hand tools were installed in many cases. Prospects for a steady demand for shell equipment are good but the volume of business will be considerably lighter than it was some time ago. Plants working on shrapnel will no doubt be fully employed during this year unless present contracts are cancelled. The market in the States is more active, domestic munition makers are buying large swing-lathes, while the British and French Governments have reentered the market for lathes for turning large calibre shells. Deliveries from U.S. manufacturers are still backward especially, for screw machines, grinders and milling machines.

Supplies

A number of price changes have been made during this week. Manila rope, transmission rope and drilling cables have again advanced; this time 1½c per pound. The market is very strong on account of the shortage and high prices of raw materials. Higher prices for dry red lead have been announced due to the increase in cost of pig lead. Prices of pure white lead are also higher being now quoted at $10.45 per 100 pounds. Gasoline and benzine are unchanged but the market is very strong and higher prices are looked for in the near future. Lard oil has advanced and is now quoted at $1.28 per gallon. Union thread cutting oil and Imperial quenching oil have also advanced and are being quoted at 54c and 38c per gallon expectively. The linseed oil market is weaker and prices have dropped to $1.02 and $1.05. Turpentine is stationary at 87c per Imperial gallon.

Metals

The metal markets are steady and prices generally unchanged with the exception of antimony which is higher.

CANADIAN PURCHASES FOR FRENCH WAR OFFICE

Philippe Roy, General Commissioner for Canada, Paris, advises the Department of Trade and Commerce, Ottawa, that an order has been issued by the War Department of the French Government to the effect that all purchases made by the Supply Branch in Canada will pass through the Hudson Bay Co. Canadian producers should therefore submit their future offers through the office of that company at Montreal. It is further stated in Mr. Roy's communication that Canadian lumber, steel and meat will find in France an important market for years to come, but it is necessary that Canadian firms should have in Paris representatives entrusted with the necessary authority, especially if it is desired to secure Government contracts.

The copper market continues to attract considerable attention but prices are unchanged, although higher in London. The tin market is quiet but the possibility of shipments being lost is helping to keep prices up. Spelter market is quiet but firm with prices unchanged. There is no change in the lead market which continues strong. A scarcity of spot antimony has caused higher prices with a strong market. The aluminum market is firmer but unchanged.

Copper.—The market is strong with supplies of metal scarce for early deliveries. The copper situation is very strong and shows no sign of any change for months to come. The demand for copper for munitions has been, and still is, far greater than was ever anticipated, and if maintained prices will remain at the present high level with the possibility of an advance. Quotations locally are firm and unchanged at 27½c per pound.

Tin.—The market is quiet but firm. The outlook for the market is rather uncertain as the visible supplies continue to increase which would ordinarily lead to a decline in price. There is however the possibility of shipments of tin being lost or restrictions applied, and this is helping to keep prices up. Quotations are firm but unchanged at 45½c per pound.

Spelter.—The market is quiet but firm. There is a heavy demand for spelter from the brass mills but the demand from the galvanizing trade has fallen off owing to the high price. Zinc ore is higher being quoted at $110 to $120 per ton Joplin, Mo. Spelter is unchanged locally at 21c per pound.

Lead.—The market is firmly held, but London is weaker. Lead is quoted locally at 8c per pound.

Antimony.—The market is strong and higher. The spot market is practically nominal on account of the scarcity of metal available for immediate delivery. Antimony has advanced 2c and prices are nominal at 45c per pound.

Aluminum. — There is no improvement in the situation, supplies still being very scarce. The spot market is firmer but quotations are unchanged at 68c per pound.

CANADA SHOULD DEVELOP TRADE WITH RUSSIA

J. D. PRINCE, Ph.D., Professor of Slavonic in Columbia University, New York, speaking in Montreal recently on Russia and her commercial future with reference to the West, stated that Russia needs countless things which Canada could manufacture and send her. For example, there is a great demand for small wares such as pencils, pens, penholders, clocks and watches. She needs marine motors; nets and tackle; manufacturing machines of all sorts and many other such articles too numerous to mention. She requires also tin, iron and other metals as her own mining resources have not yet been properly developed.

This demand Canada has already in some sort discovered. It is not only sheet or pig metal that is needed. They want boiler iron, roofing, babbiting, nails, screws, etc., and thousands of similar products. In other words, here we have an immense country cut off from her chief source of supply—Germany—crying out to you and to us to across the line to feed her with the necessities of civilization.

"Here is a new field open to your great country, and the time to take ad-

vantage of it is now. The two keys to the situation are 1, information, and 2, credit, both of which are yours for the asking. Canada can certainly undertake this new departure and not only increase her own producing capacity, but cement relations with a noble ally who is giving her life blood in the interests of our common humanity."

NEWFOUNDLAND PULP INDUSTRY

MUCH uncertainty is felt at St. John's, Newfoundland, as to the effect of recent war developments on the pulp and paper industry in Newfoundland. When the announcement was made that Sweden had prohibited the export of pulpwood, which had been largely consumed in Great Britain, it was thought that much of the trade might be diverted to mills in the interior of this colony. Soon afterwards, however, it became known that the British Government had put into force more stringent regulations governing importations into England, in order to release more steamers for direct war use.

It is understood that the regulations will apply in part at least, to paper and pulp. In that case, the Newfoundland mills might be forced to curtail their output or shut down entirely.

The largest plant in the colony, controlled by Lord Northcliffe, the London publisher, and his brothers, has a daily output of 200 tons of paper and 50 tons of ground wood-pulp. Four thousand tons of these materials are now awaiting the arrival of a steamer to take them to England. Two smaller concerns, one London-owned and the other operated by Newfoundland capital, manufacture mechanical pulp.

CUSTOMS REVENUE FOR JANUARY

THE Dominion revenue from Customs in January amounted to $10,097,235, an increase of $5,068,027, or more than 100 per cent. over the corresponding month of last year. For the ten months of the fiscal year the Customs collections amounted to $81,818,539, an increase of $17,959,712. These figures, which were issued on Feb. 1, confirm the expectation that the special war taxation would be sufficient to bring the revenues up to the required total.

The financial statement of the Dominion from the beginning of the present fiscal year—namely, April 1st, 1915, to January 31st, 1916—show an increase in revenue from all sources of no less a sum than $30,000,000, as compared with the same period of the previous year. On the other hand, the statement shows that the expenditure on ordinary accounts has been reduced by $11,700,000, and the capital expenditure by the sum of $6,900,000 over those of the same period of the preceding year. Apart from war expenditure, the increase in revenue, on the one hand and the decrease of expenditure on the other show an improvement in the financial position as compared with the previous year of $48,700,000.

Of the increase in revenue $17,000,000 is due to Customs, $3,500,000 to the post office, $8,000,000 to railways and from special war taxes $2,300,000.

LARGE EXPENDITURE ON RAILWAYS

THE Dominion Government expenditures on railways up to the end of the last fiscal year reached the imposing total of $648,075,427.55 and on canals $150,205,770.34, making a grand total of $799,114,181.18. The revenues from railways and canals since Confederation and up to the close of the last fiscal year were $222,183,757.18.

These figures are contained in the annual report of the Department of Railways and Canals, brought down in the House on Feb. 2. The total expenditure on the National Transcontinental Railway for construction is given at $152,802,745.77.

The report does not deal with the operation of the Transcontinental by the Government, as the refusal of the Grand Trunk Pacific to operate the line in accordance with the Laurier contract took place subsequent to the period covered. The total expenditure on the Grand Trunk Pacific mountain section, approved and certified up to the end of March, 1915, is given as $87,119,153, while $15,556,482 was spent on the prairie section up to the end of October, 1907, no further certificates having been issued for this section.

Total Railway Expenditure

The total railway expenditure during the fiscal year to March 31, 1915, was $42,747,532.78, including the outlay on the Quebec bridge construction. This total includes $18,101,809 on the Intercolonial Railway; $1,168,757 on the Prince Edward Island Railway, and $10,071,479 on the National Transcon-

EQUIPMENT FOR AUSTRALIAN NAVAL DOCKYARD

Tender forms and specifications have been forwarded by D. H. Ross, Trade Commissioner, Melbourne, for 43 machines of various types required for the equipment of the Commonwealth Naval Dockyard, Cockatoo Island, Sydney, N.S.W. Tenders will be received, subject to the conditions specified, up to May 1, 1916, addressed to the Director of Navy Contracts, Melbourne, Australia. The last mail in time to reach Melbourne on May 1 is that leaving San Francisco on March 22 and due at Melbourne on April 12. The tender forms are open to the inspection of Canadian manufacturers at the Department of Trade and Commerce, Ottawa (refer file No. A-1435). Particulars of the requirements are briefly outlined thus:

Three 50-ton overhead travelling cranes.

One 25-ton overhead travelling crane.

Two 5-ton overhead travelling cranes.

One 10-ton revolving cantilever crane.

Two 5-ton travelling portal jib cranes.

Two 7½-ton jib cranes.

One 5-ton jib crane.

Two 15-ton hydraulic cranes.

One 6-ton hydraulic crane.

One 6-ton wall crane (hydraulic).

Two 3-ton wall cranes (hydraulic).

Two electric passenger elevators.

Two electric goods elevators.

One 2½-ton gauge locomotive with crane attached.

One 2½-ton gauge locomotive without crane attached.

Three electrically-driven air compressors, 1,500 cu. ft.

One 15-ton hydraulic winch.

One 5-ton hydraulic winch.

Nine 10-ton hydraulic capstans.

Two 5-ton hydraulic capstans.

One bar shearing machine.

One double-ended horizontal punching machine.

One 10-ton overhead travelling crane for shipyard fitting shop.

tinental Railway. The canal expenditure amounted to $7,314,131.

With the addition of small miscellaneous expenditures, the total outlay for the year on railways and canals amounted to $50,063,988. The revenue derived from Government railways and canals is $12,577,120, including $12,149,357 from railways and $427,763 from canals, the latter being partly a statistical revenue, since the canal tolls were abolished eleven years ago. There was, however, a sum of $236,277 derived from hydraulic and other rents.

The operation of the Intercolonial Railway for the year resulted in a profit of $42,965, a large proportion of which was transferred to equipment renewal account. The total earnings amounted to $11,444,873.

Hudson Bay Road

The report deals with the progress made on the construction of the Hudson Bay Railway and terminals and contains some very interesting photographs of the railway and of the harbor works. It states that navigation during the open season of 1914 was conducted satisfactorily, 36 passages of vessels having been made through the straits without serious accident. The expenditure for the year was $4,773,743, bringing the total up to $10,860,776.

The year's expenditure on the Quebec bridge was $2,816,305, paid out of capital, making the total capital expenditure on the reconstruction of the bridge $7,764,393. The total expenditure by the Railway Department up to the end of the year in connection with this bridge is given as $8,198,748, irrespective of the subsidy of $374,253 paid to the Quebec Bridge Company and of the sum of $6,975,266 paid for the guaranteed bonds of that company.

Dealing with the Welland Ship Canal, the report states that the expenditure for the year was $4,074,200, making a total of $5,068,458, plus the sum of $187,238 for preliminary surveys and borings. Railway subsidies for the year amounted to $5,191,507.

ONTARIO TIMBER PRODUCTION

STATISTICS of timber production on Crown lands in Ontario, and of the revenue, etc., during 1915 and 1914 are as follows:

Pine sawlogs, square timber, etc.; 1915, 407,874,044 ft. b.m.; 1914, 382,582,027 ft. b.m.

Sawlogs, etc., other than pine: 1915, 59,308,403 ft. b.m.; 1914, 77,451,857 ft. b.m.

Pulpwood: 1915, 301,061 cords; 1914, 104,544 cords.

Ties: 1915, 729,164; 1914, 5,439,845.

Area under license: 1915, 15,712 square miles; 1914, 17,333 square miles.

Revenue: 1915, $1,629,640.60; 1914, $2,009,122.43.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

Engineering

Galt, Ont.—An electric motor will be purchased for the pumping station.

Brantford, Ont.—Fire at the American Radiator Co. plant here on Feb. 4 did $1,000 damage.

Millbank, Ont.—H. E. Ratz & Co., is in the market for a 50 h.p. Wheelock or Corliss engine.

Chatham, Ont.—The Gray-Dort Motor Co., are equipping a plant here for making motor cars.

Ailsa Craig, Ont.—William Hay is in the market for electrical machinery for mill installation.

Toronto, Ont.—The Hamilton Carburetter Co., will make an addition to their factory on Queen street.

Hespeler, Ont.—Fire last Saturday destroyed part of the A. B. Jardine & Co. factory. The loss is estimated at $75,000.

Toronto, Ont. — Campbell's Flour Mills, Ltd., are in the market for a 2-phase 60-cycle 220-volt motor, about 20 horse power.

Vancouver, B.C.—The Pumps & Power Co. is in the market for drill presses, a 25 or 50-h.p. direct current motor, and a complete switchboard.

South Porcupine, Ont.—Tisdale Township Council will purchase a high-pressure, electrically-driven fire pump to cost about $5,000. W. H. Wilson is the clerk.

Montreal, Que.—The Canadian Architectural Iron Works, Bellechasse street, were totally destroyed by fire recently. The machinery will probably be a total loss.

Peterborough, Ont. — The premises formerly occupied by the Canadian Cordage Co. will be taken over and equipped by the Peterborough Metal Products Co.

Toronto, Ont.—A building permit has been issued to the Toronto Laundry Machine Co., for the erection of an addition to the factory. The cost is estimated at $2,800.

Brussels, Ont.—The Cardiff & Dames Co. are in the market for a gasoline motor, rock crusher, pulverizing machinery, and considerable other equipment for the manufacture of limestone fertilizer.

Welland, Ont.—The Canadian Steel Foundries, Ltd., will spend $100,000 in improving their plant here. A 35-ton open-hearth furnace will be installed, and the rolling mills will be overhauled.

Three Rivers, Que.—W. Paquin, 318 St. Julie Street, is inquiring for wood-working machinery, steam boilers, hoisting apparatus and other miscellaneous shop equipment.

Quebec, Que.—The Ross Rifle Co. has contracts to give out to manufacturers of small work, such as sewing machines, telephones, phonographs, typewriters, etc.

Thorold, Ont.—The Ontario Paper Co., will erect a sulphite mill with a capacity of fifty tons per twenty-four hours. There will be two digesters, each 15 feet in diameter by 49 feet in height installed.

Calgary, Alta.—It is reported that the Ford Motor Co. has purchased a site 500 by 130 feet on C. P. R. trackage for an assembling plant to be erected here. The building will be four storeys high.

Durham, Ont.—The National Portland Cement Co. contemplates extensive changes in its plant, and will be in the market for a large quantity of machinery. W. Calder, Durham, Ont., is plant manager.

Sarnia, Ont.—The Union Natural Gas Co. have decided to relay the pipe line from Tilbury to Sarnia, a distance of 57 miles. The pipe will be of steel, 10 in. diameter, and the cost is estimated at $300,000. Work will begin in the spring.

Municipal

Ridgetown, Ont.—The Town Council contemplate making extensions to the waterworks system.

North Vancouver, B.C.—The city council may purchase motor driven hose wagons.

Berlin, Ont.—The Council have given the by-law to guarantee the bonds of the proposed Hydro radial railway line from Toronto to London to the amount of $774,000 its third reading.

Hay Township, Ont.—A by-law will be voted on to raise $1,768 to provide a hydro-electric distribution system.

Port Dover, Ont.—A filtration plant will probably be installed here. James. Loudon & Hertezberg, of Toronto, are the engineers.

London, Ont.—The proposed extensions to the waterworks system will be commenced shortly. A large number of hydrants will be required.

Stephen Township, Ont.—The Township Council propose spending $1,632 on a hydro-electric distribution system. A by-law will be submitted to the ratepayers on February 14.

General Industrial

Niagara, Falls, Ont.—The Oneida Community Co., propose building a factory here.

London, Ont.—The city council are in the market for transformers and other electrical equipment.

Sandwich, Ont.—The Cadwell Sand & Gravel Co. will construct a factory here at an estimated cost of $50,000.

Vancouver, B.C.—The American Car Co., will build an addition to their factory here, estimated to cost $70,000.

Stratford, Ont.—A. J. Bates, of the McConkey-Bates Co., proposes to build a factory for the manufacture of corrugated iron.

Vancouver, B.C.—The Vancouver Creosoting Co., Ltd., will build a plant there to cost $150,000. J. B. Johnson is interested.

Sarnia, Ont.—The Board of Trade is negotiating with the Wallaceburg Woollen Mills with a view to having that concern sold to local interests.

Brockville, Ont.—Fire on Feb. 7 destroyed the Roebuck Cheese Factory, together with a new box factory located at Roebuck near here. The loss is only partly covered by insurance.

St. Johns, Nfld.—The Harmsworth paper plant at Grand Falls, which supplies the newspapers owned by Lord Northcliffe, was the scene on Feb. 2, of a fire which destroyed thousands of cords of barked wood. The probable loss was estimated at $100,000.

London, Ont.—Plans are being prepared for enlarging the plant of the Parnell Steam Baking Co., and installing new machinery. Estimated cost, $50,000. E. Parnell, Bruce Street, is manager.

Berlin, Ont.—A. J. Kimmel has resigned the presidency of the Canadian Consolidated Felt Co., and has purchased the Cobourg Felt Mills and shoe plant, located at Cobourg, Ont. This company has a share capital of $200,000, all of which was purchased by him.

Contracts Awarded

Montreal, Que.—The Montreal Tramways Co., have awarded a contract for boilers to the Babcock & Wilcox Co., and for a steam turbine and generator to the Canadian General Electric Co.

Toronto, Ont.—The Board of Control has awarded to the American La France Fire Engine Co., the contract for two six-cylinder tractors for the hook and ladder trucks at $6,127 each, and one six-cylinder tractor for the aerial truck at the same figure, a total amount of $18,381.

Tenders

Ottawa, Ont.—Tenders will be received until Feb. 29, for the supply of waterworks materials for this year. Particulars can be obtained from R. L. Haycock, waterworks engineer.

Montreal, Que.—The Board of Control have decided to call for new tenders for a supply of 6,000 tons of asphalt, replacing the former call, which was illegal, due to a mistake in the preparation of the advertisement. Tenders close on March 2.

Calgary, Alta.—Tenders will be received by the city commissioners up to Monday, February 14th, for the manufacture and delivery of switch board equipment. Specifications with the city electrical engineer, City Hall.

Toronto, Ont.—Tenders for lead covered cable, addressed to the chairman, the Toronto Electric Commissioners, will be received until Wednesday, February 16, 1916. Specifications and form of tender can be obtained at the office of the purchasing agent, 15 Wilton avenue.

Toronto, Ont.—Tenders for pole type transformers, addressed to the chairman of the Toronto Electric Commissioners, will be received until Wednesday, February 16. Specifications and form of tender can be obtained at the office of the purchasing agent, 15 Wilton avenue.

Montreal, Que.—Tenders will be received by the Board of Control until Feb. 15, for the construction of a building and supply and installation of a pump. Particulars may be obtained from the office of the engineer superintendent of sewers, City Hall.

Ottawa, Ont.—Tenders will be received by R. C. Desrochers, secretary, Department of Public Works, Ottawa, up to Tuesday, February 15th, for the supply of: Brooms and brushes, chain, coal, hardware, hose, oils and greases, packing, paint and paint oils, Manila rope, wire rope and steam pipe, valves and fittings, for the requirements of the Departmental Dredging Plants in Manitoba, New Brunswick and Nova Scotia, during the fiscal year 1916-1917. Tender forms may be obtained at the Department of Public Works, Ottawa.

Ottawa, Ont.—Tenders will be received until Monday, February 28, 1916, for the construction of timber lock gates and their equipment for the East River Lock, near New Glasgow, Pictou County, N.S. Plans and forms of contract can be seen and specification and forms of tender obtained at the Department of Public Works, Ottawa, and at the offices of the district engineers at Antigonish, N.S.; Halifax, N.S.; Shaughnessy Building, Montreal, P.Q.; Confederation Life Building, Toronto, Ont., and on application to the Postmaster at New Glasgow, Nova Scotia.

Hamilton, Ont.—Tenders will be received up to Wednesday, March 1st, 1916, for supplying the corporation of the City of Hamilton, with the following:—Castings (ordinary and special), iron pipe, hydrants, valves, extension boxes, lead pipe, pig lead, rubber hose, rubber boots, road oil, lubricating oil, flux, fuel oil, coal oil, gasoline, concrete and garbage duck covers, bass brooms, sectional sweepers, brass work, including ordinary and special brass castings for water department, hardware. Specifications and form of tender for all of the above can be obtained at the office of the city engineer, Hamilton, Ont.

Departmental Dredging Plant.—Separate sealed tenders addressed to R. C. Desrochers, secretary Department of Public Works, Ottawa, will be received until February 15, 1916, for the supply of brooms and brushes, chain, coal, hardware, hose, oils and greases, packing, paint and paint oils, Manila rope, wire rope, steam piping, valves and fittings, for the requirements of the Departmental Dredging Plant in Ontario and Quebec during the fiscal year 1916-1917. Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures. These forms can be obtained at the Department of Public Works, Ottawa.

Montreal ,Que.—Under the direction of the Hon. the Minister of Militia and Defence, certain condemned stores as follows:

Bunting	10 lbs.
Old canvas	750 "
Old leather	4,540 "
Old linen	2 "
Old brass	1,901 "
Old Copper	9 "
Wrought iron	15,687 "
Scrap steel	116 "
Steel files	2 "
Cotton rags	145 "
Woollen rags	4,491 "
Old rope	383 "
Rubber	1,900 "
Ground sheets	270 "
Old tentage	907 "
Brass buckles, ⅞"....	19,500 "
Brass buckles, ¾"....	18,500 "

in possession of the Senior Ordnance Officer, No. 4 Division, Montreal, are for sale by public tender. The above stores may be seen on application to the Senior Ordance Officer, 66 St. Paul St., East Montreal, any day between the hours of 10 a.m. and 4 p.m., Saturdays and Sundays excepted. Sealed tenders for the purchase of any or all of the lots, addressed to the Senior Ordnance Officer, at the above address, will be received until February 15, 1916.

Railways—Bridges

Brantford, Ont.—The L. E. & N. Ry. started its service between Brantford and Galt last Monday without formalities.

Edmonton, Alta.—It is proposed to build a railroad between Athabasca and Fort Vermilion. The Hon. A. B. McKay of Edmonton, is interested in the proposition.

Marine

St. John, N.B.—The fog alarm station at Cape Spencer has been destroyed by fire, involving a loss of $6,000.

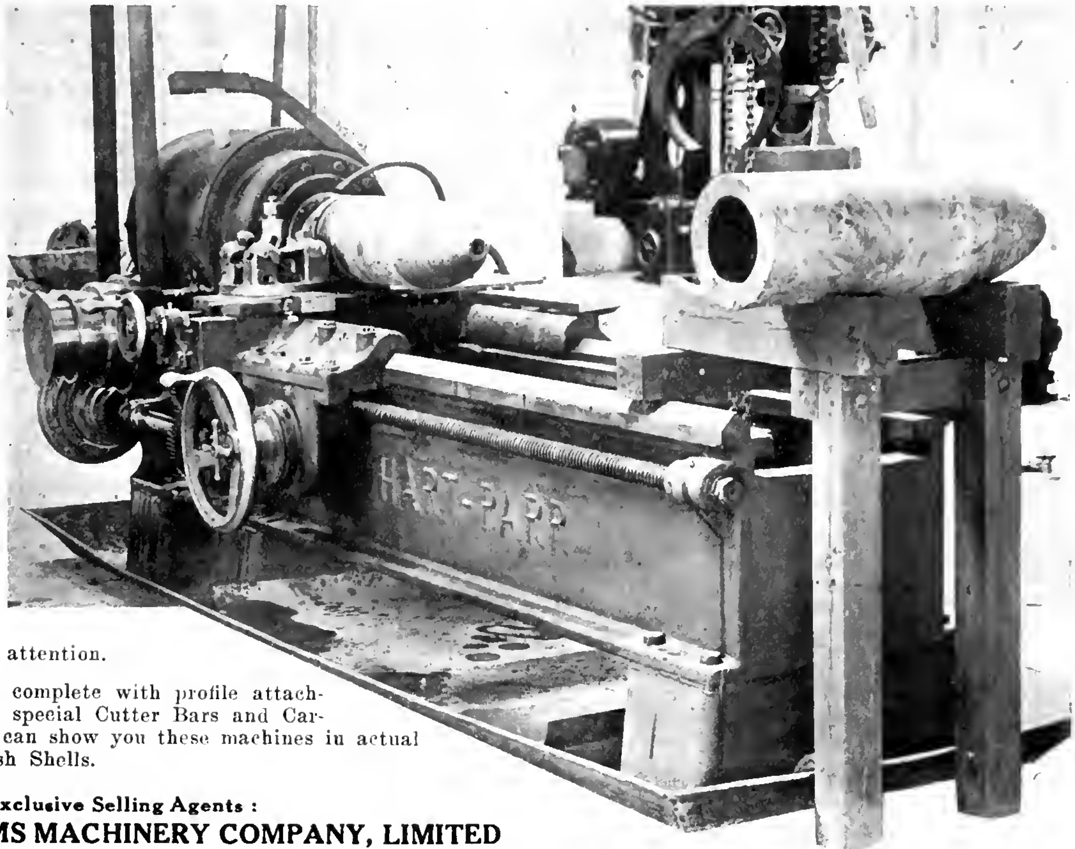
St. John's Nfld.—W. F. Coaker, of this city is considering the establishment of a shipbuilding plant at Catalina, on the north coast of Newfoundland The intention is to revive the shipbuilding industry which was at one time prosperous.

Wood-Working

Oakville, Ont.—Wallace, Chapman & Marshall will establish a factory for the manufacture of boxes, baskets, etc.

HART-PARR LATHE

for producing SHELLS from 6 in. to 9 in. diam.



This tool possesses enormous stiffness and great durability, and is wonderfully easy to control.

It has the accuracy that's so highly essential in the manufacture of munitions, and requires very little attention.

Fitted up with tooling complete with profile attachments for turning, and special Cutter Bars and Carriages for boring. We can show you these machines in actual operation on 9.2" British Shells.

Exclusive Selling Agents :

The A. R. WILLIAMS MACHINERY COMPANY, LIMITED

TORONTO, CAN.

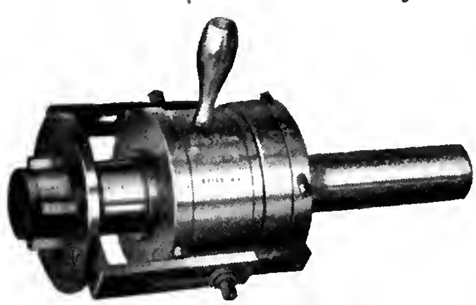
WHAT REASON HAVE YOU

For not using a Geometric Collapsing Tap in tapping out holes above ¾-inch diameter? **Your rate of production would be increased, and your cost of production decreased.**

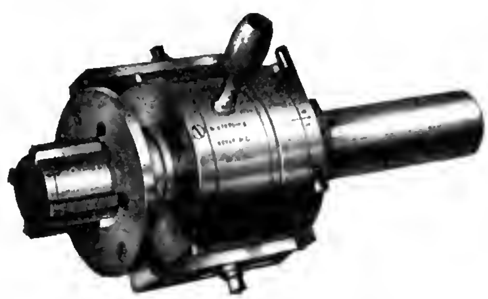
Geometric Collapsing Taps require no backing out over the threads. They are rigid while cutting, but collapse their chasers at the prescribed depth of thread.

It makes no difference what the thread is, a Geometric Collapsing Tap can be furnished that will produce it

to your entire satisfaction.



Geometric Collapsing Tap Arranged for Plug Bottoming.



Geometric Collapsing Tap Arranged for Tapping.

We will fit the tap with whatever size shank your machine requires. Send specifications of your work, and our experts will make a study of it and tell you what we can do for you. Look over our catalogue. Get in touch with us, at least.

The Geometric Tool Company, New Haven, Conn., U.S.A.

Canadian Agents:

Williams & Wilson, Limited, Montreal   The A. R. Williams Machinery Company, Limited, Toronto, Winnipeg St. John, N.B.

Calgary, Alta.—The sawmill owned by the Riverside Lumber Co., at McGillivray, B.C., which was totally destroyed by fire with a loss of $65,000, will be rebuilt.

Prince Rupert, B.C.—T. M. Michaels and F. J. Burling plan the construction of a modern wood-working plant in this city. A sawmill will also be erected in the early spring at Port Simpson, B.C.

Building Notes

Montreal, Que.—The Northern Electric Co., will make an extension to their factory.

Woodstock, Ont.—The Standard Wire Fence & Tube Co., will build a new warehouse to cost $1,000.

New Incorporations

The Manitoba Steel Foundries, Ltd., Winnipeg, has been incorporated with a capital stock of $100,000 by P. J. Smith and others to manufacture machinery, steel, etc.

The Lyman Tube & Supply Co. has been incorporated at Ottawa, with a capital of $180,000, to carry on business at Montreal, Que. Incorporators: Charles P. Lyman, Lawrence Macfarlane and William B. Scott, all of Montreal.

The Pembroke Ironworks Ltd., has been incorporated at Toronto with a capital of $100,000 to do a general foundry and machine shop business at Pembroke, Ont. Incorporators James F. Munro, William F. Fenton and Thomas Pink, all of Pembroke, Ont.

The Perkins Glue Co. has been incorporated at Ottawa, with a capital of $40,000, to manufacture vegetable and other glues at Hamilton, Ont. Incorporators: James G. B. Perkins, Hugh J. McKenna, and L. F. Stephens, all of Hamilton, Ont.

The Canadian Rock Drill Co. has been incorporated at Ottawa, with a capital of $50,000, to take over the Canadian business of the Denver Rock Drill Mfg. Co. The head office is at Toronto, and the incorporators are Walter J. Boland, John F. Boland, of Toronto.

The Ontario Machine Co. has been incorporated at Ottawa, with a capital of $100,000, to carry on business as mechanical engineers, iron founders and manufacturers of munitions. The head office is at Toronto, and the incorporators are William G. Smart, James Chisholm, and Thomas B. McQuesten, all of Hamilton, Ont.

The St. Clair Oil Refining Co. has been incorporated at Ottawa, with a capital of $250,000, to carry on business as refiners, with head office at Toronto, Ont. Incorporators: J. E. Stanton, of Raglan, Ont.; T. H. Hamilton, of Toronto, and W. R. Mather, of Stirling, Ont.

Machine & Stamping Co., has been incorporated at Toronto with a capital of $100,000 to carry on business on wood and metal products. Head office to be at Toronto and the provisional directors are Kenneth F. McKenzie, William H. Cook and Arthur L. Reid all of Toronto.

Advance Engineering Co. has been incorporated at Ottawa, with a capital of $20,000, to carry on business as consulting and operating engineers, chemists and contractors. The head office is at Toronto, and the incorporators are Howard S. Ross, Eugene R. Augers and Henry M. Gardner, all of Montreal, Que.

EQUIPMENT REQUIREMENTS OF VICTORIAN RAILWAYS

Tender forms with reference to the following materials required by the Victorian Railways, Melbourne, have been forwarded to the Department of Trade and Commerce, Ottawa, by D. H. Ross, Trade Commissioner, Melbourne:

Copper plates for engines.

Brass locomotive boiler tubes for maintenance.

Brass locomotive boiler tubes.

Locomotive seamless copper tubes for engines.

Solid drawn steel tubes for engines.

Copper or alternatively steel flue tubes for engines.

It is stated that the chief storekeeper's department of the Victorian Railways are at "their wits end" in the matter of securing the above materials. The question of price does not now enter into consideration, and it is entirely a question of obtaining supplies, as the completion of a number of locomotives depends entirely on whether the necessary materials can be obtained. The authorities state that if any difficulty is experienced in getting prices to the conditions as printed they will be glad to have submitted to them the best offers obtainable, since they are very desirous of doing business with Canada. Particulars should be forwarded by letter by the earliest mail, or by cable for preference (cable cypher, "Railways, Melbourne"). Canadian firms interested, on application to the Department of Trade and Commerce, Ottawa, may inspect any of the above contracts for which they are prepared to tender. (Refer File No. A-1919.)

Personal

The Hon. Francis Cochrane, Minister of Railways and Canals, has returned from Europe.

J. A. Cunningham, president of the British Columbia Manufacturers' Association, has left Vancouver on a trip to Eastern Canada.

W. G. Trethewey was appointed resident engineer of West Dome Consolidated, at a directors' meeting held recently.

J. H. Mead, formerly vice-president of the Lake Superior Pulp Co., it is reported has been appointed president of the Spanish River Pulp & Paper Mfg. Company.

Canadian Society Civil Engineers.—The new officers of the Canadian Society of Civil Engineers for the coming year are as follows: President. G. H. Duggan, vice-president and general manager, Dominion Bridge Co., Montreal; vice-president, T. H. White, chief engineer, C. N. R., Vancouver; councillors, J. R. W. Ambrose, chief engineer, Toronto Terminals Railway Co., Toronto; H. Donkin, deputy minister, Department of Works and Mines, Halifax; A. E. Doucet, Quebec; W. J. Francis, consulting engineer, Montreal; E. D. Lafleur, chief engineer, Department of Public Works of Canada, Ottawa; D. O. Lewis, district engineer, C. N. R., Victoria; D. A. Ross, consulting engineer, Winnipeg; H. R. Safford, chief engineer, G. T. R., Montreal.

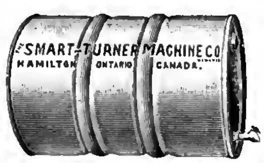
Trade Gossip

The Imperial Munitions Board propose erecting a factory at Verdun, near Montreal, for loading shells.

The Crescent Belt Fastener Co., Toronto, A. G. Walker, manager, have moved from 28 Wellington West to larger offices at 32 Front Street West.

C. B. Owens, of the Canadian Powers Regulation Co., of Toronto, has taken over the agency for the "Tuec" vacuum cleaner, until recently handled by James Y. Martindale.

Trade Enquiries.—The Department of Trade and Commerce, Ottawa, has received enquiries from England, for the following: — (1281) Large forgings.



Page 56 contains something that will interest you. Turn to it.

(1282) wagon tires and axles; (1283) high quality forgings, (1284) railway wagon springs.

Tool Steel Demand.—Arising out of the abnormal demand for tool steel, the Vanadium Alloys Steel Co. of Pittsburgh, whose plant is located at Latrobe, Pa., are installing an additional 30-pot crucible furnace.

More Shrapnel Ordered.—We understand that a further order for eight hundred thousand 18-pdr. shrapnel shells has been placed with the Imperial Munitions Board at Ottawa, on behalf of the British Ministry of Munitions. Indication of the foregoing was given in our editorial of February 3.

J. A. Cunningham, president of the B. C. Manufacturers' Association, believes that it would be in the best interests of the manufacturers of Manitoba, Alberta, Saskatchewan and British Columbia, and also the consumers for these provinces, to form a Manufacturers' Association of their own.

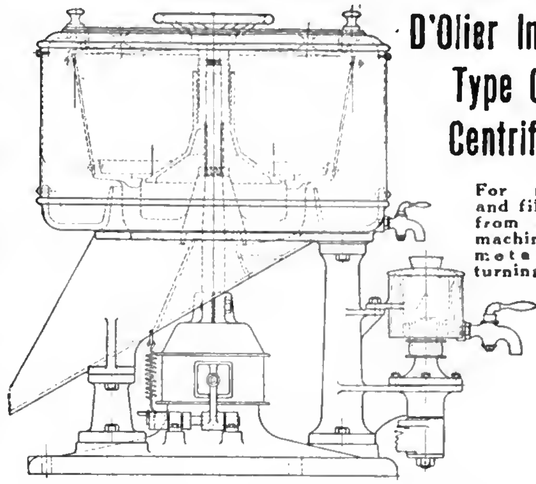
The International Nickel Co., of New York, has covenanted with the Dominion Government to establish somewhere on the Atlantic seaboard a plant for the refining in Canada of all the nickel necessary to secure to Great Britain and Canada their full requirements of the metal vital to defence purposes.

Northport, B.C.—The Northport smelter, being constructed by the Northport Smelting & Refining Co., financed by the Hercules and the Tamarack & Custer Mining Companies, will be ready to blow in March 1, according to H. V. Croll, of Allentown, Pa., sales engineer for the Traylor Engineering Co.

Railways Building in Alberta.—During 1915 there were 326 miles of new railway constructed in Alberta, or more than in all the other western provinces combined. The new mileage is credited to the various companies as follows:

Canadian Pacific Railway	22
Canadian Northern Railway	59
E., D. & B.C.	97
A. & G. W.	100
Central Canada Railway	48
Total	326

Public Works Expenditures. — The estimates for the year include $1,000,000 for St. John, N.B., harbor, and for harbor and river improvements at Fort William and Port Arthur, Ont., $1,000,000. Other large votes are Halifax dry dock, $250,000; Quebec harbor improvement, $490,000; Quebec dry dock, $1,500,000; improvements to navigation in Quebec harbor, $700,000; Toronto harbor improvements, $600,000; French river waterways improvements, $400,-



D'Olier Improved Type Chip Centrifugal

For recovering and filtering oil from automatic machined parts, metal chips, turnings, scrap, etc.

A large capacity, extremely efficient machine, especially designed and built to care for the "rush" character of work and the increasing volume of shop output now prevailing.

SPECIAL FEATURES

Weston type, self-balancing basket, 30 in. diameter, motor driven.

Bottom chute discharge and conical unloading valve.

Centrifugal oil filter attachment.

The 30" Weston type self-balancing basket, which is the largest capacity for this service, is of the non-removable type. No service (removable) baskets are required for this machine, the load being dumped into the operating basket and discharged by means of our special conical unloading valve and chute, which is a great time-saving feature.

The centrifugal oil filter, with which the machine is equipped, is operated by the main driving belt, the complete unit being therefore self-contained, simultaneously recovering and filtering the oil from the chips, turnings, etc.

D'Olier Centrifugal Pump and Machine Co.

Morris Building, Philadelphia, U.S.A.

BETTER DO IT RIGHT AWAY

Consider them on your work.

BAKER DRILLS

They are POPULAR tools on Lyddite and Shrapnel.

POPULAR because they produce ACCURATE—DEPENDABLE work at extremely low labor cost, low installation cost and small floor space.

SHELL OPERATIONS

READILY PERFORMED BY **BAKERS**

Drilling, Boring, Reaming, Counterboring, Facing, Undercutting, Nosing, Tapping.

BAKER BROS., Toledo, O., U.S.A.

Sales Agents;
The A. R. Williams Machinery Company
Toronto, Ont.

000; Vancouver harbor improvements, $350,000; Victoria harbor improvements, $1,000,000, and Esquimalt dry dock, $200,000.

Catalogues

Concerning High Speed Steel.—The Vanadium Alloys Steel Co., Pittsburg, Pa., have issued a folder with the above title which contains a statement regarding the high speed steel situation with suggestions for the guidance of users of this material. The folder refers briefly to "Red Cut Superior" and "Red Cut Cobalt" grades of high speed steel.

Hydraulic Presses.—The Hydraulic Press Mfg. Co., Mount Gilead, Ohio, are distributing two bulletins No. 5004 and No. 5005 dealing respectively with a 1,000-ton and an 800-ton hydraulic press. Bulletin No. 5004 illustrates and describes a 1,000-ton press for heading brass cartridge cases. Bulletin No. 5005 shows a 700-ton hydraulic press which was built for the Prest-O-Lite Co. for cupping and drawing dissolved acetylene cylinders. A brief specification is given of this press and method of operation described.

Recording Thermometers.—The Bristol Co., Waterbury, Conn., are distributing catalogue No. 1300, illustrating and describing Bristol's class 3, recording thermometers for temperatures between 60 degrees below zero and 800 degrees Fahr. Various methods of application are briefly described and illustrated while a number of specimen charts for the recording thermometers are shown. The catalogue also shows a number of bulbs and connections for the various applications of the thermometers, while complete price lists are included for all the various types and sizes of thermometers.

INDEX TO ADVERTISERS

Opportunities for Canada's Industrial Development-III.

By C.T.R.

In this series of articles prepared in response to numerous inquiries received from the managements of Canadian metal-working plants on the subject of post-bellum employment for their added equipment and enlarged capacity arising from an extended period of shell production, we aim to give prominence to the opportunity to manufacture such products as were previously imported for our domestic needs or have since become available for export.

THE formulation of plans regarding after-the-war commercial operations is, next to the war itself, probably the most universal subject of discussion at the present moment. Quite apart from the fact that the war may last three months or three years, the manner in which civilization will adjust itself as former conditions return, is causing not a small amount of speculation, much of it hopeful, but some of it not unmixed with apprehension.

Circumstances over which people have no control may force them into a war, rapidly and unexpectedly, but the successful completion of the reverse process after the termination of hostilities will be entirely dependent on the people of the various nations.

Success Depends on Preparedness

The history of events up to and since the outbreak, has convinced the British nation of the value, not only of preparedness, but of national organization and just as we appreciate the latter fact, so will we be able to derive any benefit from the struggle.

The great increases of German trade in the years preceding the war were directly due to commercial organization just as her advances at the beginning of the war were due to military preparedness. Science, in the form of engineering, has been the mainstay of our foe's efforts, and, as so many of us know, just as our own engineering resources have been organized so has our offensive power increased.

Engineering Industry a National Asset

That a sound and prosperous engineering trade is a national asset of great value in time of war is apparent to all. Speaking in the House of Commons on December 20th last, Mr. Lloyd George said:

"In no war ever fought in this world has the preponderance of machinery been so completely established. . . . The problem of victory is one of seeing that this superiority of the Central Powers shall be temporary, and shall be brought to an end at the earliest possible moment. There is one production in which the Allies had a complete mechanical superiority, and there they are supreme—that is, in the navy. Our command of the sea is attributable, not merely to the excellence of our sailors, but to the overwhelming superiority of our machinery."

The Canadian public, no less than the British has been awakened to the important position occupied by the engineering industry, and the widespread interest in its future prospects may well justify the hope that the combined efforts of all parties concerned will be directed to maintaining, strengthening, and ultimately extending the present manufacturing capacity of this country.

Preservation a National Duty

Commenting on this aspect of affairs the Engineering Review remarks . . "It is impossible to draw a line dividing those sections of the metal and machinery trades which can be classed as armaments and those which are, and always will be devoted to purely peaceful industry. For the war has proven that when a great Power enters into a quarrel, the thing that will count for most, both in diplomacy, and if necessary on the battlefield, is its powers of producing weapons and munitions, and that means, in effect, its total possible production, counting in every mechanical workshop within its borders. . . . But we have no experience of political manoeuvring for some years past to justify us in expecting that the Government or any powerful parliamentary group will make it their business to give special attention to the permanent protection of our means of national salvation. Therefore, it devolves upon the men who know and the men whose lifework is concerned with the production of metals and machinery to enter upon a campaign of education. . . . That is to say, it should be somebody's business, and obviously the business of the engineering industry itself, to keep hammering away at the general public, and to make the people understand, firstly, that we owe our national preservation to the engineering industry; secondly, that long before the war our enemies had entered upon a deliberate campaign unfavorable to this industry, thirdly, that this campaign will almost certainly be renewed after the war, and fourthly, that the nation cannot afford to leave the industry unguarded against such machinations."

These remarks apply to Canadian industry equally as well as to British, with the important difference that results as affecting this country had not yet become so obvious or ominous. The distance separating this country from Europe was a large factor in delaying the commercial offensive against us, but the same fact is so much more in our favor as regards future development. Canada's comparative immunity from military disturbance, the available sources of raw material, both at home and in neighboring States, cheap power supply in the manufacturing districts, and facilities for shipment to all parts of the world are, or should be potent factors in the development of an overseas trade in the not far distant future.

Desirable Foreign Markets

The foreign markets which might appeal directly to engineering manufacturers at the present moment are the British possessions and Russia. Latin America comprising the South American Republics has figured largely in American journalism, but certain features of the situation there are such that Great Britain will more than recover any temporary set-back, after removing the menace.

As a general statement without regard to any one market, the main features to be considered by a firm contemplating export trade are these—Does a demand exist for its product; if not, can it be created and if so, how? Are the resources of the firm such that it can finance the business on the conditions obtaining in the market? Presuming that the two foregoing points can be satisfactorily answered, it remains to be seen whether it is commercially feasible in view of freights, tariffs, and manufacturing costs to establish a permanent profitable business.

Individual Investigation Desirable

The answer to all of these questions must be sought by the manufacturer himself. No generalisation of statements can possibly take the place of, or equal in results obtained, a personal investigation by an interested party. The cumulative effect of numerous investigations of such a nature would result in a gradual absorption of export requirements by the trade generally, so that as worldwide commerce gradually resumed its former proportions a greater number of our manufacturers would be pepared to enter the field.

The Lure of Russia

Because of its vastness and huge population, Russia has had a peculiar fascination for students of political economy, and it is doubtful if the economic effects of the war on any one people in its relations to the rest of the world will be so marked, except, of course, adversely in the case of Germany. Writing from Petrograd in May, 1915, Mr. C. F. Just, Special Trade Commissioner, gives a lengthy report from which the following extracts are taken as being of particular interest to our manufacturers at this time:

"It is doubtful whether any conceivable scale of waste and destruction of life in the present war on the side of Russia will affect the country's economic position for any appreciable period if the past be any reliable guide in such matters. The recuperative power of Russia has invariably proved equal to every call. She has tried with impunity, economic experiments which would have seriously affected most other countries. Wars and political and social upheavals have seemingly had but little effect.

Russia internally is rich and prosperous: her national resources are very great and of infinite variety, her present population of 171,000,000, however backward and inefficient, is nevertheless being slowly raised and educated, and constitutes an important factor in the production of wealth. Apart from agriculture, in which 75 per cent. of the population is engaged, the manufacturing and mining industries, though very considerable within a restricted range of production, furnish an insignificant output in relation to the country's actual needs. For this position the lack of the spirit of enterprise among the native Russian capitalists is said to be responsible. On the other hand, liberal provision for the education and training of skilled men for modern industrial conditions is being made.

Unusual Nature of Opportunities

There is to be found in Russia, therefore, the unusual conditions of great opportunities for industrial enterprise for which the consuming power is at hand, side by side with opportunities for imports on an extensive scale, with the certainty that the former will rather stimulate than retard the growth of the latter, both in variety and extent: for with the slightest rise in the standard of comfort of such a large population the home industries can hardly expect to meet the demand, at least not for a number of years. Primarily, these factors should make Russia a great market, and if the conditions be rightly studied and understood Canadian manufacturing industries by the nature of their products which are adapted in so many instances to the requirements of a developing country like Russia, may reasonably expect to participate in the trade with that market."

The conditional statement in the last sentence of the foregoing extract is the pivot around which much discussion will inevitably develop and compliance with it is an essential factor in success in any line of business. No work of any kind can be profitably undertaken if it be not rightly studied and understood. Mr. Just studied the Russian situation on the ground, and his remarks on German trade with Russia indicate what sort of study and understanding is desirable.

Trade Methods and German Success

"The experience and success of Germany during the last 25 years in building up the trade position which she occupied in Russia at the outbreak of the war, when she had 52 per cent. of the import trade to her credit, has demonstrated the soundness and capacity of the market. The success of Germany has been principally due to enterprise based upon a thorough understanding of local needs and backed by efficient organization.

"Financial support from the German banking institutions, which are so largely interested in German industries, have no doubt also greatly facilitated the German invasion, notably in the granting of long credits, and in securing important contracts. On the whole, however, it should be admitted that German enterprise and organization have been the chief determining factors in her success. . . . In reply to inquiries as to the best way in which Canadian trade may be furthered, the advice has invariably been 'Follow the example of Germany and it will bring success to yourselves,' in short, Canadian traders should organize on the basis of a close, intelligent, personal study of the requirements of the Russian market, and supply those needs on the terms and conditions demanded by the local customs. Most important of all, they should arrange to keep in touch with the consumer through a local house or agent, so that they may always know how their goods are suiting, and how they might be varied or improved under changing conditions. They should remember that the consumer is the best teacher, and that they can also learn from him information concerning their competitors which it is important to know. One may safely give credit and large credit in Russia, but there is no country where the granting of credit calls for greater discretion, or where, when it is granted under such conditions it is likely to be safer. The highest authorities in the banking and commercial world in Petrograd are unanimous on this point."

The complete report is lengthy and has been published in detail by the Department of Trade and Commerce, and a close study and consideration of the entire situation will enable many manufacturers to decide whether to supplement the conclusions by further personal investigation.

That the matter should be taken up by a group of suitable manufacturers in preference to individual effort is evident from the following particulars regarding actual conditions to be met.

How to Trade With Russia

"The conditions of the Russian market differ from that of every other European country in that the expenses of initiating and conducting business are relatively excessive. The general opinion of independent authorities, including leading bankers in Petrograd, is that Russia is no place for the single firm which desires to run independently, as to do so in all probability would be to court failure; unless always their particular articles were likely to be of universal use, and to command such a sale as to make the initial expense a matter of indifference. Another factor against the small single firm is that Russia when she once buys, buys on a large scale. The authorities on the question, therefore, advocate the plan of associated groups, or syndicates of powerful firms whose products do not compete, but are complementary to each other. Syndicates of this class entering the market have the best prospects of success. Obviously, under these conditions the incidence of the expenses for each participator would be considerably lighter in every direction, and the work of building up an efficient organization in the chief centres would be greatly facilitated. This is the German plan of approach and has justified itself in a number of instances, having been of great assistance generally in advertising German industrial products in Russia."

Assembling and Auxiliary Works

"In the case of the import of bulky articles like machinery, special and general, for which Russia is such a promising market, particularly machinery with heavy structured sections, or parts which could be obtained, finished and fitted locally in Russia, the question of an assembling shop or auxiliary works is one that could, and indeed should receive serious consideration from a syndicate of firms as mentioned. This feature is of importance to firms of distant countries like Canada. In the first place as the Russian duties are high, and are levied on weight, the saving in duty and freight and handling would be considerable, and would assist in meeting local or foreign competition; secondly, the setting up in the country of a quasi-permanent establishment employing

Russian labor and Russian material would not only give local satisfaction, but favorably dispose the Russian authorities, in the event of the firm tendering for Government contracts. It should be remembered that under the Russian administrative system the Government is easily the first purchaser in the country, and is permanently in the market."

The following list (table 1) has been abstracted from a list of goods manufactured by German firms, and now in demand in Russia, having been compiled from recent reports received from the British consular officer in that country. The items are selected either because they are at present produced by Canadian firms, or are adaptable for production as additional lines in existing factories:

U. S. TUNGSTEN ORE OUTPUT IN 1915

THE tungsten ore output of the United States in 1915 is placed by the U. S. Geological Survey at about 2,165 net tons of concentrates carrying 60 per cent. of tungsten trioxide and valued at more than $2,000,000. This is a record output, the largest previous one being 1,821 tons in 1910.

While the price of ore late in 1914 was $9 or more per unit of contained tungsten, 60 per cent. ore was sold as low as $5.80 per unit early in 1915. The price has since then steadily advanced until $50, and even as high as $62.50 per unit or more has been paid.

Early in the war England commandeered all the ore that was produced in any of the colonies, fixing a maximum price of 55s. per unit, or about $13.50. American consumers since then have obtained ore from Mexico and South America. Portugal and Spain are also producers, but they are controlled by British capital, says the Engineering and Mining Journal. Only recently have arrangements been made by which tungsten ore, contracted for in Portugal and Spain, may now be shipped, the first cargo of any size leaving for New York in December last. Japan shipped tungsten ore to this country when the price had reached $44 per unit, and large amounts have been booked.

LOW PRESSURE TURBINE USING HAMMER EXHAUST

THE Rockford Drop Forge Co., Rockford, Ill., is installing a 300-k.w. Westinghouse low-pressure turbo-generator set to operate on exhaust steam from the hammers in the forge shop. The hammers number 17, and range in capacity from 800 to 4,000 lb. The exhaust steam is collected in a 10-in. overhead main, and the distance to the turbine station approximates 125 ft. The steam is used at a pressure of 2 lb. at the turbine, and connection is made with the live steam main through a reducing pressure regulator, so that inadequacy of exhaust steam at any time is compensated for automatically.

This turbine unit will supply power for the die-sinking department, and it will also provide for the requirements of the adjacent Mechanics Machine Co., replacing electric power previously purchased. Heretofore the exhaust has only been utilized for shop heating and feed-water heaters, the greater portion having been wasted. With the new turbo-generator unit, a saving of $1,000 per month is figured.

Table I.

GOODS NOW IN DEMAND IN RUSSIA. THESE HAVE BEEN LARGELY SUPPLIED FROM GERMANY, AND ARE SUITED FOR PRODUCTION BY CANADIAN FIRMS.

Abrasives.
Agricultural machinery and implements.
Aluminum cooking utensils.
Ball bearings.
Blowers—Sandblast apparatus.
Boat motors.
Boats, motor.
Boiler fittings—Valves and cocks, indicator, etc.
Combustion engines, internal.
Crude oil engines.
Cutters, milling.
Drills and drilling tools.
Electrical machinery and apparatus of all descriptions.
Enamelled ware.
Extinguishers, fire.
Files.
Friction couplings.
Furnaces—Heating, hardening, tempering.
Gas producers and similar plant.
Governors for shafts, temperatures, revolutions, etc.
Guns, rifles, revolvers.
Hammers, pneumatic.
Hardware and tools.
Hoists.
Laundry machinery.
Machine tools.
Mining machinery.
Motors, gasoline.
Narrow-gauge railways.
Oil cooking stoves.
Optical instruments.
Packing, engine.
Pumps of all kinds.
Pyrometers.
Reamers, etc.
Saw mill machinery.
Scientific instruments.
Separators, cream.
Sewing machines.
Sheet metal working machines.
Sporting requisites.
Steam traps.
Street and road rollers.
Toys—
Turbines—Steam and water.
Typewriters.
Valves of all descriptions.

The following items (table 2) are abstracted from the statement of Russian imports for 1913 furnished by British officials in Petrograd. The proportion of these goods formerly obtained from Germany will indicate the possibilities of future trade when the Allies are in a position to express national sentiment through the medium of tariff regulation.

Table II.

ABSTRACT OF PRINCIPAL ARTICLES IMPORTED INTO RUSSIA DURING THE YEAR 1913.

(Note: One rouble = 52 cents.)

Articles.	From all Countries.	From United Kingdom.	From Germany.
Bricks, fire-bricks, tiles, etc.	3,115,000	428,000	3,275,000
Cast Iron—			
Raw	3,069,000	278,000	1,795,000
Worked	4,042,000	479,000	3,012,000
Iron, assorted	3,782,000	828,000	2,270,000
Iron and steel, articles of	19,461,000	2,338,000	15,329,000
Steel—			
Raw and assorted	1,542,000	398,000	1,032,000
Rails	48,000		
Plates	519,000		
Hardware, cutlery, hand tools, etc.	13,153,000	1,123,000	8,443,000
Copper, aluminum, nickel, bars and rods	12,058,000	1,652,000	5,976,000
Machinery (except agricultural) and parts of	120,705,000	15,060,000	86,890,000
Wire—			
Worked	4,177,000	508,000	1,345,000
Iron, copper, etc.	1,951,000	508,000	3,432,000
Agricultural machinery	36,657,000	6,008,000	12,652,000
Cement, clays and other building materials	5,601,000	812,000	3,026,000
Carriages, motor cars, bicycles, and other vehicles	22,507,000	2,038,000	17,201,000

Big Demand for Coke.—Activity in the metalliferous mines of West Kootenay and the Boundary districts has so increased the demand for coke that every oven in Fernie, B.C., is running, and 200 ovens at Michel, which have been idle for three years, also have been lighted up.

PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

MOLDING A PULP DRIER RING

By J. H. Eastham

THE angle ring casting shown in plan and section by Fig. 1, forming part of a pulp drier contract, measured at working size, 8 feet 3 inches extreme diameter, 7 feet, 3 inches, inside

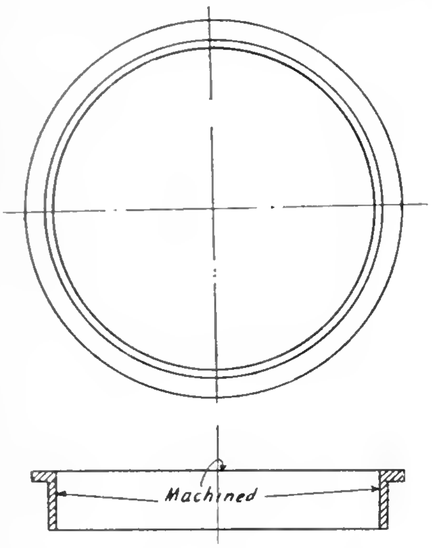

FIG. 1.

diameter, 12 inches deep, and in the rough weighed approximately 3,400 pounds. As the chances of a repeat order were very remote, coupled with the fact that low competitive prices necessitated economical production in every de-

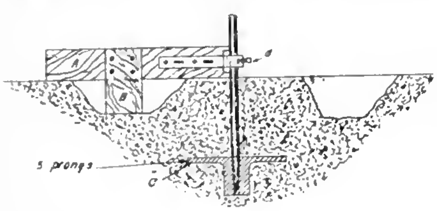

FIG. 2.

partment, a complete pattern was considered out of the question. The method of moulding determined upon was as follows:—

The spindle socket indicated at C, Fig. 2, of type used in loose and swept-up work, was bedded in the foundry floor with its upper face about 12 inches below the mean working level A 2-inch spindle was inserted, and after ramming-

FIG. 3.

up the hole tightly to prevent tilting or subsidence the sweep board A, with bed strickle B attached, was bolted to the spindle arm, and a circular hole 14 inches deep opened up a sufficient area to allow free working space, as shown at Fig. 2.

A bed was next swept up 12 inches below the extreme lower edge of the horizontal board A, the bed board B being then removed, and replaced by the one-sixth pattern section illustrated in

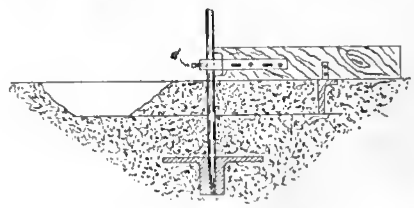

FIG. 4.

plan at Fig. 3, due allowance being made for contraction and machining. Extreme care was necessary at this point; correct dimensions being imperative with a view to keeping machining costs at the lowest figure compatible with a number one finish.

The pattern was now rammed up as shown to the right of sketch, Fig. 4, the set screw (a) slackened to permit of pattern and board being drawn up together,

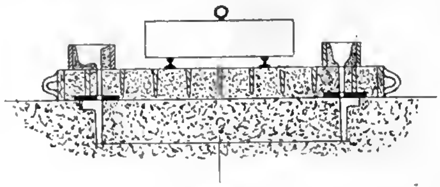

FIG. 5.

moved round and lowered again. About 8 inches of the pattern was left in the first mould impression to prevent "ramming in." This operation was repeated several times until the circle was completed. The board, pattern and spindle were next removed, and the open mould

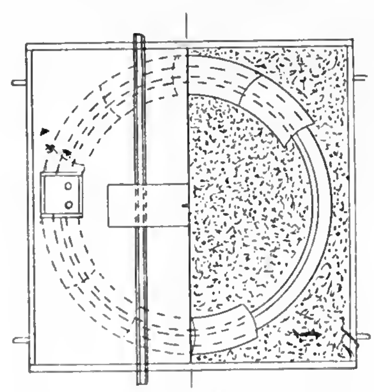

FIG. 6.

covered with interlocking sections of slab cores pierced at various points with 1 in. holes to serve as runners and risers. These cores are shown heavily outlined in black at Fig. 5, and in plan in the composite view of the assembled mould, Fig. 6.

After all the core joints were waste padded to avoid entry of loose sand into the mould, a ten-feet square cope plate was lowered to place, gate pins inserted, and the wedges lightly driven between the lower edges of the cope bars and the upper faces of the cover cores, this being done to prevent strain when pouring. The cope was next rammed full, the runner boxes lined, and cope weighted previous to pouring.

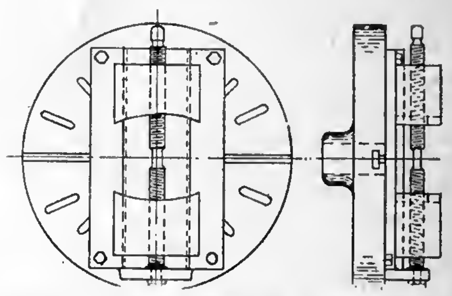
Aside from the very considerable saving in lumber and in patternmaker's time, a careful checking of the foundry costs, including labor, material, and all overhead charges, showed the productive cost of this casting to be 1.75 cents per pound.

SHARPENING LAWN MOWERS

By G. M.

THE method of sharpening and adjusting lawn mowers as described by J. R. Tate in the February 10th issue of Canadian Machinery, has been read with considerable interest, since the writer has also had experience of this particular class of work in a small repair shop.

Although the use of oil and emery in combination is being rapidly superseded by grinding machines, specially adapted



SPECIAL CHUCK USED WHEN SHARPENING LAWN MOWERS.

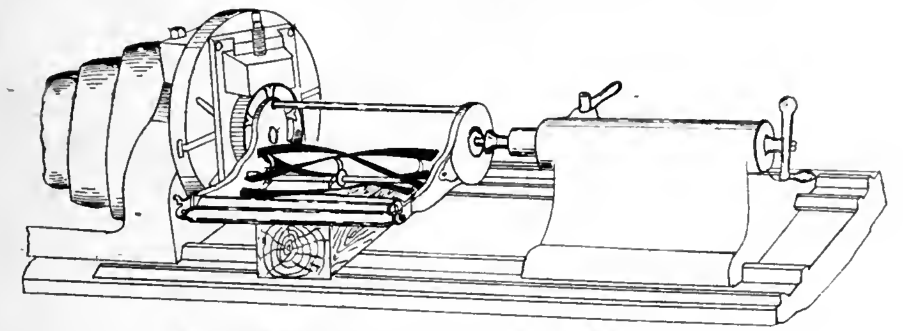
for lawn mower grinder, still the former method is one in which the results obtained will in every case give absolutely satisfaction, owing to the fact that both the knives and the cutter bar are ground down or lapped as one. This then insures a perfect evenness of cut when the mower is in actual operation.

Referring to Mr. Tate's method of grinding, it seems to indicate, that, after the pinions are reversed, and the knife bar set, the mower is turned upside down and "run" for about 300 feet. The manner in which the mower is "run" is not explained, but I understand it to mean that the mower is "pushed" across the floor.

If this be the method adopted by Mr. Tate, I am sure, that he, with a little study could surely devise an even more tradesman-like means of securing results. In a shop, where I was formerly employed, we made profitable use of an old lathe for grinding mowers. A simple two-jawed chuck was made in the manner shown in the sketch. A rectangular base plate, with suitable vees planed thereon was bolted to the face plate. The chuck jaws were made of two solid blocks of cast iron bored and threaded respectively with a right and left-handed square thread. The operating screw was threaded in manner as shown; one end being supported in a lug cast solid with the end of the base casting.

In using this device the mower is driven directly from one wheel; the pinion being previously reversed in order that the knives revolve in the opposite direction to the regular cutting motion. The pinion and wheel on the opposite end are removed and the mower is supported by the wheel axle held in a cup centre. A block of wood of sufficient height is also used to support the centre of the mower and to raise it to a suitable angle in order to allow the mixture of emery and oil, when applied, to gradually run down to the edge of the bar. When the lathe is speeded up, the mower can be quickly as well as satisfactorily ground in four or five minutes.

Another important feature about this method is the fact that the machine when set in motion requires practically no attention apart from an occasional application of the grinding compound; thus, while the machine is in operation, the operator can give his attention during the completion of the grinding, to the preparation of another mower for treatment.



EQUIPMENT FOR SHARPENING LAWN MOWERS.

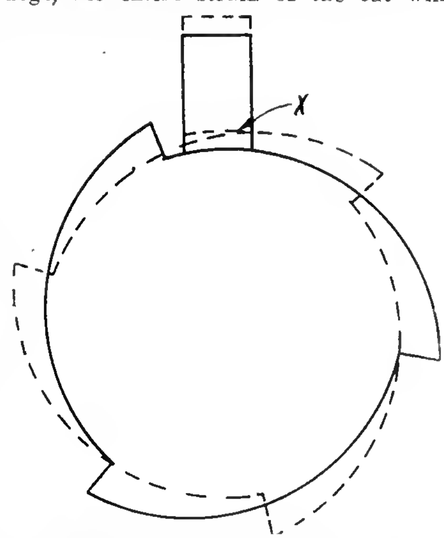
EXPANDING MANDREL CRITICISM

By Chas. F. White

THE expanding mandrel designed by G. Barrett, which was described in the February 3 issue of Canadian Machinery, calls for a certain amount of criticism. This type of mandrel looks quite acceptable on paper, but under actual working conditions, I am sure it would be found lacking in many respects.

In the first place, if this mandrel were intended for use on finished shells, the hardened serrated steel dogs, would have to enter the surface of the shell in order to secure a grip. This then would condemn the shell since the finished bore would be marred to a certain extent. Again, if the mandrel were used on rough shells it would also be impracticable. The size, straightness and taper vary considerably in the forgings, and since each dog would be expanded to the same diameter, the chances are that only one or two of the dogs would grip the forging and thus take the whole strain of the roughing cut.

The body of this arbor, according to Mr. Barrett is milled with a concave cutter, thus forming three arcs. These arcs cannot be struck from the centre of the mandrel, therefore, as the latter rotates and forces out or expands the dogs, the entire strain of the cut will



EXPLANATORY DIAGRAM COVERING EXPANDING MANDREL CRITICISM.

be taken by one sharp edge of the dogs. This can be readily seen by referring to the sketch, in which the dotted lines show the arbor rotated to force out the dog, also the dog in the outer position, the strain being taken on the point X This would naturally cause the edge of the dog—being hard, to cut into and form a shoulder, which would then prevent further rotation of the mandrel.

This mandrel is similar in many respects to the famous McGregor chuck (patented) but it lacks many of the saving perhaps which the McGregor embodies. A few of these features are, the rolling seat behind the jaw, the extreme shortness which gives a minimum amount of trouble with the tailstock, the fact of it being screwed on to the lathe spindle and also its tiger-like grip.

SMALL ARMS AMMUNITION OUTPUT

WE understand that the Dominion Government has made arrangements to increase enormously the output of small arms ammunition in Canada. Some months ago orders were placed for a large quantity of new equipment. The machines will be delivered within the next six or eight weeks, and will make it possible for the Government to provide additional facilities in some central point in Canada for the manufacture of this ammunition. The manufacture of small arms ammunition is now done at the Quebec arsenal, and the new machinery may be placed there. The production capacity will be increased four to five-fold.

SEMI-STEEL

IN a recent paper by J. E. Hurst, read before the Manchester branch of the British Foundrymen's Association, it was pointed out that the steel should be added in the cupola, and that, since the melting point of steel scrap was rarely reached in the ordinary cupola, it was evident that the steel absorbed carbon which lowered the melting point. The necessity of melting hot was, therefore, evident.

The author had met with a good deal of trouble in the matter of pin-holes when adding the steel in large pieces, but the trouble was less when the steel was added in the form of borings; it might be added, however, that this trouble can be overcome by watching the melting heat. An ingenious method of adding steel to cast iron in the ladle was referred to, steel in the form of punchings or turnings being placed in the bottom of the ladle together with some thermit, and as a molten cast was poured upon it, the action of the thermit gave sufficient heat to melt the steel. In the course of the discussion several interesting points were brought out. It was stated that the proportion between the sizes of the pieces of cast iron and of steel was of importance, and should be at least 3 to 1. With respect to obtaining strength in the bar, 35 per cent. of steel was given as the most suitable proportion. The occurrence of hard spots is, of course, a general trouble, and is more frequent when low silicon mixtures are used.

Series of Practical Questions and Answers for Mechanics

Every care is being taken to include only pertinent practical questions, and give same direct, reliable answers. Catch questions will be avoided. Arithmetic, consisting of simple addition, subtraction, multiplication and division will be found a useful companion study.

Question.—A 2-inch drill running 50 revolutions per minute, goes through a 3-inch cast iron web in $4\frac{1}{2}$ minutes. What is the maximum cutting speed in feet per minute, and the feed per revolution?

Answer.—The maximum cutting speed will be that of the outer edge of the drill, or $2 \times 3.1416 \times 50 \div 12 = 26.18$ ft. per minute. The feed per revolution will be the time divided by the thickness, divided by the number of revolutions per minute, or

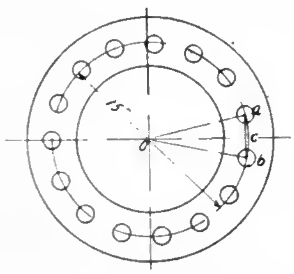
$$\frac{4.5}{3} \qquad \frac{3}{50} = \frac{4.5}{3} \times \frac{1}{50} = \frac{4.5}{150}$$

$= .03$ inch per revolution.

* * *

Question.—On a pipe flange it is required to drill 15 equidistant holes on a 15-inch circle: what would be the step of the trammel or dividers in laying off the centres of the holes.

Answer.—The step or trammel would equal the base of the triangle a. o. b. The angle a.o.c. will be $360 \div 30 = 12$



degrees. To find the length a.c. we proceed as per formula: Side opposite = hypotenuse $\times$ sine $= 7.5 \times .20791 = 1.559$ inches. Therefore step or trammel will equal $1.559 \times 2 = 3.118$ inches.

* * *

Question.—What must be the diameter of a cast iron ball to weigh 15 lbs?

Answer.—A cubic inch of cast iron weighs approximately .26 lbs., therefore, the volume of the ball will be the total weight divided by the weight of a cubic inch, or $15 \div .26 = 57.69$ cubic inch.

The volume of a sphere is equal to .5236 times the cube of the diameter, or $.5236\ d^3$. Diameter would then be the cube root of the volume divided by .5236, or

$$\sqrt[3]{\frac{V}{.5236}} = \sqrt[3]{110.18} = 4.8 \text{ inches}$$

* * *

Question.—Would two poles placed a certain distance apart and in a vertical position be parallel with each other?

Answer.—Theoretically no, practically yes. A vertical line, if extended would pass through the centre of the earth and would therefore form a portion of a radial line, and as two radial lines cannot be parallel, the two poles would be inclined from each other. However, the poles would be considered as parallel for all practical purposes.

* * *

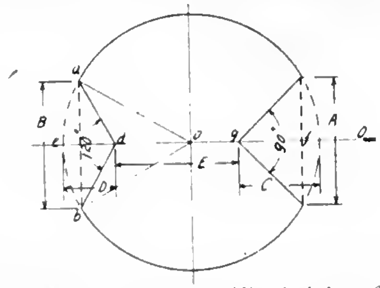
Question. — When turning castings, etc., where the cutting is intermittent, as facing flanges with cored holes, cast gears or pieces with notches, what can be done to avoid the jerking action, which often results in breaking the cutting tool.

Answer.—This can generally be remedied by preventing the work "jumping" ahead as it enters the space. The trouble is greater in an old lathe where bearings and gears are badly worn. By preventing the back lash of the gears and creating a constant pull, much of this annoyance may be removed. A convenient method is to apply sufficient friction to overcome the jerk caused by the tool leaving the cut and entering the space. A narrow board placed below the face plate or chuck circumference and wedged to the desired pressure will give good results.

* * *

Question.—A shaft three inches in diameter requires to have two grooves milled diametrically opposite, as shown in cut, one forming an angle of 90 degrees, and the other an angle of 120 degrees. The length of the arc removed in each case is one-sixth of the circumference. What will be the distance of A and B, depth of cuts C and D, and the distance E?

Answer.—The length A or B would equal the side of a hexagon whose diagonal is three inches but, as the triangle a o b is an equilateral triangle, the length A or B will equal the radius of



the shaft, $1\frac{1}{2}$ inches. The height of the segment will equal the radius minus the length o—e. By formula:—side adjacent = hypotenuse $\times$ cosine $= 1.5 \times 86603 = 1.299$ inches, $e—e = 1.5 - 1.299 = .201$ inches. To find c—d, use formula, side opposite = side adjacent $\times$ tangent, or $c—d = a—c \times .57735 = .75 \times .57735 = .433$ inches. Depth of cut D $= .433 + .201 = .634$ inch.

As f—g equals one half of the diagonal A, the depth of cut C will be $.75 + .201 = .951$ inch. The distance E $= 3 - (.634 + .951) = 1.415$ inches.

* * *

Question.—In the hydraulic press used for the pressing on of the copper bands on shells, what pressure is exerted on the shell?

Answer.—With a gauge pressure of 1,500 lbs. per sq. in. and a cylinder of 6.5 inches diameter, the pressure of each piston will be $1{,}500 \times 6.5^2 \times .7854 = 49{,}770$ lbs., or about 25 tons. With the six cylinders the pressure might be considered as $25 \times 6 = 150$ tons.

NOTES ON PATTERN-MAKING

By J. N. Hill

NO proof is needed of the fact that pattern-making, being the first step in practical engineering work, is of such importance that if faulty castings are obtained it can most probably be traced to the patterns. To ensure sound castings several points must be borne in mind, and some of these should be the care of the designers. In the writer's experience many vital principles are often overlooked, perhaps owing to many designers being trained machinists and fitters but untrained in the production of castings, as is sometimes the case in small shops.

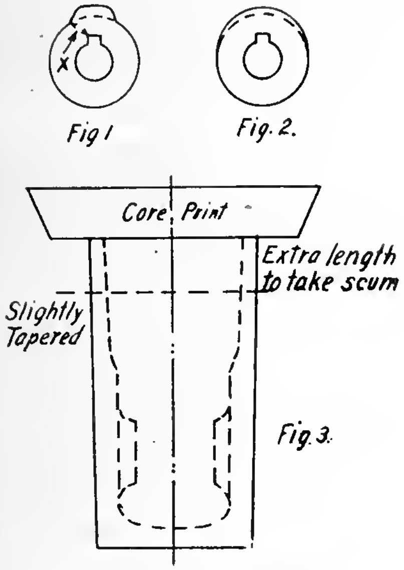
To take just one instance, the bosses of pulley patterns, which require strengthening pieces round the keyway, seldom have the metal properly proportioned. The usual way is to provide a swelling like Fig. 1, which really defeats its purpose as it introduces weakness at X, across which a fracture will occur, if at all, as broken pulleys often prove. If the strengthening piece is made as Fig. 2, then the weak place is avoided, as the metal crystals are more evenly distributed.

Defects such as these can be readily seen by a patternmaker, and are quickly rectified, whereas afterwards it would be difficult. It is essential, therefore, that such matters be looked into, and what follows will deal with some such phases of patternshop practice.

Of course, all drawings or blue prints provided have to be worked to, especially in a shop where direct communication with the designer is impossible, but de-

signers should always remember that the foundryman abominates a pattern that provides for metal of great variation in thickness. Patterns of this sort give a lot of trouble when casting, owing to the metal always flowing towards the heavier parts, leaving blow holes in the lighter parts. Even when good castings are obtainable, and this by running in several places, they are much weaker than castings of a more uniform thickness.

Another point to ensure strength is to provide where possible for the rounding, however small, of all sharp corners, and likewise filleting of sharp angles, for although this adds to the cost of the pat-



NOTES ON PATTERNMAKING.

terns, it lessens the risk of breakdowns and future expense, besides adding to the general appearance of the castings. The above rules are of use to, and are sure to be employed by, a thoroughly trained engineer, as well as helping the patternmaker to guarantee sound castings.

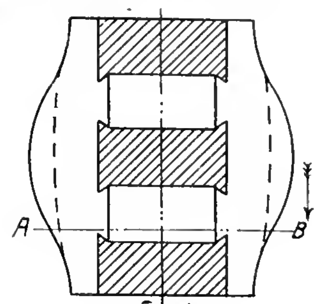
The moulding of patterns, which directly concerns the patternmaker, is of importance. Tapers should be provided where necessary and as much as convenient, sufficiently large bottom box prints to support cores, and well tapered steadying or top box prints. Always make patterns to mould as far as possible in the bottom box or, in other words, taper the patterns and prints up, so that the joint line shall be along the top edge wherever it can be arranged. This will avoid a big lift of top box and also bad joint marks, consequently less cleaning up is necessary.

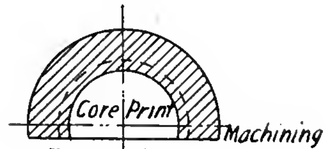
To illustrate an excellent method of moulding, a sketch (Fig. 3) is given of a piston pattern which is made to mould "end down," preventing scum in the head of pistons, thus giving strength and soundness where most needed. In Figs. 4 and 7, a dove-tailed bearing cap for white-metal liner and core box are shown. The dovetails are cored out in the very simple manner shown to give the moulder less work, as moulders hate a lot of fragile loose pieces which soon get broken or lost, resulting in scrappy castings.—Foundry Trade Journal.

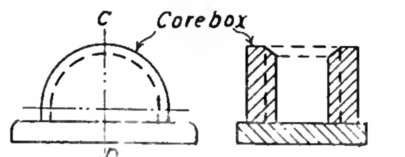
GRINDING HELICAL GEARS

By L. E. Gehman.

THE use of helical gears for speed reduction extends over a great number of years. The cast gear was first used, but







later came the demand for steel cut gears of greater accuracy, especially since the advent of the high-speed turbine. On account of the high speed at which these turbines are driven, the high spots and tool marks soon wear off, leaving the gears loose and very noisy. To overcome this, it is necessary to grind the gears, using a combination of emery and oil or ground glass and oil, the latter proving the most suitable.

It is first necessary to make special grinding pinions, this being on account of the gear being much larger than the pinion. For the smaller sizes it is advisable to cast the pinions and shaft in one piece, but for the larger sizes this is found rather expensive, as some of the pinions weigh several hundred pounds. One manufacturer, who makes a specialty of speed reduction gears, made his grinding pinion as follows:—

The shaft A, Fig. 1, is of a suitable size, and is ground for bearings, the end B being turned to fit a special driving fixture. The pinions C are forced on the

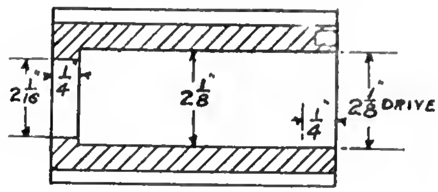


FIG. 2.

shaft near the centre, which is made slightly larger than the bearings. Thus, if the bearings were 2 inches in diameter, the part which holds the pinions would be 2 1-16 in. and 2⅛ in. This may be seen in Fig. 2, which shows a pinion bored to size. Taking for example the shaft 2 inches in diameter at the bearings, the pinions for it would be bored 2⅛ inches to within ¼ in. of the end, and this diameter being made a tight drive fit. The remainder of the pinion is bored 2 1-16 inches. These pinions are held in place by the pin E and clamp F.

The pinion which is held by the pin is driven home, while the one which is held by the clamp is partly forced on by hand. The shaft is then placed in its bearings. The pinion which is only partly on will find its proper position when in mesh with the gear. It is then driven home, following the spiral till it is up against the flange. The clamp F

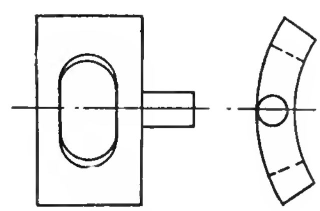

FIG. 3.

is then tightened. This clamp, illustrated in Fig. 3, is made of tool steel and bent to fit a groove in the shaft, and it is tightened by the stud H and the nut K. The hole for the stud is elongated to the length of the circular pitch. The lug L engages with a slot in the pinion and holds it in place.

Several sets of pinions are used in grinding the marks from the gear, and after the gear has been properly ground the pinions which are to be run with the gear are placed in position and ground from the gear.

Inventive Genius and Research Operate to a Dual End — They Aim to Improve What We Now Possess and Bring to Our Service Commodities Before Unknown

METAL CONSTITUENT OF GERMAN SHELLS*

By Dr. J. E. Stead, D.Sc.

As a result of the raid on the North East coast of England on December 16, 1914, by enemy warships, many German shells—whale or in part, became available for analyaical investigation, by British steel interessts.

The pieces analyzed in most cases were small fragments, and it was consequently impossible to determine the dimensions of the shells of which they formed a part. Judging from information received from Hartlepool and other places, it is certain that there were shells of many sizes from 11.2 in. armor-piercing shells down to 4 in. high-explosive shells.

Description of Shells

Many of the larger shells had not burst, and it was possible to measure them. Shrapnel shells do not appear to have been used. The shells used may be divided into two classes, namely: 1—Armour-piercing shells; 2—high-explosive shells. The armour-piercing shell fragments were easily detected by the presence of nickel and chromium—elements universally added to steel employed in that connection. The Germans had affixed to these armour-piercing shells the soft nose pieces which are invariably used with shells of this description. The analyses of fragments of these shells were made by Mr. F. Saniter, of the South Durham Steel Works, and were as follows, namely:—

	Per cent.	Per cent.
Iron (by difference)	91.862	....
Carbon	0.840	0.50
Manganese	0.381	——
Silicon	0.401	0.42
Sulphur	0.033	0.028
Phosphorus	0.032	....
Nickel	3.100	....
Chromium	3.351	....
	100.000	

The several analyses and their sources are given in the following table:

What the Shell Fragments Show

Most of the fragments examined were small, and the fractures generally indicated material of very high tenacity. There were a few large pieces, and these had a much coarser crystalline structure than the smaller ones. It is well known that the appearance of the fractured surfaces of metals broken by sudden shock is a very useful guide in forming a correct judgment of the physical character of the material. If the surfaces are more or less coarsely granular, and the fracture has travelled in straight planes, the material is usually relatively weak. Such fractures somewhat resemble the fractures of lump sugar. If they are more finely granular the surfaces are not usually flat, and frequently have tongues or pointed strips of metal attached to the fracture, suggesting a tearing action and tough material. Some of the inner and outer surfaces of the shell fragments were fissured by a multitude of fine cracks, generally parallel to the vertical axis of the shell. The flat surfaces of one of the base plugs where it came into contact with the explosive charge were similarly broken up into fissures, but these did not extend to the outside of the plug. The force must have been of such violence as to tend to tear the metal to pieces.

One writer in describing the German shell fragments says: "We can have little conception of the terrible nature of these until they are handled. They bristle all over with horrible points and edges—some as keen as a razor." One peculiarity is the manner in which the fragments broke, leaving what may be described as "shear fractured surfaces," with sharp knife-like terminations. The tracks of the fractures were often at angles of 35 deg. to 45 deg. to tangents of the shells, and the broken surfaces of many of them had a somewhat fibrous appearance characteristic of great toughness. Tests made on the fragments of both the coarsely granular and fibrous varieties confirmed the conclusion that the former were brittle and the latter extremely tough.

The fragment corresponding to analysis No. 13 was particularly interesting. It had "shear fractures" on both its sides, was of fine crystalline structure, and evidently ideal in its character, yet this contained about 0.07 per cent. sulphur and the same amount of phosphorus. Moreover, it contained 0.011 per cent. nitrogen; an indication that it was made by the Bessemer process, for no open-hearth steel, so far as is known, contains nearly so much of that element. As acid Bessemer converters are rare, if not non-existent, in Germany, it is justifiable to conclude that the steel is basic Bessemer. This fragment showed a fine micro-structure with practically no free ferrite, due to the exceedingly high proportion of manganese present. In metallographical terms, the steel was sorbitic, consisting of unsegregated pearlite. On reheating to about 800 deg. Cent. and cooling in about half an hour to 400 deg. Cent. and then to 15 deg. Cent., its original structure and hardness were reproduced. The Brinell hardness number was 255 deg., equal to about a tenacity of 56 to 57 tons per square inch. What the elongation was could not be determined, but it certainly would not exceed 12 per cent.

Little comment is necessary on the armour-piercing shells. A broken piece

*From a paper read before the Cleveland, England, Institute of Engineers.

from the point was exceedingly hard, as indicated by the Brinell machine. The shell had evidently exploded on coming into contact with something not hard enough to damage the point itself. The projectile is 3 ft. long, 11.2 in. diameter and weighs 7½ cwt. For obvious reasons one cannot compare the shells produced by the Germans with those produced by the Allies, although, no doubt, the enemy knows all about the latter.

High Explosive Shell Analyses

On examining the analyses of the high explosive shells, one cannot help being struck with the very wide range in the composition. Placing side by side the maximum and minimum amount of each element, we have:—

	Per cent.
Carbon	0.393 to 1.12
Manganese	0.380 to 1.40
Silicon	0.078 to 0.597
Sulphur	0.027 to 0.083
Phosphorus	0.028 to 0.105

Out of the twenty-two analyses, nine show more than 1 per cent. manganese, seven show more than 0.3 per cent. silicon; twelve more than 0.2 per cent. silicon; three show more than 0.07 per cent. sulphur; five more than 0.06 per cent. phosphorus. The average per cent. of carbon is 0.75 per cent. What is the reason for these great variations? One cannot, of course, say with certainty, but there are only two explanations one can offer:

1.—That the German authorities have been careless in their selection of the steel. That the occasional premature bursting of a shell in a gun and the consequent destruction of the gun and gunners did not matter, as they had so many guns and men to spare, a suggestion actually made, but which is obviously absurd.

2.—That the German experts have found that provided the steel is suitable for the purpose required, a great latitude in the composition and physical properties is permissible.

I think the first hypothesis may be dismissed without much consideration, for the very shells sent into our towns, varying greatly in composition, did not burst in the gun, and also because the Germans have devoted more time and money and thought to the preparation for this war than any other people. We must admit they know what they are doing, at least as well as we do.

Shell Deformation In Gun

An examination of the larger fragments of German shells did not lead to the discovery of anything in the nature of rokes or surface flaws, and the very high percentages of silicon and manganese in most of them suggest that soundness was considered as of primary importance. The fact that nitrogen was found in a relatively large quantity in one of the best specimens, leads to the conclusion that nitrogen is not harmful, and that probably basic Bessemer steel has been found quite suitable, provided a sufficient quantity of silicon and manganese is present to ensure soundness. Any intelligent person with no engineering or special knowledge of the subject would tell us at once that the stresses put on a shell in the gun are compressive not tensional. That if the shell were made of lead instead of steel, the sudden compressive force applied to the base would cause the shell walls to bulge outwards, and to become reduced in length, and that very soft steel would probably behave in the same manner. Therefore, the Germans were careful to avoid this, and made steel strong enough to resist deformation by compression in the guns.

We may conclude, therefore, that what was feared was bulging more than breakage by shock. It cannot be denied by anyone who knows that steel containing 0.75 per cent. carbon and above 1.2 per cent. manganese is brittle to shock, and that if such material were made into a rail and were tested in the usual way, it would fly to pieces under falling weight test, yet steel shells of that description did not burst in the German guns, but burst on us. Every rail maker knows that a shell containing 0.10 per cent. sulphur and phosphorus, 0.45 per cent. carbon and 0.8 per cent. manganese would be less liable to break under shock than such steel if sulphur and phosphorus were entirely absent.

Premature Explosion

What must be avoided is anything at all likely to cause explosion of the shell whilst in the gun itself. There are several conditions which might lead to premature explosion.

(1)—Defective fuses.

(2)—The possible formation of sensitive compounds, such as picrate of lead and other metallic picrates, due to the accidental presence of particles of lead, etc., which on being acted on by picric acid might lead to the formation of the sensitive salts referred to.

(3)—Gross porosity of the base of the shell sufficient to admit hot gases from the ignited propellant.

(4)—Allowing the shells to rest for a long period in a very hot gun tube, whereby the detonator explodes and the charge is fired.

(5)—Shells made of steel of too soft a character, causing bulging and excessive friction between the shell walls and the sides of the gun tube, leading to the accentuated pressure of the propellent gases exceeding the bursting pressure.

(6)—Excessive brittleness of the steel.

It is obvious that when a gun has burst it is impossible to say whether the fuses have been defective or whether the cause has been the presence of explosive picrates, or if the steel has been porous. It might be possible to determine whether the shell jammed or the steel was excessively brittle. Those who loaded the shells and fixed the fuses, of course, could not be convicted no matter how badly their work was done. Yet I, myself, have seen a shell burst directly it left the gun tube, a happening which could only be explained on the assumption that something was wrong other than the steel itself. The officer in charge concluded that the fuses were at fault.

Mechanical Test vs. Chemical Analyses of Shell Steel

The analyses of the German shells naturally makes us question our own practice and specifications, which lead to the rejection of material such as would be accepted in Germany. Our authorities may have proofs I do not know of, justifying their specifications, but to say a shell has burst in a gun, therefore the steel is at fault, is not justifiable, neither is it justifiable to form any dogmatic conclusion without ample proof. We have the highest respect for the systematic and most careful methods our authorities use to guard the lives of our gunners and guns, and their conscientious adherence to what they consider to be the right thing. It would be morally criminal if they were to allow unsuitable steel to be made into shells. The only question is, and we are justified in asking it, whether they are certain as to what is suitable and what unsuitable material. It must be obvious that it is only by mechanical testing that one can find out. For reasons I need not mention, the methods or method of testing shells cannot be discussed here. One method gives conclusive proof that steel of a certain origin which is not at present admitted by our authorities, is quite suitable for high-explosive shells. Further trials are in course of execution, which it is proposed to ask some of the gentlemen responsible for our specifications to witness. One thing we must admit, and that is that if a steel is proved by suitable mechanical testing to be satisfactory, on no account should it be rejected on chemical analyses, for one remembers that mechanical testing is the base on which rests all chemical specification. As you know, I am an analytical chemist, and it is not to my interest to make that statement, but long experience, actual knowledge, common sense, and my country's welfare force me to state what I believe to be the truth.

Conclusions Arrived At

In conclusion, judging from the analyses of the German shells, it would appear:

(1)—That our enemies are not par-

ticular in having shell steel of uniform quality.

(2)—That the steel used is generally of relatively high tenacity, and much more liable to break up by shock than what we produce and prescribe.

(3)—That most probably some of the German shells are made by the basic Bessemer progress, judging from the relatively large amount of nitrogen present in one of the toughest and best fragments, which also contained 0.07 per cent. sulphur and phosphorus.

(4)—That the analyses of the armour-piercing shells correspond with analyses of similar material made in other countries.

(5)—That if the high-explosive shells with between 0.07 and 0.1 per cent. phosphorus did not burst in the gun, it seems probable that great freedom from that element has been found to be unnecessary.

In view of these considerations, is there not reason for our authorities to doubt the expert advice given them—on which, of course, they must depend—to restrict so drastically the allowable quantity of both sulphur and phosphorus, and thereby restricting the output of shell steel. As the question can so readily be settled by making suitable mechanical tests on the finished shells, such as I myself have made with convincing result on material at present barred, is it not in the national interest that such tests should be made without the usual delay by the authorities at head quarters? If the results of my mechanical tests are confirmed, then the obvious thing to do is to alter the specifications forthwith. If the mechanical tests are found to be conclusive, then it would be a national crime to reject material on any chemical specification before submitting the steel in question in the form of a finished shell, to the more convincing mechanical test.

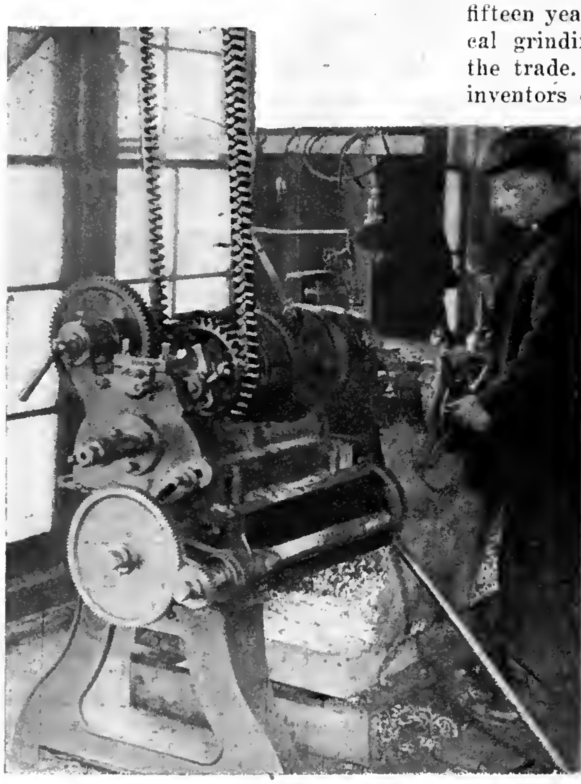
SILENT CHAIN DRIVE INCREASES SHELL PRODUCTION

By J. H. R.

OWING to the difficulty of securing suitable machinery within a specified time, many of the manufacturing plants now making explosive shells, and other munitions, were forced to remodel old machines, or equip them with special attachments before being in a position to complete all the operations. In a large number of cases, machines which were thought to have long passed their span of usefulness, were pressed into service, to take part in the rapid development of the shell making industry.

One of the large engineering firms in Montreal, who were somewhat late in getting started, decided to use their shop equipment, as far as possible, in the production of 4.5 shells. Very little of the machinery was of modern design, but tools were overhauled, and suitable attachments designed and constructed, with the result that a very satisfactory output is now being mantained.

One of the greatest difficulties encountered was on the lathe selected for the turning of the copper bands. To secure increased driving power the cone pulley was removed from the spindle and also the counter shaft, and replaced by two 10-inch diameter, 6-inch face pulleys. A five-inch belt was first tried, but proved unsatisfactory. The use of two belts, one on top of the other failed to give the desired result, as it seemed impossible to overcome the slip of the belt, under load which was considerable when the cutting tools were operating on the copper bands. The drive being almost vertical, the tension on the belt was so great that it was necessary to clamp the lathe to the floor to keep it in position. This also was the cause of overheating of the spindle bearings. However, with this arrangement the best output obtainable was about 80 shells per day of 10 hours.



BAND TURNING LATHE WITH "RENOLD" SILENT CHAIN DRIVE WHICH INCREASED OUTPUT 200 PER CENT.

As this was the only machine available for this particular operation, the production was not sufficient to keep pace with the other machines, and on the advice of a transmission engineer it was decided to equip the lathe with a chain drive.

The cut shows the lathe fitted with a "Renold" 2-inch silent chain running over 10 in. diameter cast iron sprockets; the chain being guided by the centre links extending beyond the normal face of the sprocket and running in a groove. The expectations of the officials were more than realized, as the output rose to 250 shells in ten hours, an increase of over 200 per cent.

The centre distance of the shafts was about 10 feet, requiring about 23 feet of chain, but the advantage of increased output, long life of chain and elimination of belt and bearing trouble, more than repaid the initial cost of installation.

FINISHING BY GRINDING

By C. W. Blakeslee

IN late years what a tremendous advance has been made, especially in precision grinding. I recall about fifteen years ago the first large cylindrical grinding machine being offered to the trade. When one of the principal inventors of the machine called on the big engine builders in the Middle West, well do I remember how little consideration was given the man who was years ahead of the time, as is proved by the fact that thousands of those very machines are used for the purpose of roughing as well as finishing by grinding the world over at the present time.

Three of the most important objections made at that time to the grinding machine were: The belief that the particles of emery would imbed themselves in the work, that the wheel would be reduced anywhere from 1/8 to 1/4 in. in grinding from one end of the work to the other, and, further, that the price was entirely too high for a grinding machine. Argument after argument against installing the machine even on trial was brought forth. "No, sir, there was nothing to it." The method of finishing in the lathe with a water tool, a file, an emery cloth fastened to a "slapstick" and oil could not be beaten, but the inventor knew he was right.

Strange to note, where water some years ago was considered most essential for milling and gear cutters, reamers, slitting saws and such fine edge tools, practically no water is used at the present time on these classes of fine edge tools excepting, of course, the larger class of inserted tooth milling cutters and reamers, thus demonstrating the wonderful advance of the wheel manufacturer to a position to furnish extremely soft, porous and consequently cool cutting wheels.

PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

PORTABLE COMBINATION WOOD-WORKER

THE advantages to be obtained through the use of what is termed a combination woodworker, are such that without one a modern pattern or carpenter shop may find itself somewhat seriously handicapped. Possibly the chief value of such a tool lies in the fact that its scope of application is wide and diversified.

Machines of this class have been on the market for some time, and each has its own special features which go towards making it a valuable asset to the shop or mill in which it may be operated.

An excellent idea of the portable combination woodworker being manufactured by the Hutchinson Woodworker Co., Sherbourne Street, Toronto, may be obtained by referring to the accompanying cut, Fig. 1. It will be seen that its attractive features lie in compactness and rigid, self-contained construction. The table is of cast iron with a maple top, the whole being securely braced, thus doing away with abnormal vibration.

The main supporting column is made of extra heavy steel tubing, which is supported on a suitable cross piece by means of clamps placed beneath the table as shown. To this column is fitted a heavy cast iron bracket, which supports the two steel rods carrying the motor and the saw mandrel. The motor is secured to a base plate, which in turn is bolted to the back end of the steel rods by means of countersunk head, set screws.

The saw mandrel is supported in a suitable casting, secured to the front end of the steel rods. An idea of the construction of this casting may be readily obtained by referring to Fig. 1. At the top of the casting is a horizontal handle, by means of which the workman is enabled to draw the saw through the work. It may also be stated that the mandrel is fitted with self-oiling boxes which from their design prevent oil from running on to the finished work.

An interesting feature of the machine is the ball-bearing rollers which carry the steel rods, thus insuring an easy horizontal motion. A sketch of the arrangement showing the manner of adjustment is shown in Fig. 2. The roller is counterbored at both ends and the two ball-races are fitted therein. The supporting spindle is turned eccentrically as shown, permitting any adjustment which may be necessary. Thus, if the rods, bear too heavily, or too lightly on the rollers, the set screws which hold spindle in place are loosened, and the spindle is turned in the direction which may be necessary to raise or lower the roller.

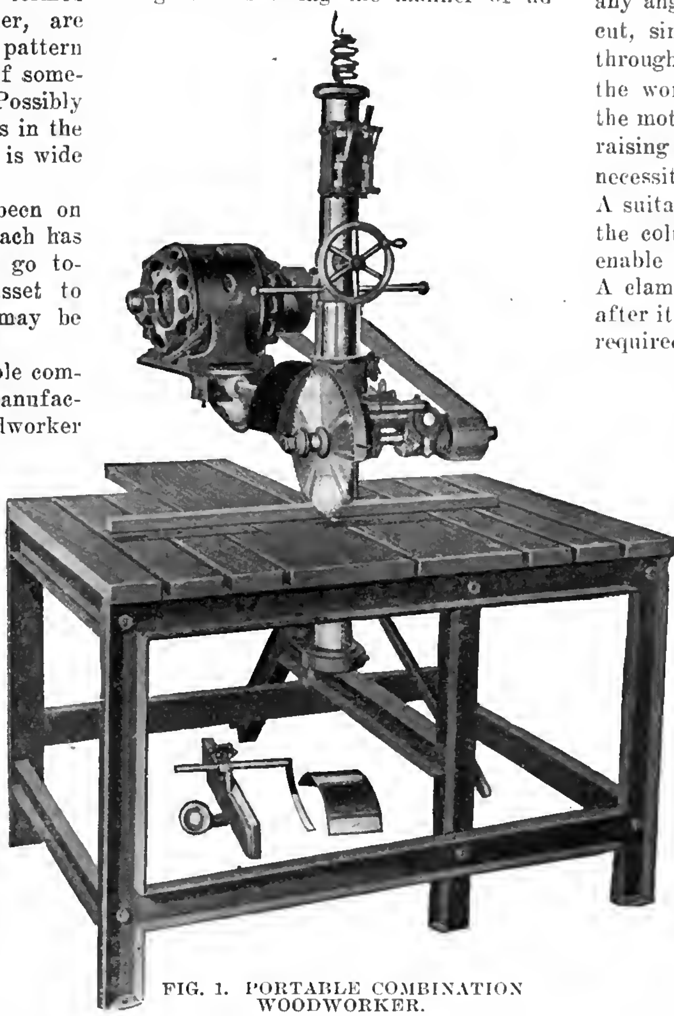


FIG. 1. PORTABLE COMBINATION WOODWORKER.

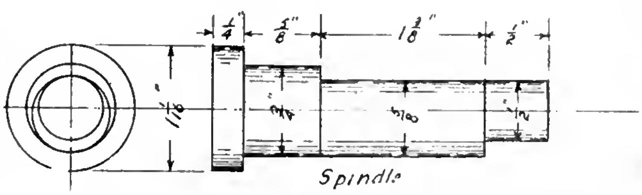

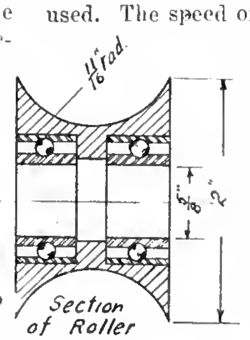

FIG. 2. ADJUSTABLE BALL-BEARING ROLLER AND SPINDLE.

The saw can be made to operate at any angle and also to take any depth of cut, since it can be raised or lowered through a space of eight inches to suit the work. Further, the fact that both the motor and saw move as one piece, the raising or lowering of the saw does not necessitate any adjustment of the belt. A suitable clamp is provided for locking the column after it has been turned to enable the saw to cut the desired angle. A clamp also locks the bracket in place after it has been raised or lowered to the required height. The method of adjusting the depth of the cut is by means of the handwheel shown. This operates a pair of mitre gears and a suitable square threaded spindle; the latter engaging with a bronze nut held in the bracket.

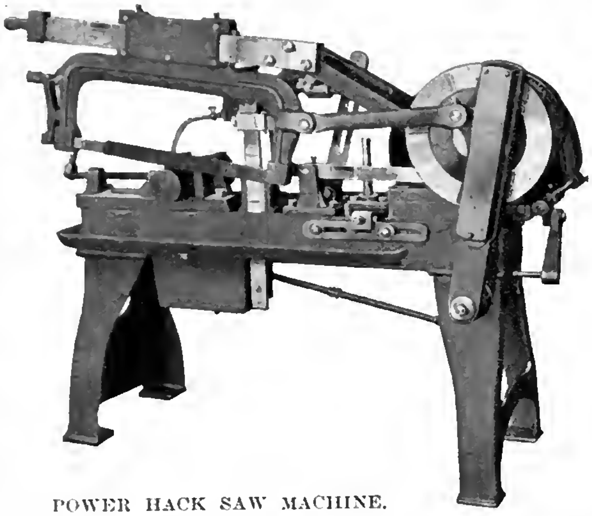
The range of work, as previously mentioned, is practically unlimited; cross-cutting, ripping, dadoeing, sandpapering and boring being accomplished with the least amount of labor. For sandpapering, a special cast iron disc is provided, to the face of which is secured the paper. Boring is accomplished by means of a special chuck secured to the pulley end of the mandrel.

The machine is driven by means of 1½ h.p. single phase, 25-cycle motor, or through a 2½ h.p. single phase, 60-cycle motor, with swivel placed conveniently at top of column. The length of drive is 46 inches, and 3 in. balata belting is used. The speed of the saw is 2,500 r.p.m. Another advantage of this machine is the fact that by means of a cone pulley, the motor can be made to drive both the saw and a pony jointer at the same time. An interesting type of the latter machine is also manufactured by the Hutchinson Woodworking Co.

M. Gorman, proprietor of the Gorman Foundry Petrolia. Ont., died on Feb. 13.

HIGH DUTY POWER HACK SAW MACHINE

THE Diamond Saw & Stamping Works of Buffalo, N.Y., have recently developed a heavy duty power hack saw machine, which they term No. 5 "Sterling," and in which are embodied a number of interesting features. Its construction and design enable it to give a maximum cut when running at from 50 to 55 strokes per minute. The fact of running at this slow speed naturally adds very materially to the life of blade, and this is particularly important at the present time on account of the great amount of round steel, high in carbon and manganese being cut.



POWER HACK SAW MACHINE.

Normally weighted, we understand, this machine with a new and sharp blade separates 3½ in. round material, in from three to four minutes and has a record of thirty-two cuts being made with one blade on 3½ in. round material high in carbon and manganese at an average of 5½ minutes per cut. The machine is designed particularly to cut material in diameter from 6 in. round and under.

Besides its other special features it has an automatic lift which is positive and raises the blade on return stroke. It works all the time and is one of the particularly effective features of the unit. Tight and loose pulleys are used for driving.

RUSSIAN SHELL PRODUCTION CONTROVERSY

STATEMENTS to the effect that the high explosive shells being manufactured on the Canadian Car & Foundry Co.'s Russian contract were technical "freaks" and had caused difficulty—in some instances almost bankruptcy — to firms making them, and that the Car Company, through the Imperial Munitions Board at Ottawa, had endeavored to foist unprofitable business on Canadian firms, have been denied by W. W. Butler, senior vice-president, and F. A. Skelton, secretary-treasurer and a director of the Canadian Car & Foundry Co. The charges that the company had been "let in" by accepting the business, and that the Munitions Board had come to the rescue by trying to distribute the work among firms in this country, were contained in a bitter attack on the Ottawa officals by a Toronto paper.

The Tapored Bore Feature

The main point brought out in the article was that the high explosive shells, called for a tapered bore, and not a straight bore, like British shells. Some American firms who accepted the business were said to have lost money, while others were said to have refused contracts after examination of the blue prints. The article alleges that the Munitions Board and the Car Co. tried to arrange with Canadian firms to turn out five million of the "trick" shells.

Mr. Butler states that from the acceptance of the contract until the present time no participants had actually encountered any technical difficulty; that 125 firms, and not 256, as alleged, were sharing in the business; that the best proof that the company had not been "let in" lay in the fact that one of the firms specifically mentioned as having refused a portion of the contract on account of the tapered bore, had been actively engaged for months in producing, and was now shipping large quantities of the "trick" shells. Further, the Car Company did not have a contract for five million high explosive shells to begin with. The original order of $83,000,000 was divided into 2,500,000 shrapnel and 2,500,000 high explosive missiles.

Mr. Butler says that the attack on the Munitions Board is unwarranted. A number of Canadian munition firms applied to Ottawa for additional shell contracts and as at the time there were no Imperial Government orders to be placed, it was suggested that they might accept portions of the Canadian Car Co. Russian order. They were offered sub-contracts at a slightly higher figure than that at which the same class of work had been distributed among American manufacturers. Most of them could not promise the delivery necessary and, as a result, most of the business had since been placed in the United States.

Mr. Butler names two firms in Montreal who have accepted orders for Russian high explosive shells. One of them had been working on the business for some weeks and was turning out the so-called "trick" shells without difficulty.

About two weeks ago the Car Company received a concession from the Russian Government, allowing the substitution of the straight for the tapered bore, and it is expected that hereafter most of the firms participating in the business will adopt the British rather than the Russian standard.

The delays experienced had not been due to technical trouble arising from manufacturing operations, but to financial difficulties. These had been satisfactorily arranged and it would now be possible for officials of the company to devote their energies to speeding up production, a thing impossible while the financial outlook was uncertain.

Both Mr. Butler and Mr. Skelton say that the Car Company's affairs are in a healthy condition. They resent keenly an insinuation that either the Car company or the Munitions Board had tried to load up Canadian concerns with unprofitable business and believe that the next few months will prove that the so-called "trick" shells have been manufactured at a comfortable profit for both the sub-contractors and the Canadian Car & Foundry Company.

DOMINION REVENUE AND WAR EXPENSE

The net debt of Canada at the end of January totalled $527,488,999, says an Ottawa despatch, an increase of $12,344,980 during the month of January and of $132,110,983 during the twelve months. War expenditure for the month of January is given in the monthly financial statement as $12,237,788 and for the ten months of the current fiscal year $97,986,686.

Revenue for January totalled $17,522,000, an increase of nearly eight millions as compared with January of last year. Of this increase, a little over five millions comes from Customs receipts. For the ten months of the current fiscal year the total revenue has amounted to $139,550,000, an increase of a little over thirty millions as compared with the corresponding ten months of 1914-15.

According to present indications, the total revenue for the fiscal year should run between 165 and 170 million dollars, or about 40 million dollars more than last year. Total expenditure on revenue account for the ordinary expenses of administration will probably run up to about 145 or 150 millions, or a little over ten millions less than last year. Capital expenditure apart from the war will probably reach in the neighborhood of 40 million dollars.

Vol. XV. FEBRUARY 17, 1916 No. 7

CURT AND TO THE POINT

IN reply to a member's question a few days ago in the House of Commons, Ottawa, as to the Government's intentions regarding the appointment of a Canadian Minister of Munitions, Sir Robert Borden submitted a written answer embracing one word. It was "no."

Curt and to the point, and sufficiently emphatic to reassure and restore confidence even among those to whom the depth of imaginings had given place to a real belief that the management of munitions contracts and their subsequent fulfilment were in a state of chaos and oppressed incompetence, it would seem nothing short of fanaticism then to push further, as is being done in some quarters, the demand for a Canadian Ministry of Munitions. There is nothing modest in the insistent attitude being adopted towards the establishment of such an office; even although the lack of modesty may constitute a virtue betimes. The cause in such circumstances must needs be a just one, however.

OPPORTUNITY AND PRIVILEGE

A PLEASING feature in connection with the recent Canadian Patriotic Fund Campaign is that of the appearance of so many United States manufacturing and financial concerns among the lists of contributors. The war has had a beneficial influence on American industries, both as regards their activities and their profit-earning, due of course in great measure to the large-in-quantity and varied-in-kind orders for machine tools, raw and semi-finished materials, munitions and general supplies, placed direct by Great Britain and her Allies.

Of necessity, Canada, although also a direct recipient of the Entente Powers' favor in the matter of war contracts for the above-mentioned commodities, had to have recourse to a considerable extent, to American manufacturers for equipment to enable her metal-working and other plants to meet promptly the unique situation thrust upon her. The opportunity to serve us by the United States interests concerned, has been fully taken advantage of, and our immediate needs have met with a ready response. Is it not then a matter of more than ordinary satisfaction that the co-operation displayed in catering to our plant equipment requirements should find still further exemplification, and that as a privilege, when war-created tasks peculiarly our own have to be undertaken and their accomplishment success-crowned?

THOSE RUSSIAN SHELL ORDERS

SHELLS contracted for by the Russian Government, and more particularly the big order secured by the Canadian Car & Foundry Co., Montreal, have been much in the limelight during recent weeks. The hugeness of component quantity of shells and financing involved naturally called for administrative skill of the highest order, both in distributing the work and providing the capital necessary to secure prompt and satisfactory accomplishment. From a report on the opposite page it will be noted that a successful outcome in both directions is now assured.

Our Imperial Munitions Board in the sincerity of their activities to maintain to the fullest extent possible the productive capacity of those of our metal-working plants whose British shell contracts were on the eve of completion, acquired a large block of Russian 2.96 in. H.E. shells from the Canadian Car & Foundry Co. Immediately, however, it was noted that the design and finish features differed in some respects—materially, so far as productive cost was concerned, we might say, from the corresponding British shell of our manufacture.

Dame rumor gets busy, and sinister motives have been imputed to both the Imperial Munitions Board and the Canadian Car & Foundry Co. Is our patriotism so bubbling-over-British that we have no place in our make-up for Britain's Allies, or are we unwilling to meet a more exacting test of our mechanical engineering skill in tackling the new proposition offered? The latter would seem so if the report of refusals of Russian shell orders is any criterion. The views of the Chairman of the Imperial Munitions Board on the foregoing and with reference to the shell situation generally in Canada which we quote below are worthy of close scrutiny and serious consideration by those of our manufacturers approaching completion of or who have already completed all contracts on hand for British type shells:

"No manufacturer," says Mr. Flavelle, "has refused a contract because of the price named for machining and assembling shells or for supplying any other product required by the Imperial Munitions Board. We have had a great number of contractors who have been disappointed because they did not secure a contract at the prices now current. The report in question may have arisen out of the disinclination of some of the contractors to accept some Russian business which we secured but which they refused, fearing Russian inspection.

"At the moment, manufacturers who have had contracts for 18-pounder high explosives are concerned as to renewal orders or as to what shell they can secure in place of these 18-pounders, as the Imperial authorities have indicated they do not desire to continue the manufacture of this size. On all other sizes, manufacturers have a sufficient supply to keep them occupied for periods of from a very few months to the next twelve months.

"Broadly speaking, manufacturers are eager to quote even lower prices than those at which recent contracts have been let, if they could feel assured of continuous operation during 1916. The development of capacity to do this work in England, however, has increased so largely that they are unwilling at the moment to extend orders to Canada for a sufficient number of shells to satisfy the capacity of all manufacturers who desire to do this work.

"We hope the British authorities may see their way clear at the termination of the present contracts in England, to divert some of their factories machining and assembling shells to other work which we could not so easily do for them in Canada, and thus place an added number of shells at the disposal of Canadian manufacturers. Naturally this is a consideration which could not be settled without the whole question being looked into."

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents

Montreal, Que., Feb. 12, 1916.—Industrial conditions continue to show unabated pressure in all directions. Considerable impetus has been given to the shell-making industry over the placing of an order for a further supply of 18-pdr. British shrapnel shells. Despite the improbability of additional orders for 18-pdr. high explosive shells, prospects of increased business in other lines are very encouraging, and will help to allay recent impressions that the supply of munitions was accumulating at such a rate that the production in Canada might have to be curtailed.

The present international crisis has brought about many changes in industrial affairs, not the least being connected with the production of certain materials which up to a year and a half ago were considered as belonging to certain countries or individuals. A case in point is that of Great Britain, who, while controlling half the world's production of tungsten ore, was wholly dependent upon Germany for tungsten metal. During the past year Great Britain has created facilities, and is now producing all the metallic tungsten required from Burmese and Australian ores.

Present indications are that the nickel refining industry in Canada will be developed along lines more beneficial to this country than the past.

The activity of Canadian agents in acquiring foreign trade is beginning to bear fruit. Several lines of machinery which had previously been imported from Germany are now being manufactured in this country. Several large wire looms have been constructed during the past year by a Montreal firm, and further orders are pending. Much anxiety in shipping circles is being experienced, owing to inadequate tonnage of ocean transportation. Many shipbuilding firms are contemplating increasing their facilities for the coming season, to accommodate the demands of prevailing conditions, which are likely to continue for an indefinite period.

Pig Iron

The market is comparatively quiet. As most of the requirements for first and second quarters have been covered, many are figuring on the placing of orders for their last half supplies, but in some instances buyers are not anxious to get into the market. No English pig iron is available on the Canadian market, as the supply is not sufficient to meet their own needs. Some of the large furnaces in Canada that are producing pig are not putting it on the market, but using it for their own steel requirements. Considerable interest is being manifest in the increased demand for foundry iron, and the prospects for continued activity in this direction are very promising.

Steel

Little change is noted in the steel situation; in fact, the conditions are such that it would be almost impossible to predict a change, unless something remarkable was to happen. Many of the large mills are virtually out of the market for the remainder of the year, the orders on their books being sufficient to maintain a capacity output for the balance of 1916. With the large tonnages daily leaving the country it is practically impossible for consumers and small dealers to secure sufficient steel to cover their requirements, and they are little better off now than they were some months ago, even with many of the mills producing more than their scheduled rating. Just what the bookings are for foreign delivery it is impossible to determine, but the impression is that the total amount must be very large. Under these abnormal conditions and the higher prices offered for war steel, the domestic trade must naturally suffer, and when it comes to the point where producers have to choose between profitable war business and that of general domestic customers, at a much lower figure, the choice is usually made where the home buyer has to suffer.

These conditions along with the constant rise in price of raw materials have likewise affected all other branches of the steel trade. Wire nails, rods, bolts, etc., have all followed the general trail, and advances are evident almost every week. The galvanized trade has not been very active of late, but improvement is expected, and it is anticipated that early quotations will show an advance. Black sheets are in good demand, and prices are very firm. The high-speed steel situation is still acute, and no definite price can be quoted, but the normal price might be stated as between \$2.50 and \$3 per lb.

CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion \$100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.

Metals

The feeling that was prevalent a few months ago that the high price of copper was due largely to misrepresentation on the part of producers, and apparent speculation of large buyers, is being replaced by the realization that a serious shortage is not only possible, but altogether probable. This impression is so strong that consumers are becoming nervous, and are trying to cover their requirements as early as possible. Even with the large increase in production during the past year the abnormal demand is so enormous that an actual famine seems not unlikely.

The situation in tin shows little change, and nothing of interest has developed during the week. An unlooked-for demand for lead at the present time would develop a situation similar to that prevailing in copper. In view of present conditions higher prices are expected.

Copper.—Copper is apparently being absorbed at enormous rates at the present time, and the demands upon producers are far beyond the capacities of the smelters. Early delivery is almost an impossibility, and March, April and May metal is commanding premium prices, and dealt with under special conditions.

Deliveries for February and March electrolytic have sold at 27½c, and some spot carloads at 28 cents (New York). The requirements for war supplies are so enormous that the consumption of copper is greater than the industrial world has ever before experienced. However, even at present prices of all kinds of copper, buyers are still anxious to cover their needs.

Montreal prices have again advanced, and are now quoted at 30 cents for lake and electrolytic, while castings have advanced .02 cents a pound, dealers now asking 29 cents.

Tin.—During the early part of the week the market was dull and quiet, but recent inquiries and demands for immediate and near future delivery have added considerable strength to an otherwise uncertain situation. The present requirements appear to indicate a much stronger tone and further advances may be looked for.

With the supposition that certain leakages are taking place, a report is abroad that the British Government are contemplating prohibiting Eastern export to neutral countries, so as to better control the Eastern output and enable them to keep a larger stock on hand available for possible contingencies. Local dealers,

following the advance in foreign markets are quoting tin at 46 cents, being an increase of ½c per lb.

Spelter.—The present situation is firm, with slight advances noted in foreign markets. Due to increased inquiries for early shipment and severe floods in the Joplin district (which has materially checked the production of the necessary ore), the tone of the market is much stronger. The demand for galvanized sheets continues light, and it is estimated that the requirements of spelter for this branch of industry do not exceed 50 per cent. of normal. However, it is not improbable that quotations may show an advance in the near future. Dealers are quoting last week's price of 22 cents.

Lead.—The market continues strong, with a higher tendency. The demand is still very good and in some instances where consumers have been compelled to cover their needs substantial premiums have been paid. This also applies in the case of considerable export shipment. The situation as regards foreign demand is very indefinite, as little reliable information is available, but is generally conceded that the foreign requirements are as heavy as at any previous time. The supply at the present is sufficient to meet all normal demands. Local quotations remain unchanged at 8 cents per pound.

Antimony.—Dealers report the market in a fair condition. The demand for early delivery has created considerable inquiry for futures; but with a fair supply in sight, it is expected that the present tension may be shortly relieved. Local prices are firm and unchanged at 50 cents.

Aluminum.—The market is steadier than of late, but conditions are otherwise unchanged. A shortage in raw material has temporarily strengthened the market, but dealers here are holding firm, with prices unchanged at 68 cents a pound.

Machine Tools and Supplies

The machinery market is gradually becoming more settled, as the bulk of the war orders for necessary machinery have been completed. Some of the plants manufacturing war supplies have added a few machines to increase the facilities of production.

Reports are abroad of foreign agents placing orders for large quantities of machine tools. The domestic demand, while not very great, shows signs of improvement, and the outlook seems encouraging for the coming year.

The manufacturers of small tools, such as twist drills, reamers, milling cutters, etc., are being flooded with orders and inquiries, and the demand is so strong that in many instances customers must content themselves with quantities much less than their requirements. Certain tools, such as high-speed twist drills, are now selling at six times their normal value. All quotations on tools and supplies are nominal and subject to change without notice.

Old Materials

The general situation in scrap metals is exceptionally strong at the present time, and the market is quite active. Heavy melting steel scrap is quiet, but firm. The trade in old copper is very good, and an advance of $2 a ton is quoted, present prices being: Light, $17,-25; crucible, $20.50; heavy and wire, $20.25; No. 1 machine composition, $16; composition turnings, $13.50 (an advance of 1 cent a lb.). New brass clippings and brass turnings, also scrap zinc have each advanced $2 per ton, and are now quoted at 13¼, 11 and 14½ cents a lb. respectively.

ALLIES PURCHASING AGENTS

The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:

International Purchasing Commission, India House, Kingsway, London, Eng.

French.—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendence Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.

Russian. — Col. N. Golejewski, Military Attachè, Room 904 Flat Iron Building, New York City.

Toronto, Ont., Feb. 15.—The steady increase in cost and growing scarcity of steel is exerting a widespread influence and causing considerable uneasiness in engineering circles. A large number of products composed either wholly or partly of steel are being affected with the result that prices are advancing and deliveries getting more backward. The ingot metal markets are again strong, and higher levels for copper, tin, spelter and antimony have been registered. Cost of production is increasing and there is a general upward tendency in price for practically all finished and semi-finished products. There is no prospect of the market weakening for some time to come, and there is no doubt that prices will advance to considerably higher levels than prevail at the present time. A number of price changes have been made during the week affecting boiler plates, pressed steel spikes, galvanized sheets, chain, billets, plate washers, copper rivets, scrap copper, brass, etc. Makers of machine tools are also advancing prices on account of increase in cost of production.

The industrial situation continues to improve due to the activity resulting from war orders and also by reason of a better domestic demand. Financial conditions are also improving and there is a more optimistic spirit in business circles. Although there will be far less money expended on civic works this year than in normal times, some municipalities are preparing to undertake improvements which are urgently required, makers of farm implements are looking forward to an active season as stocks of machinery in the West are low on account of the heavy demand due to the big crop last year. The situation as regards ocean freights does not improve to any great extent, and exporters are being seriously handicapped by the difficulty of obtaining tonnage.

Steel Market

The steel market is very strong and prices continue to steadily advance. The steel companies are getting so much business that they are further behind than ever on deliveries. The production of bars for shells is sold up practically for the rest of the year. The scarcity of steel is getting more acute and there is a great possibility of a famine in steel products. The supply of steel from the States is almost entirely cut off, throwing the entire demand in Canada on the Canadian mills, while in addition there is a large export demand. The announcement that the Canadian Car & Foundry Company will re-open the Welland plant is an indication that the domestic trade of Canada is getting back to more normal conditions. It is stated that the company has orders on the books to keep the plant operating a capacity for many months. The output will consist of reinforcing bars, flats and angles while, in addition, shell steel will be produced. The report for the past year issued by the Nova Scotia Steel & Coal Co. shows that this concern had a record year and has made large profits. The steel industry was never before in such a sound position. As already intimated, prices on a number of steel products have been advanced and include the following. Boiler plates ¼ to ½ in. have advanced 25c, and are now quoted at $3.20, with heads at $3.45 per 100 lbs. Tank plates 3-16 in. are now quoted at $3.55 per 100 lbs. Pressed steel spikes, ⅝ in. diameter are now quoted at $3.75 per 100 lbs. Higher prices have been announced for proof coil and electric

weld coil chain. The new discount on plate washers is 32½ per cent.

As was generally anticipated, prices of galvanized sheets have advanced and the market is very firm. The situation continues irregular and uncertain as a result of conditions in the spelter market and steady increase in cost of black sheets. Galvanizing plants in the States are still operating at considerably reduced capacity owing to the unfavorable conditions prevailing in the trade. Apollo sheets 10¾ oz. are now quoted at $6.75.

The large steel mills in the States are sold up on heavier products for the rest of the year and some business has been booked for plates and shapes for the first quarter of 1917. The United States Steel Corporation reports unfilled orders on hand on Jan. 31st at 7,922,767 tons compared with 7,806,220 tons on Dec. 31st. The heavy demand for steel bars continues both for export and domestic consumption, and prices are largely nominal depending to a great extent on delivery. Wire rods are scarce and higher, $50 per ton having been offered for Bessemer or open-hearth rods for shipment in two to three months from date of contract. It is reported that a sale of 2000 tons of Bessemer rods was made recently by a Pittsburgh mill for export to Canada at $45 or higher. There is no improvement in the billet situation, and it is causing considerable anxiety to consumers. Open-hearth billets have advanced and are now quoted at $35 per ton Pittsburgh.

Pig Iron

The market is quiet but prices are firm and unchanged. The demand for steel making pig iron is heavy and there is some improvement in demand for foundry grades.

Old Materials

The situation in this market is unchanged. There is a good demand for copper and brass scrap, and prices are higher, being about 1½c per pound above last week's level. Business is fairly good for other metals and the market is firm.

Machine Tools

The situation in the machine tool market is unchanged, the demand being lighter but steady. Conditions in the States are affecting the local market. A number of important manufacturers in the States have advanced their prices 10 per cent. on nearly all machine tools. Prices now are approximately 25 to 60 per cent. higher than they were a year ago. Deliveries have improved but are still backward.

Supplies

The market is firm and prices continue to advance. Plumber's oakum is now quoted at 5½c per pound. The cheaper grades of babbitt metal are higher, the range now being 11c to 60c per pound according to mixture. The new discount on plate washers is 32½ per cent. Gasoline and benzine are unchanged, but higher prices may be expected any time as Canadian crude oil advanced 5c recently and is now quoted at $1.98. The linseed oil market is firm and prices unchanged at $1.02 for raw and $1.05 for boiled oil.

Metals

The influence of the London market is being felt locally and higher prices have to be noted for copper, tin, antimony and spelter. As regards copper, the situation is abnormal and there is little doubt that considerably higher prices will be reached. Tin at the present figures is reasonable, but may go higher as the market is affected by freight rates and insurance, the latter having recently gone up. Spelter as in the case of copper and tin advanced in London with the result that prices locally have advanced. The "Trust" price for lead is higher but local quotations are unchanged meantime. Antimony is higher and quotations nominal, while aluminum is firm at last week's figures. Solders are unchanged but firmer in sympathy with the tin market.

Copper.—The abnormal situation in the copper market continues and prices have again advanced. The advance in London caused a sensation in that market and was due to a scarcity of metal. No one can say where the market will stop but it is generally believed that prices will go considerably higher. Producers have practically control of the situation owing to the enormous demand which promises to increase rather than otherwise. Copper locally has advanced 2c and quotations are nominal at 30c per pound.

Tin.—The market is higher following an advance in London. Tin is reasonable at present prices but may go higher as insurance rates have recently been increased. There has also to be considered the possibility of shipments being lost at sea, although at the present time the visible supplies are fairly heavy. Tin has advanced 1c and is quoted at 46c per pound.

Spelter.—The market is firm and higher both in London and New York due to improved demand principally from the brass mills. Zinc ore is quoted from $95 to $118, Joplin, Mo. Spelter has advanced 1c and is quoted at 22c per pound.

Lead.—The market is quiet but firm at unchanged prices. The "Trust" advanced prices to 6.25c New York and the market is firm at that figure. Lead is quoted locally at 8c per pound.

Antimony. — The market is very strong and higher with prices nominal. Spot-metal is very scarce as is also March delivery. The demand has greatly improved, the Dominion Government having recently concluded a large purchase of Chinese antimony which has had the effect of strengthening the market. Local quotations have advanced 2c and antimony is quoted at 47c per pound.

Aluminum.—The market has strengthened by reason of a better demand but prices are unchanged at 68c per pound.

CANADIAN PURCHASES FOR FRENCH WAR OFFICE

Philippe Roy, General Commissioner for Canada, Paris, advises the Department of Trade and Commerce, Ottawa, that an order has been issued by the War Department of the French Government to the effect that all purchases made by the Supply Branch in Canada will pass through the Hudson Bay Co. Canadian producers should therefore submit their future offers through the office of that company at Montreal. It is further stated in Mr. Roy's communication that Canadian lumber, steel and meat will find in France an important market for years to come, but it is necessary that Canadian firms should have in Paris representatives entrusted with the necessary authority, especially if it is desired to secure Government contracts.

CANADA FOUNDRIES & FORGINGS

THE annual meeting of the shareholders of Canada Foundries & Forgings was held at Brockville, Ont., on Feb. 9. The following were elected directors for the current year:—F. C. Billings, Hartford, Conn.; Henry Bertram, Dundas, Ont.; John H. A. Briggs, Brockville; F. D. Canfield, Jr., New York; John T. Dillon, Titusville, Pa.; Thos. J. Dillon, Welland; Hon. Geo. P. Graham; J. Gill, Gardner, Brockville; H. B. Hausser, Toronto; Clarence F. Smith, Montreal; Hon. W. J. Shaughnessy, Montreal; Wm. M. Weir, Montreal.

Wm. W. Weir was appointed president; J. Gill Gardner, vice-president, and John H. A. Briggs, secretary-treasurer.

The year was the most prosperous in the history of the company. A dividend of $96,000 was declared on common stock and $11,200 on preferred stock, both payable February 15. It is understood that a net balance was carried forward of $630,000, as compared with $15,463 a

year ago. This balance is, after writing off for depreciation, providing for bond interest and dividends on both the common and preferred. It would represent 64 per cent. on the common stock, making earnings at the rate of 74 per cent. for the year, before deducting the 10 per cent. dividend recently declared. The common stock of the company is $960,000.

TIN POSITION IMPROVES

THE "Ironmonger," London, Jan. 15, says: "The general position seems to be rather stronger than for the past month or two, but unless any more tin-carrying steamers are lost prices will probably keep steady during the remainder of the month, as there is no immediate prospect of any increase of the consuming demand, and the statistical position is not likely to show much alteration. There is a fair business doing with America, but there is no sign of any increased demand, as that country's needs are being met with a direct supply that is well sustained. The output of tin from the Federated Malay States for 1915 is given as 783,043 piculs, against 823,909 piculs in 1914, a decrease of 40,866 piculs, or 2,194 tons. This reduction and the lack of Chinese, Banca and Billiton supplies have had the effect of keeping prices as steady as they have been during the past year, and as there is not much prospect of any considerable increase of supplies from any of these sources there does not appear to be any possibility that values will fall away for months to come."

TUNGSTEN PRODUCTION AFFECTED BY WAR

THE European war is responsible for enormous foreign contracts for American machine tools. The demand for high speed tool steel has also increased amazingly. At the same time the supply of tungsten available in this country has been reduced 50 per cent. or more by the cutting off of importations from Europe, India and Australia. In round figures the world's production of tungsten ore is about 10,000 tons of which 4,500 tons are produced in India, 2,000 tons in Australia, and about 1,500 tons in Portugal. The embargo placed by the British Government against exports of tungsten ore and the English financial control of the Portugal deposits has prevented any importations into U.S. in the last year. The production in this country until recently has been 2,000 tons annually, most of which is produced in Colorado and California. Diligent search is now being made for new deposits in the far West and South. Some ore was recently discovered in Mexico. In the manufacture of tool steel about 15 to 20 per cent. of tungsten is used in the crucible process and about half this percentage in the electrical process. Tungsten ore some years ago was selling at $840 a net ton. More recently it has brought $3,000 per ton. Tungsten, the metal which sold at 75c per pound before the war has recently sold at $6 to $8 per pound.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

Engineering

Stratford, Ont.—R. M. Ballantyne Co. will make an addition to their power plant.

St. Catharines, Ont.—The Metal Drawing Co. will build an extension to their factory.

Toronto, Ont.—The Hamilton Gear & Machine Co. will build an addition to its plant, to cost $5,000.

Hagersville, Ont—Frank Tyrrel is receiving prices and information on woodworking machinery.

Toronto, Ont.—The Toronto Laundry Machine Co. will build an addition to its plant, to cost $2,800.

Toronto, Ont.—The Canada Pipe & Steel Co. will build an addition to its machine shop, to cost $3,000.

Broderick, Sask.—Robert Reid is in the market for a screw-cutting engine lathe, about 18-in. swing, gap bed.

Windsor, Ont.—The Universal Stove & Furnace Co. is considering the erection of a plant for the manufacture of stoves, furnaces, etc.

Montreal, Que.—The forge department of the Canadian Car and Foundry Co., was damaged by fire last Saturday to the extent of $50,000.

Markham, Ont.—The Hall Motors Co., have secured a plant here which will be equipped for making motor trucks. E. A. Hall is manager.

Montreal, Que.—P. G. Dunham, Windsor Hotel, will receive proposals for supplying one 200-h.p. engine and one 200-kw., 220-volt, direct-current generator.

Hespeler, Ont.—A. B. Jardine Co.'s plant, which was recently damaged by fire, will be rebuilt. Some of the machinery was badly damaged.

Vancouver, B.C.—Black Bros., Ltd., manufacturers of automobile tops and bodies, are in the market for a metal swedge or beader and carriage hub borer.

Port Robinson, Ont.—MacFarlane-Pratt-Hanley, Ltd., are in the market for 8 x 10-in. or 7 x 12-in. double hoist, double drum with ratchet, pall and brake straps with swinger attached.

Toronto, Ont.—The Property Committee of the Board of Education have decided to experiment with an oil-burning heating system. The experiment may be made in the Earl Grey School.

Vancouver, B.C.—Bids are being received for the construction of a 4-storey, 125 x 130-ft., addition to the plant of the American Can Co. Estimated cost, between $60,000 and $70,000. B. C. M. Bigger is manager.

North Vancouver, B.C.—The City Council have decided to submit a by-law to the ratepayers to guarantee the bonds of the Amalgamated Drydock and Engineering Co., to the extent of $750,000. This company will build a shipbuilding plant and drydock here, estimated to cost $5,500,000.

Sudbury, Ont.—The Sudbury Construction & Machinery Co. has commenced the construction of brick and steel extensions to its plant, to cost about $6,000, including an addition to the foundry, 30 x 40 ft., to be devoted to brass castings; the construction of a cupola house, 30 x 40 ft., and the installation of a furnace which will increase its capacity 50 per cent.

Niagara Falls, Ont.—It has been announced by an official of the Ontario Power Co. that work would be started early next spring on a third pipe line. The new pipe line will supply two additional units, increasing generating capacity of the plant to 180,000 horsepower. The pipe line will be about 6,000 feet in length and 18 feet in diameter. It will require all of two years to construct.

EQUIPMENT FOR AUSTRALIAN NAVAL DOCKYARD

Tender forms and specifications have been forwarded by D. H. Ross, Trade Commissioner, Melbourne, for 43 machines of various types required for the equipment of the Commonwealth Naval Dockyard, Cockatoo Island, Sydney, N.S.W. Tenders will be received, subject to the conditions specified, up to May 1, 1916, addressed to the Director of Navy Contracts, Melbourne, Australia. The last mail in time to reach Melbourne on May 1 is that leaving San Francisco on March 22 and due at Melbourne on April 12. The tender forms are open to the inspection of Canadian manufacturers at the Department of Trade and Commerce, Ottawa (refer file No. A-1435). Particulars of the requirements are briefly outlined thus:

Three 50-ton overhead travelling cranes.

One 25-ton overhead travelling crane.

Two 5-ton overhead travelling cranes.

One 10-ton revolving cantilever crane.

Two 5-ton travelling portal jib cranes.

Two 7½-ton jib cranes.

One 5-ton jib crane.

Two 15-ton hydraulic cranes.

One 6-ton hydraulic crane.

One 6-ton wall crane (hydraulic).

Two 3-ton wall cranes (hydraulic).

Two electric passenger elevators.

Two electric goods elevators.

One 2½-ton gauge locomotive with crane attached.

One 2½-ton gauge locomotive without crane attached.

Three electrically-driven air compressors, 1,500 cu. ft.

One 15-ton hydraulic winch.

One 5-ton hydraulic winch.

Nine 10-ton hydraulic capstans.

Two 5-ton hydraulic capstans.

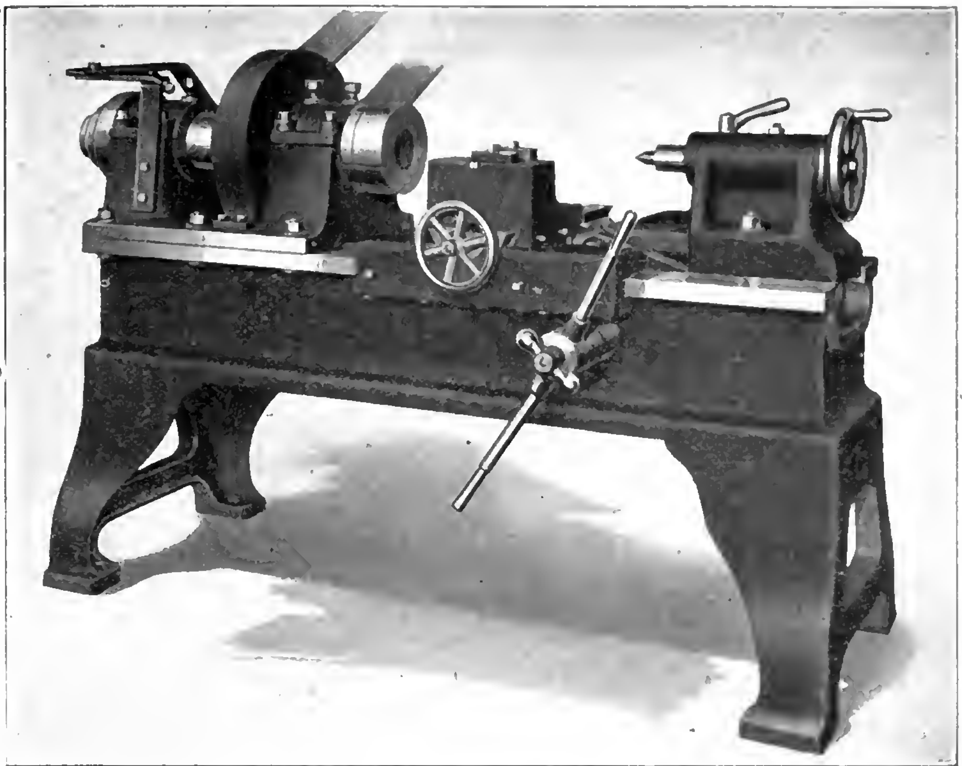
One bar shearing machine.

One double-ended horizontal punching machine.

One 10-ton overhead travelling crane for shipyard fitting shop.

The Hepburn Single Purpose Heavy Duty Shell Turning Lathe

(Patents Applied For)



This machine tool is an excellent example of speed, accuracy, power, strength and simplicity. Its new features—bronzed bearings, oil pan, felt wiper fitted in carriage and an increased proportion of working parts give you the service and quality idea that has been built into this lathe and insure its long and efficient use.

Drop us a card for specification and full details.

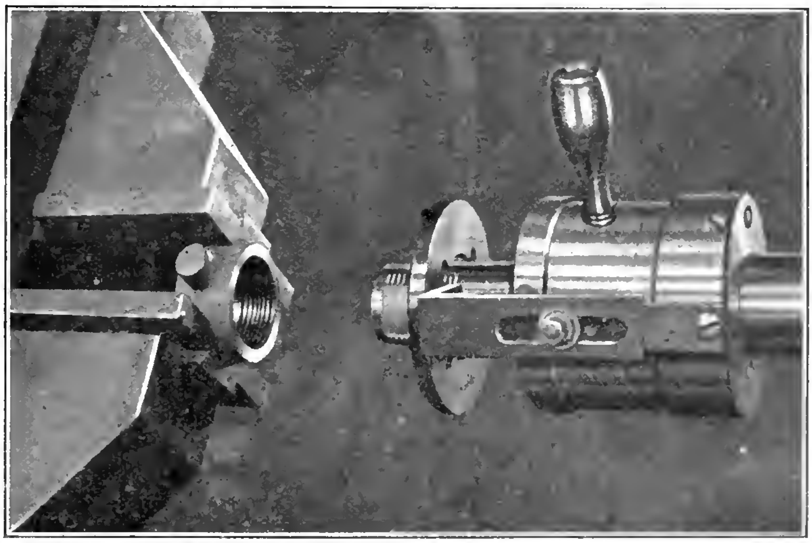
We can make delivery on Heavy Duty Turrett Lathes of same pattern.

The A. R. Williams Machinery Co. LIMITED

64-66 Front Street W., Toronto, Canada. St. John, N.B., Winnipeg, Vancouver.

IF IT'S MACHINERY—WRITE "WILLIAMS"

Let the Geometric Collapsing Tap Show You How



A Geometric Standard Tap on the Job

Universally adopted for tapping operations above ¾-inch diameter.
Fitted for Turret Head Machines or Live Spindles.

Send along your specifications and get our quotation.

THE GEOMETRIC TOOL COMPANY NEW HAVEN, CONN., U.S.A.

Canadian Agents: Williams & Wilson, Ltd., Montreal. The A. R. Williams Machinery Co., Ltd., Toronto, Winnipeg and St. John, N.B.

E ectrical

Amherstburg, Ont. — Niagara power has finally been decided upon for Amherstburg, and within a short time a new street lighting system will be installed at a cost of $2,582.

Toronto, Ont. — The Bedford Park Ratepayers' Association have succeeded in getting the York Township Council to consider the installation of hydro lights on Bedford Park and Woburn avenues, and will, in accordance with the instructing of the hydro engineer, draw up a plan of the streets, which will be submitted to the township council at their next meeting.

Municipal

Montreal, Que.—The Board of Control will instal a sewage pump at Notre Dame de Grace.

Maillardville, B.C.—The city will instal a waterworks plant and system to cost $10,000.

St. Mary's, Ont.—The Town Council contemplate making extensions to the waterworks system.

Cooksville, Ont.—Toronto and Etobicoke Township ratepayers last Saturday voted in favor of Hydro-radial bylaws.

Ottawa, Ont.—The City Council have decided to make extensions to the water distribution system in various parts of the city.

Ford, Ont.—The Town Council contemplated making improvements to the street lighting system. A by-law will be voted on.

London, Ont.—The City Council have decided to instal an ornamental street lighting system on Talbot and King Streets at a cost of about $3,000.

New Toronto, Ont.—The waterworks system will be considerably enlarged to take care of the increased demand due to new factories locating here.

Lindsay, Ont.—The town council are considering the question of buying a motor truck for the fire department at a cost of about $1,200.

Tecumseh, Ont. — The Eau Claire Waterworks Co., which was recently incorporated, proposes to construct a waterworks system, estimated to cost $20,000.

Wellesley, Ont.—The council will shortly call for tenders for the construction of an electric distribution plant, to cost $7,500. P. F. Schummer, St. Clements, Ont., is town clerk.

Toronto, Ont. — Toronto Township ratepayers also voted favourably on a by-law granting the Credit River Works, Ltd., a fixed assessment for ten years of $10,000 on the Barberton Mills.

Stratford, Ont.—At a special meeting of the City Council last Friday the bylaw to guarantee the bonds of the proposed hydro radial from Toronto to London to the extent of $651,000 was given its third reading after brief discussion.

St. Mary's, Ont.—The ratepayers of the township of Blanshard, one of the few municipalities which defeated the Hydro-Radial by-law in January, will vote on it again, the township council deciding to re-submit the proposal on March 13.

Hamilton, Ont.—Following a decision of the Controllers to disfranchise the National Natural Gas Co. for not living up to its contract, Hamilton gets control of what will be the biggest coke plant in Canada. The United Gas & Fuel Company is behind the scheme, although Chicago is financing it.

Montreal, Que.—The Board of Control have instructed that plans be prepared for the construction of a hydro-electric power and pumping station to be built at the end of the aqueduct canal. It will have a capacity of 10,000 h.p., and will cost complete $1,500,000. Frederick E. Field, Atwater Avenue, is the engineer.

St. Mary's, Ont.—The town council have refused to pass the final reading of the agreement between the town of St. Mary's and the Hydro-Electric Commission of Ontario, known as the Hydro-Radial by-law, by the casting vote of the mayor, Mr. Weir, who claims that he was acting on the advice of his legal adviser.

Waterloo, Ont.—At a prolonged session of the town council on Feb. 8, the motion to give the third reading to the Hydro-Radial railway by-law was defeated by a vote of 5 to 4. The majority of the councillors were not satisfied with the assurances that have been given by Sir Adam Beck that the route to be selected through Berlin and Waterloo would be satisfactory to both municipalities.

General Industrial

Wyoming, Ont.—Efforts are being made to establish a clothing factory here.

Toronto, Ont.—Fire at the Ideal Bedding Co.'s factory on Jefferson avenue, caused damage estimated at $3,000.

Montreal, Que.—The Gold Medal Furniture Mfg. Co., suffered a loss of $15,000 on Feb. 8, by fire, smoke and water.

Grand Falls, Nfld.—The Harmsworth paper plant, operated by the Anglo-Newfoundland Development Co., was damaged by fire Feb. 3 with a loss of about $100,000.

Edmonton, Alta. — The three-storey plant of the Emery Mfg. Co., engaged in the manufacture of overalls, dresses, etc., was destroyed by fire on Feb. 7. The loss is estimated at $100,000.

Campbellford, Ont.—Fire on Feb. 13, at the Northumberland Paper & Electric Co. building here, practically destroyed the whole plant. The loss is understood to be covered by insurance.

Toronto, Ont. — Architect T. J. Hepburn is calling tenders for the erection of an addition to the Avon Hosiery factory on Erie street. It is expected that an addition will be built extending the present building 60 feet to the back of the lot. The addition will be three storeys high with basement.

Trade Gossip

The Alton Foundry Co. have increased their capital stock to $100,000.

The Canadian Ice Machine Co., Toronto, have been awarded the contract for the supply and installation of an addition to the cold storage plant at the Municipal Abattoir, Toronto, Ont.

Quebec, Que.—The Minister of Colonization and Mines has introduced a bill before the Legislative Assembly to encourage the development of the mining industry in the Province of Quebec.

Charters Surrendered—The following companies have surrendered their Ontario provincial charters: Norfolk Gas Co., Enterprise Gas Co., Port Rowan Natural Gas Co., Michigan Cobalt Mines Co.

The Maxwell Motor Co., will build a factory at Windsor to cost about $65,000. The initial plant will have a floor area of 30,000 square feet and seven acres of ground have been secured to permit of future extensions.

Preston, Ont.—At a meeting of the Board of Trade the following officers were elected for the ensuing year: President, M. H. Mullin; vice-pres., R. A. MacGillivray; secretary, C. G. Robertson; treasurer, A. L. Amys.

Waterloo, Ont.—At a meeting of the Board of Trade held recently, the following officers for the year were elected:—President, P. V. Wilson; 1st vice pres.,

H. M. Snyder; 2nd vice pres., J. R. Kaufman; sec.-treas., W. S. Naylor.

The Ontario Metal Products Co., Toronto, have taken over the building which extends back from 50 Pearl Street, to Adelaide Street. It is the intention to enlarge same with a view to further business development.

Prescott, Ont.—At a meeting of the Board of Trade, the election of officers resulted as follows: President, P. Kingston; 1st vice-president, J. P. Dunne; 2nd vice-pres., T. H. Pringle; secretary, W. F. Macpherson; Treas, H. P. Bingham.

The Globe Electrical Machine Co.—Hamilton, Ont., have removed to larger premises in Mary Street where additional equipment has been installed for the manufacture of cutting off machines, turret lathes and special machinery for shell manufacture.

Canadian Patriotic Fund—Vanadium-Alloys Steel Co., Pittsburgh, Pa., used Canadian Machinery and Manufacturing News as its medium in transmitting two cheques of $250 each to the Toronto Headquarters of the Canadian Patriotic Fund a few days ago.

Niagara Falls, Ont.—The Board of Trade has reorganized by electing former Mayor C. C. Cole president for the third consecutive time. A Civic Improvement Committee has been added to the list of committees, and J. C. Gardner has been made its chairman.

Toronto, Ont.—The appropriations in the Dominion Government's estimates for Toronto for this year include $210,000 towards a federal building, $600,000 for harbor improvements, $455,000 for a postal station, $500,000 for a Customs building and $97,000 for post offices on Queen St, and Spadina Ave.

Regina, Sask.—W. G. Styles was elected president of the Regina Board of Trade at the annual meeting held recently. E. A. McCallum is first vice-president, and N. J. Rutledge, second vice-president. Commissioner McDonald was re-elected secretary-treasurer. The newly-appointed council will consist of thirty-four members, eleven of whom were not on the 1915 board.

The International Time Recorder Co., Binghamton, N.Y., has formed a separate corporation in Canada to be known as the International Time Recorder Co., of Canada, which has purchased the W. A. Wood Co. plant at Montreal. It will also establish a factory at Toronto, about April 1, for the manufacture of time clocks, recorders, etc. J. E. Rogers has been elected president and F. E. Millen, general manager.

Hudson Bay Railway.—According to a reply in the Commons on Feb. 8, by Hon. Frank Cochrane to a question by J. H. Sinclair, nearly $15,000,000 have already been spent on the Hudson Bay Railway project, and it will take at least another $10,000,000 to complete the undertaking. On the railway itself $9,557,340 have been spent, while over $5,000,000 have been spent in dredging, lighting and other improvements at Port Nelson.

The Canadian Meter Co., of Hamilton, Ont., which is now operating under a provincial charter, is seeking incorporations under the Dominion Companies Act. The applicants are John Berthlone McNary, E. H. Ambrose, J. R. Marshall, Stanley Rowland Jefferess and Clarence H. W. Grace, of Hamilton. The business of the present company will be taken over as a going concern, but incorporation under the Dominion act will give the company increased powers.

York County Roads.—The improvement of 210 miles of roads at an expenditure of between $700,000 and $800,000 within the next four years is the comprehensive good roads scheme decided upon by a committee of the York County Council, and recommended to a special

session of the council, to be held to-day. The roads to be improved all run north and south through the county, and are known as the Weston, Vaughan and Kennedy roads and Yonge street.

Toronto, Ont.—The entire common stock of the West Kootenay Light & Power Co. will be purchased by the Consolidated Mining & Smelting Co. Shareholders of the latter company met here on Feb. 7, and ratified the project. The West Kootenay Light & Power Co., Ltd., has a capitalization of $2,500,000, of which $2,000,000 is common stock, fully paid up, par value $100 per share. The common stock has been paying 5 per cent. Directors of Consolidated Mining & Smelting Co. are: W. D. Matthews, president; George Sumner, vice-president; Sir Edmund B. Osler, H. S. Osler, W. L. Matthews, Charles R. Hosmer, J. C. Hodgson, W. M. Farwell and J. J. Warren

U.S. Copper Production. — The Engineering and Mining Journal reports the production of refined copper in the United States in 1915 as having been 1,652,775,822 pounds. Stock on hand Dec. 31, 1914, was 162,566,683 pounds; on Dec. 31, 1915, 84,666,380 pounds, as per following table (in pounds):

	Supplies	Production	Stock, Dec. 31
Year 1915	1,776,250,869	1,652,775,882	84,666,380
Year 1914	1,492,843,502	1,533,781,394	162,566,683
Year 1913	1,649,430,326	1,622,450,829	91,438,867

Winnipeg, Man.—Another big change in the Shoal Lake water district plans has been decided on. It is that the site of the 250,000,000 gallon reservoir near Transcona that will cost over $300,000 will be shifted two miles south of the first planned location and to a point 6,394 feet further from Winnipeg. In addition the three consulting engineers from New York and Boston have all agreed that it would be best to now change the Transcona-Red River pipe line to concrete instead of steel as originally suggested. The water board nevertheless have issued instructions for an estimate of the cost of a cast iron pipe between these two points.

Personal

F. S. Lewis, managing director of the Tudhope-Anderson Co., of Orillia, Ont., has been elected president of the Board of Trade in that town.

Asa S. Cook, president of the Asa S. Cook Co., manufacturers of automatic wood screw machines, of Hartford, Conn., died on Jan. 16.

Major F. H. Deacon, of Toronto, president of the John Morrow Screw & Nut Co., Ltd., Ingersoll, Ont., has been appointed inspector of supplies for Military District No. 1, at London, Ont.

Sir Charles Rivers-Wilson, K.C.M.G., former president of the Grand Trunk Railway, died in London, England on Feb. 9. Sir Charles was born in England in 1831, and entered the British Treasury in 1856, having a distinguished career as a financier. He was president of the G. T. R., from 1895 to 1909.

S. A. McGaw, who was general manager of the Western Canada Flour Mills, Winnipeg, Man., for the past ten years, died at Los Angeles, Cal., on Feb. 9, as a result of an automobile accident. The deceased only retired from business a few weeks ago, and was taking a holiday.

George Stark, of Woodside's Foundry, Port Arthur, Ont., has been appointed manager of William Kennedy & Sons' new machine shop at Owen Sound, Ont.

F. W. Harrison, president of John Harrison & Sons, Co., sash and door manufacturers, Owen Sound, Ont., died on Feb. 9.

J. H. McKechnie, president of the Canadian Consolidated Rubber Co., died at his residence, Montreal, on Feb. 8. The deceased was born at Granby, Que., 66 years ago, and assisted in organizing the Granby Rubber Co., which eventually amalgamated with the Consolidated Rubber Co., of Montreal. Mr. McKechnie was elected president of the company in April, 1915.

Tenders

Ottawa, Ont.—Tenders will be received until Feb. 29, for the supply of waterworks materials for this year. Particulars can be obtained from R. L. Haycock, waterworks engineer.

Montreal, Que.—The Board of Control have decided to call for new tenders for a supply of 6,000 tons of asphalt, replacing the former call, which was illegal, due to a mistake in the preparation of the advertisement. Tenders close on March 2.

Ottawa, Ont.—Tenders will be received by the secretary of the Water Works Committee, up to February 24, 1916, for brasswork, cast iron pipe, lead pipe and pig lead, oils and grease, special pipe castings or valves. Specifications, form of tender and full particulars may be obtained on application to the city engineer's office, city hall, Ottawa.

Toronto, Ont.—Tenders will be received by the Chairman, Board of Con-

trol, City Hall, up to Tuesday, March 14, 1916, for the supply and delivery of: One single-truck, double-end street car, completely equipped; one car body, double-end, single-truck; equipment for one single-truck; equipment for one single-truck car. Specifications and forms of tender may be obtained at the Works Department, Room 12, City Hall.

Ottawa, Ont. — Tenders will be received up to March 1, 1916, for:—1. The construction of a pumping station and electric sub-station on Lemieux Island, for the City of Ottawa. 2. The manufacture, delivery and installation of:— (a) main piping, valves and specials. (b) Heating and plumbing. All for the above Stations. Plans and specifications may be seen at the office of the engineer, John B. McRae, 310 Booth Bldg., Ottawa.

Collingwood, Ont. — Tenders will be received by the chairman of the Collingwood Water & Light Commission until Wednesday, March 1, 1916 for the following works:— (1) Steel water tower. (2) Foundation for steel water tower. (3) Pumping machinery, comprising one motor-driven unit of 800 Imperial gallons capacity. (4) Pump well and connections. Plans and specifications may be seen at the office of the Engineers Chipman and Powers, 204 Mail Building, Toronto, or at the Water and Light Office, Collingwood.

Ottawa, Ont.—Tenders will be received until Monday, February 28, 1916, for the construction of timber lock gates and their equipment for the East River Lock, near New Glasgow, Pictou County, N.S. Plans and forms of contract can be seen and specification and forms of tender obtained at the Department of Public Works, Ottawa, and at the offices of the district engineers at Antigonish, N.S.; Halifax, N.S.; Shaughnessy Building, Montreal, P.Q.; Confederation Life Building, Toronto, Ont., and on application to the postmaster at New Glasgow, Nova Scotia.

Hamilton, Ont.—Tenders will be received up to Wednesday, March 1, 1916, for supplying the corporation of the City of Hamilton, with the following:—Castings (ordinary and special), iron pipe, hydrants, valves, extension boxes, lead pipe, pig lead, rubber hose, rubber boots, road oil, lubricating oil, flux, fuel oil, coal oil, gasoline, concrete and garbage duck covers, bass brooms, sectional sweepers, brass work, including ordinary and special brass castings for water department, hardware. Specifications and form of tender for all of the above can be obtained at the office of the city engineer, Hamilton, Ont.

Contracts Awarded

Niagara Falls, Ont.—Contract awarded to Gartshore-Thompson Pipe & Foundry Co., Hamilton, for the supply of cast iron pipe.

Owen Sound, Ont.—The Meaford Wheelbarrow Co. has received an order for 50 field kitchen for the use of the Canadian overseas force.

The S. F. Bowser Co., of Toronto, has been awarded the contract by the Toronto board of control for the installation of 10 standard gasoline equipments at city fire halls, at a cost of $1,780.

Rates (payable in advance):—2c per word first insertion, 1c per word subsequent insertion. 5c additional each insertion when Box Number is required. Each figure counts as one word.

FOR SALE

18 IN. x 10 FT. BRADFORD LATHE AND countershaft, also 18 in. x 8 ft. Lodge & Shipley, both in splendid condition; immediate delivery. Box 172, Canadian Machinery. (8)

FOR SALE—CINCINNATI ENGINE LATHE, 18" x 6'; taper attachment, hollow spindle, quick-change gears, compound rest, two chucks; also 12 H. P. gas or gasoline engine. Apply Wheeler Needle Works, Paris, Ont. (7)

MACHINE SHOP WITH MACHINERY, garage and house, on nine thousand four hundred feet land, with adjacent vacant twenty-eight thousand feet; next railway station; good site; good accommodations; twenty miles from Montreal; immediate possession; bonus expectation to big concern. Box 173, Canadian Machinery. (6)

TURRET LATHES FOR SALE—3—2 x 24 Jones & Lamson Turret Lathes, $500.00 to $600.00 each. 3—19" swing Jones & Lamson Turret Lathes, fitted with Diamond Turret. The above machines are in good condition, also 2 Small Turret Machines, 1¼" hole in the Turret Head. Apply to A. B. C., Box 171, Canadian Machinery. (6)

Corporation of Paisley Electricity Department

The above Corporation have for disposal one horizontal cross compound steam engine, as follows:—

Speed=90 revs. per minute.

Diameter of H.P. Cylinder=24 inches.

Diameter of L.P. Cylinder=48 inches.

Steam pressure=150 to 175 lbs. per sq. in.

Fitted with coreless valve gear.

Weight of Flywheel=about 20 tons.

Makers: Daniel Adamson & Co., Ltd., Dukinfield.

The lowest price that will be considered for the Engine will be £2,000. This may be inspected by arrangement at the Works, Blackhall Street, Paisley, and all enquiries should be addressed to the undersigned.

C. F. Parkinson
Engineer and Manager
Blackhall Street, PAISLEY

FOR SALE—INGERSOLL-RAND CLASS NE-1 power-driven, single-stage, straight line air compressor, close connected for belt drive to motor. Piston diameter 12 inches. Piston displacement 258 cubic feet per minute. Designed for pressure, minimum 35, maximum 55, lbs. per square inch. Length 7' 6". Width 3'. Height 4' 3". Been used for 4 weeks only. Box 160, Canadian Machinery. (8)

SITUATIONS VACANT

JUNIOR DRAFTSMAN, EXPERIENCE ON structural work an advantage; permanent position to right man; give fullest possible particulars. Box 174, Canadian Machinery. (7)

WANTED — MACHINISTS AND FLOOR hands on heavy and miscellaneous medium work; steady employment, modern shop, good wages. Apply, stating age and experience, P.O. Box 6, Walkerville, Ontario. (6)

AGENCY WANTED—A FIRM IN ENGLAND is desirous of securing the sole agency for Great Britain for twist drills, taps, stocks, dies, reamers, milling cutters, etc. Please communicate full particulars to Box 175, Canadian Machinery.

MACHINE TOOL SALESMAN WANTED BY a well-known and progressive manufacturer of a high-grade line of grinding machines. Thorough mechanical training with selling ability necessary. Give full particulars as to experience, age, salary expected, etc. Box 170, Canadian Machinery. (42)

Sell Your Scrap Materials Direct to the Wholesaler

Get our quotations before selling. We are wholesale dealers in all grades of Scrap Iron Shrapnel turnings and borings, Scrap Copper Brass, etc. This week we are paying 27 cents per pound for Scrap Aluminum.

Send for our monthly price list. Our Motto, "Honest dealings and prompt settlements."

INDEX TO ADVERTISERS

Opportunities for Canada's Industrial Development-IV.

By C.T.R.

In this series of articles prepared in response to numerous inquiries received from the managements of Canadian metal-working plants on the subject of post-bellum employment for their added equipment and enlarged capacity arising from an extended period of shell production, we aim to give prominence to the opportunity to manufacture such products as were previously imported for our domestic needs or have since become available for export.

THE general attitude of Canadian manufacturers as a whole towards export trade has at no time in the past been so vigilant as it is at present, nor so aggressive as it promises to be in the future. To those of us who have not heretofore contemplated carrying their efforts further afield, the trade possibilities offered by the various members of the British Empire are bound to appeal more forcibly than those pertaining to countries of alien nationality, customs, and language.

The medium of intercourse will always have a more or less restrictive influence on the expansive efforts of many of our manufacturers, which time and intercourse alone can modify, and the many difficulties in the way of attaining a desirable and necessary mutual understanding with foreign clients is bound to react in favor of trade with English-speaking peoples and others who already have intimate trade relations with Great Britain.

The Outlook For Others

Due largely to the geographical location of Canada, trade opportunities present a similar aspect to us as to our neighbors in the United States. The attitude of manufacturers in that country was well indicated at the recent Foreign Trade Convention held at New Orleans last month. Apart from the fact that the papers were contributed by leading men of the country, whose position and experience were sufficient to demand close consideration of their views, the subject matter discussed by them was in itself indicative of a final and permanent awakening to the necessity for organized effort by the various industries concerned. The need of foreign markets for the United States may be pressing as an ultimate factor in the economic life of that country, but events in Canada are proving every day that our own welfare demands that we also prepare for a similar subsequent development in our industrial history.

Supremacy Founded on Finance

That "Trade follows the flag" is an old saying founded on the manner in which the British Empire extended its sway and developed its commerce. Leaving the flag out of the question, the modern manufacturer, outside of England and Germany, must realize that "Manufactures follow the money."

The remarks of President Farrell, of the United States Steel Corporation, at the New Orleans Convention, indicate in a broad manner the principal conditions which have contributed to Britain's commercial supremacy, and, although spoken before American manufacturers, their applicability to Canadian trade conditions and prospects is very great. Regarding the foreign investment of American capital as an aid to their foreign trade, he said:—

"It will not be disputed that the more complex the form assumed by the industry of any people, the more rapid must be its increase in wealth. In other words, it would pay us better to convert our own raw materials into finished products here than to sell them for conversion abroad. But our advance in that direction will be relatively slow without a constantly broadening foreign outlook for articles of American manufacture.

"To attain the maximum efficiency for our factories and workshops, they must be operated at their full capacity. Hence, on this ground alone it is absolutely essential that we should insure against the consequences of recurring periods of domestic depression by cultivating foreign markets. It is thus as much in the interest of the workman as of his employer that provision should be made for the steady sale abroad of the products of the mechanical industry of the United States. It is in the interest of both that the capital needed in that industry should be obtainable on easy terms. But it has been shown that the condition and prospects of the foreign trade of a given industry are a factor of very considerable weight in determining the value of its securities. In fact, the foreign business of many corporations, since the war began, has been their greatest asset, and the only justification for the operation of their plants on full time."

As was pointed out by Mr. Farrell, these conditions in the States will cease after the war, just as they will here in Canada, and the ability of many plants in both countries to then dispose of their product will depend on something more tangible than ability to make deliveries. Trade conditions may occasionally be such that certain goods sell themselves, but only for part of the time. All of the time the great majority of manufactured products call for effort to secure their prompt and profitable disposal, and just as the members of any one industry acquire the knowledge of where, when, and how to sell their products, so will they build up permanent business in their particular lines.

Credit Necessary, Investment Desirable

All students of the situation are of one opinion regarding the influence of credit on foreign business. Credit, however, must not be confused with investment which as a national characteristic has been largely responsible for the foreign trade of Britain. Canada as a nation will not be in a position to assume the role of investor on a large scale for some years to come, but a few facts regarding Britain's financial relations with foreign countries will indicate the ultimate desirability of Canada becoming a creditor nation.

At the commencement of hostilities foreign countries were indebted to Great Britain to the extent of $20,000,000,000. Of this amount $9,240,000,000 was invested in British dominions, colonies and possessions, $3,160,000,000 in the United States, with the remaining $7,600,000,000 distributed among the rest of the world. The vast annual interest yielded by such a sum has never been entirely removed from its source, amounts ranging from $600,000,000 to $800,000,000 being reinvested annually, thus increasing the markets or more firmly securing the existing investments.

Other countries, notably Germany, followed Great Britain's example in thus securing foreign markets for their products, particularly in South America, but with the exception of certain enterprises on the west and north coasts, the United States has not figured as a national investor in South American countries. The error of this aloofness is at last dawning upon them, but so far little has been done in financing such countries as offer openings for investment.

Two Classes of Products

A consideration of the conditions involved shows that manufactures suitable for export can be divided into two groups, viz.—The ordinary articles of commerce which are distributed through dealers to individuals or corporate consumers who desire the best article for the price they are prepared to pay, and, secondly, machinery, equipment, raw materials and stores necessary for the development of extensive enterprises. Of the second group it can be truly said that manufactures follow the money, as the supplies required by this class are

frequently arranged with or form part of loan transactions. As such business is principally railroads, public work, steamship activity, or raw material exploitation on a large scale, the possibilities of Canadian trade expansion in that direction must, under existing conditions, be limited.

The similarity of conditions between the United States and Canada with respect to national influence in foreign trade renders enlightening a consideration of those methods which have enabled several large American corporations to extend their activities to every quarter of the globe.

Such lines as steel production, agricultural, machinery, sewing machines, typewriters, and oil, offer examples of self-contained development which have taken place in spite of an absence of international investment. These items belong obviously to the first group of manufactures referred to above inasmuch as the consumers are free agents, spending their own money, and trying to get the most for it. "Big business" influences could not appreciably hold up foreign trade in such lines as these.

The ability of these private corporations to finance foreign sales in an adequate manner emphasizes the handicap under which many would-be exporters are placed, and until this handicap is removed, Canadian export trade will not advance in proper proportion to its ability to do so. In the absence of international financial influence, it devolves upon the industries concerned to persuade their own bankers to do their part in establishing credit machinery.

Trade depends on manufacturing, marketing, and financing or establishing credit. Our manufacturers can produce the goods, our bankers can and ought to produce the credit, and the world can produce the market. We already have the means of filling the first and second of these conditions, but can we as easily secure the last? Do our would-be exporters know what they should export and whether the trade would be remunerative, temporarily or permanently? Are they prepared to build slowly and well, or are they so satiated with easy money, and long contracts secured without genuine selling ability, that the thought of digging up business again is distasteful—or have they looked on their present prosperity in the light of the ten talents, to be used industriously so that in due time they will be doubled.

Trade With British Colonies

Apart from sentimental reasons, the British colonies in the temperate zones appeal most strongly to Canadian commerce largely because of the increasing importance of their agricultural and allied interests, and also because of the relative absence of manufacturing resources.

South Africa occupies a place of increasing importance in the eyes of the exporting world. That its future possibilities are being recognized by competitors is shown by the following statement issued by the Boston Chamber of Commerce in October 1914: "There is a rapidly developing agriculture which is utilizing more and more the resources of fertile soil and favoring climate in the cultivation of crops and the raising of live stock. These will undoubtedly become in time the leading and permanent industries of this vast region, a domain more than double the area of Texas, and lying entirely within the temperate zone. Its chief imports are manufactured products and the natural and convenient source of supply in the emergency is the United States." That it is worth while endeavoring to make Canada a "natural and convenient source of supply" all the time may be gathered from a report by Trade Commissioner Egan from Cape Town, last November. In it he states that the future prospects of all farm implements and machinery are likely to be increasingly large. The country is progressing in agricultural conditions and farmers are using more up-to-date methods. Progress generally is good in spite of conditions of drought. Reference is made to a demand from South African firms for ploughs, implements, and machinery of all kinds, farm-yard and house hand machines, particularly those adapted to motor-power as well. In the year 1911, there were amongst other things the following machines and devices in use on South African farms: 18,619 cream separators, 33,804 churns, 1,331 steam engines, 980 oil engines, 241 gas engines, 211,927 one furrow, 70,259 two-furrow, 7,428 three-furrow, and 178 four-furrow ploughs; 12,597 mowers, 4,659 ordinary reapers, and 3,829 self-binding reapers, etc., etc.

Comparison with American Exports

American manufacturers secured the larger part of this trade. Last year out of a total import in windmills, valued at $340,000, American firms shipped goods to the value of $280,000, while Canada's share was $375. In water-boring machinery, the United States' share of the trade was $81,000, out of a total of $96,000. In pumps the total imports were $600,000, the American share of this trade being $140,000, while Canada exported only $1,800. In other dairy and farm implements and machinery imports, the total value last year was about $1,800,000. Of this amount more than $800,000 was shipped from the United States. Canada's share was $225,000.

These figures show that sufficient trade already exists to justify greater exertion by Canadian firms and those firms who are only now contemplating entering this market will find valuable suggestions offered, and local conditions carefully analyzed and stated in Weekly Bulletin No. 518, page 605, of the Department of Trade and Commerce. The system which has been found most successful in agricultural and dairy lines is resident firms for specified districts. Initial investigation by a factory representative has been a feature of all successful enterprises.

For mining and general machinery of a heavy nature, local representation is an absolute necessity, Johannesburg being the proper location for an agent who should have full power to handle all sales and contracts. When the line will permit of it, a branch house of the manufacturer is best; if this be not possible the manufacturer should come over and select his agents, supplying suitable samples, models, catalogues and advertising material.

Requirements of the Antipodes

The commonwealth of Australia, and the Dominion of New Zealand both resemble, in some respects, our own country here, being more advanced in some directions, while in others Canadian development is ahead. The metal-working industry is an example of the latter, and although the comparatively small proportions attained so far in these colonies may not offer much inducement to many Canadian firms at the present moment, due attention must be paid to the recent commencement of steel making in Australia. The lack of raw material has hitherto retarded the development of hardware and similar manufactures but with extensions in hand to bring the output of steel up to 170,000 tons per annum, the prospects of ultimate business in machine tools, transmission machinery and allied products should appeal strongly especially as most European lines have been cut off during the war.

New Zealand is less likely to develop manufacturing lines to any extent, which might tend to discourage importers, but hydro-electric development under favorable auspices has been inaugurated successfully, and its gradual adoption for power and light will ultimately increase the consumption of certain lines of machine shop products.

Imports of motor vehicles to the value of $2,077,000 for eight months to August 31, 1915, occupy fourth place, but this business is highly specialized by the leading concerns. Various kinds of machinery imported to the following values, indicate the present variety and size of the trade: Dairy, $188,000; agricultural, $260,000; electric, $1,027,000; engines, gas and oil, $390,000; mining, $124,000; sewing, $165,000; railway and tramway plant, $745,000; tools, $349,000; pipes and fittings, $753,000.

Conclusion

A consideration of the various aspects of the question of foreign trade possibilities as affecting the engineering and allied trades of Canada brings one to the conclusion that in certain lines our manufacturers, as such, are capable of competing with those of any other nation, but as exporters they are, speaking generally, disinclined to exert themselves outside of their former spheres of activity. Foreign trade calls for investigation, perseverance, resource, adaptability, patience and organization; profits must be earned by continuous effort, and in many cases, early profits must be sunk in the business for some time to insure a safe and desirable ultimate rate of progress. Adaptability is one of the outstanding features which conduced to the success of Germany in the past, and consists largely in "putting oneself in the other fellow's shoes." By doing so one will avoid much loss in trying to educate a prospective customer away from his own ideas.

Climate, population, geographical location, political and commercial surroundings have much to do in forming national tastes in life, and while machinery and similar manufactured products are perhaps less influenced by these features than are other products, the methods of business involved in their disposal in other countries frequently presents in comparison with our home conditions, a contrast sufficiently great and startling to deter many intending entrants from further effort.

The more the matter is considered, the more promising appear the prospects of a Greater Britain. The British Dominions, with their uniformity of language, in many cases, of climate, and in all cases, of purpose, offer, with their respective diversity of products the greatest opportunity which the world has ever witnessed for the building up and welding together of the four corners of the earth, a consummation in which Canada through the efforts of her industrial and agricultural workers, is destined to play no insignificant part.

COMMERCIAL SIDE OF ENGINEERING

by F. G. Hatch

ENGINEERING, as we know it to-day, could not exist without its commercial side. The young engineer too often thinks that all engineering matters should be regarded as having only technical interest, and that commercial considerations are beneath the notice of the engineer. Well, abstract science is of very little value to the everyday world until it has been commercialised in some form or another.

Of what value to the world at large would Stephenson's invention of the locomotive have been if, after he had made his first engine, it had been described in papers, examined by learned professors, looked upon as an interesting novelty, and—allowed to rust? Its value to mankind became apparent and real when it was seen to open up a new era in transportation, then commercial men advanced the money to build a railway, by means of which it was demonstrated that goods were hauled cheaper and quicker than had previously been possible.

Commercial Aspect Neglected

Is this aspect of their work sufficiently borne in mind by engineers? The writer ventures to think that it is not, especially by younger members of the profession or business, whichever you like to name it. It is an aspect of his future work which is rarely mentioned by his early teachers and masters, and it is seldom mentioned in the classes of college or technical school.

When the young engineer enters a works for his practical training, the one part that he never spends any time in is the commercial offices. His training is supposed to be completed when he has been through the shops and drawing-office, although he may have only the vaguest notions as to how material is bought and the products of the works are marketed and sold. He knows practically nothing of such things as costs, capital charges, profits and loss accounts, and balance sheets.

Is it any wonder, and can it be otherwise, in view of the fact that engineering students receive no regular business training, that engineers, as a whole, are poor business men. The engineer too often fails to realise the fundamental fact that as soon as he leaves the training ground of school and college or workshop and becomes a salary or wage-earner, he has entered the business of engineering and that all his actions and works will eventually be judged by the dollars and cents, standard.

Commercial Value the Final Test

It has been pointed out that engineering work has to pass the final commercial test, and it can be seen that every engineer is also subject to the same scrutiny. As he advances in life and obtains more important positions, he finds that business matters enter more into his work, to the exclusion of much technical work, till finally his next step will depend not so much on his technical as on his business ability.

This is a commercial age, and it is inevitable that anyone failing to combine business ability with technical skill is doomed to limited advancement.

Here it may be well to say that, in speaking of business or commercial methods, out and out commercialism is not intended to be the standard aimed at, but rather a judicious blend of technical skill with a more extensive use of true business principles in everyday work and problems. The engineer may rest well assured that there is no loss of dignity—certainly nothing degrading—in giving due weight and consideration to commercial values.—'From a paper read before the Junior Institution of Engineers.'

NEW TAXATION FOR WAR PURPOSES

THE accompanying statement of the main features of the proposed new taxation for war purposes as disclosed in the recent Budget spent of the Dominion Finance Minister will enable our readers to take hold at a glance of what is involved and who are most directly affected.

A tax of 25 per cent. on the net profits since the beginning of the war, in excess of 7 per cent., of financial, industrial, milling, transportation, public utility and other corporations and munitions firms.

A tax of 25 per cent. on the net profits since the beginning of the war in excess of 10 per cent. of individuals, partnerships and associations with capital of more than $50,000.

No exemption as to capital is made in the case of munition manufacturers.

Under pro rata arrangement tax will apply to companies not incorporated in Canada, but doing business in Canada.

Capital defined as amount paid up on capital stock.

If capital of any company is increased, or additional stock issued after February 15, 1916, Minister of Finance will have power to decide whether it is fair and proper to include such increase when determining capital of the company.

No deductions from gross profits for depreciation, renewals, etc., allowed except such amounts as appear reasonable to Minister of Finance.

Deductions from gross profits for salaries of directors, managers, etc., must not exceed, except in special circumstances, the sums deducted in last accounting period prior to August 4, 1914.

Life insurance companies, while not subject to tax, will be expected to keep a certain proportion of their assets in Dominion Government securities.

In case of banks, amount being paid under previous war tax will be credited when charging new tax.

Tax will be payable November, 1916.

Expected to realize revenue of $25,000,000 to $30,000,000.

An increase from 40 to 90 cents per barrel in the general tariff on apples.

A duty of ½c per gallon on petroleum fuel oil.

Compulsory investment by insurance companies in Government securities.

PRODUCTION METHODS AND DEVICES

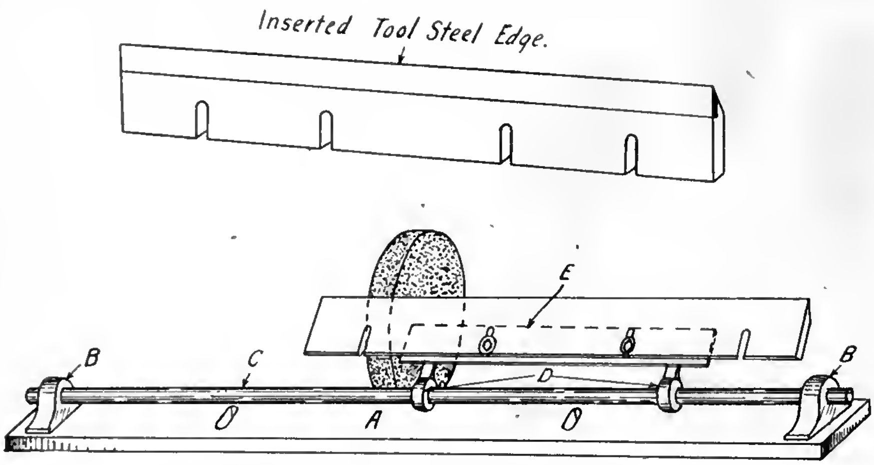
A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

GRINDING LARGE PAPER KNIVES

By H. C. F.

MECHANICS who are connected in any way with the printing or paper trades, realize the necessity of keeping the paper cutting knives in perfect condition. It is essential that the edge be kept extremely keen in order to insure that the work for which they are intended will be accomplished with the least effort, while at the same time procuring a clean even cut.

The knives are similar in design to that shown by the sketch, Fig. 1. The body of the knife is made of a good quality soft steel, with an inserted tool, steel-cutting edge, as shown. The knives vary in size, according to the class of work for which they are intended. An average length, however, would be about 50 inches; the width and thickness averaging about 5 in. and 5/8 in. respectively. The width of the bevel is approximately $1\frac{1}{8}$ inches, this being practically standard, since it has been found to give the most satisfactory results.



FIGS. 1 AND 2. PAPER KNIFE GRINDING.

In grinding the knives, a certain degree of skill is necessary, and at the same time considerable care must be taken, especially when an emery or carborundum wheel is used. There is always the danger of overheating the knife, causing the edge to lose its temper. Should this occur, the natural result is that the usefulness of the knife is somewhat seriously impaired.

Special grinding machines have been designed for this particular class of work and no doubt they accomplished their purpose satisfactorily. A small machine shop, however, would not be repaid for installing such a machine, especially when a jig, which will give just as good results, can be constructed with practically very little outlay.

This jig, as shown in Fig. 2, is secured to the front of an ordinary grinding machine. The base A is made of cast iron, or more preferably of wrought iron bar stock, about 6 feet long by 5 inches wide. To either end of the base are bolted the blocks B, which act as supports for the shaft C. The latter should be of generous diameter—about $1\frac{1}{2}$ inches—so as to prevent any sagging when the weight of the knife is thrust upon it. The two collars D are made a sliding fit for the shaft, and to them is fastened the plate E as shown. The knife is bolted to this plate, and is so adjusted as to enable the stone to cut the desired bevel. In adjusting the knife, care must be taken to have both ends of exactly the same height, otherwise one end of the knife would be brought to an edge much quicker than the other.

The wheel used should be of a fine grain carborundum, about 12 inches in diameter, and 2 in. or $2\frac{1}{2}$ in. face. A wet stone might preferably be used, since it, to a certain extent, eliminates the danger of taking the temper from the knife edge. In operation, the knife is simply moved backward and forward across the face of the stone, until the edge is brought up to the desired keenness. After being ground, the knife is hand-whetted, in order to remove any burr which might be found during the grinding operation.

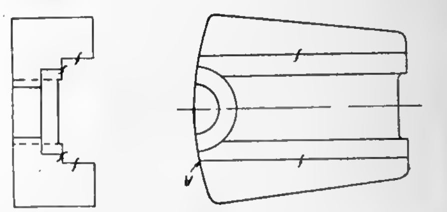
It might be interesting to note here the manner of grinding paper knives as adopted by a small shop which "exists" on grinding only. The old grinder man—he has been grinding for over forty years — states that "paper-cutting knives should neither be ground by special machinery nor emery wheels." Perhaps he is right, for the fact remains that he has built up one of the largest knife grinding shops in one of our leading cities.

His methods are simple—in fact, crude. The stone used is a soft sandstone, about 5 feet in diameter, with a 10-inch face, and running about 200 revolutions per minute. A long, rough-planed board is fastened to the front of the wheel-stand, and in this a few spikes are driven to act as a guide for the knife. The latter is merely held against the stone by hand pressure, being at the same time moved across the face. By this method, it requires about one hour to grind an average size knife; and since the stone is running in water and at a slow speed, the danger of over-heating the knife edge is entirely obviated.

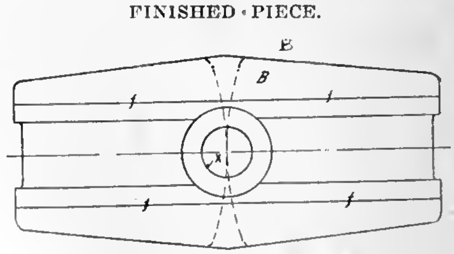
COMBINING PARTS FOR PRODUCTIVE MANUFACTURE.—II.

By F. Scriber.

AN interesting example of the combination of two pieces for convenience in drilling is shown by Fig. 9, where A is the finished product and B the work in combination. After milling the various portions, as indicated by the finish marks, the hole X is bored, thus leaving the two parts as shown in the illustration. These are sawn apart, and placing a number of them in the fixture, Fig. 10, on a boring mill, the radius



FINISHED PIECE.



WORK AFTER DRILLING.

FIG. 9. COMBINATION OF MILLING AND DRILLING OPERATIONS.

Y is turned in the usual manner. In this fixture the parts are located radially by means of the seat A, and are set against the pins B by means of the screws C to

obtain the correct radius relative to the bored holes. The parts are clamped in pairs by means of the clamps D.

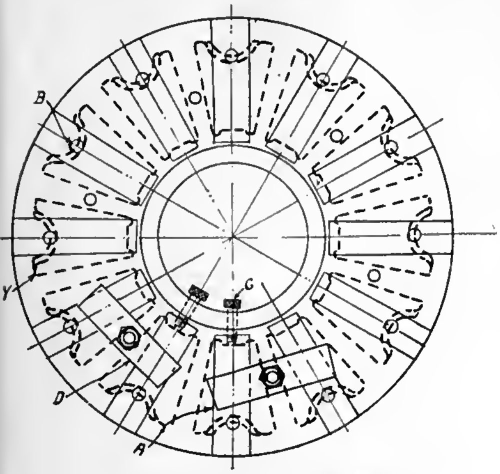


FIG. 10. METHOD OF TURNING RADIUS ON PART SHOWN IN FIG. 9.

As a commercial proposition, the possibilities of accurate cutting off are quite often overlooked, and on work not suited to the screw machine the usual practice is to cut off the work before starting to machine it; but it is often possible to work to better advantage by leaving this operation until after turning. In this manner a long bar may be centered and turned in a lathe by using a follow rest in the manner shown by Fig. 11, following which the bar or a number of bars may be cut off within two or three-thousandths on a modern cutting-off machine. To do this, the bars are rested in accurate vee blocks and cut into short lengths with a circular saw.

In Fig. 12 a drill jig, suitable for finishing collars, made from the bar in the foregoing manner, is shown, which consists of a holder for the work X, which is located from the outer diameter, a clamping screw A to keep the work in place, and the two guide bushings B for drilling in the usual manner.

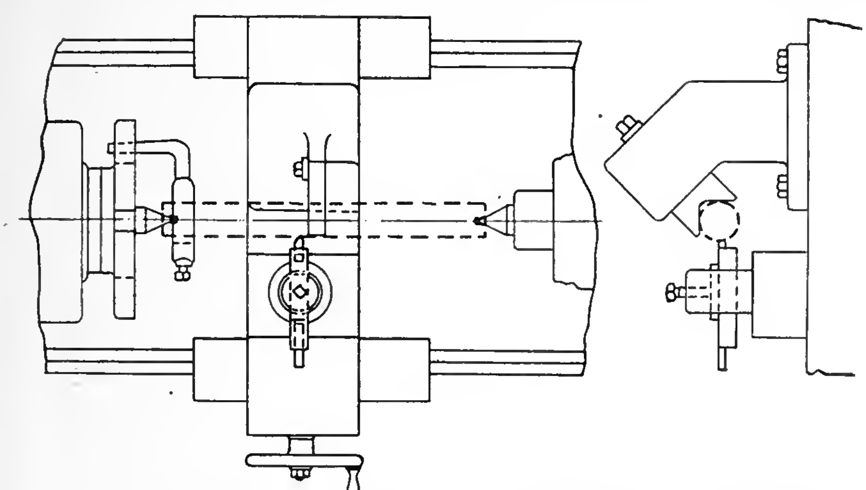

FIG. 11. TURNING A LONG BAR IN LATHE USING FOLLOW REST.

Introducing Turning

When a large number of parts, such as are shown at A, Fig. 13, are to be machined all over, they may be handled as a combination and made up in ring form, as shown at B, Fig. 13. To accomplish this, the forged steel ring from which the parts are cut is placed on a boring mill while the hole is bored and one side is faced, holding the work by the outside in chuck jaws. Following this, the unfinished side is finished by gripping the work with soft jaws from the inside in the manner shown from the illustration, Fig. 14. The next illustration, Fig. 15, shows the manner of drilling the holes, this being accomplished on a multiple spindle drill, all holes being put in the ring at one time. The next operation is to cut the rings into the required sections, using an indexing fixture, Fig. 16, for this purpose. In operation this fixture is placed on a horizontal milling machine with a saw on the arbor. The ring A is located by the hole on the plate B with pin C in one drilled hole for radial location, while each portion of the ring to be cut apart, except the first, is clamped by straps D tightened by nuts E. After setting this fixture in place, the work is securely clamped, and the first cut taken; the fixture is now indexed and the second cut taken and the portion between cuts is taken out. By successive indexing, as each two pieces are cut, a clamp may be removed, thus when the last part is cut but one clamp must be loosened. This method practically permits the use of all the time for cutting.

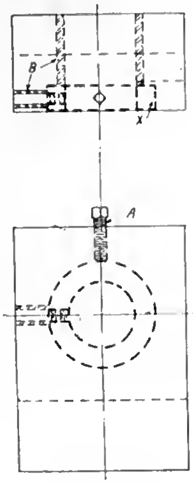

FIG. 12.

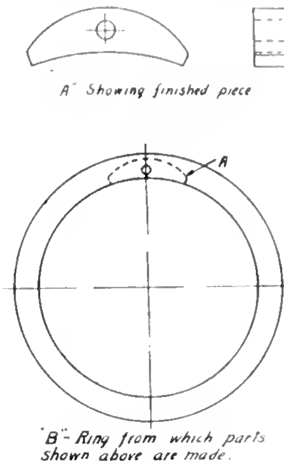

FIG. 13.

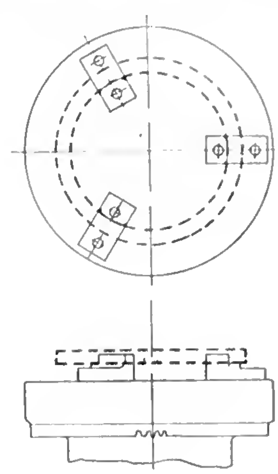

FIG. 14.

The last operation leaves the work as shown at A, Fig. 17, and the final operation consists of milling the form opposite the radius. This is accomplished by the use of special vise jaws and a pair of formed milling cutters. To perform this operation the work is set up on a horizontal milling machine in a vise, as in Fig. 17. The work is located by the radius X on a formed jaw B, centralized by the pin C. In this position it is evident the form can be cut in two operations, roughing close to form and finishing with cutters D. The operations on this piece simply enumerated are: forge ring, bore and face ring, drill holes, cut apart, and mill form.

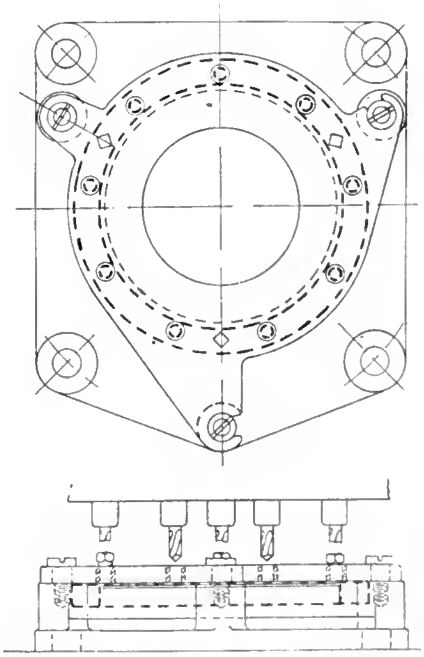

FIG. 15. DRILLING HOLES IN RING, FIG. 13, WITH MULTIPLE SPINDLE DRILL.

The examples here described are such as are readily accomplished by combining the parts throughout most of the operations and, needless to say, the limit

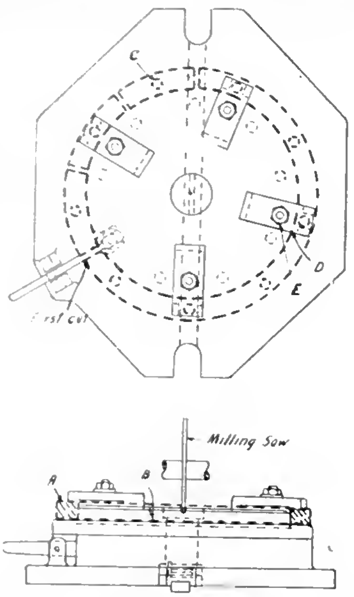

FIG. 16. METHOD OF CUTTING RING APART.

to the possibilities of this system can only be determined by careful selection of the every-day problems which modern production presents. Often where an

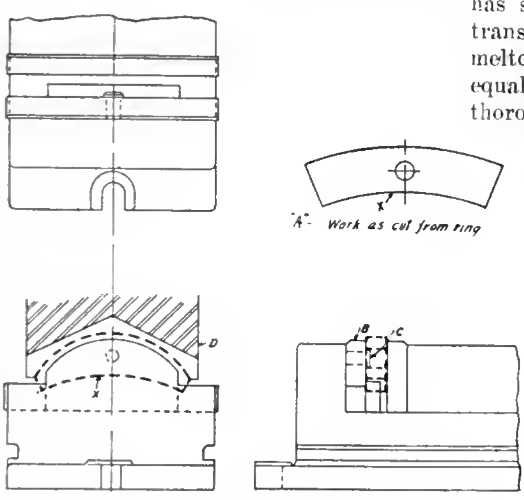

FIG. 17. FINAL OPERATION ON PART SHOWN IN FIG. 13.

expensive special tool may be required to finish a part in its desired form two or more parts together can be readily handled at less expense.

FLOATING AXLES

THERE appears to be much diversity of opinion as to the meaning of the term "floating," "semi-floating" and "non-floating," as applied to live axles. These terms, says G. W. Watson in a paper on "Live Axles" read before the Insititution of Automobile Engineers, are much used in impressive tones by many salesmen and others who have obviously no conception of their meaning; they often couple them with varying arrangements of spring mounting, torque and thrust rods, etc., in a most perplexing manner.

The interpretations proposed by Mr. Watson are:—Floating axle: An axle in which the wheel-driving or differential shafts transmit only torsional effort.

Semi-floating axle:—An axle in which the wheel-driving shafts partly or wholly support the bending stresses due to the gear drive plus the torsional stresses, but which are relieved of all bending stresses due to the imposed load and the tractive resistance.

Non-floating axle:—An axle in which the differential shafts wholly or partly take the combined bending stresses due to the imposed load and the tractive resistance, plus the torsional stresses due to the transmission of power to the wheels.

SEALING-UP HOLES IN TRANSFORMERS

IT is often necessary to seal up holes in transformer or oil-switch cases where wires pass through. Probably the most commonly used material for this purpose is a mixture of sulphur and plaster of Paris. Either material used by itself may answer the purpose in some cases, but if the two are mixed half and half it gives a very hard substance when it has set, and one that is impervious to transformer oil. The sulphur should be melted in a ladle or pot and then an equal quantity of plaster of Paris mixed thoroughly into it. This mixture should be poured into place while hot.

Trouble is often experienced from oil being syphoned out of transformer cases on account of the braided insulation on the lead wires. When this takes place it is usually found that the insulation on the wire dips down into the oil. If the oil level is lowered below the terminal board inside the case and the insulation on the leads scraped off so that where the wire enters the surface of the oil its metallic surface only is exposed to possible contact with the oil and the leads are properly sealed, there will be little trouble due to syphon action.

COST OF LIVE FLOWING STEAM

By W. F. S.

TOO few engineers appreciate the value and usefulness of Napier's formula. It is used, generally, wherever steam is allowed to flow directly from high boiler pressure into the atmosphere, as in furnaces for creating draft, in soot blowers, in whistles, etc. The formula is

$$W = \frac{p\,a}{70}, \text{ where}$$

w = the weight of steam in pounds flowing through the area (a) per second.

p = steam pressure in lb. per sq. in.

a = area of orifice in sq. inches.

To make this formula a little more applicable to most engineering conditions, I have converted it into this form:

Cost of steam in dollars per 10-hour

$$\text{day} = \frac{9}{35}\,\frac{p\,a\,c}{s}, \text{ where the additional let-}$$

ters represent the following:—

c = cost of coal in dollars per ton of 2,000 pounds.

s = pounds of water evaporated into steam in the boiler or boilers per pound of coal.

For example, what is the cost of the steam per day flowing through a ½ inch nozzle for creating draft in a furnace wehere,

p = 140 pounds per sq. in.

$$a = \left(\frac{1}{2}\right)^2 \frac{P}{4} = 196 \text{ sq. in.}$$

c = $4 per ton.

s = 8.5.

Substituting in the formula, we get,

$$\frac{9 \times 140 \times .196 \times 4.}{35 \times 8.5} = \$3.32 \text{ per 10-}$$

hour day.

ARMATURE KEY TROUBLE

A 100-KILOWATT direct-connected exciter set soon after erection developed a slight knock which the operators were unable to stop. It ran about four years with the sound gradually getting worse, and the operators were sure that the trouble was in the armature, which was keyed solidly on the shaft, but which gradually seemed to be getting out of balance. Finally the risers from the commutator to the armature coils began to break. The commutator was then removed from the shaft, and the trouble found out. The armature was fitted with the usual cast iron spider with all the laminations keyed to it with one key. The laminations were too large for the spider and had been improperly keyed on, allowing them to work backwards and forwards on the key, thus causing the knock and finally crystallizing the risers. A new key was fitted, and the set is running quietly.

The Chalmers Motor Co. was incorporated under the laws of Canada recently with a capital of $1,000,000, as the first step toward a Canadian branch. C. A. Pfeffer is vice-president and assistant general manager of the company. Mr. Pfeffer has stated that motor car manufacturers in the Dominion can now obtain practically everything that goes into the construction of motor cars in this country.

Lathe and Screw Machine Automatic Mechanical Control *

By L. D. Burlingame

The growing tendency towards the adoption of automatically controlled machines arises from the fact that uniformity and quantity of product easily surpass that obtainable by hand-operated mechanisms in the sphere of commercial manufacture. The introduction to the paper points out the more important considerations entering into the question of installing automatically controlled equipment, following which a classification of the prominent and essential features relative to the latter is given accompanied by typical illustrations.

IN a general way the term "automatic control" applies to the organization of a machine so that all operations required to complete the work are automatically performed, and the object is to have these operations so performed as not only to secure in large measure the advantages of hand work guided by human intelligence, but also to insure a uniformity and quantity of product beyond that which can be commercially obtained by hand work.

In determining whether the employment of automatically controlled machines is warranted, the vital question is whether the product is wanted in sufficiently large quantities and whether the design is sufficiently well established to justify the investment in such special machines.

It must be determined whether the added original cost and greater cost for repairs are justified when to this must also be added the more expensive tool equipment and longer time required for setting up. In considering the cost for repairs, the conditions to be borne in mind are the greater danger of a breakdown and the greater skill required to keep the machine in running condition.

The fact that, in operating automatically controlled machines, the human factor is less in evidence than is the case in hand operated machines, makes it possible generally to employ less skilful workmen without lowering the quality of the work. On the other hand, the use of automatically controlled machines increases the need of skilful supervision and of skilled men for their construction and repair.

The features most prominent and essential in the automatic control of machine tools can be classified as follows:—Spindle drives; means for inserting and removing the work; feeding mechanisms; indexing mechanisms; controlling means for the various mechanisms.

Spindle Drives

Features of automatically controlled spindle drives may be classified as speed change, reversal, stopping.

Speed Change.—In automatic turret machine work it is often important to have more than one spindle speed available during the operation on a given piece of work, in order that time may be most fully economized.

The automatic change of spindle speeds on machines having a constant speed motor drive is usually provided for by gearing controlled by the mechanism of the machine. Fig. 1 shows the front view of an automatic turret lathe embodying this feature. In this construction any one of eight changes of spindle speed can be automatically obtained, the changes being made by means of an intermittently revolving drum carrying dogs which shift levers 1, 2 and 3 as desired. Levers 1 and 3 control clutches to engage gears giving four speeds, and the number of speeds so obtained can be doubled by the operation of lever 2 which either clutches direct to the spindle for the fast range of speeds or connects through differential gearing for a slower range of speeds. The dogs on the drum may be so set as to bring the levers into idle positions, thus disconnecting the gearing.

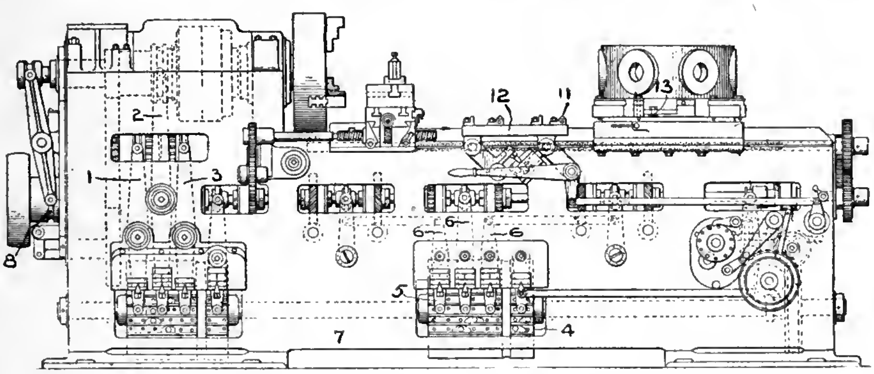

FIG. 1. AUTOMATIC LATHE WITH VARIABLE SPEEDS AND FEEDS CONTROLLED BY DOGS ON DRUMS—GISHOLT MACHINE CO.

In types of machines such as cutting-off machines or those on which squaring-up operations are largely performed, a gradual and continuous change of spindle speed is desired. A means for automatically accomplishing this is shown in Fig. 2. The automatic shifting of the belt on the tapering cones gives the desired change of spindle speed. Cam 1 is connected by gearing to the tool carriage of the machine and controls the traverse of the belt shifter 2, so that by providing the required accelerating lead to the cam, a constant cutting speed is obtained.

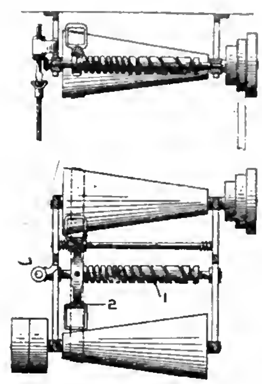

FIG. 2. COUNTERSHAFT FOR CUTTING-OFF MACHINE TO GIVE CONSTANT CUTTING SPEED.

Reversal of Spindle.—In designs of machines where the threading or other operations require a reversal of the spindle, this is automatically accomplished in various ways, an example being shown in Fig. 3. From the constant

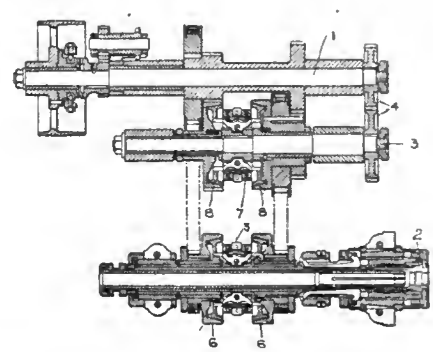

FIG. 3. CONSTANT SPEED DRIVE FOR SCREW MACHINE PROVIDED WITH AUTOMATIC REVERSE AND SPEED CHANGE. BROWN & SHARPE MFG. CO.

*Presented at the annual meeting of the American Society of Mechanical Engineers, December, 1915.

speed shaft 1, the spindle 2 is driven in either direction and at various speeds, the control being automatic for direction and for one change of speed. Other changes of speed are by means of change gears 4. The reverse is obtained by shifting thimble 5, engaging respectively friction clutches 6 connected by chain and sprocket with the oppositely revolving shafts 1 and 3. The shifting of the thimble is by means of a lever operated by a cam on an intermittently revolving shaft. The intermittently revolving shaft is in turn set in motion by a trip lever operated by dogs on a continuously revolving disk. The automatic change of spindle speed is by means of thimble 7 engaging respectively clutches 8, also operated by lever connection to a cam on an intermittently revolving shaft.

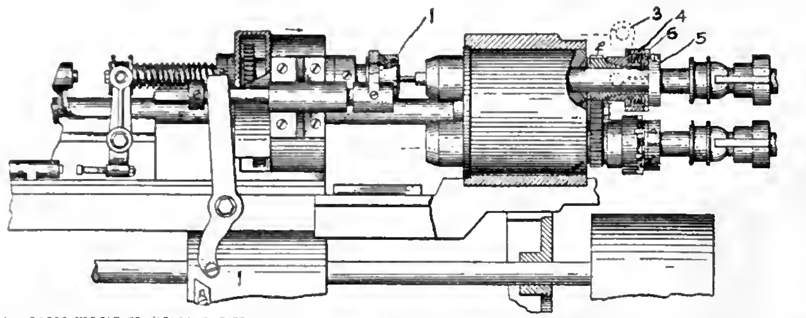

FIG. 4. MULTIPLE SPINDLE SCREW MACHINE WITH MEANS FOR AUTOMATICALLY STOPPING THE SPINDLE. NATIONAL ACME MFG. CO.

Automatic stopping of the spindle is required for various kinds of work. Some screw machines are so designed as to unthread the die or tap by stopping the work spindle to run the die or tap off after the threading operation. Sometimes the spindle is stopped to perform a milling, cross drilling or similar operation, and sometimes to save time in removing and replacing work when this is a hand operation.

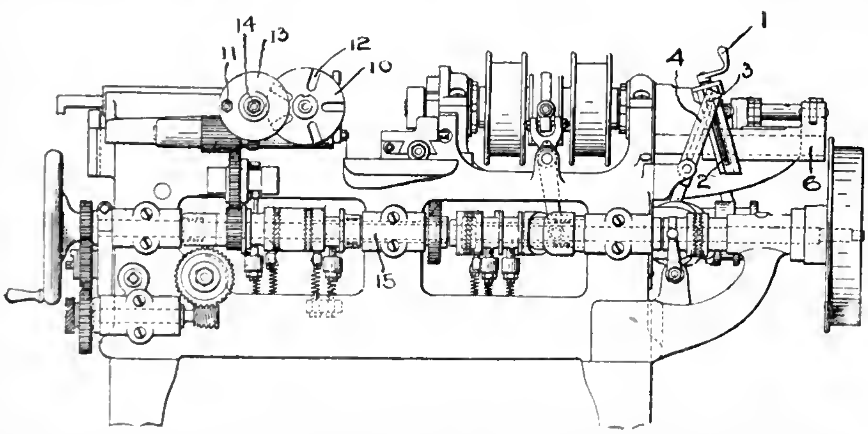

FIG. 5. AUTOMATIC SCREW MACHINE SHOWING FEEDING AND INDEXING DEVICES, ALSO USE OF CONTROLLING SHAFT, BROWN & SHARPE MFG. CO.

An automatic screw machine having the feature of stopping the spindle for the purpose of threading is illustrated in Fig. 4. The revolving tap or die spindle is shown at 1, and when each successive work spindle is brought in line with it, a clutch on the constantly revolving gear 2 is disengaged by the lever 3 operated by a cam through a series of levers. This lever 3 engages a sleeve 4, which is normally in spring pressed engagement with gear 2, disengaging same from gear 2, and engaging it with collar 5, which is fast to the spindle and which constitutes a brake to stop the spindle from revolving.

Inserting and Removing the Work

Means for Feeding and Holding Bar Stock.—Bar feeding devices have in a general way followed the lines of the hand operator Parkhurst feed, brought out in the shops of the Pratt & Whitney Co., about 1871. The use of feeding fingers and roller feeds, in the latter case necessarily feeding against a positive stop, are forms of development which have since followed. In the former case graduated levers or scales determine the distance the stock is fed.

An illustration is shown in Fig. 5 of an automatic feeding device which can be adjusted so as to feed any required distance from zero to the full traverse of the machine. By means of the crank 1, the screw 2 adjusts a nut carrying a block 3, so that the motion of the lever 4 operated by a cam may give any desired feed to the slide 6, and thus to the feed tube, the setting being to a graduated scale. At the forward end of this feeding tube are feeding fingers to engage the bar of stock to feed it forward.

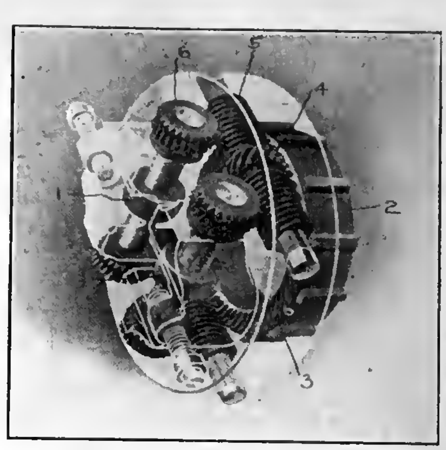

FIG. 6. ROLLER FEED. JONES & LAMSON CO.

After the stock is gripped by the chuck by means of chuck levers operated by a cam, the feeding fingers are retracted ready for the next operation. By means of a special device, the machine can be stopped when the bar of stock becomes exhausted.

A well-known design of the roller principle for feeding the stock is shown in Fig. 6, where the rollers 1 engage the bar of stock and feed it forward against a stop. The driving means for the rollers consists of the circular rack 3, on the intermittently revolving ring 2, which, when held stationary, revolves the gear 4, which in turn revolves the worms 5, and the worm wheels 6, the latter being fast on the shafts carrying the feed rollers.

Inserting and Removing Chucked Work

This may be considered through successive stages from the hand-operated method of the Fay automatic lathe, where the work, when it is to be finished on an arbor, is driven on one arbor by the workman so as to be ready to replace the piece being operated on when that is finished, the automatic feature in this

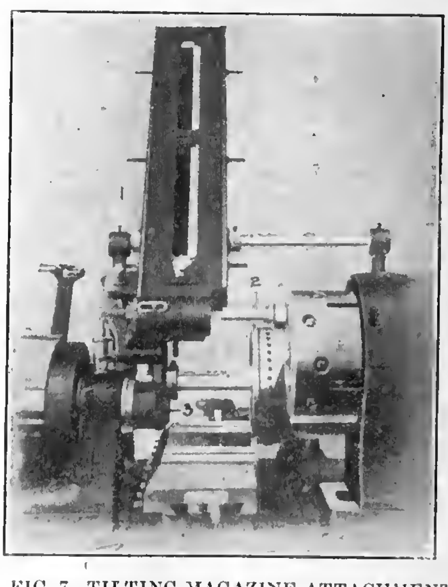

FIG. 7. TILTING MAGAZINE ATTACHMENT —CLEVELAND AUTOMATIC MACHINE CO

case being the stopping of the spindle, as already described.

Magazines for handling work to be chucked automatically have developed along many lines. Fig. 7 shows a tilting magazine attachment with the magazine 1 in position, so that the conveyor 2 can advance to take a piece of work. After the piece of work is taken by the conveyor, the magazine tilts up out of the way of the turret tools. The conveyor 2 then brings the piece in line with chuck 3 and deposits it in same. The conveyor is free to revolve so as to facilitate the pressing of the work into the revolving chuck. An ejector inside the spindle removes the work when completed.

A form of hopper for feeding studs into the rear end of the spindle is shown in Fig. 8. This might be called a reservoir magazine, as it has a widened upper portion to carry a large number of pieces. An agitator 1, operated by a lever 2, makes the feeding sure. The frame 3 is adjustable for different lengths of studs. The studs are fed positively into the back end of the spindle by the rod 4.

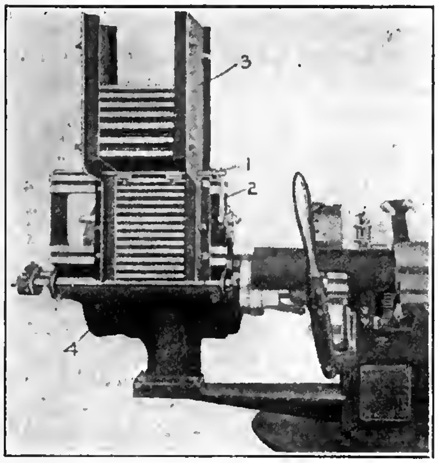

FIG. 8. VERTICAL HOPPER MAGAZINE—CLEVELAND AUTOMATIC MACHINE CO.

Large or irregular work presents many difficulties in automatic chucking, and hand methods are usually resorted to for such work. In some cases, however, automatic means have been devised for the chucking operation.

Even when placing the work in the chuck by hand, automatic devices can be made to assist in many ways. Fluid or pneumatic means can be employed for gripping the work, and this can be so applied as to reduce the pressure for the finishing cut, still maintaining sufficient to hold the work securely, but without risk of distortion. Means for automatically ejecting the work can also be applied.

Transferring Work for Secondary Operations

It is a common practice to transfer work from the main spindle to an auxiliary spindle or holder, after part of the operations have been performed, for additional operations such as milling, cross drilling, etc.

Fig. 9 shows a transfer holder in use for slotting the heads of screws. The transfer arm 1 is swung by the rock shaft 2 so that the hole 3 is in line with the work 4 in the main spindle and engages same before the work is severed from the rod. After the work is severed, the arm 1 is swung to the position shown in the illustration. The rock shaft 2 is then fed longitudinally toward the saw 5, both this motion and the rocking motion being imparted by cam action.

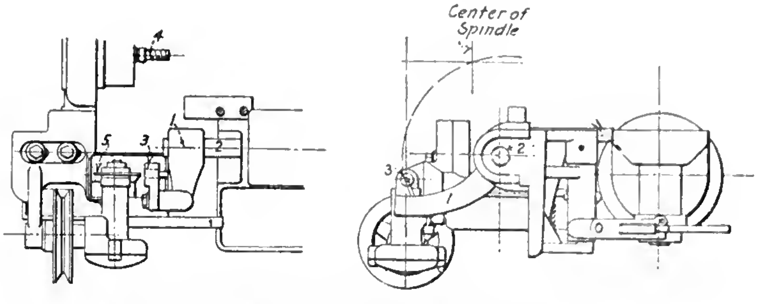

FIG. 9. TRANSFER ARM FOR SECONDARY OPERATIONS, BROWN & SHARPE MFG. CO.

The transfer holder can be made to turn the work end for end if desired.

Feeding Mechanisms

Feeding mechanisms may be classified by the methods of controlling the movements by removable strap cams; by permanent cams, and adjustable cams and dogs; by adjustable dogs on drums; by cams specially formed for each job, and by permanently set dogs in combination with adjustable stops. The object to be attained by all these means is to save time by speeding up during the idle movements, and to provide the most efficient feed for each operation of cutting by providing a change of feed which can automatically be made effective during the operation of cutting.

Control by Removable Strap Cams.—This type had its origin in the Spencer machines, first brought out in the early 70's. A recent development of this type of machine and one also designed by Mr. Spencer is shown in Fig. 10. In this machine the stock feeding mechanism, the tool feeding mechanism and the cross feeding mechanism are all operated by adjustable strap cams. In the case of the two former, the straps are on the periphery of drums shown at 1 for the stock feed and at 2 for the tool feeding machanism; in the case of the last, as well as for indexing and locking the turret, they are on the faces of discs (shown at 3 for the cross slide and at 4 for the indexing).

The machines of the Hartford Automatic Screw Machine Co. in the United States, and of the Alfred Herbert Co., England, are among the best known examples of the use of this method of camming.

Control by Permanent Cams and Adjustable Cams and Dogs.—An example of the combined use of permanent cams with adjustable cams and dogs is shown in Fig. 11, where the feed of the individual tool holders 1 is controlled by the

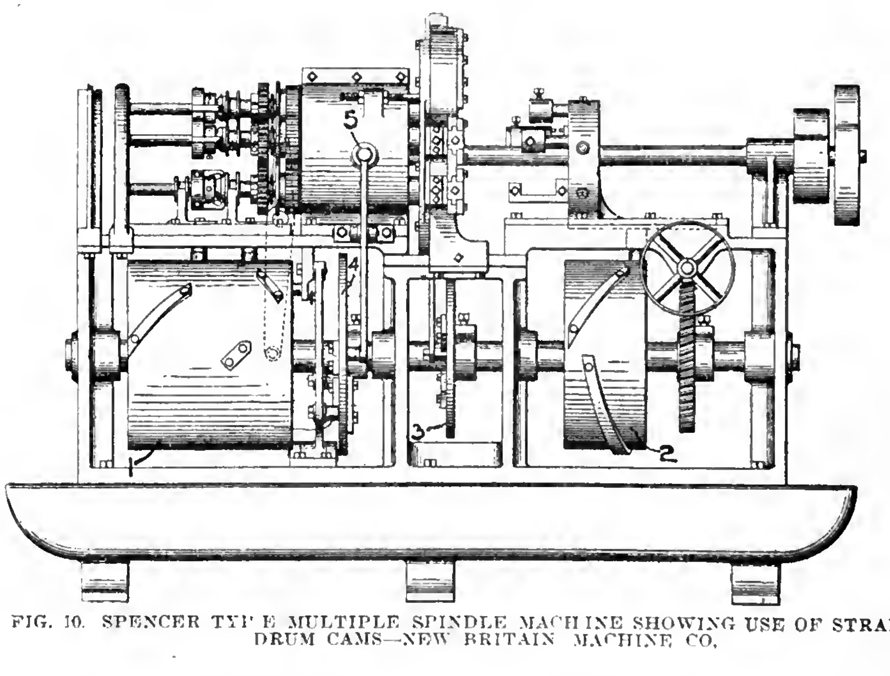

FIG. 10. SPENCER TYPE MULTIPLE SPINDLE MACHINE SHOWING USE OF STRAP DRUM CAMS—NEW BRITAIN MACHINE CO.

permanent cam 2. The rate of revolution of this cam 2 is controlled for varying the feeding movements by an adjustable cam 3 which through roll 4 governs the position of friction wheels 5 between the discs 6. Besides this variable feeding movement, a quick movement of the cam 2 is obtained by action of the cam 7 which operates a double clutch 8 to connect either direct, giving a quick movement, or through the reduction gears 9 for the feeding movement.

The strap cam 10 regulates the cross feed, and this cam also partakes of the quick and slow movements controlled by clutch 8; it thus provides for moving the cross slide forward quickly to the point of cutting and then reducing to the required cutting feed, after which it may be quickly returned so as to bring the rear tool into cutting position following which the feeding movement is again engaged.

Control by adjustable dogs on drums.—The machine shown in Fig. 1 has its movements controlled entirely by dogs on intermittently revolving drums, the only exception being the back facing device which is controlled by a permanent cam 8. For the turret, the feeding is controlled by means of dogs 11 on the hinged carriage 12 engaging adjustable tripping blocks 13 on the turret, providing an independent tripping point for each tool of the turret.

Control by cams specially formed for each job.—The advantages aimed at by this method are the securing of the ideal conditions as to rate of feed, etc., for each operation, and the minimum time for idle movements, and being able to duplicate readily these results for the same job at any future time, the cams being marked and preserved for this purpose.

The cam operated turret feed mechanism of such a machine is shown in Fig. 12. The advance feed is obtained by the cam 1 operating through the segment lever 2 to feed the turret slide 3. The return motion is accelerated by the revolution of the crank 4 bringing the turret back quickly an amount equal to the throw of the crank. The cross feed slides, which are independent of each other, are also operated by special cams adapted to each particular job.

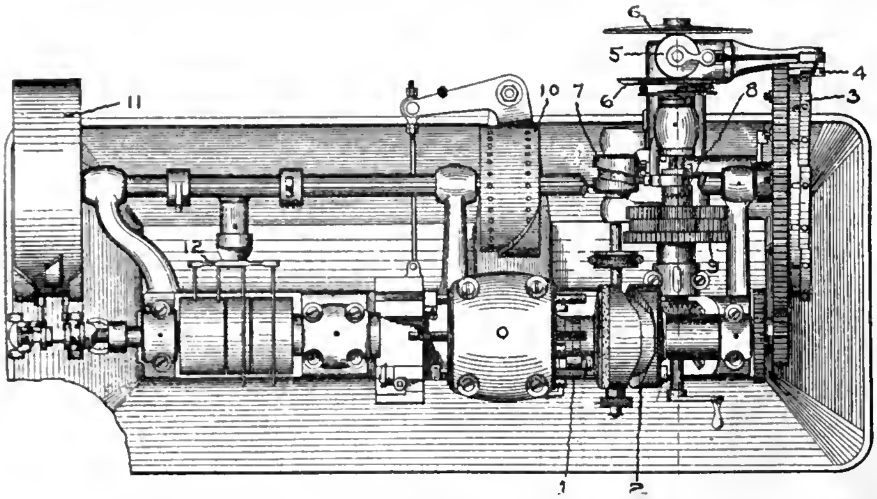

FIG. 11. SHOWING CONTROL BY PERMANENT CAMS AND ADJUSTABLE CAMS AND DOGS. CLEVELAND AUTOMATIC MACHINE CO.

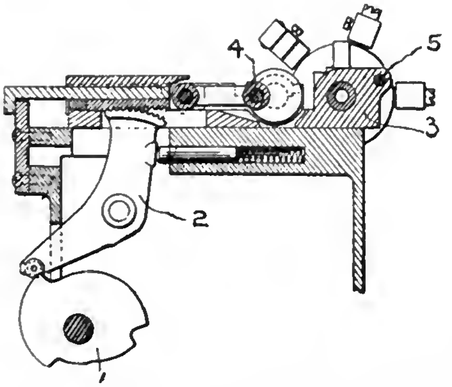

FIG. 12. FEEDING OF TURRET SLIDE BY CAM SPECIALLY FORMED FOR THE JOB. ADDITIONAL QUICK RETURN DEVICE. BROWN & SHARPE MFG. CO.

In a machine for high speed work it becomes important, both in securing the desired speed and in avoiding objectionable shock, to move and reverse the lightest possible parts. For this reason, machines having turrets of the "revolver" or "barrel" type, in which each spindle can be fed independently, are specially adapted to high speed work. In such machines each tool carrier is connected successively with a reciprocating feed slide, and only the feed slide with one of the tool carriers connected therewith requires to be reciprocated for the feed and return movements. Fig. 11 shows a machine of this type. In order to "speed up" still further this type of machine, the use of an auxiliary slide has been resorted to. this auxiliary slide alone being moved during that part of the quick return movements required to retract each tool and even this being disconnected for the remainder of the return movement, thus avoiding the shock which would result from the rapid movement of these slides.

Control by Permanently set dogs in combination with adjustable stops.—This is a feature of the Bullard Mult-au-Matic vertical lathe, Fig. 13. In this machine the workman inserts and removes the work at one station or indexed position of the machine, while tools in the remaining positions are performing successive operations on other pieces. The rods 1 and 2 carry dogs which engage stops on the frame of the machine and trip respectively the advance and return feed movements. The quick traverse motion, which, in addition to retracting the tools quickly, can also bring them quickly forward to the point of cutting, is operated through gears 3 and 4 controlled by clutches. The advance feed for cutting is through bevel gears 5 and change gears connecting shafts 6 and 7, the worm 8 on the shaft 7 driving worm-wheel 9. These two trains of mechanism

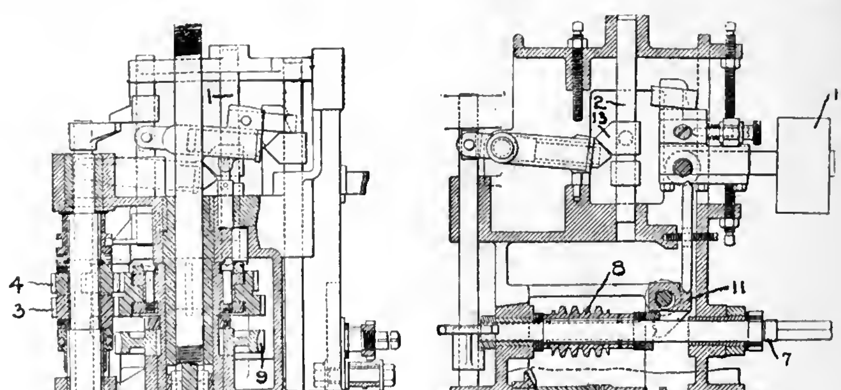

FIG. 13. TOOL DEVICES HAVING THE FEATURE OF TRIPPING THE FEED IF PRESSURE ON TOOL BECOMES EXCESSIVE. BULLARD MACHINE TOOL CO.

give the desired advancing and retracting movements through connection with screw 10.

Indexing Mechanisms

Under indexing mechanisms are here treated: (a) Method of revolving turret; (b) Method of locking and clamping turret, and (c) Rectifying the indexing.

Method of Revolving Turret.—A well-known method of indexing automatic turret machines is by the use of the principle of the Geneva stop. This has the advantage of giving a slow starting movement gradually, accelerating and slowing down before reaching the stopping point, thus securing rapid indexing and at the same time avoiding shock. An illustration is shown in Fig. 5 where the turret 10 is indexed by the engagement of a pin 11 in the slots 12, the disk 13 carrying the pin being intermitently revolved on the shaft 14.

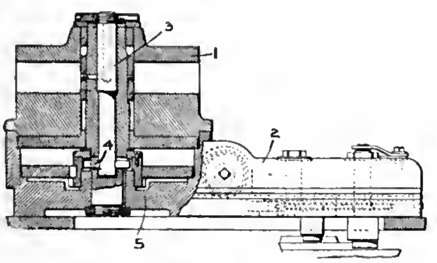

FIG. 14. CLAMPING DEVICE FOR TURRET. POTTER & JOHNSTON MACHINE CO.

Methods of Locking and Clamping the turret.—It has been the general practice in turret machines to have a locking pin to automatically engage to insure the accurate alignment of the turret with the spindle and to hold the turret firmly in position while the tools are operating. Such locking pins are shown at 5, Fig. 10, and at 5, Fig. 12. In addition to the use of a locking pin, a further clamping device is often used which automatically clamps the revolving turret securely to the slide or bed and unclamps it before the next indexing.

An example is shown in Fig. 14, where the turret 1 is clamped to the turret slide 2 by the central stud 3 which is forced downward by a camming action on the projecting lugs 4. This camming action is produced by the revolving of gear 5, this gear in turn being acted on by a rack controlled by dogs acting at the desired point of the return motion of the turret slide. The locking pin for the turret is also operated from this same rack, and thus is timed with the clamping device.

Means for rectifying the indexing.—In multiple spindle machines it is more difficult to secure accurate indexing and thus produce accurate work than in single spindle machines, because of the mechanical difficulties of constructing the machine. It is difficult to bore the spindle carrying head and mount the spindles in it so that they will be equally spaced and equidistant from the centre. To overcome such inaccuracies as are due to this cause, rectifying stops have been employed as shown in Fig. 15, one for

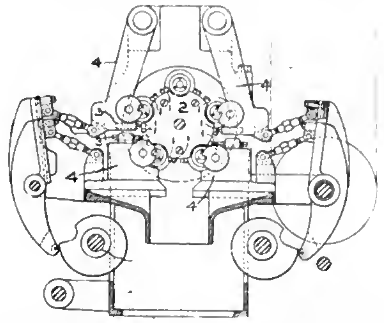

FIG. 15. MEANS FOR RECTIFYING THE INDEXING OF MULTIPLE SPINDLE MACHINE. DAVENPORT MACHINE CO.

each cross tool carrier. These consist of a series of pins 1 projecting from the disk 2, which disk is secured to the front end of the spindle head. These pins are engaged by co-operating stops 3 on the tool carriers 4, and are made so that the cutting edges of the tools carried by the tool carriers 4 will be exactly the same distance from the centre of each spindle when the pins and their co-operating stops are engaged, thus tending to counteract the inaccuracy above referred to, or any which may result from wear in the machine.

Controlling Means for the Various Mechanisms

Aside from the ordinary practice in directly controlling the various movements of an automatic turret machine, Mr. Flanders in his paper before the International Congress at San Francisco, last year, pointed out that the use of a controlling shaft or, as he terms it, a "lay shaft," constitutes a separate type of control. A machine with this type of control is shown in Fig. 5, where the shaft 15 drives the various mechanisms, except the spindle, and by means of clutches controls their operations.

The shaft 7 in Fig 1 may also be said to be another type of controlling shaft, as through the interposition of dogs and levers it controls the various operations of the machine although it does not drive them. It is an application to what Mr. Flanders terms the screw feed type of machine. The Bullard machine, Fig. 13 is also of this type.

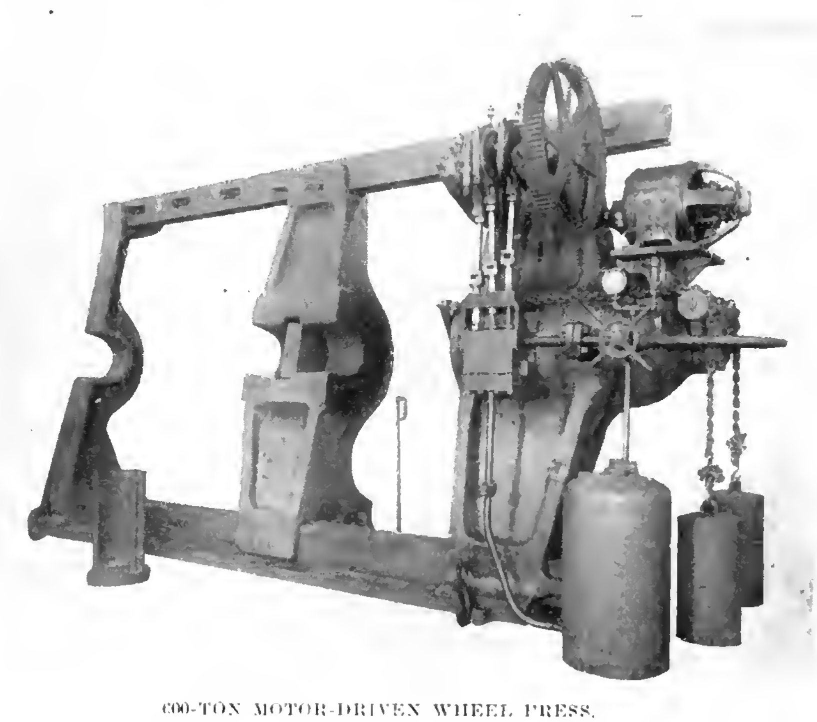
SIX HUNDRED TON WHEEL PRESS

A WHEEL press for operating on locomotive driving wheels is shown in the accompanying illustration. This machine is of ample size and strength to handle work of the heaviest class, the ram exerting a total pressure of 600 tons while the vertical space between the tie bars in 96 inches.

Four adjustments are provided for the resistance post which is carried on rollers running on the lower tie bar which forms the bed of the machine. This post is traversed when necessary by means of the hand lever shown next it.

The press, at the right hand end, carries the ram, along with a triple plunger air pump, and a 15 horse-power motor. The pump is connected to a filling tank, supplying the air at 80 lbs. pressure, per sq. in. Large counter weights are used for drawing back the ram.

Complete with base, the press weighs 50,000 lbs. and is built by the Southwark Foundry and Machine Co., Philadelphia., Pa.



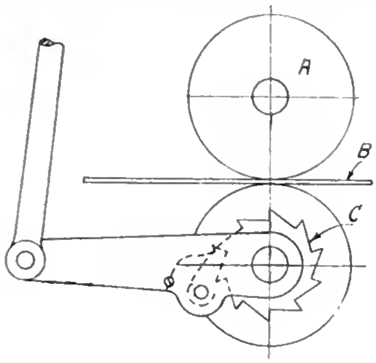
600-TON MOTOR-DRIVEN WHEEL PRESS.

Series of Practical Questions and Answers for Mechanics

Every care is being taken to include only pertinent practical questions, and give same direct, reliable answers. Catch questions will be avoided. Arithmetic, consisting of simple addition, subtraction, multiplication and division will be found a useful companion study.

Question.—In the sketch shown, what should be the diameter of the feed rolls A, to advance the strip B, one inch for each notch of the ratchet wheel C; the pitch diameter of the gears being 3 inches?

Answer.—As there are ten teeth in the ratchet wheel, the circumference of

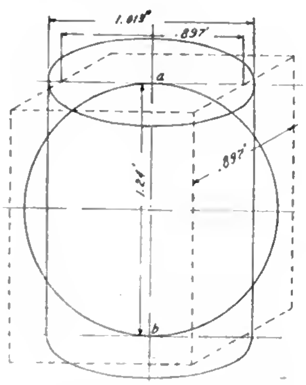


the feed rolls will be 1 × 10 = 10 in. Therefore, the diameter of each roll should be 10 ÷ 3.1416 = 3.119 inches.

* * *

Question.—What shape tank will contain the largest quantity of liquid with the least possible material?

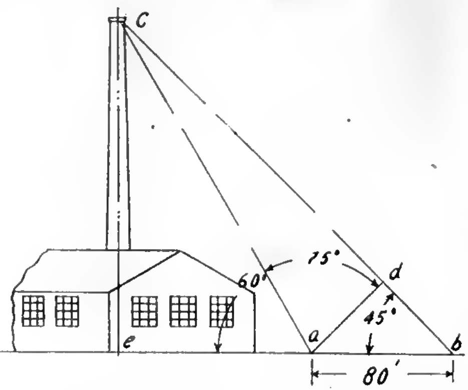
Answer. — Without taking into consideration the seams or joints the sphere has the greatest volume for surface exposed, or in other words the material used to hold the contents. The comparative sizes of a sphere, cylinder and square prism of equal heights, each of which will contain one cubic foot, are



shown in the accompanying sketch. The sphere, with a volume of 1 cu. ft., has a diameter of 1.24 ft. and a surface of 4.83 sq. ft. The cylinder with a height of 1.24 feet has a diameter of 1.013 feet and a total surface of 5.56 sq. feet. The square prism with a height of 1.24 ft. has a side of .897 feet and a total surface of 6.063 sq. feet.

Question.—How can the height of a chimney or high object be determined?

Answer. — This can be found from observation and calculation of angles, as shown in the sketch. By taking observations from two points at a known distance apart, it is possible to solve by trigonometry the desired height. For instance, to find the height of the chimney shown; suppose from the point (a) it is found that a 60 degree inclination will cut the top of the stack. We will assume that at the point (b), eighty feet away, in a direct line from the chimney or object being observed, a sight line of 45 degrees inclination, also cuts the top of stack. Now to find the height c e it is necessary to solve the triangle a b c. To do so it is necessary to form two right triangles by drawing the line a d perpendicu-



lar to the line b c. To find the length of the sides of a right triangle, the two acute angles being equal or 45 degrees, you extract the square root of one-half of the square of the diagonal or hypotenuse, thus:

$$b\ d = \sqrt{\frac{(a\ b)^2}{2}} = \sqrt{\frac{80^2}{2}} = 56.568 \text{ ft.}$$

This is also the length of the line a d.

To find the length c d, use the formula side opposite = side adjacent × tangent or c d = a d × tan. of angle of 75 degrees = 56.568 × 3.73205 = 211.115 ft. Then b c = 56.568 + 211.115 = 267.683 feet. We now have the right triangle c e b, with the length c b known; therefore, c e will equal $\sqrt{\frac{(c\ b)^2}{2}} =$

$$\sqrt{\frac{267.683^2}{2}} = 189.28 \text{ feet, the height}$$

of chimney.

* * *

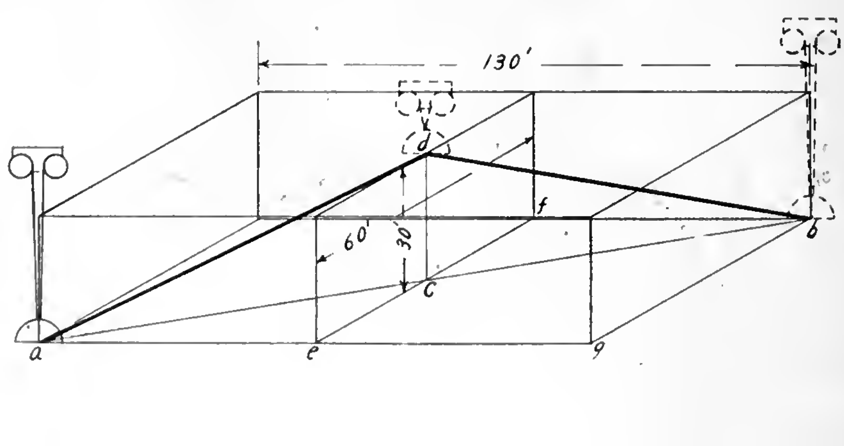
Question.—What weight can be raised by a screw jack, with a ¼ inch pitch screw, a force of 50 lbs. being applied at the end of a 30 inch lever, friction being taken at 5 per cent.?

Answer.—During each revolution the work expended would be equal to the pressure applied multiplied by the distance through which it moves, or 50 × 30 × 2 × 3.1416 = 9424.8 inch lbs. Therefore, the weight raised would be the work expended divided by the height raised, or 9424.8 ÷ .25 = 37699 lbs. or about 19 tons.

* * *

Question.—A weight is picked up by a crane from the floor at one corner of a shop and transmitted to the opposite end and corner in ¾ of a minute. During its progress across the shop it is elevated to a height of 30 feet. If the shop is 130 feet long and 60 feet wide, what is the average velocity of the weight in feet per second?

Answer.—If the motion of the weight is constant, that is, moving in the three directions at the same time, the path of the weight will be over the heavy line a d b, therefore, it will be necessary to find the length of this line. The plan of this path will be the diagonal a b. To find the length of this line we extract the square root of the sum of the square of the length and the square of the width, or $a\ b = \sqrt{(a\ g)^2 + (b\ g)^2} = \sqrt{130^2 + 60^2} = \sqrt{20500} = 143.178$ feet. Then a c will equal 143.178 ÷ 2 = 71.589 feet.



Then a d will equal the square root of the sum of the square of a c and the and square of cd, or $\sqrt{71.589^2+30^2} = \sqrt{6024.9849} = 77.62$ feet. The distance passed over by weight will therefore be $77.62 \times 2 = 155.24$ feet.

The velocity in feet per second will be the space divided by the time, or

$$\frac{155.24}{\frac{3}{4}\text{ of }60} = \frac{155.24}{45} = 3.45 \text{ ft. per sec.}$$

* * *

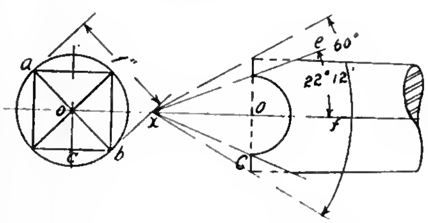
Question. — What chemical treatment is used in the re-sharpening old files?

Answer.—The files are first cleaned of loose grit and then boiled for nearly an hour in a solution of ¼ lb. of saleratus to a quart of water. After thoroughly washing in clear water, they are submerged, in a vertical position, in an acid solution of ¼ lb. of sulphuric acid to a quart of water, and allowed to remain for about 12 hours. After removal and washing in clean water they are then given a thin coating of oil to prevent rusting.

* * *

Question.—On page 84 of the January 27 issue of Canadian Machinery there appeared a "Round Shaft Query". which brings to mind a similar problem on the milling of square centers. When milling a four sided square centre to retain a cutting angle of 60 degrees what angle of inclination is necessary?

Answer.—The triangle formed by a central section of a 60 degree center would be an equilateral triangle; therefore the slanting length would equal the



diameter of the stock. With a diameter of one inch, the distance x o would be found from the formula $\sqrt{\text{hypotenuse}^2 - \text{side}^2}$, or $\sqrt{1^2 - .5^2} = \sqrt{.75} = .866$ inch.

As the triangle o c b is a right triangle with two 45 degree angles, the length of one side can be found by the formula,

$$\text{side} = \sqrt{\frac{\text{diagonal}^2}{2}} = \sqrt{\frac{.5^2}{2}} = \sqrt{.125} = .3535 \text{ inch.}$$

Then by formula:

$$\text{tangent} = \frac{\text{side opposite}}{\text{side adjacent}} = \text{tangent of}$$

$$\text{angle } o\,x\,c = \frac{.3535}{.866} = .40819,$$

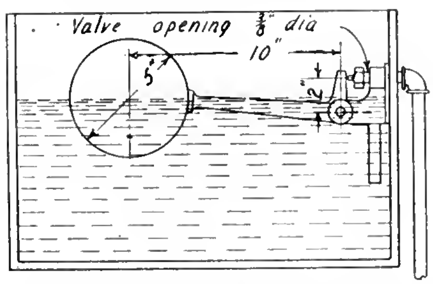
and corresponding angle equals 22 degrees 12 minutes.

Question.—I have sometimes seen a mechanic pass a drill over a flame a few times before using. What would be the purpose of this operation?

Answer.—In many instances hardened steel is extremely brittle when cold, and it is generally speaking good practice to warm a carbon or high speed drill or reamer before using. Such a proceeding often prevents breakage, and in fact high speed drills invariably operate much better when warm, often performing the best work when blue chips are produced from the heat generated. The efficiency of a twist drill is sometimes seriously impaired by suddenly plunging it into cold water after being heated from grinding or drilling. Such a practise may result in a number of small invisible cracks developing, to be followed later by a break.

* * *

Question.— (a) Neglecting the weight of the ball and lever, what is the pressure exerted on the valve spindle shown in the sketch, when the ball is half submerged?



(b) What would be the reacting pressure per sq. inch if the valve opening had a diameter of ⅜ inch.

Answer.—(a) The water displaced by the half submarged ball will be

$$\frac{5^3 \times .5236}{2} = 32.725 \text{ cu. in.}$$

Weight of this volume of water will be $.03617 \times 32.725 = 1.184$ lbs. Then the pressure on the spindle will be

$$\frac{1.184 \times 10}{2} = 5.920 \text{ lbs.}$$

(b) The area of the valve opening will be $(\frac{3}{8})^2 \times .7854 = .1104$ sq. in. and the reacting pressure will be $5.92 \div .1104 = 54$ lbs. per square inch.

A MILLING FIXTURE

By D. S. Mann.

THE fixture shown in Fig 2 was designed for milling the sides of the bosses of the drop-forged rocker arm, shown in Fig. 1. To facilitate this work both

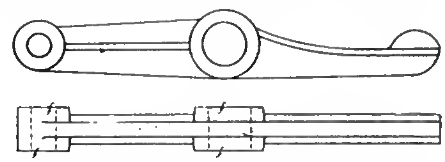


FIG. 1—DROP FORGED ROCKER ARM

bosses were made of the same length. To the base A is bolted the steel upright C, in which are cut the two vees for carrying the rocker arm; it being necessary to mill a groove through the centre for the rib clearance. The width of this upright must, of course, be slightly less than the length of the bosses. The piece is held in position by the steel arm B, which is pivoted at the other end and held away from the work when released by the spring S. The clamping effect is obtained from the hand-operated eccentric H. This makes a very quick-operating fixture, and one which is quite rigid and at the same time simple and fairly cheap to construct.

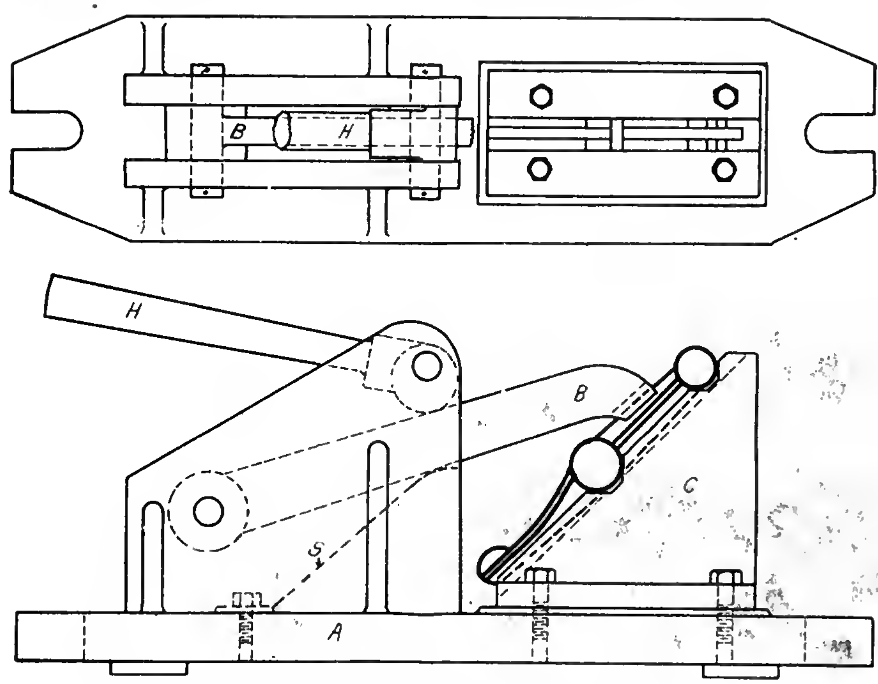

FIG. 2.—MILLING FIXTURE FOR DROP-FORGED ROCKER ARM

PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

TWO THOUSAND TON EXTRUSION PRESS

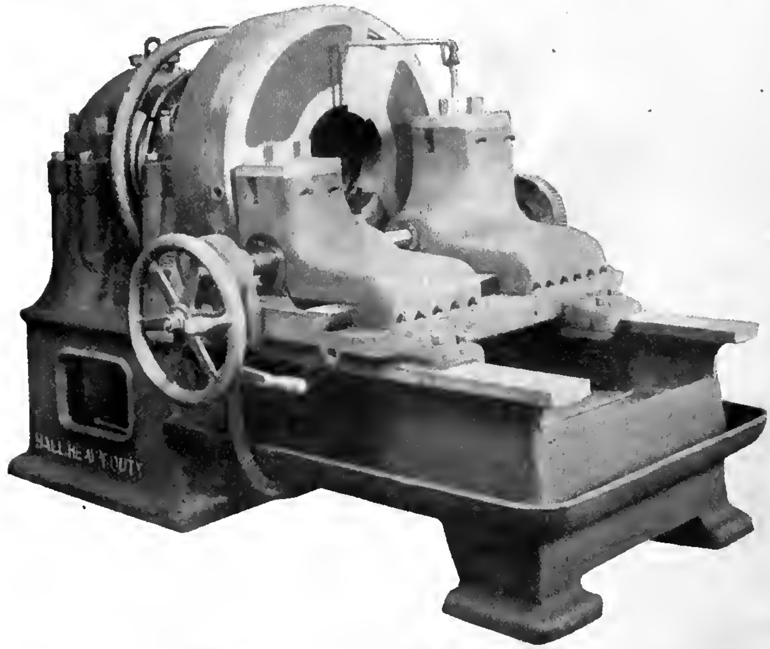
THE press illustrated herewith is designed for the purpose of producing extruded rods. It is a product of the Southwark Foundry & Machine Co., Philadelphia, Pa., and is so designed that, when operated with their system of control, rapid production is obtained with a minimum expense for power and toll replacement.

The machine as shown is arranged for extruding 5¾ in. diameter billets, 25 in. long, weighing about 200 lbs. each, and will extrude up to 30 billets per hour, according to the ability of the operator. It is mounted on a cast iron bed plate, and is of the four column type, with a clear distance between columns of 42 in. horizontally and 38 in. vertically.

All of the parts are either steel castings or forgings except the main ram and some minor parts which are made of close grained cast iron. The pressure cylinder is of forged steel and is provided with a jacket of cast steel. Between the pressure cylinder and jacket, an open space is provided through which the heated gases from the fire place arranged beneath the pressure chamber can pass, thus maintaining the temperature of the pressure chamber at the required degree.

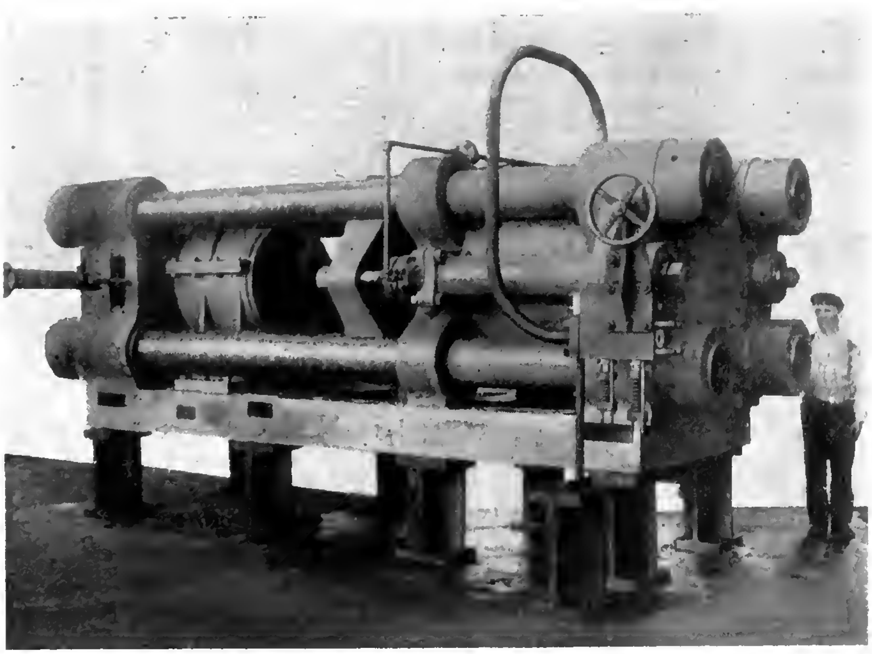
During the process of extrusion the walls of the pressure chamber are subjected to a high temperature, which, along with other conditions, demands the use of metal of an exceptionally high-grade. Numerous installations have proven the suitability of the metal used for this purpose.

A hydro-pneumatic tank is furnished with this press from which low pressure water is supplied to the main ram during the idle portion of the stroke, at the end of which the working pressure of 4,000 lbs. per sq. in. is employed. The use of an accumulator of ample capacity has a beneficial effect on the life of the dies and containers compared with operating directly from a pump. With this method in use, no annealing is required, and only one draw is necessary to finish the extruded rods.



HEAVY DUTY CUTTING-OFF LATHE.

A cast iron table 50 ft. long, is furnished to support the extruded rods, and between this table and the back head of the press, a 30 ton cutting-off press is arranged for cutting off the ram stump of the billets from the die block. The stroke of this press is long enough to draw hot copper tubes after the concontainer and container castings are removed.



2,000-TON EXTRUSION PRESS.

HEAVY DUTY CUTTING-OFF LATHE

THE accompanying illustration shows a High Speed, Heavy Duty Cutting-off Lathe which has been especially designed for work on large shells, ingots, and bar stock. The machine has a capacity of from 6 in. to 12 in. and the bed which is of the box lathe type possesses sufficient weight and strength to provide ample rigidity under severest working conditions.

The front part of the bed is cast with a solid bottom, which catches all the cuttings, and is inclined so as to allow the cutting lubricant to drain into a

reservoir of about one-quarter barrel capacity, cast integral with the bed in rear of machine.

The spindle is very heavy being 15 in. diameter with a 10½ in. long front bearing, and a 9½ in. long rear bearing. The bearings are of cast iron, removable and interchangeable, and are carried in supports cast solid with the bed. This feature removes all possibility of separate parts working loose under the continued strain and vibration involved in non-stop work at full load. The hole through the spindle is large enough to pass 12½ in. diameter.

Driving gears are of extra wide face, and all are made of steel except the large drive gear which has 5¼ in face and is made of gray iron. This gear is bolted direct to the driving chuck.

A three jaw independent chuck of extra heavy proportions is fitted. The jaws have wide bearings, removable interchangeable tool steel facings and phospor bronze nuts for the tightening screws to work in. Directly behind the front bearing is a universal scroll chuck, operated by a large hand wheel, for the purpose of supporting and centering the rear end of shell forgings, or bar stock.

The carriage is of massive construction, with long bearings on the bed, and is made so that it can be either bolted and locked to the bed, or clamped with the gibbs as required. It carries two tool blocks gibbed to the cross slide and fitted with heavy bronze nuts for the operating screw to work in. Tool slots in blocks will take 1½ in x 3 in. tools, but smaller can be used in preferred.

Feed screw is 2 3-16 in. diameter and is power operated through a worm wheel and clutch at the back end, the clutch being controlled by a feed lever near the hand wheel. The power feed is geared direct to the drive shaft and provision is made for altering the gear ratio to suit various conditions of work.

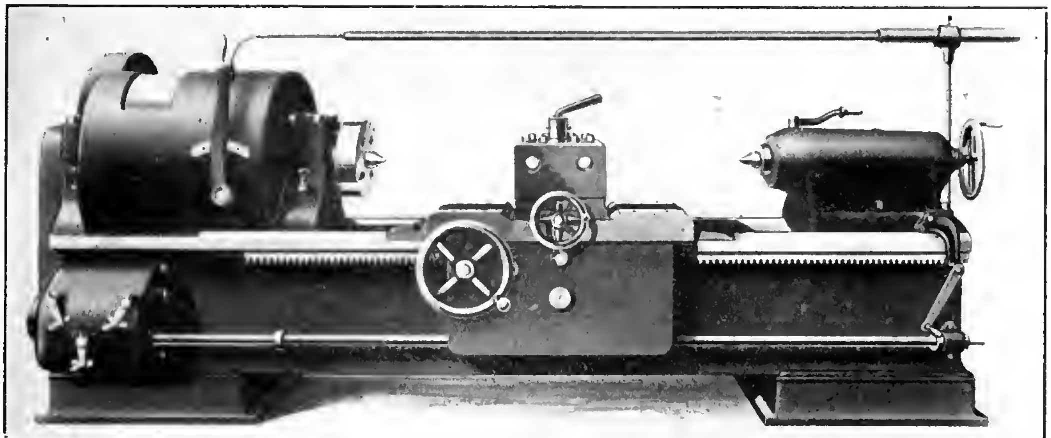
The machine is complete in every respect, including lubricant pump etc. Three speeds are obtained through the countershaft which carries three tight and three loose pulleys, the latter being provided with compression grease cups. At an extra cost, the machine can be equipped to make one, two, or three cuts separately or simultaneously.

John H. Hall & Sons, Ltd., Brantford, Ont., are the makers of this machine which weighs about 8,800 pounds, requires 10 horse-power, and occupies a floor space 5 ft. 6 in x 7 ft.

26 IN. HEAVY DUTY SHELL LATHE

AN excellent example of a single purpose machine tool is afforded by the 26 in. Simplex lathe illustrated herewith This machine is being marketed by Kellog & Co., Toronto, and is known as a heavy duty, geared head, single pulley drive shell lathe.

It is specially designed for machining shells of the larger sizes, up to and including 12 inch shells. The reduced swing over the vees is 26½ in.; swing over bridge, 15 in.; takes 5 ft. between centers on 12 ft. bed; weight of plain lathe crated, 13,500 lbs. approximately.



26-IN. SINGLE PURPOSE HEAVY DUTY GEARED HEAD SINGLE PULLEY DRIVE SHELL LATHE.

Four speed changes are available through the geared head and countershaft, a positive drive dog tooth clutch being incorporated in the head stock design. The drive pulley, 23 in. dia x 7¼ in. face runs at 400 revs. per minute, and transmits the power through steel gears running in oil, having gear ratios of 26½ to 1, and 18 to 1. All gears in head stock are bronze bushed, the two main gears being respectively 24 1-3 in. and 22 in. dia. x 4½ in. face, with teeth of 3 diametral pitch.

The hollow spindle is of high carbon steel, hardened and ground, with a 2½ in. hole. It is carried in cast iron ring oiling bearings with large oil reservoirs. Front bearing 8 in dia. x 9½ in. long; rear bearing 5 in. dia. x 7½ in. long.

The carriage has a length of bearing on vees of 42 in. and 15 in. width of cross bridge. Hand feed to cross slide is provided with automatic longitudinal stop to carriage. The shrouded box type of apron provides a double support for each stud and gear, all gears in apron being steel with exception of worm gear which is of semi-steel. A hardened steel worm on the feed shaft transmits the drive to apron gears, the gear reduction being 80 to 1.

A heavy tailstock of the offset pattern is provided with three clamping bolts which tighten the one piece clamp the full length of tailstock. The spindle is 4½ in. dia. x 9 in. travel, and has a double thread screw for quick traverse.

Six changes of feed are supplied, from 1-32 in. to ⅜ in. per revolution, power being transmitted by silent chain from spindle to feed box. All feed gears are steel.

The bed is very heavily constructed with liberal size ribs and two vees, and is planed on the back to receive standard forming attachment.

Double friction clutch pulleys, 18 in. dia., for 7 in. belt, with a main drive pulley, 27 in. dia. x 7½ in. face, are mounted on the countershaft, which should run at 425 revolutions per minute for 8 in. and 9 in. shells, and 362 revolutions per minute for 10 in. and 12 in. shells.

Attachments consisting of a four-hole turret, and forming attachment for interior operations, and four tool turret post with forming and waving attachments are obtainable as required.

MONTREAL - VANCOUVER TELEPHONE

The Bell Telephone Co. at Montreal on Feb. 14, successfully opened the Montreal-Vancouver line, said to be the longest ear-to-ear circuit in the world, 4,227 miles, the New York-San Francisco line, recently opened, being 3,400 miles in length. Lord Shaughnessy spoke to F. W. Peters, superintendent of the C. P. R. in Vancouver; Sir Frederick Williams-Taylor talked to Douglas R. Clarke, at the Vancouver branch of the Bank of Montreal; and Ald. Boyd, of Montreal, congratulated Mayor McBeath of Vancouver, on his election. The telephone line is not direct through Canada, but runs via the following connecting points: Buffalo, Chicago, Omaha, Salt Lake City, and Portland, Oregon. The cost of a conversation from Montreal to Vancouver is $22.15 for the first three minutes, and $6.95 for each additional minute. The cost from Toronto to Vancouver is $20.15 for the first three and $6.30 for each additional minute.

Vol. XV. FEBRUARY 24, 1916 No. 8

ONTARIO REFUSES RUSSIAN 15-PDR. SHELL CONTRACTS

A FEW weeks ago we made official intimation of the fact that the Imperial Munitions Board had acquired from the Canadian Car & Foundry Co., of Montreal, for distribution among Canadian shell manufacturers, a block of half a million Russian 15-pdr. high explosive shells, at a price for machining of $1.85 per shell, providing individual quantity contracts placed were fulfilled by the end of July, this year. From interests quite close to shell making, inspiration of refusal to have anything to do with this particular projectile emanated and had the tendency to, and incidentally resulted in the Imperial Munitions Board and the Canadian Car & Foundry Co. being placed in an altogether unfavorable light. The former's effectiveness as an institution capable of procuring, to the fullest extent possible, a supply of British shell orders — all sizes and types, was impugned, while the latter were made to appear as being only too glad to saddle Canadian shell makers with something that numbers of their sub-contractors in the United States had fallen down on.

We are in a position to state that one-half or 250,000 of the half million Russian shells acquired by the Imperial Munitions Board have been placed in Montreal, two firms there having accepted that quantity between them. Further, the balance, 250,000 Russian 15-pdr. high explosive shells intended for Western Ontario points, has been cancelled as a result of the contract refusal propaganda.

THE NEW TAXATION FOR WAR PURPOSES

THE proposed new taxation for war purposes, disclosed in the Dominion Budget on February 15, is of more than ordinary interest to our commercial and industrial communities, the sources from which the additional revenue will be realized belonging almost entirely to these sections. Taken as a whole, the proposals have met with at least friendly criticism and with what might be termed passive approval, even on the part of those to whom the taxation will make its presence most heavily felt. It was hardly to be expected that any scheme of revenue provision, however carefully devised and worked-out would be unerring in its application and unreserved in its scope; our economic fabric is too diversified in its operation features, and too complex in its individual structure for results to be otherwise.

The most readily apparent weakness or shortcoming is to be found in the proposal to collect a tax of 25 per cent. on the net profits in excess of 7 per cent. since the beginning of the war, from financial, industrial, milling, transportation, public utility and other corporations, also munitions manufacturing concerns. We refer to the capitalization protection. Many of our industrial and commercial enterprises are so "loaded up," so to speak, with capital, and, as a matter of fact, so shy on a much-less-than 7 per cent. net revenue, that the proposed war tax will not even begin to have a look in. Others again, and most of our metal-working plants will figure largely under this latter head, are very moderately capitalized; the natural inference being of course that they will bear the brunt of the new impost.

In the week that has elapsed, increasing attention has been given this capitalization feature, and ere final parliamentary approval is given to the proposals as a whole, we expect to see such amendments incorporated as obviate, making "fish of some and flesh of others." By saying that friendly criticism and passive approval have marked the appearance of the Dominion of Canada Budget for the ensuing year, we refer entirely to the general attitude taken as regards the necessity of meeting our war-time expenditure, and the willingness to do so. Resentment will, however, be quickly aroused if steps be not taken to make impossible from exclusion, or of making a relatively disproportionate contribution, those corporations with heavy capitalization to their credit, and in addition the anomaly of meagre earnings.

ONTARIO GOVERNMENT TO MERGE ITS INDUSTRIAL DEPARTMENTS

NOTICE has been given of an interesting piece of legislation which will be brought forward at the coming session of the Ontario Parliament. It will involve the merging into one department, and under the direction of one responsible head or general superintendent, of the Labor Bureau, Factory Inspection, Steam Boiler Inspection, and Stationary Engineers' License administrations. We understand such a move has been under consideration for some considerable time past, and that the plans for giving effect to the reorganization as outlined are now fully matured. The Parliamentary head of the new establishment will be the Hon. Finlay MacDiarmid, Provincial Minister of Public Works.

The legislation proposed is such as to awaken the keenest interest in industrial circles, embracing as it does the whole wide field of provincial manufacturing and commercial enterprise. Progressiveness may perhaps be the most concise and at the same time sufficiently comprehensive phrase to employ regarding the coming development, and properly recognized as such, little difficulty will be experienced in placing the enactment on the Statute Book.

Heterogeneous fitly expresses the existing conditions relative to labor, factory inspection, steam boiler inspection, and stationary engineers' license departments of the Province of Ontario, and in placing all of them under the wing of the Minister of Public Works, a quite appreciable advance in the direction of greater efficiency cannot fail to be registered. All of the sections involved in the proposed merger can easily be extended in scope, usefulness and efficiency through the appointment and instrumentality of a thoroughly qualified Deputy Minister or general superintendent.

INDUSTRIAL NOTABILITIES

JOSEPH WESLEY FLAVELLE, LL.D., chairman, Imperial Munitions Board; president, William Davies Co., Toronto, Ont.; president, National Trust Co.; director, Canadian Bank of Commerce; vice-president, The Robert Simpson Co.; vice-president, Toronto Penny Bank; director, Imperial Varnish & Color Co.; director, John Murphy Co., Montreal, Que.; director, Harris Abattoir Co., was born of Irish origin, near Peterborough, Ont., February 14, 1858, the son of the late John and Dorothea (Dundas) Flavelle. He was educated at the Public and Grammar Schools in Peterborough, and in early years engaged in the pork packing and provision business with his father there. He removed to Toronto in the year 1887.

Mr. Flavelle is a Councillor of the Canadian Branch, British Red Cross Society; was chairman Toronto Board of License Commissioners, 1905; member International Commission on Bovine Tuberculosis, 1909; is a Governor, Toronto Branch, Victorian Order of Nurses; governor Toronto University; founded a Travelling Fellowship in Classics, Toronto University, 1905; was created

JOSEPH WESLEY FLAVELLE, LL.D.

LL.D., Toronto University, 1906; was chairman of Royal Commission to recommend a plan to reorganize Toronto University; chairman Board of Trustees, Toronto General Hospital; member General Board of Missions, Methodist Church; endowed a Chair in Hebrew, Victoria University; was one time owner of Toronto Daily News, and is a liberal subscriber to charitable and patriotic funds.

Mr. Flavelle's recent appointment to the Chairmanship of the Imperial Munitions Board has opened a new field for the exercise of his nature-endowed administrative qualifications, and incidentally has brought him into close touch with the activities of Canadian metal-working plants engaged in munitions manufacture for the British Government. As was to be expected from his successful business and other experiences, his work on the Imperial Munitions Board bids fair to at least equal, if not surpass, his best previous achievements.

Mr. Flavelle married Miss Clara Ellsworth, daughter of Orrin Hamilton Ellsworth, on September 29th, 1881, his family consisting of one son (J. Ellsworth Flavelle) and two daughters.

His residence is "Holwood," Queen's Park, Toronto; his clubs, the York, Albany, National and Queen City Curling, Toronto, and the Mount Royal, Montreal. His recreations are golf, fishing and outdoor sports generally. In politics Mr. Flavelle is Conservative, and in matters religious a Methodist.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents

Montreal, Que., Feb. 21, 1916.—The general industrial situation shows little change from that of a week ago, although the embargo placed on export shipments by the Pennsylvania Railroad has interfered with shipments to Canada, and caused considerable inconvenience locally. The expected shortage of ocean tonnage during the coming season is causing much anxiety here, as it is feared that the port of Montreal will not benefit by the heavy increase in exports as much as if sufficient tonnage were available. In any event, warehouse space will be severely taxed. The Montreal Harbor Commissioners have issued their annual report dealing at length with the work done in recent years, and the proposed improvements to be undertaken in the near future.

Pig Iron

A fair inquiry is reported for foundry pig, and it is expected the demand for this grade of iron will gradually increase. The requirements of the steel mills are keeping the producers of steel making pig busy, and the prospect for future activity seems very bright. Local prices are normal, but holding firm.

Steel

The remarkable condition throughout the iron and steel industry is apparently unchanged. The strength of the market is largely due to the pressure being exerted upon the mills for current delivery, as the demand for new domestic business is below normal. However, the requirements of the war continue to occupy the attention of steel producers to such an extent that any relief whatever is most acceptable; but the general belief is that little pressure will be removed from the steel mills for the remainder of the year; in fact, indications point to present conditions extending over a much longer period.

With the continuation of hostilities the probabilities point to a further curtailment of domestic demands, as the handicap of abnormal prices is greater than construction companies can well overcome, unless the case is one of absolute necessity. However, it is encouraging to note that some large orders for various purposes, apart from the war, are being considered, and in the event of an early cessation of hostilities, it is felt that the domestic developments would be resumed with considerable activity.

Bessemer billets and sheet bars (f.o.b. makers' mill, Pittsburg) show an advance of $2 a ton; open-hearth billets and sheet bars have advanced $3 a ton, quotations being $35 and $38 respectively. Blue annealed and galvanized sheets are very strong and firm, with prices nominal. I.C. terne plate (Pittsburg) is easier, having declined to $3.60.

All wire products have taken on strength recently, and are quoted at advanced prices, the increase being 10c per hundred pounds. Pittsburg prices are: Plain wire, $2.15; galvanized wire, $2.85; wire nails, $2.30; painted barb wire, $2.45; galvanized barb wire, $3.15. No change is noted in proof coil chain, but advances may be expected.

Metals

The trend of the metal market is ever upward, and indications point to a very unsettled situation, especially in copper, and there seems to be no end to the demand even at the constantly advancing prices; in fact, some are looking forward to a runaway market, as it seems impossible for anyone to describe the present remarkable situation. Although refiners are producing more copper than ever before, many are obliged to refuse orders from their regular customers. Considerable activity is taking place in tin, and a strong export demand for lead has developed lately. A scarcity of antimony has developed a strong market, and all quotations are nominal.

Copper.—The present condition of the copper market is unchanged, and the feeling of uncertainty is very evident on all sides. The abnormal situation prevailing throughout the copper world is largely, if not entirely, due to war conditions, and it is very unlikely that much metal is being purchased at present prices unless the demand is absolutely necessary. Additional war orders are being received almost daily, and this adds to the pressure upon producers of all necessary materials. In view of the outlook, many consumers, dubious of future conditions, are insuring themthemselves by acquiring safety stocks against possible contingencies.

Little excitement is apparent, however, and no reliable information can be had on early deliveries, even at handsome premiums. Spot metal is almost impossible, and nearby is quoted as high as 29.50 (New York) and declining to 27 for June and later delivery. Consumers in many cases are offering any price for immediate delivery.

Local dealers report good business at the high prices. Present quotations show

an advance of ½c over last week; lake and electrolytic are quoted at 30½ cents and castings at 29½ cents per pound.

Tin.—The demand for tin, while not as pronounced as war munitions metal, continues very good. After a period of comparative dullness, considerable buying has been going on during the past week, and following the advance noted in foreign markets, local dealers have advanced their quotations a little, and report trade very good. The quotation of $46.50 shows an advance of ½c a lb.

Spelter.—Following the quiet of the early part of the week, the market has developed considerable strength and activity. Spot and early delivery is hard to get, and some producers appear filled up for April. Buyers do not seem anxious to book far in the future, but the present outlook indicates increased interest in second and third quarter metal. Advices from London report an advance of £6 per ton, and this has had the effect of strengthening the market here. An advance of 1 cent a pound brings this week's price up to 23 cents.

Lead.—The general situation is unchanged, and the market is featureless. The shipping question has been, and still is, causing uneasiness. However the prospect of improvement in the near future is encouraging, and the anxiety of dealers is decreasing.

Foreign reports show an advance, but local dealers are holding firm at last week's price of 8 cents per lb.

Antimony.—During the past week an active demand for early delivery developed a stronger market, and sales are reported for February, March and April shipments from the East at record high prices. Owing to further restrictions on the trade of antimony, placed by the British authorities, it is expected that additional inconvenience will be experienced for a time, as they propose to keep in close touch with the future supply and its points of destination.

Dealers here report unchanged conditions with quotations firm at 50 cents., with a feeling that prices may advance shortly.

Aluminum.—After a spell of firmness with unchanged prices, the market during the week has taken on considerable activity. Inquiries are fair and trade is very good. An advance of 1 cent is quoted, this week's price being 69 cents per pound.

Machine Tools and Supplies

Inquiries for machine tools are gradually dropping off, but the demand for present requirements are still great.

Some buyers are not very enthusiastic over purchasing machine tools, which owe their existence to prevailing conditions preferring to obtain standard machines, which would be of universal service at the close of the present crisis.

The small tool supply continues to be a feature in the machine working industry, as the abnormal steel situation has had its effect upon all auxiliary lines. All small supplies are in great demand, and consumers are often unable to secure the full amount of their placed orders.

Old Materials

The situation continues to show the abnormal condition that has prevailed in old material for many months. The requirements of the steel industry are again calling for increased quantities of heavy melting scrap. As a large proportion of steel production is leaving the country, the available supply of scrap is becoming limited, and consumers are endeavoring to obtain sufficient quantity for their possible needs.

The large consumption of copper for war munitions is creating a great demand for scrap metal of all descriptions, and exceptionally high prices are being paid for any class of old copper. The recent demand for aluminum has advanced the price of the old metal, and the available supply is commanding high prices. Scrap zinc is also very strong and in good demand. All coppers have advanced ¼c a pound. No. 1 machine composition advances ¼c, being quoted at 16¼c a lb.

Aluminum scrap advances from 32c to 34c, and scrap zinc is quoted at 15c, being an advance of ½c.

CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.

Toronto, Ont., Feb. 22.—The chief topic of the week has been the budget speech containing the proposed business tax. While the proposals constitute a new method of taxation in Canada and are far reaching in effect, they are being generally well received in business circles, the necessity for increased revenue being recognized. Some features of the proposed measure in their application require explanation, which will no doubt be forthcoming in due course. The tax will affect machine tool builders and dealers, the latter in the majority of cases being allowed 10 per cent. profit on capital before the surplus is touched. The most encouraging feature of the budget was the reference to the prosperity in Canada and the large increase in revenue, being $31,000,000 over the same period of the preceding year. The grand total revenue was $20,000,000 in excess of the estimate, the largest proportion of the revenue being derived from Customs.

The general industrial situation continues satisfactory, although the local teamsters' strike has caused considerable delay to the shipment of goods. Prices of raw materials are still advancing, and deliveries from manufacturers show no improvement. Higher prices for a number of iron and steel products have recently been registered. New prices for wrought iron pipe have been announced, the advance being two points for black and three points for galvanized pipe. Boiler tubes, both seamless and lapwelded, have advanced 10 per cent., while cold rolled steel shafting is now nett list at warehouse, as against 10 per cent. off formerly. The ingot metal market is very strong, copper, tin and spelter having advanced. The list of discounts on carbon drills and reamers has been revised, the change affecting reamers principally. New prices for cotton and wool waste have been issued. Prices of rope are also higher, due to abnormal conditions in the fibre markets. Prices of lead sheets are higher, while solders have also advanced on account of the tin market being stronger.

Steel Market

The situation in the steel trade is unchanged, the market being very strong, with prices still advancing. Conditions in the trade are abnormal, and it is impossible to say what level prices will eventually reach. The most serious feature is the possibility of a steel famine, as indications certainly point to one, especially if the consumption continues to increase at the present rate. Quotations on steel products are practically nominal, depending upon delivery and tonnage. The upward tendency of prices in the United States is affecting this market, and higher prices have been announced on a number of steel products, following advances in the States.

Boiler tubes, both seamless and lapwelded, have advanced 10 per cent. Mills have their output sold up for three or four months, and are behind on deliveries. Discounts on black and galvanized pipe have been lowered two points for the former and three points for the latter. Scarcity of steel and higher prices for kelp are the reasons for this advance. Cold-rolled steel shafting has again advanced, warehouse prices being now net list, while mill prices carry a discount of 10 per cent. The mills are sold out for from five to six months. Specifications are very heavy and consumers are only getting about half of the shafting called for in

their contracts. Prices of steel bars are very firm at $2.75, and deliveries are very backward.

Conditions in the galvanized sheet trade do not improve, and the market is very strong. Some of the mills in the States have withdrawn prices, their action being attributed to the further advance in spelter. Black sheets are also higher, and are becoming more difficult to obtain on account of the heavy demand. Prices of galvanized sheets are very firm, and an advance may be looked for in the near future.

The output of the United States Steel Corporation is sold up until the end of this year, unfilled orders now aggregating over eight million tons. The market has every appearance of developing in the second and third quarter a more serious shortage in supply of finished products than now exists, as it will be impossible for mills to increase their output, since they are now running to full capacity. There is no lessening in the demand for steel bars for munitions, both for domestic and export consumption. Prices for large rounds are very strong, 3.50c to 4.00c at mill being quoted for this material for last-half delivery. Prices on steel products continue in an upward direction, the advances this week including black and galvanized pipe, $2; wire rods, $5; shafting, $5 per ton; spikes, bolts and rivets, $2 per ton. Wire rods are now quoted at $50 per ton, Pittsburgh. Chicago warehouse prices for finished steel products have advanced $2 per ton, bringing steel bars and shapes to $2.60, and plates to $2.80. Steel bars are quoted at 2.25c, plates 2.50c, and shapes 2.00c, Pittsburgh. There is a great scarcity of billets, and the situation for semi-finished steel products promises to be more acute for the second half of the year than at present. The shortage of ferro-manganese is very serious, and quotations as a result are much higher. Prices on 80 per cent. ferro-manganese range all the way from $225 to $250 per ton seaboard for prompt shipment.

Pig Iron

There is no change in the pig iron situation, and quotations are at the same level as last week. Grey forge Pittsburgh iron is unchanged, as is also Lake Superior charcoal iron, the latter with an unusually wide spread of quotations. Hamilton and Victoria irons are unchanged.

Old Materials

The market is steady, with higher prices for copper, lead and zinc, which have moved up in sympathy with the ingot metal market. The scarcity of aluminum has increased the value of scrap metal, and prices have again advanced. Dealers have so far been unable to get a reduced freight rate on shipments of scrap from Western points.

Machine Tools

The machine tool market is quieter, and inquiries have fallen off. Canadian machine tool builders are very active, and have sufficient orders on their books to keep them busy for some time. Deliveries from American builders are still very backward, as many of these concerns are sold up for several months. Standard tools are particularly difficult to obtain, and deliveries run well towards the end of the year. The demand is almost entirely for machinery for munitions, normal requirements being very light.

Supplies

The market is steady, and dealers report very fair business. Prices on all supplies continue very firm, and are higher in some lines. Higher prices for cotton and wool waste have been issued, the advance being ¼c to 1c, according to grade. The increase in cost of raw materials is the cause of this, and another advance is expected in the near future. Manila rope has advanced 1c per pound, and the market is very strong. The record prices for rope which now prevail are due to extraordinary conditions in the fibre market. There is a great scarcity of Manila, and stocks in the hands of importers are very light, while the shortage of tonnage is seriously affecting the situation. Gasoline and benzine are unchanged, but higher prices are expected any time, as there is no improvement in the crude oil situation, and the demand for gasoline is steadily increasing. Prices of petroleum fuel oil will be higher on account of the duty which has been placed on imported oil, but lubricating and illuminating oils will not be affected. A revised list of carbon drills and reamers is included this week in the selected market quotations. The drills are practically unchanged, but the discounts on reamers have been lowered in some cases.

ALLIES PURCHASING AGENTS

The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:

International Purchasing Commission, India House, Kingsway, London, Eng.

French.—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendence Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.

Russian. — Col. N. Golejewski, Military Attachè, Room 904 Flat Iron Building, New York City.

Metals

The metal markets continue strong and prices are still moving upward for copper, tin, lead and spelter. The copper situation continues abnormal and the trade is asking where the present movement will lead to. The persistent advance in copper is the most prominent feature in metal circles just now, and the comparative scarcity of supplies will tend to force the market still higher. The tin market is quiet but a considerable volume of business has been transacted and prices are higher. Spelter is also moving up gradually, following higher quotations in London for both prompts and futures. The lead market is strong following the advance by the "Trust" to 6.30c New York and quotations are also higher locally. The antimony market is active and well sold up on spot and nearby futures. The supplies of aluminum are very scarce and the market is very firm. Solders have advanced following the increase in cost of tin.

Copper.—The remarkable situation in the copper market continues and the prices are still advancing. Copper producers are steadily selling their output farther ahead and spot metal is practically unobtainable. The consumption of copper is very heavy and is increasing rather than otherwise while indications point to still higher prices. Copper has advanced ½c locally and now quoted at 30½c per pound.

Tin.—The demand for tin has improved and quotations higher. The market is quiet but firm and indications point to higher prices as the position of this metal is a good one. It is reported that considerable quantities of tin have been purchased in the East at comparatively high prices principally for American account, which may also have a tendency to raise prices. Tin has advanced 1c and is quoted locally at 47c per pound.

Spelter.—The market is strong and higher following an advance in London. There is an improved demand for spelter and the market appears to be entering on another buying movement. Spelter has advanced 1c and is now quoted at 24c per pound.

Lead.—The market is very strong, the "Trust" having advanced their price to 6.30c New York. This price is abnormal but another advance would not be a surprise as Independents are well sold up and the market is in the hands of the "Trust". Local quotations are higher at 8¼c, being an advance of ¼c per pound.

Antimony.—The market is active and well sold up for spot and nearby futures. Prices remain unchanged on early deliveries at 47c per pound.

Aluminum.—The market is strong and unchanged but higher quotations are probable owing to the great scarcity of aluminum. Quotations are unchanged at 60c per pound.

Solder.—Prices have advanced as was anticipated owing to the increase in cost of tin. Half-and-half is now quoted at 25c per pound.

$16,000,000 FUSE ORDER PLACED

THE International Arms & Fuse Co., one of the recently organized "war order" corporations, with an extensive plant located at Bloomfield, N.J., has secured a contract through J. P. Morgan & Co., as agents for the British Government, calling for the manufacture of an unknown quantity of time and contact fuses. The aggregate value of the contract which has been closed by the company is approximately $16,000,000.

This order is in addition to the large order for time fuses obtained early in 1915 by the company from the Shell Committee of the Canadian Government, the filling of which has already progressed to a considerable extent. The new contract has been made so as to provide fuses needed for shrapnel and high explosive shells, contracts for which have been in course of fulfillment by various American and Canadian manufacturing companies for the past ten months.

Under the terms of the contract closed with the agents of the British Government, the International Arms & Fuse Co. is to receive an advance from the local banking agencies for Great Britain amounting to $750,000, for which surety bonds are still to be furnished. No performance bond is being required from the company, as the concern has already demonstrated its ability to carry out satisfactorily such manufacturing operations as may be required in filling the present order.

NEW CANADIAN ATLAS

THE new Atlas of Canada just issued by the Department of the Interior, of which Hon. J. W. Roche is head and W. W. Cory, C.M.G., deputy minister, is one of the most complete compilations of information about the country that could be prepared. The series of maps of the Dominion and provinces are beautiful examples of the cartographers' art. There are maps showing the geological formation, mineral deposits and forest distribution of the whole country. Another series shows the annual rainfall and climatic conditions of various sections at a glance. The canal, telegraph and railway systems are depicted in graphic form in others.

An interesting series of maps shows by colors the origins of the people, while the mixed settlement of the Western provinces is made vivid. Density of population is also shown by colors. The exploration of the country from the earliest discoveries is shown by means of maps also. In addition to the maps there is a very complete series of figures and diagrams illustrating the progress of trade and commerce, agriculture, manufactures, the growth of the Canadian mercantile marine, finance, fisheries and the whole economic activity of the country.

CANADIAN PURCHASES FOR FRENCH WAR OFFICE

Philippe Roy, General Commissioner for Canada, Paris, advises the Department of Trade and Commerce, Ottawa, that an order has been issued by the War Department of the French Government to the effect that all purchases made by the Supply Branch in Canada will pass through the Hudson Bay Co. Canadian producers should therefore submit their future offers through the office of that company at Montreal. It is further stated in Mr. Roy's communication that Canadian lumber, steel and meat will find in France an important market for years to come, but it is necessary that Canadian firms should have in Paris representatives entrusted with the necessary authority, especially if it is desired to secure Government contracts.

Many figures are given as to population, education, vital statistics and maps of all the cities in Canada are an added useful feature. The whole Atlas is admirably arranged and indexed. It was prepared under the direction of J. E. Chalifour, chief geographer.

THE LONDON COPPER MARKET

THE "STANDARD" London England in an issue of recent date states that: the most prominent feature in metal circles just now is the persistent advance in the price of copper and the comparative scarcity of supplies. In London there is practically no refined metal obtainable for early delivery, while in New York the value of electrolytic has nearly reached the level touched during the boom that was in evidence in 1907, when as much as 26 cents per pound was conceded.

In the standard market here recently less than 2000 tons changed hands, but the undertone was decidedly bullish, and with the visible supply showing a further decrease of 585 tons, rates were put higher, cash closing at £89 and three months at £88 12s. 6d., representing gains of £4 15s. and £3 12s. 6d. respectively for the week.

Electrolytic advanced very sharply on scarcity to £120, which is fully £6 higher than the quotation registered a few days previously. The advance has since been continued, and sentiment at the moment is decidedly against any check on the upward movement in view of the strong cables from Transatlantic sources and the reserve of sellers.

In New York where the key of the position is to be found, the copper market has been extremely firm and excited, and present indications go a long way to confirm the view that the corner in the supplies of the red metal there, that was prognosticated for the end of January, has very nearly materialised. Spot metal is practically unobtainable, while the quotation for delivery three or four months ahead is as high as 25½ cents, and more or less nominal at that.

At this time last year the selling price of the same description was just over 14 cents, so that the value has appreciated no less than 80 per cent. during the twelve months. Considering that the total United States output of copper last year was 735,000 tons, this is a surprising state of affairs, and affords striking evidence of the extraordinary demand for the metal.

The purchase by the British Government last December has stimulated American consumptive buying. Munition makers on this side are covered by the Government offer to supply them at £100 per ton, but in the open market there is very little best selected or electrolytic to be had, and the high freights now ruling, coupled with the abnormal shortage of steamer space, preclude any alleviation of the position for some time to come. In any case, with American consumers extremely anxious to cover their future needs and the leading New York agencies sold out for several months to come, there is no denying the fact that producers have the market under perfect control, and the long-expected corner looks like eventuating in accordance with predictions.

As the large Government purchase was made at about 20 cents per pound it is a matter for congratulation that so much foresight was shown over the transaction. Of course, a great deal now depends on the future requirements

for munition purposes, which constitute the greater part of the present abnormal demand; but taking into consideration the financial ease in America, and the fact that the output has reached such a height that it cannot be raised further for some months to come, there does not appear to be any prospect of present conditions changing in favour of consumers in the near future.

Personal

G. S. Kilbourn, of Calgary, Alta., has accepted the position of managing director of the Canadian Malleable Iron Co., Owen Sound, Ont.

Arthur P. Scott, well-known in engineering circles in Montreal, died in that city on Feb. 17, aged 39. Mr. Scott was a graduate of McGill University and for the past year had been connected with the Snider Electric Co., of Chicago, Ill.

A. J. Latornell, B.A.Sc., has resigned his position as city engineer of Edmonton, Alta., in order to enlist for overseas service.

M. C. Rose has been appointed Publicity Agent for the town of Oshawa, Ont. A campaign will be conducted to secure new industries for this town.

J. W. McCallum, for many years superintendent of the Amherst branch of the Canadian Car & Foundry Co., died at Amherst, N.S., on Feb. 16.

Andrew J. Davies has been elected a director of the Northern Electric Co., Montreal, to fill the vacancy caused by the death of Robert Archer.

Miller Sutherland, foreman of the pipe shop at the Vancouver Engineering Works, Vancouver, B.C., has joined the 6th Canadian Field Engineers for overseas service.

Harry Cockshutt, president and managing director of the Cockshutt Plow Co., Brantford, Ont., has been made Lieut.-Col. in the active militia and will command the 215th battalion.

Capt. Alex. Lewis, of the Queen's Own Rifles, late secretary of the Toronto Harbor Commission, will be second in command of the new "Bantam" battalion recently authorized.

Duncan Coulson, president of the Bank of Toronto, died on Feb. 19, at Toronto, Ont., following a long illness. The deceased was born at Toronto in 1838 and had been connected with the bank since 1858, being elected president in 1911.

T. A. Trenholme, of Montreal, has been elected a director of the Cedars Rapids Manufacturing and Power Co. Mr. Trenholme has been a large holder of Montreal Power and Shawinigan securities for some years and took a large interest in the new Cedars enterprise when it was floated under the direction of the two older companies.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

Engineering

London, Ont.—The Southern Ontario Gas Co. contemplate making considerable extensions to the distributing system.

New Toronto, Ont.—The Brown Brass Rolling Mill Co. will make an extension to their plant at a cost of about $25,000.

Hespeler, Ont.—The A. B. Jardine Co.'s plant, which was recently damaged by fire is being rebuilt.

Montreal, Que.—The Steel Company of Canada will build an addition to its plant here to cost $24,000.

Ingersoll, Ont.—Fire caused an explosion at the local gas plant, destroying a purifier, and doing about $4,000 damage. Mr. Montgomery is superintendent.

Toronto, Ont.—The National Equipment Company are building an extension to their factory estimated to cost $17,500.

Sault Ste. Marie, Ont.—It is reported that the Algoma Steel Co. will extend their plant by the addition of a building 350 feet long by 120 feet wide.

Cap Madeleine, Que.—The St. Maurice Paper Co., will build a large paper mill here. The Geo. A. Fuller Co., of Montreal, are the general contractors.

Stevensville, Ont.—John Pirson, is in the market for machinery for tight barrels, drum saw and a 36-in. stave joiner.

Toronto, Ont.—Witchall & Sons, Toronto, are receiving sub-tenders in connection with the power station which is to be erected near Orillia, Ont.

Sarnia, Ont.—The Imperial Oil Co. will erect an addition to the machine shop and ten new pressure stills will be built.

Montreal, Que.—It is reported that the Imperial Oil Co. will build a plant here for making road oils and paving materials.

Guelph, Ont.—Alex. Callander, formerly with the Taylor-Forbes Co., proposes to erect a foundry here for making light castings. The plans are prepared and work will begin shortly.

The Imperial Oil Co. are purchasing through the Sarnia, Ont., office all the steel work, machinery, pumps and boilers, etc., for the proposed refinery at Regina, Sask.

Calgary, Alta.—The Ford Motor Co., will build an assembling plant here, to cost $200,000. It has secured a site at Eighth Street West and Eleventh Avenue. The initial building will be 130 x 200 ft., four stories.

Moncton, N.B.—Fire on Feb. 20 destroyed the main building of the Record Foundry & Machine Co. The loss on the building and plant is estimated at $100,000, which is covered by insurance. In the part of the plant destroyed were the sales and shipping rooms, fitting and nickel finishing departments.

Municipal

Peterborough, Ont.—The city council are considering the installation of a sewage disposal plant.

Weyburn, Sask. — The city council contemplate increasing the capacity of the civic power plant. It is proposed to raise $35,000 for this purpose.

South Vancouver, B.C. — The city council are considering buying additional equipment for the fire department and building fire stations.

Sarnia, Ont.—Negotiations are in progress with a large linen company which may be induced to build a plant in this city for the purpose of taking care of the Canadian trade.

Sarnia, Ont.—The city is carrying on negotiations with a number of concerns which are considering building branch plants in Canada and it is likely that

EQUIPMENT FOR AUSTRALIAN NAVAL DOCKYARD

Tender forms and specifications have been forwarded by D. H. Ross, Trade Commissioner, Melbourne, for 43 machines of various types required for the equipment of the Commonwealth Naval Dockyard, Cockatoo Island, Sydney, N.S.W. Tenders will be received, subject to the conditions specified, up to May 1, 1916, addressed to the Director of Navy Contracts, Melbourne, Australia. The last mail in time to reach Melbourne on May 1 is that leaving San Francisco on March 22 and due at Melbourne on April 12. The tender forms are open to the inspection of Canadian manufacturers at the Department of Trade and Commerce, Ottawa (refer file No. A-1435). Particulars of the requirements are briefly outlined thus:

Three 50-ton overhead travelling cranes.

One 25-ton overhead travelling crane.

Two 5-ton overhead travelling cranes.

One 10-ton revolving cantilever crane.

Two 5-ton travelling portal jib cranes.

Two 7½-ton jib cranes.

One 5-ton jib crane.

Two 15-ton hydraulic cranes.

One 6-ton hydraulic crane.

One 6-ton wall crane (hydraulic).

Two 3-ton wall cranes (hydraulic).

Two electric passenger elevators.

Two electric goods elevators.

One 2½-ton gauge locomotive with crane attached.

One 2½-ton gauge locomotive without crane attached.

Three electrically-driven air compressors, 1,500 cu. ft.

One 15-ton hydraulic winch.

One 5-ton hydraulic winch.

Nine 10-ton hydraulic capstans.

Two 5-ton hydraulic capstans.

One bar shearing machine.

One double-ended horizontal punching machine.

One 10-ton overhead travelling crane for shipyard fitting shop.

Nobility in Overalls

Lord Norbury "ringing in" on an "International"

In these stirring times many remarkable incidents are being recorded. The illustration shows Lord Norbury, one of England's wealthiest noblemen, going to his job as fitter in an aeroplane factory in overalls, "ringing in" on an

International Time Recorder

The International Time Recorders play no favorites—lords or laborers, it gives the same automatic record—accurate, indisputable — made by the employee himself.

The International is the choice in the great factories of the world for checking the cost of labor, saving money. It will do the same for you.

There is an International Time Recorder and System that exactly fits your business, no matter how peculiar your requirements may be—ready to guard every minute of the time you pay for.

The International will soon discharge its debt and bring you in profitable returns from the time saved and the efficient service given.

WRITE US FOR FULL PARTICULARS.
The prices range from $95.00 up.

International Time Recording Co. of Canada, Limited

Ryrie Bldg., Corner Shuter and Yonge Sts., TORONTO

F. E. MUTTON,
General Manager

Montreal Representative: W. A. WOOD, Jr.
Sales Agent, Cor. McGill and Notre Dame Sts., Montreal

some of these at least will be secured for Sarnia.

St. Mary's, Ont.—The Council contemplates the erection of an auxiliary pumping plant to cost $8,000. Gasoline engines may be used. Thomas M. Clark is clerk.

Wellesley, Ont. — The Town Council will call tenders in about two months for the erection of an electric distribution plant to cost $7,500. The town clerk is P. F. Schummer, St. Clements P. O., Ont.

Electrical

Mount Elgin, Ont. — The Durham Township Council contemplate installing an electric light system.

Dashwood, Ont.—The people of the police village of Dashwood voted on Feb. 15, in favor of Hydro-electric power. It is understood that the line will be built from Exeter West to Dashwood, with branches from Sarepta north to Zurich and south to Crediton.

General Industrial

Toronto, Ont.—J. A. Scythes & Co., will build an extension to their factory on Paton road.

Coaticook, Que.—The Warrior Fabric Co. are considering making an extension to their factory here.

Oshawa, Ont.—The Bryant Manufacturing Co. will probably establish a factory here.

Toronto, Ont.—E. F. Brown representing the Fardrew Peet Mfg. Co., of Boston, Mass., has been here looking for a suitable location for a clothing factory.

Toronto, Ont.—The Gutta Percha & Rubber Co., will at once erect an addition to its factory on West Lodge Avenue.

Bridgeburgh, Ont.—Edwards & Edwards, Toronto, Ont., have leased a building at this place, and will equip it for the manufacture of leather goods of all kinds.

Edmonton, Alta.—The Emery Co., whose plant was recently destroyed by fire will resume operations as soon as suitable premises can be secured and the necessary machinery installed.

Saskatoon, Sask.—A concern known as the Sand & Gravel Deposits Ltd., has been incorporated with the object of making concrete chimneys, fence posts, window sills, etc. E. E. McEown is interested in the proposition.

Toronto, Ont.—As the new registry office is nearing completion, it will be necessary to equip same with steel filing apparatus and other metal furniture, as well as the provision of electric lighting fixtures. The approximate cost of this work will be $60,000.

Tenders

Ottawa, Ont.—Tenders will be received until Feb. 29, for the supply of waterworks materials for this year. Particulars can be obtained from R. L. Haycock, waterworks engineer.

Montreal, Que.—The Board of Control have decided to call for new tenders for a supply of 6,000 tons of asphalt, replacing the former call, which was illegal, due to a mistake in the preparation of the advertisement. Tenders close of March 2.

Toronto, Ont.—Tenders will be received up to Tuesday, March 7th, 1916, for furnishing and constructing radial brick chimney and foundations for the refuse incinerating plant on Don Roadway. Specifications and forms of tender may be obtaned from the office of the Street Commissioner, City Hall.

Toronto, Ont.—Tenders addressed to the Secretary-Treasurer, Board of Education, will be received until Wednesday, March 8, 1916, for science class electrical equipment for Humberside Collegiate Science Department. Specifications may be seen and all information obtained at the office of the Clerk of Supplies, City Hall.

Ottawa, Ont.—Tenders will be received up to March 1, 1916, for:—1. The construction of a pumping station and electric sub-station on Lemieux Island, of the City of Ottawa. 2. The manufacture, delivery and installation of:—(a) Main piping, valves and specials. (b) Heating and plumbing. All for the above stations. Plans and specifications may be seen at the office of the engineer, John B. McRae, 310 Booth Bldg., Ottawa.

Toronto, Ont.—Tenders will be received by the chairman, Board of Control, City Hall, up to Tuesday, March 14, 1916, for the supply and delivery of: One single-truck, double-end street car, completely equipped; one car body, double-end, single-truck; equipment for one single-truck; equipment for one single-truck car. Specifications and forms of tender may be obtained at the Works Department, Room 12, City Hall.

Collingwood, Ont.—Tenders will be received by the chairman of the Collingwood Water & Light Commission until Wednesday, March 1, 1916, for the following works:—(1) Steel water tower. (2) Foundation for steel water tower. (3) Pumping machinery, comprising one motor-driven unit of 800 Imperial gallons capacity. (4) Pump well and connections. Plans and specifications may be seen at the office of the Engineers Chipman and Powers, 204 Mail Building, Toronto, or at the Water and Light Office, Collingwood.

Ottawa, Ont.—Tenders will be received until Monday, February 28, 1916, for the construction of timber lock gates and their equipment for the East River Lock, near New Glasgow, Pictou County, N.S. Plans and forms of contract can be seen and specification and forms of tender obtained at the Department of Public Works, Ottawa, and at the offices of the district engineers at Antigonish, N.S.; Halifax, N.S.; Shaughnessy Building, Montreal, P.Q.; Confederation Life Building, Toronto, Ont., and on application to the postmaster at New Glasgow, Nova Scotia.

Hamilton, Ont.—Tenders will be received up to Wednesday, March 1, 1916, for supplying the corporation of the City of Hamilton. with the following:—Castings (ordinary and special), iron pipe, hydrants, valves, extension boxes, lead pipe, pig lead, rubber hose, rubber boots, road oil, lubricating oil, flux, fuel oil, coal oil, gasoline, concrete and garbage duck covers, bass brooms, sectional sweepers, brass work, including ordinary and special brass castings for water department. hardware. Specifications and form of tender for all of the above can be obtained at the office of the city engineer, Hamilton, Ont.

Building Notes

Swift Current, Sask.—The Imperial Oil Co. propose building a warehouse and storage tanks here.

Owen Sound, Ont.—In the estimates for the fiscal year, $25,000 is included for a drill hall here.

Sarnia, Ont.—The H. Mueller Mfg. Co., will erect an office building 60 ft. by 60 ft. and 3 stories high.

Toronto, Ont.—J. A. Scythes and Co., have secured a permit to add an extra storey to their factory on Brown's Ave. to cost $3,500.

Swift Current, Sask.—The contract for converting the old Central school into a town hall has been let to the local contracting firm of More & McWilliams at $2,963.

Toronto, Ont.—Tenders have been received for rebuilding the Princess Theatre. The work is estimated to cost about $200,000. Mr. Crane of Detroit, Mich. is the architect.

Toronto, Ont.—The city architect has granted a permit to the Martin Corrugated Paper Box Co., for the erection of a one-storey brick factory at 353 Pape avenue. It will cost $16,000.

Toronto, Ont. — The Laura Secord Candy Co., have been granted a permit for the erection of a four-storey, brick building for use as a factory at 64 Princess street. The estimated cost is $9,000.

Toronto, Ont.—The Management Committee of the Board of Education at a special meeting decided to recommend the expenditure of more than $595,600 in providing a new collegiate school and making necessary additions to several public schools.

Toronto, Ont.—The city architect has approved of plans presented by the Canadian Bank of Commerce for alterations at their premises, 27-29-31 King street west. According to the plans the new building will consist of four storeys, brick and stone. It will be sixty feet high and is estimated to cost $10,000.

Wood-Working

Montreal, Que.—P. E. Bourassa & Son will make extensions to their woodworking plant.

Stratford, Ont.—The George McLagan Furniture Co. will erect this year a four-storey addition to their present plant. The addition will have a depth of 160 feet, and will be about 60 feet wide.

Railways—Bridges

Edmonton, Alta. — Plans are being prepared for a big steel bridge over the Peace River Crossing. The total cost will be about $750,000.

Toronto, Ont.—The application of the Toronto, Barrie and Orilla Railway to be allowed to proceed with the construction of its proposed line of railway was heard by the Cabinet Council on Feb. 17.

Hamilton, Ont.—Plans for the bridge over the Valley Inn., to be used in connection with the entrance of the Toronto-Hamilton highway to the city will shortly be considered by the Board of Control. It is estimated that the bridge will cost $250,000.

Edmonton, Alta.—An all-steel bridge containing 650 tons of steel is to be constructed over the Heart river, a short distance south east of Peace River Crossing, for the E. D. and B. C. road. The Dominion Bridge Co., which has the contract, already has the steel fabricated. The bridge is to be 600 feet long.

Refrigeration

Hamilton, Ont.—The Board of Health have passed a resolution favoring the establishment of a municipal abattoir, which, it was thought, would insure a proper inspection and handling of the meat supply of the city.

Trail, B.C.—Tyson Bros., proprietors of the City Meat Market, are having their new market equipped with a 5-ton refrigerating plant and small ice-making system, furnished by the Armstrong Machinery Co., Spokane, Wash.

St. John's, Nfld.—It is proposed to organize a concern which will be known as the American-Newfoundland Packing Co., with J. W. Clouston as general manager and E. St. John Howley as vice-president and managing director. A big cold storage plant in connection with the St. John's house will be operated at Bay Bulls, and several other stations will be erected around the coast.

Trade Gossip

Carter Welding Co, Toronto, have recently been appointed sales agents for oxygen made by Lever Bros., Toronto.

The John Galt Engineering Co., of Winnipeg and Calgary will in future be known as Haddin & Miles Ltd.

The Pollard Manufacturing Co., has been authorized to increase the capital stock of the concern to $150,000.

Sherbrooke, Que.—The city council have awarded the contract for the supply of transformers to the Canadian General Electric Co., Montreal.

The Canadian General Electric Co., Toronto have been awarded a contract for two transformers by the St. Thomas Hydro-Electric Commission.

London, Ont. — A number of local business men in conjunction with the Board of Trade propose securing a factory site in order to attract new industrials to the city.

William R. Perrin, Ltd., Toronto, have designed and are superintending the installation of a 1,000 ton hydraulic forging press for the Dominion Steel Foundries Ltd., Hamilton, Ont.

The Eugene Dietzgen Co., dealers in engineering and scientific instruments and supplies, have moved their head Canadian office from 116 Adelaide St., West, to 31 Richmond Street West, Toronto.

The Saxon Motor Co. of Detroit, Mich., will open up a Canadian branch at Windsor, Ont., with K. W. Macrae as manager. A factory will not be erected at present, but it is expected that an assembly plant will be established later.

Fort William, Ont.—The annual meeting of the Board of Trade was held recently and the following officers were elected for 1916: President, W. L. Bird; vice-president, W. K. O'Donnell; secretary-treasurer, W. Webster.

The St. Helen's Cable & Rubber Co., of Warrington, Lancs, Eng., manufacturers of the St. Helen's patent cab tyre, sheathed cable, etc., are now entering the Canadian market. The Canadian business will be conducted through the agency of J. D. Lachapelle & Co., 317 St. James street, Montreal, Que.

Bureau of Commercial Export Intelligence.—Canada is to have a branch of the Trade and Commerce Department to foster the manufacture of new lines of export goods. It will be known as the Bureau of Commercial Export Intelligence. The plan will embrace a section of imported articles that could be made in Canada, and their display at a central point with all information that can be secured to enable manufacturers to determine whether they could take up these lines for competition with other countries.

Receipts at Trial, B.C.—The Consolidated Mining & Smelting Co. of Canada, ore receipts at Trial Smelter for the week ending February 10, 1916, and from October 1st, 1915, to date, were in tons as follows:—

	Week	Year
Centre Star	2,635	61,187
Le Roi	2,353	48,177
Sullivan	1,550	17,153
No. One	151	1,768
St. Eugene	....	182
Silver King	....	15
Other mines	1,350	29,173
Total Tons	8,039	157,755

St. Catharines, Ont.—The N. St. C. & T. Electric Railway have asked Parliament to extend the time allotted for finishing its railway from Fort Erie to Niagara-on-the-Lake; from St. Catharines to Hamilton and Toronto, and from Port Colborne to Fort Erie, but is partly to allow the N. St. C. & T. R. time to purchase the Michigan Central line from Fort Erie to Niagara-on-the-Lake. This sale is pending, and when it is consummated and the N. St. C. & T. Company's proposed line from Port Colborne to Fort Erie is built it will give the N. St. C. & T. Railway a circuit right around the Niagara peninsula.

Contracts Awarded

Ottawa, Ont.—The City Council have awarded a contract for two pumps to Mussens Ltd., Montreal, Que.

Winnipeg, Man.—The Winnipeg Construction Co., have awarded a contract

for centrifugal pumps to the London Concrete Machinery Co., London, Ont.

The National Iron Works, Ltd., Toronto, Ont., have been awarded a contract by the City of Ottawa for the supply of a large quantity 18-in., 20-in., 24-in, 30-in. and 36-in. cast iron waterpipe, aggregating about 4,000 tons.

Personal

John Collins has been appointed general manager of the Canadian Steam Boiler Equipment Co., Toronto, manufacturers of the "Cyclone" shaking and dumping grate bar. Mr. Collins was formerly supervising engineer with Gillespie Bros., Toronto.

Hon. Wm. M. Hughes, Premier of Australia, arrived in Ottawa last Thursday and will be a guest at the Government House. The party was met at Central Station by Major-General Sir Sam Hughes and a guard of honor from the 77th battalion.

J. Harry Smith, for many years Montreal representative of the Chapman Double Ball Bearing Co., Toronto, Ont., died in hospital at Saint John, N.B., from acute appendicitis, on Feb. 6th. Mr. Smith was widely known in the Eastern provinces, and to many of his numerous business friends his death at the age of 51 came as an unexpected shock.

New Incorporations

The Chicago Roche Deboule Copper Co., has been incorporated with a capital of $100,000,000.

The Excelsior Machine Co., Ltd., Saskatoon, Sask., has been incorporated with a capital stock of $10,000 to manufacture machinery, tools, etc.

The Steel Foundry of Quebec, Ltd, Quebec., has been incorporated with a capital stock of $49,000 by J. A. Larue, E. Massicotte, E. Trudel, and others, to manufacture machinery, iron, steel, etc.

H. Muehlstein & Co., Montreal, have been incorporated with a capital stock of $10,000, by Joseph A. Perodeau, Francis E. McKenna, Paul S. Conroy, and others to manufacture rubber, tires, etc.

La Fonderie d'Acier de Quebec, Ltd., has been incorporated, with a capital of $149,000, to carry on a foundry and engineering business at Quebec. The incorporators are J. A. Larne, E. Trudel and W. Boulet, all of Quebec.

The Aeroplane Products, Ltd., has been incorporated at Toronto with a capital of $40,000 to manufacture, aeroplanes, and flying machines, etc. Head office at Toronto. Incorporators: A. Mearns, E. G. Long and J. E. Belfrey all of Toronto

The Sudbury Nickel Co., has been incorporated at Toronto with a capital of $100,000 to develop mineral lands and refine copper and other minerals. Head Office at Sudbury, Ont. Incorporators, T. E. Smith, W. N. Smith and R. T. Smith, all of Sudbury.

The Boston Creek Mining Co., has been incorporated at Toronto with a capital of $2,000,000 to acquire and develop mines and mineral lands. Head Office at Toronto. Incorporators, P. W. Cashman, A. Gillies and J. C. Thompson, all of Toronto.

The Thomson-Gordon Co., has been incorporated at Toronto with a capital of $40,000 to manufacture engine packings and mill supplies. Head office at Hamilton. Incorporators, G. J. Thomson, E. Gordon and W. C. Thomson, all of Hamilton, Ont.

The Multisize Rotary Press Co., has been incorporated at Ottawa with a capital of $150,000 to manufacture all kinds of machinery and printing presses, etc. at Toronto, Ont. Incorporators, G. M. Willoughby, J. M. Bullen and H. L. Steele all of Toronto.

The London Gas Power Co., has been incorporated at Ottawa with a capital of $100,000 to carry on the business of iron and brass founders, steel makers, etc. Head office at London. Incorporators, W. H. Heard, J. W. G. Winnett and C. A. Bowman, all of London, Ont.

The Excelsior Charcoal Co., has been incorporated at Ottawa with a capital of $100,000 to manufacture charcoal and other products. Head office at Montreal.. Incorporators, Arther Lalande, Hector Lalande and A. Lalande all of Montreal.

The Waterland Motor Co. has been incorporated at Ottawa, with a capital of $300,000, to manufacture automobiles, trucks, etc. The head office to be situated at Walkerville, Ont. Incorporators: William R. Woollatt, George Reid and Chauncey M. Bennett, all of Walkerville, Ont.

The Metropolitan Class Co., has been incorporated at Toronto with a capital of $40,000 to manufacture glass and mirrors of all kinds and building materials. Head Office at Toronto. Incorporators, J. B. Robertson, G. A. Robinson and G. D. McLeod, all of Toronto.

The Callander Foundry & Manufacturing Co., has been incorporated at Toronto with a capital of $40,000 to carry on a general foundry and machine shop business. Head Office at Guelph. Incorporators, J. M. Ferguson, J. P. Walsh and A. C. Rutherford, all of Toronto

The Saxon Sales Co., has been incorporated at Toronto with a capital of $40,000 to carry on the business of manufacturers of automobiles, motor cars, motor trucks; etc. Head office at Toronto. Incorporators G. F. Green, W. C. Omand and C. H. Peaker, all of Toronto.

The Canadian Consumers Casein Co., has been incorporated at Ottawa with a capital of $50,000 to manufacture casein and other supplies, necessary in the manufacture of paper or paper products. Head office at Toronto. Incorporators, J. M. Bullen, H. L. Steele and F. H. Hurley all of Toronto

The Guelph Carriage Top Co. has been incorporated at Ottawa with a capital of $50,000, to purchase from the Guelph Carriage Top Co. the business now carried on by the company at Guelph, Ont. The head office to be situated at Guelph, Ont. Incorporators: Charles L. Dunbar, Leo W. Goetz and John Sutherland, all of Guelph, Ont.

The Canadian Cartridge Co. has been incorporated at Toronto with a capital of $750,000, to manufacture copper, bronze, brass and steel products, hard-

ware, cartridges, shells, ammunition and other kinds of goods. The head office to be situated at Toronto. Incorporators: Wm. S. Morlock, E. G. Murphy and Bruce V. McCrimmon, all of Toronto, Ont.

Catalogues

The Roller-Smith Co., New York, have issued a leaflet showing an "oscillogram" of a Roller-Smith circuit breaker.

Cleaning Compounds.—A bulletin being distributed by The Munning-Loeb Co., Mattawan, N.J., describes No. 6 cleaning compound for the electro-plating trade. The principal features of this compound are described in detail and a comparison made with other materials used for the same purpose.

Book Review

Engineering as a Career.—Edited by F. H. Newell, Professor of Civil Engineering, University of Illinois, and C. E. Drayer, secretary Cleveland Engineering Society, 226 pages, 5 in. x 7 in., published by the D. Van Nostrand Co., New York, price $1.00 net. This book consists of a series of papers prepared by eminent engineers and presents for the guidance of young men and their advisers some of the facts usually hard to obtain concerning engineering as a life work. The choice of a vocation is as a rule a most difficult problem to solve for at the time when the decision has to be made, the boy or young man has little idea as to what will be required of him in his work. The same remark often applies to parents who cannot always judge what career the boys' qualifications are best suited for. The engineer who has written these articles endeavors to explain what he believes to be the personal and educational qualifications required, for success, and what opportunities await the young man who chooses engineering as a career.

The inspiration for the book came in response to numerous inquiries from high school teachers and others who are frequently called upon to advise young men in their choice and preparation for a professional life. It was found from experience that many youths who planned to study engineering had only the most hazy ideas of what is involved, nor were their teachers and parents much better informed. The book should prove of special value to professional advisers in vocational guidance work and to parents who have the opportunity of continued observation and intimate acquaintance from which may be learned the aptitudes of their sons.

Press Tools Used in the Manufacture of Cherry Pitters

Staff Article

The elaborate nature of many tools seems in some cases to be in inverse proportion to their service purpose, and the production of simple household articles affords many examples of such. In this, as in many other spheres of manufacture, the economy of production is directly due to the skill of the designer and tool-makers in developing labor-saving devices.

IN the manufacture of many simple household articles, there are numerous interesting operations performed, which to the casual observer seem comparatively unimportant, but when investigated reveal the fact that many five and ten-cent articles now on the market are only obtainable at these figures because of the special equipment developed for rapid and cheap production. Such equipment easily runs into hundreds of dollars and frequently into thousands.

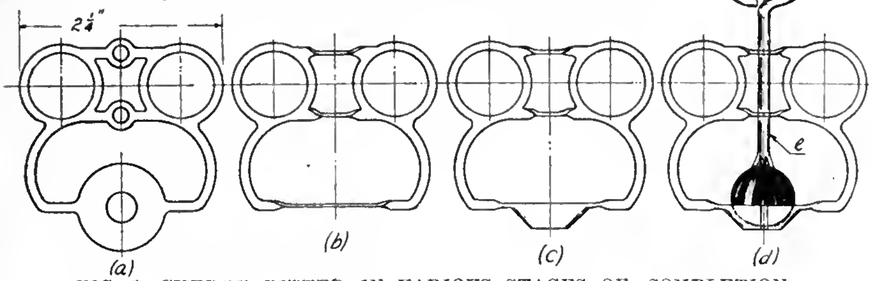

FIG. 1—CHERRY PITTER IN VARIOUS STAGES OF COMPLETION

The tools and methods described herewith are those used in the manufacture of a domestic cherry pitter, all of the operations being performed on single acting punch presses with the single exception of forming the eye on the ejector rod.

Selection of Material

One of the essential features in the manufacture of articles of this nature is the selection of material. Ribbon stock is preferable, as it permits a continuous feed in one direction, with a minimum expenditure of labor; greatly facilitating gauging operations. The metal should be homogeneous, of sufficient hardness to retain the desired shape after blanking, piercing and forming operations, and yet not so brittle as to tear in the twisting process, shown at (b) Fig. 1. In this figure is shown the cherry pitter in the various stages of completion; (a), the piece as it comes from the progressive die, Fig. 2; (b) as it looks after the twisting operation; (c) shows the shape of piece when it comes from the cupping die, Fig. 4; and (d) is a view after the cup has been notched in the die Fig. 5; (d) also gives an idea of the completed article after the ejector rod is in position.

Blanking and Piercing

The progressive or blanking and piercing die, is shown in Fig. 2; (a) being a cross section (lengthwise) of the punch and stripper; (b) is a plan of the die, and (c) is a section taken on the line x-y.

As shown in Fig. 2, the die is composed of four separate die blocks, dovetailed into the bed, and firmly held laterally by means of the wedge-shaped strips E, one on each end. The steel dies are further secured by the set-screws shown. The hole through which the pit of the cherry is ejected must be of a certain size after the cupping and notching operations, therefore when constructing the die, Fig. 2, it was necessary to complete the blocks A, B and D, leaving the piece C blank until the desired size had been determined.

The first step in the making of the progressive die is to ascertain the relative proportion of the die blocks. The feed of the stock will be the extreme width of the blank, shown at (a) Fig. 1, plus the allowance for scrap—in this case about 1/8 inch; therefore, the centres of the three stages of progression will be 2 3/8 inches. From the design of the article and position of the various holes, the two blocks A and D had a length of 3 1/4 inches, the centre pieces B and C a length of 1 1/2 inches; the three sections having a uniform

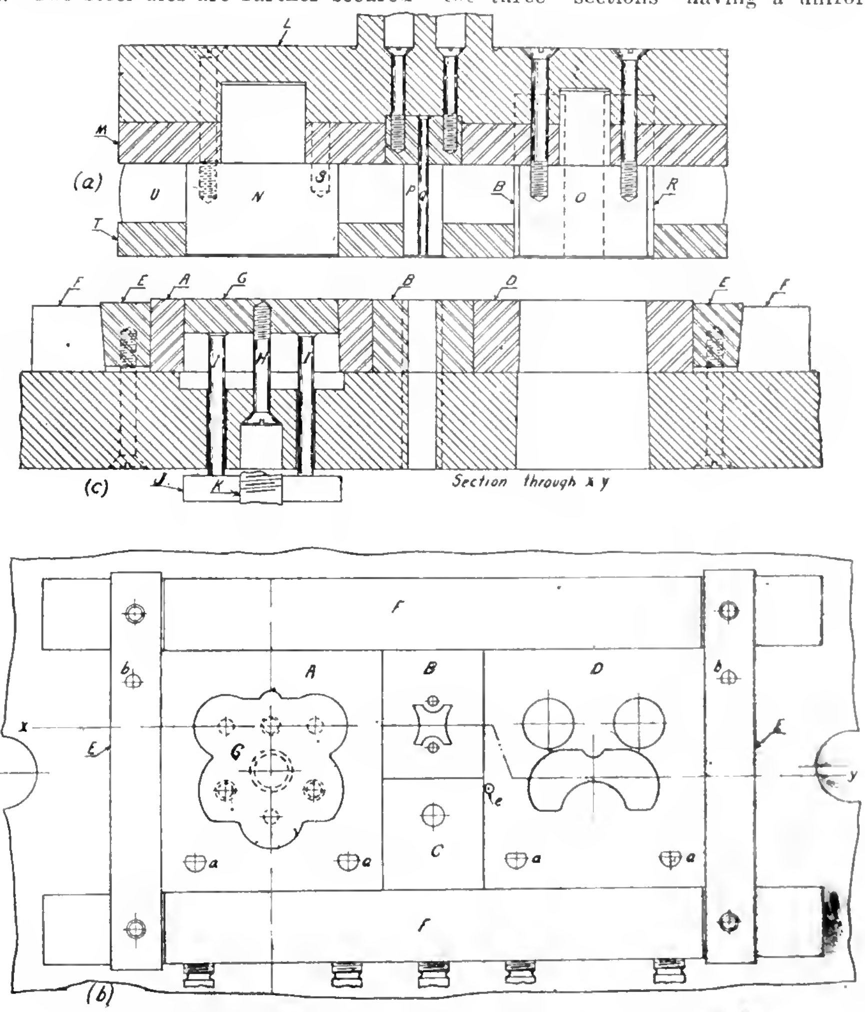

FIG. 2—PROGRESSIVE DIE FOR PUNCHING OUT FLAT SHAPE

width of 3 15-16 inches, with a side angle of 8 degrees. The blocks were made from 4-inch by 1⅛-inch cast steel. After the die blocks are in position, they are rigidly held together by means of the wedge strips E, one on each end.

To eliminate the possibility of distortion—which would arise if the finished piece was allowed to pass through the die A—it was decided to have the blank forced back into the strip after the cutting operation. This was performed by the ejector or knockout G, which, is kept flush with the cutting edge by means of the three screws H. The upward pressure on this plate is transmitted through the pins I, by the disc J, which is forced upward by a rubber cylinder (not shown).

The design of the punch is shown in section at (a) Fig. 2. Secured to the cast iron punch block L, is the punch pad M, which forms a support for the smaller punches. The large punches N and O, also the two round punches for the die D, have shanks which extend through the pad M and into the punch block L. In addition to this they are secured by means of the screws and dowels shown. The punch P was made from 1¼ inch round stock, shaped to the desired dimensions, with the base turned to fit the hole in the punch pad. The round base of the punch P formed a support for the two piercing punches Q. The stripper or pressure pad T is

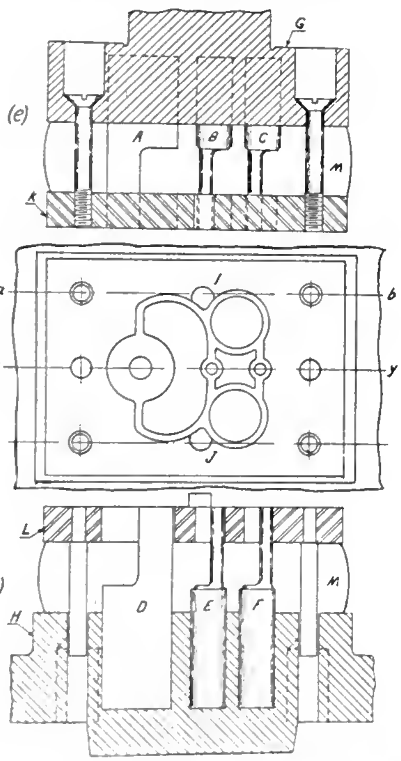

FIG. 3—FIXTURE FOR TWISTING RINGS

made to slide freely over the various punches while the pressure is derived from two strips of rubber running the full length of the stripper.

The stock which is in strips 2½ inches wide, is fed between the gauge pins (a) and (b) up against the pin (c); this pin gauges the progressive positions of the stock, as it comes in contact with

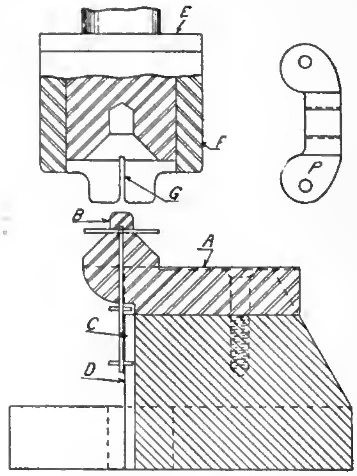

FIG. 4—CUPPING PUNCH AND DIE

the inner edge of the irregular-shaped hole punched in the first operation, or die D, Fig. 2. As it passes to the second position, the holes shown in dies B and C are punched, and when in the third position the blank is completely finished. At each succeeding stroke of the press one piece is completed as shown at (a) Fig. 1. During the operation the stock is held perfectly flat by means of the pressure plate T, and the blank is forced back into the ribbon, to be pressed out by the fingers after clearing the die.

Twisting the Centre Section

The next step is to twist the three centre rings to a position at right angles to the main portion. See (b) Fig. 1. This is done with a punch and die as shown in Fig. 3; (c) is a section through the die on the line xy, (d) is a plan of the die face, and (e) is a section through the punch on a line corresponding to a-b on the plan (d).

The punches, which are made of round stock are secured in the punch block G, and the die bed H. These punches are cut away as shown, so that when in position, a space equal to a little over the thickness of the stock is left between the vertical flat faces. The blank is held in the desired positions between the gauge pins I and J, and the pressure plates K and L, prevent the main portion from distortion while the center rings are being twisted to the desired angle of 90 degrees. Rubber M is also used in this die to retain the original shape of the article.

Cupping the Bowl

The piece is now ready for cupping the cherry bowl, as shown at (c) Fig. 1. A cross section of the punch and die used for this operation is shown in Fig. 4. P being a plan of the die bed used in both Figs. 4 and 5. Referring to Fig. 4, a dove-tailed groove is shaped in the top to receive the cast steel block A. This piece is further secured by means of the screw shown. On the outer end of this block is the forming post, B the pilot turned to fit the hole in the cherry pitter, and the cone portion made to suit the required shape of the cherry bowl. The lower front edge of the piece A is cut away, to allow the cherry pitter to swing into position. A groove C is shaped below the post to permit the cherry pitter to rest against the face D, which is half the thickness of the stock back of the centre line of the post B.

The punch E is bored out to fit the cone of the post B with a hole to receive the pilot pin. On the outer diameter of the punch E is the ring F, which is cut away at the front and back to clear the block A. The purpose of the narrow slot at G is to prevent the stock from buckling while the cup is being formed.

Notching the Bowl

The thickness of the punch required to notch the cone will be determined by the width of slot desired. Owing to the action of the twisting and cupping operation, a certain strain has been set up in the metal surrounding the cone, therefore allowance must be made for this when notching the bowl. When the proper thickness has been determined, the next step is the making of the notching die. This was constructed as shown in Fig. 5; a die bed similar to that used

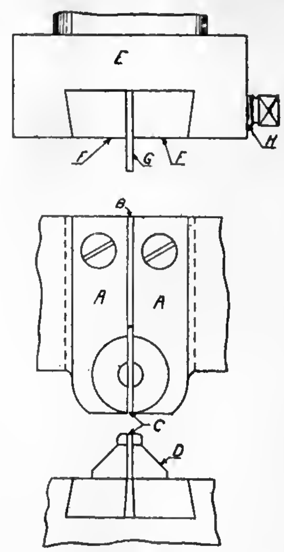

FIG. 5—NOTCHING PUNCH AND DIE

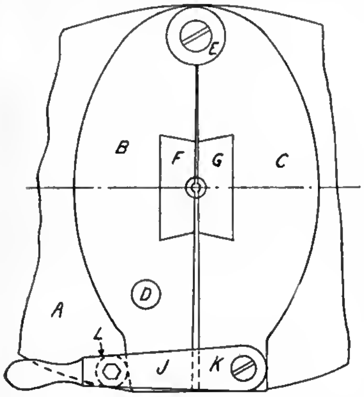
for Fig. 4 was shaped out to receive the two pieces A, A plus the piece B, which is the thickness of the punch required. This piece B is made of sheet cast steel and just long enough to leave the slot C, through which the punched stock can pass. This, like the cupping die is turned to fit the cone as produced from the preceding die, as shown at D.

The cast iron punch block E is shaped out to receive the pieces F, and the sheet steel punch G. Additional security is obtained by the set screw H. It will be found, after notching the cone, that the slot is a little wider than the die opening, due to the removal of the strain in the metal, caused by the two preceding operations. The object of this slot is to allow the cherry stems to be drawn through while the pit is being ejected.



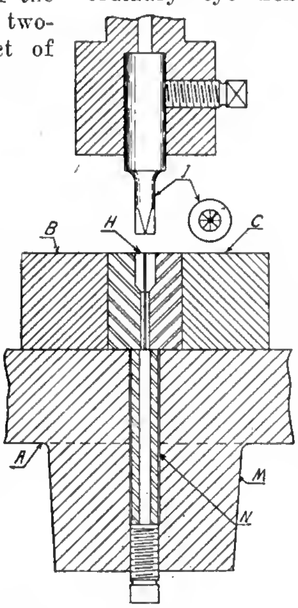


FIG. 6—PUNCH AND DIE FOR SPLITTING END OF EJECTOR ROD

Splitting the Ejector Rod End

The die used for splitting and spreading the ends of the ejector rod (e) Fig. 1, is shown in Fig. 6. Upon the top surface of the die bed A, are the two blocks B and C; B is doweled in position by the pin D, shown in plan view, and secured to the bed by the screw E. This screw also acts as a centre upon which the block C is swung to and fro, to permit the insertion and removal of the wire rod. The two dovetailed cast steel clamping pieces F and G, are firmly pressed into their respective blocks. With these two vise blocks held firmly together the centre hole is drilled a shade smaller than the diameter of the ejector rod (e) Fig. 1; this rod is made from No. 9 tinned wire. The counter bore shown at H was a free fit for the punch I, and of sufficient depth to give ample support to the punch before commencing to split the end of the wire. The clamping lever J is pivoted at K, and carries a roller L, which is forced over the eccentric arc, firmly clamping the wire between the vise jaws. On the lower surface of the die bed is the boss M, of sufficient depth to allow of a set screw being used for height adjustment of the wire. The tube N was inserted to aid in preventing the wire from buckling while being split.

The cast steel punch I is held in the punch holder by the set-screw shown; the end of the punch is filed to give four chisel edges of a fairly acute angle. An end view of the punch is also here shown.

When the ejectors have been spread on the end, they are placed in the pitter and the eye on the end is formed in an ordinary eye bending machine, with the forming block of the desired shape.

USE OF OXY-ACETYLENE WELDING IN WAR TIME

By C. R.

THE war has provoked a great development of the oxy-acetylene welding, and we are informed that this process has been a very great help in permitting the quick manufacturing of articles required by the army.

It is no secret that oxy-acetylene is used on a vast scale for the manufacture of bombs and also aerial torpedoes. But outside of these warfare engines, which are not very accurate, a new trench gun has been perfected a few months ago, which is accurate, and does immense damage to the enemy's trenches. The shells for these new guns are made by oxy-acetylene process, and could hardly be done by any other process. However, the application of welding for such manufacturing is very difficult, because the welds have to be afterwards machined on the lathe, must show a very high strength, special physical properties, and be absolutely non-porous.

It is claimed that to obtain such results it has been necessary to use new methods of working with special filling materials, and this new method has been evolved by the French Association of Autogenous Welding. It is kept a secret, and is only transmitted to the munition department of the allies.

General Requirements of the Armies

Outside of these new shells, and other bombs and projectiles made largely by oxy-acetylene process, there are many articles made by the same process, which are manufactured owing to the increased requirements of the army, such as cooking utensils, sterilizing apparatus, coffee roasters, rolling kitchen, reservoirs, tanks, washing machines, metal beds and tables, parts for power factory, shovels, aeroplane parts, sheet metal bodies for aeroplanes and automobiles, trucks, harness, hooks, metal piping, rings and hooks for drinking bottles, forging for artillery, etc.

Acetylene welding is also used largely for the repairing at the front of broken pieces of machinery, automobiles, trucks, and for the cutting of bridges and iron and steel parts.

All these works have greatly enhanced the demand for oxygen, and it is understood that in France, the oxygen factories are working at capacity, and, owing to the lack of oxygen cylinders, are hampered to supply the trade.

TRADE AFTER THE WAR

THE directors of the Glasgow Chamber of Commerce at a meeting held recently to consider the report of a committee on the question of trade after the war, passed, among others, the following resolutions:—

(1)—That his Majesty's Government be urged to take immediate steps for the establishment of a Department of Commerce and Industry and the appointment of a Minister of Commerce with cabinet rank, in order that the manufacturing and commercial interests of the British Empire may in future be effectively promoted and safeguarded.

(2)—That his Majesty's Government take immediate steps to consult the Governments of the Dominions Overseas, and ascertain (a) their views with regard to reciprocal trading, and (b) the regulation of trade relations with enemy countries and the control of businesses in the colonies managed or owned by the subjects of enemy countries, it being important that their views be first obtained before any definite steps are taken by the United Kingdom.

(3)—That his Majesty's Government be urged to inquire into the desirability of subsidising or otherwise protecting for a period those industries which have since the commencement of the war been engaged in the manufacture of articles formerly made to a large extent in enemy countries.

(4)—That the question of preferential reciprocal trading relations between all parts of the British Empire, reciprocal trading relations between the British Empire and Allied countries, the favorable treatment of neutral countries and the regulation by tariffs or otherwise, of trade relations with all enemy countries be considered by his Majesty's Government, and steps taken to render impossible a return to pre-war conditions.

(5)—That his Majesty's Government be asked to take into consideration the present banking system of the country with a view of ascertaining whether any steps can be taken further to facilitate and encourage industrial enterprise.

PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

ECCENTRIC DEVICE FOR TURNING CAMS

By H. C. F.

THE method in general use for turning cams and other irregularly-shaped pieces of work is by the use of a special arrangement whereby a former is used to impart the necessary reciprocating motion to the tool. By this method a plate or former, the shape of which corresponds to the shape of the piece to be machined, is bolted to the face-plate and a tracer arm or pointer is held against it by means of a weight or spring. As the lathe spindle revolves, the arm follows the irregular shape of the former, and by suitable mechanism causes the lathe tool to move back and forth in the desired manner.

Where the work can be produced in a lathe, the foregoing method is most generally adopted for shapes of the description mentioned, but for simple cams of a symmetrical cross section, as shown in Fig. 1, the following arrangement has given every satisfaction in actual use:

By referring to sketch Fig. 2, an idea of the arrangement will be obtained. It will be seen that a large gear A is fitted to the lathe spindle and meshes directly with the pinion B, in which is inserted a feather key of suitable dimensions. The pinion is made a sliding fit for the shaft C, the latter having a keyway milled along its entire length to correspond with the inserted key in the pinion. The shaft is supported in the two boxes H, as shown, these being secured to the lathe bed and carriage respectively, and fitted with suitable bronze bushings. The end of the shaft E is turned eccentrically and to this diameter is fitted the connecting rod D, the opposite end of which engages with the pin G, which in turn is securely fastened to the face of the cross-slide. It might also be noted that the cross-feed screw has been previously removed, this being done in order that the cross-slide will be free to move as required.

The methods of setting up the device for operation are somewhat complex and a considerable amount of care must be taken to so arrange the tool and cam that a comparative depth of cut will be taken. The cam is tightly held on a suitable mandrel, and, after being supported between centres, the lathe spindle is turned until the side X (Fig. 1) of the cam is in a perpendicular position. The lathe carriage with its special attachments is then run back in the direction of the tailstock until the outer end of the shaft C is sufficiently clear of the bearing to allow the pinion B to be removed. The shaft C is next turned by hand until the eccentric E is at the extreme inward limit of its throw, or in the position as shown in Fig. 2. When the cam and shaft are thus set, the pinion is again replaced and the carriage moved forward in readiness to commence the cut. In replacing the pinion, care must be taken that neither the cam or shaft are moved to any appreciable extent from the positions in which they were first set, as otherwise the outward or inward throw of the eccentric would not be in unison with the throw of the cam. The natural result would then be an extreme unevenness of cut. (The device can also be set by having the side O of the cam in a direct horizontal position with the centre axis of the lathe, while the eccentric shaft is turned until the throw is at the extreme outward limit. The pinion is then replaced in the same manner as was previously mentioned).

When the device is thus set up, the lathe is ready for operation, the tool being fed in to the desired depth by means of the compound feed screw. The longitudinal feed is next engaged, and as the carriage moves along the bed, the eccentric shaft and connecting rod move with it, the revolving shaft imparting the desired reciprocation to the tool.

LINING-UP PLANER WORK

By F. H.

THE use of wedges and packing of various shapes and sizes for lining up work on planers is one of the practices in connection with planer work that should be, wherever possible, eliminated. It not only requires a longer period of time to set-up the work but it also proves in many cases, a very unsatisfactory procedure.

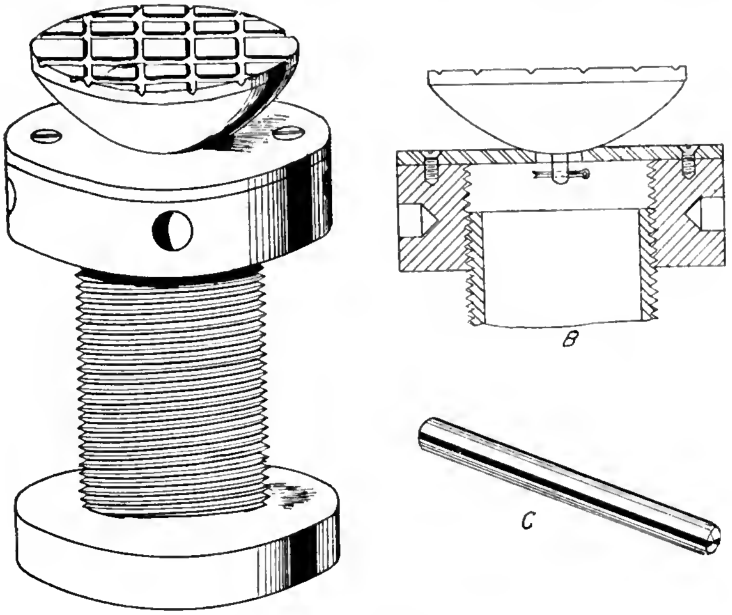
A more suitable method, and one that is employed in great many instances, involves the use of jack screws. These of course can be easily obtained, and at a reasonable price, but, to obviate even this outlay, a suitable jack screw can be cheaply and simply constructed with materials to be found in almost every shop.

The design of the jack-screw is shown in the accompanying sketch. A piece of ordinary 1½ inch pipe is threaded for its entire length, and one end is screwed securely into a suitable cast iron base. To the other end of the pipe is fitted a suitable nut which is threaded to operate freely, and to which is secured an adjustable cap. An idea of the working features of the latter may be obtained by the sectional view B.

It will be noted that a plate, having a hole of suitable size drilled through the centre, with the top counterbored to

a convenient radius is bolted to the top of the nut. The cap proper, is made spherical in shape with a flat top and has a small lug fitted into the bottom as shown. The lug is left considerably smaller in diameter than the hole in plate, so that when the cap is in position it will be free to adjust itself as desired, while, at the same time, a cotter pin which is inserted in the lug prevents the cap from coming out.

From the foregoing it can be seen that the cap is made adjustable to any irregularities that may occur in the casting being levelled up. Raising or lowering of the nut is accomplished through a small lever engaging with the holes drilled on the nut side, and, while the distance through which it can be raised or lowered is somewhat limited, it is still sufficient for the purpose intended.



LINING UP PLANER WORK

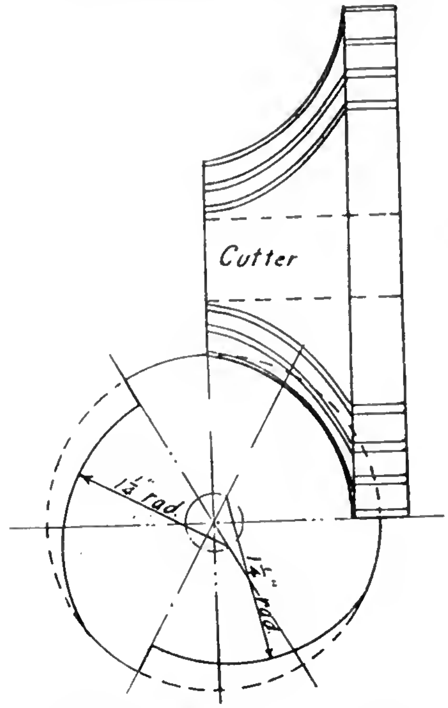
work. It is adjustable up or down in the split bracket, being locked by the two cap screws D. It will be seen that the clamping bracket is sawed under at E in order to bind evenly on the piece.

EXPANDING MANDREL CRITICISM

By G. Barrett

IN the Feb. 17 issue of Canadian Machinery, C. F. White offers a criticism on the expanding mandrel described in a previous issue. Mr. White's contentions as to the flaws in the mandrel there featured are, I may say, wholly disproved by the fact that, at the present time there are sixteen of them in operation at the plant in which the writer is employed, and each is producing excellent results.

This style of mandrel is not intended for employment on shells that have a finish bore, being used entirely on the rough forgings. If employed on the finished shell, all danger of the dogs marring the bore could be removed by having a plain surface on the dogs rather than the serrated effect. As for the mandrel being unsuitable for rough forgings on account of variation in size, straightness and taper, I might say that during my entire shell experience I have never met with a case in which the forgings varied to such an extent that the mandrel would not accommodate itself to them.



EXPANDING MANDREL CRITICISM.

I do not agree with Mr. White's remark that there will be a strain on the point X as shown by his sketch. The dogs are left square on the bottom, and are not of the same radius, as that of the mandrel, and furthermore, they are made to fit the slots in the casing so as to slide without play.

Referring to the accompanying sketch the method of machining the convex surfaces is shown. The mandrel is placed between the indexing centres on the milling machine table and divided into three equal spaces. A concave cutter similar in design to that shown in the sketch is used. By spacing off the mandrel in this manner there will be no difficulty experienced in striking the arcs from a centre.

J. H. Mead is now president of the Spanish River Pulp & Paper Co.

CONVENIENT STEADY-REST FOR MILLING MACHINE

A. E. Granville

THE steady rest shown is useful for many milling machine jobs, and as it is easily made, will interest mechanics generally. The base is made of cast iron and the vee-support A slides in a guide planed in it. This support is made of steel, hardened and ground smooth in the vee. It is locked in position by means of a bolt B, the nut for which is on the back of the block. The over-arm C is made of tool steel hardened and polished where it comes in contact with the

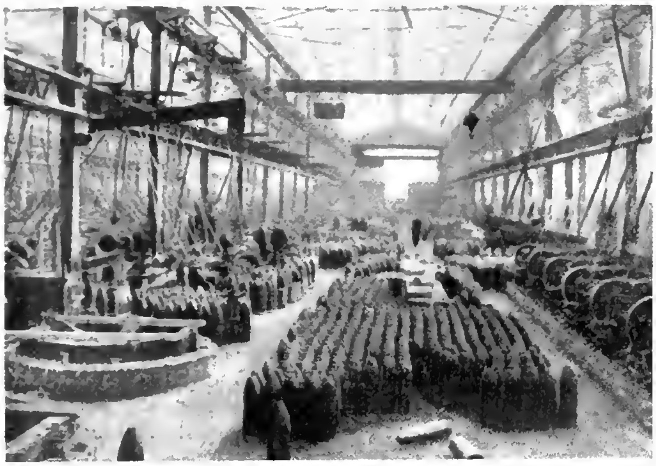
CONTEMPORARY WAR ARTICLES

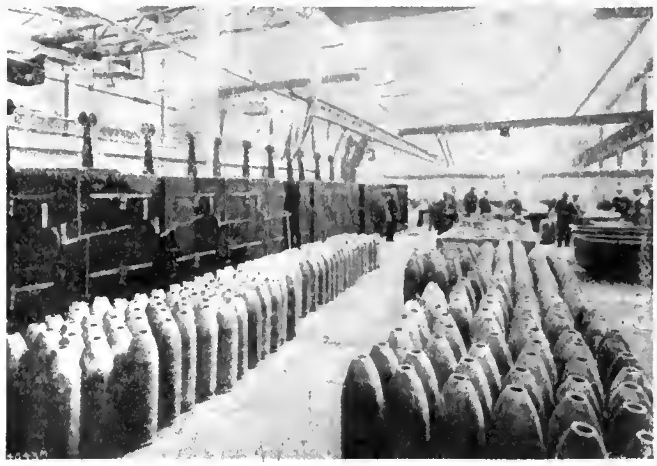
Embracing Information and Data Drawn from a Variety of Sources Relative to and Arising from the Prosecution of this Many-Sided European War

ONE OF BRITAIN'S NEW PROJECTILE-MAKING PLANTS-I.

A LARGE part of the feeling of disquietude—not yet entirely at an end—in connection with the production of a sufficient supply of shell—shrapnel and high explosive—has been due to an inadequate knowledge on the part of laymen as to the extent of the plant necessary for producing shells, and the number of operations and high degree of accuracy involved in their manufacture.



PRESSING COPPER BANDS ON LARGE SHELLS.



LARGE SHELL VARNISHING DEPARTMENT.

As has been time and again pointed out, unskilled labor or partially-skilled labor is utilizable, and is now being employed in increasing measure in most of the operations; this fact suggested that the processes were simple, alike as regards the extent of mechanical appliances and the degree of intelligence necessary on the part of workers. This, however, is one of those cases where the excellence of the machine in its mechanical accuracy and completeness supersedes experience and mechanical skill on the part of the operative. As we had not contemplated war, and, so far as the army was concerned, were ill-prepared to meet the drain of warlike operations, it followed that before the production of shells on a sufficiently immense scale could be undertaken the factories had to be organized, or constructed anew, and equipped with the most efficient appliances, so arranged as to ensure the greatest output for the minimum manual effort.

Artillery Feature Dominant

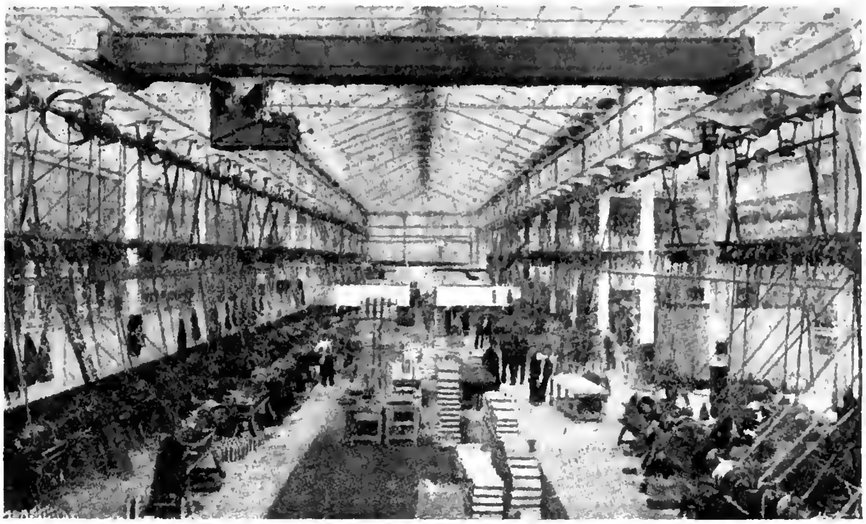
When it was realized that the tactics in the field demanded a domination of artillery over infantry or cavalry action, the problem which faced the authorities was the question not only of increasing the emergency supply by almost superhuman effort on the part of the workers available, but also so to augment the producing facilities of the country as to make certain that the immense flow of shells from the muzzles of all the guns in action could be maintained at its maximum volume over a lengthened period.

The argument was used that even little machine shops should be re-arranged to make shells, or at least to execute one or the other of the many operations which constitute the long line of manufacturing processes. It was ultimately realized, however, that, with the manual resources of the country taxed to the fullest degree, the transport of shells over great distances was wasteful in the extreme. We have known of cases where shells have had to travel miles between the forging and the finished machinery; 300 yards generally sufficing in well organized works. The authorities, therefore, acted wisely in deciding that while extraordinary measures, however inefficient, might be justified to meet immediate emergency, the preferable course was to arrange for the rapid completion of immense new factories, where the transport would be minimized and the

EXTERNAL VIEW OF ONE OF BRITAIN'S NEW PROJECTILE-MAKING PLANTS

organization and equipment would be such as to achieve the greatest production with the smallest possible number of men of military age.

Without entering into the details of manufacture, which might be helpful to the enemy, it is possible to convey even to the lay mind such an idea of the energy and enterprise shown in the bringing into action of such a shop as to dispel a large proportion of the misunderstanding and criticism, due to incomplete knowledge, regarding the action of the authorities in meeting the demand for shells.



MEDIUM SIZE SHELL MACHINING DEPARTMENT.

New Factory Layout

The shop illustrated, which embraces 10 acres under the glass roof, is one of many now in full operation, turning out thousands of shells per day. Others are being as rapidly brought to the same state of efficient production. Six months prior to the taking of some of the photographs which we reproduce, the site of this immense shop was used as a coal and iron store, and the first operation was the clearing away of between 5,000 and 6,000 tons of such materials. The ground had to be levelled and the foundations put in, and there was then erected the steel building shown, which in its completeness and permanence equals anything yet done.

Moreover, the admirable details of the design, notably for supporting cranes and for carrying the lines of shafting for the machine tools, will easily be appreciated by a close study of the various illustrations. There are nine bays of an average length of 370 ft., with a total floor space of 196,600 sq. ft. Two of them are arranged as press shops for the forging from bars into shell cylinders—either of the shrapnel or high explosive type, ranging in diameter from the smallest to the largest required.

The smaller shells are machined in an upper floor over one end of the machine bays, the larger shells in the remaining bays, and railway tracks are laid for the movement of the shells to the bays having machine tools installed for undertaking the finishing operations. Rapidity of output is facilitated by each machine being confined not only to one size of shell, but to one separate operation. The minimum of time is, therefore, involved in the setting of the lathe, while the machinist, when initiated into the carrying out of this one operation, becomes very expert, and requires only the slightest supervision.

The Power Plant

In the power station, the hydraulic accumulators form a prominent feature. The principal unit is the installation of pumps for supplying pressure water to the presses for forging the bars into shell cylinders. There are nine of these, each working up to 1,500 lb. pressure per sq. in. They are steam-driven, and the aggregate power developed under ordinary working conditions is about 3,000 horse-power. These pumps deliver to two accumulators, 26 in. in diameter by 20 ft. stroke, and the supply of pressure water is controlled by electrical and mechanical devices, which come into action as the accumulator approaches the top of its stroke.

For hydraulic pressures of 4,480 lbs. per sq. in., there are three horizontal pumps, developing 510 horse-power, delivering into a pair of accumulators, 15 in. in diameter by 16 ft. 6 in. stroke, and similarly controlled. Steam is supplied by four water-tube and five Lancashire type boilers, all fitted with mechanical stokers. Two of the water-tube boilers are of Stirling type, and two of Babcock & Wilcox design, all being fitted with chain-grate stokers and induced-draught fans. The boilers are fed with town water by vertical feed pumps. Electrical and pneumatic power is supplied from a separate central station.

Raw Material and Forging Provision

Raw material is brought to the factory in bars of suitable diameter and stored in racks for ready use. Adjoining these are the parting-machines which cut the bars into the required lengths for the manufacture of single shells. The furnaces for heating these are distributed along the two press-shops and contiguous to the presses. The latter range in power from 160 tons for small shells to others of 2,500 tons for the largest. Hydraulic pressure is maintained at two levels—1,500 lbs. and 4,480 lbs. per sq. in., according to the size of the presses.

These are arranged with two dies, so that the shell is forged at two operations in the larger of the presses, the dies are accommodated on hydraulically-actuated

LARGE SHELL MACHINING DEPARTMENT.

carriages, which move one or other of them under the forging tool. The shell cylinder, after being forged, travels across the several bays, as each of these is arranged to deal with one or two sizes of shell only.—Engineering.

SPECIFICATION REVISION FOR SHELL STEEL

UNDER normal conditions shell steel is made under such rigid specifications that its manufacture was undertaken by comparatively few firms, says the Liverpool Journal of Commerce. The object sought by the authorities was to obtain a material of the highest possible grade, and it was a simple task to defend this practice when the required output was small and there was ample time in which to produce it. Experience in the present war has, however, clearly indicated that the quality of the steel so long as the material would withstand essential, as distinguished from refined tests, was of far less importance than the quantity which can be produced within a limited period.

Makers of steel for shellmaking have been agitating for some time past for a revision of the specification. They recognize far better than War Office officials, who are inclined to play for safety, that the needs of the government cannot be met unless the regulations governing quality are relaxed on immaterial points. That is one of the lessons taught during the past year, and it is hoped it has now been learned by those who are in a position to apply its teachings.

Steelmaker and Scientist in Agreement

Fortunately the steelmaker did not lack the support of the scientist in the campaign against rigidity of specification. No less an authority than Dr. Stead came to his aid; and an investigation which was carried out in conjunction with leading firms on the north-east coast, showed that here, as elsewhere, Germany had demonstrated how the needs of the war could best be served. Mechanical and other tests of shell steel used by the enemy, which were made on specimens picked up after the naval bombardment of the North East Coast showed that it was not necessary to use steel of uniform quality, that a relatively large percentage of nitrogen, and even the presence of sulphur and phosphorus up to 0.07 per cent. did not prejudicially affect the quality of the shell, as these impurities were present in some of the toughest and best of the German specimens. The teaching was clear that the output of steel for shell making need no longer be restricted by clinging to the old shibboleths.

Dr. Stead has expressed the opinion that if the mechanical tests on shell steel are found to be conclusive it would be a national crime to reject material on any mere chemical specification. This clear pronouncement may not improbably cause some disquietude among those who have pinned their faith to the tests by chemical analysis, but this is not the moment to allow differences between rival schools of scientific thought to exert any influence. The thing that matters is to produce a steel which will meet the needs of shell manufacture, and if the amendment of the specification will achieve this, and at the same time enable the output to be materially increased, there ought not to be any hesitation in adopting the amendments which have been proposed.

QUEBEC MINERAL PRODUCTION

HON. HONORE MERCIER, Minister of Colonization, Mines and Fisheries, tabled in the Quebec Legislative Assembly on February 25, a preliminary statement of the mineral production in the province during 1915. The mineral production for 1915 was valued at $10,796,348, a decrease of $936,347, as compared with 1914. The best year, 1913, showed production of a value of $13,119,811.

A comparison of figures in the different products of the mines shows asbestos to lead with a value of $3,544,302, while in the class of structural materials, cement leads with a value of $2,805,374. Copper and sulphur ore netted $1,020,605, and limestone and marble $1,477,362.

The falling off from 1914 was in the structural materials, the decrease there being 28 per cent., while the actual products of the mines showed an increase of 32 per cent.

The chief increases in 1915 over 1914 are in asbestos, copper and sulphur ore, magnesite and the heavy decreases in brick, cement and granite, every one of the structural materials showing a decrease.

The report states: "The production of magnesite has been greatly stimulated by the war. Formerly Austria was the source of the world's supply of this material for refractory purposes. From a previous maximum figure of $9,645, the shipments of Quebec magnesite reached $137,304 in 1915. Chromite mining has also benefited by the present industrial conditions. The shipments of chromite jumped from $1,210 in 1914 to $221,287 in 1915.

During 1915 the number of men employed in the mines, quarries and concentrating mills of the Province of Quebec was 5,777, as compared with 6,956 for the previous year. Their wages totalled $3,109,549. There were 173 accidents, of which 13 were fatal.

CANADIAN MUNITIONS WORK DEVELOPMENT

ACCORDING to a statement issued on Feb 23, by the Imperial Munitions Board, Ottawa, 454 Canadian firms are engaged in the machining and assembling of shells, in the production of component parts, in the production of powder and explosives, and in the loading of shells or parts. These factories are distributed from Halifax and St. John in the east to Victoria, B.C., in the West. The board has the responsibilities of purchasing the steel and the component parts entering into the shells. They arrange for the work to be done upon these parts, and for their shipment to machining and assembling plants, and they are thus responsible for a continuous supply of material to keep the assembling factories employed

$5,000,000 A Week.

The Board stated that over $5,000,000 per week is paid out for materials supplied and work performed. It is estimated that employment is given to 200,000 to 250,000 persons in Canada. The staff employed at the offices of the Board in Ottawa number 150. There are 2,300 inspectors distributed in the factories and machine shops engaged in the production of munitions, 1,400 of them being under the direction of Major Ogilve, an Imperial officer with headquarters at Quebec.

Business Administration

The board has developed an organization for the administration of its business. George Edwards, chartered accountant, Toronto, has assumed oversight of the accounting and the disbursements. Through the courtesy of Lord Shaughnessy, Edward Fitzgerald, of the purchasing department of the C. P. R., has assumed charge of all purchases and contracts.

Volunteers

Allan McAvity, Canadian Buffalo Forge Co., Berlin, Ont., volunteered for service, and has been given supervision of production in the machining and assembling plants. E. A. Schofield, of the firm of Jones & Glassco, Montreal, has been given the duty of seeing to the distribution of component parts of shells to the various factories. R. J. Durley, lately professor in McGill University, Montreal, has taken charge of the production and standarization of gauges. Bertram Seton, of Toronto, and recently from Scotland, is in charge of the adjustment department to provide for a fair settlement between the various manufacturers concerned for material declared faulty by the inspectors. F. W. Lamont has been placed in charge of all matters pertaining to insurance upon material belonging to the board.

COMPOSITION OF FILLING MATERIAL A FACTOR IN AUTOGENOUS WELDING

By C. Royers.

When a boiler maker manufactures a tank by oxy-acetylene welding, or a machine shop has a broken piece repaired by this process, they are directly interested in the strength of their welds and wish them to stand up as well as the rest of the piece. Outside of suitable equipment and skill of the welder, the results obtained depend largely on the selection of the welding material which has been fused in the weld. It is desirable that everybody doing welding should know in what way the filling material affects the results of a weld, and the reasons which guide the choice of a suitable material.

It is well, first, to mention that in welding the metal is fused drop by drop, and is subjected to a tremendous temperature, to the action of the gases of the flame and of the air, and that chemical action is liable to take place independently of the skill of the welder, and consequently it is difficult to expect the metal fused in the weld to be as sound as the metal of the piece to be welded, which metal has been prepared in large quantities in a furnace made for the purpose, and which has been subjected to mechanical and thermal treatment to improve its qualities.

In order, then, to obtain the best efficiency in a weld, it is necessary to choose welding material purer than the piece to be welded—that is to say, free as much as possible from impurities liable to be injurious to the weld, and to such pure material should be sometimes added elements capable of combating the ill-effect of the influences of the fusion under the blowpipe. Very small quantities of impurities are liable to destroy the mechanical properties of a weld, and it is the effect of these impurities we are going to consider.

Welding of Iron and Mild Steel

For welding plates and boilers, the welding material should be as pure as possible—that is to say, should contain the least carbon, sulphur and phosphorus obtainable. The best quality of Norway or Swedish iron as a rule fulfils these conditions.

Influence of Carbon

Though carbon increases the tensile strength of iron in a weld, it decreases its elongation, and as any weld always shows a decrease in elongation, it is well to keep the carbon low in order to avoid any reduction in elongation. Moreover, carbon increases the tendency of steel to crystallize under the influence of alternate expansion and contraction as in boiler work, or under shocks and vibration, etc.; also mild steel at 200 degrees C. temperature loses some of its property of elongation with increased carbon. Consequently, in boiler work it is absolutely necessary to use a welding material very low in carbon in order to decrease the tendency of the metal to crystallize under working stress and produce cracks and break later on.

Influence of Sulphur

Sulphur, which is found in almost every welding material, combines with the iron and makes an eutectic (ferrite and sulphur), which becomes isolated between the molecules of metal and renders the metal brittle when hot.

This eutectic becomes liquid at cherry red and surrounds the solid molecules of iron. For this reason, welding material which contains any quantity of sulphur cannot be hammered without developing cracks, which will spread between the solid molecules of iron.

Influence of Phosphorus

Phosphorus in the welding material induces, during crystallization, the formation of large crystals, which considerably increase the brittleness, and are liable to prove dangerous in the welding of pressure tanks and reservoirs.

For the welding of boiler plates and plate work, use Swedish or Norway iron of good quality to obtain the soundest weld possible with the maximum elongation. There is no doubt that the tensile strength of the weld will be lower than in using mild steel, but the elongation will be better and possibility of breaking after a period of use will be eliminated.

It is well to add here that one of the greatest evils in welding is the formation of oxide of iron, which dissolves in the molten iron, and which decreases the elongation and reduces the tensile strength, but up to now no sufficiently tried element has been found which, added to the welding material, will eliminate the ill-effect of the oxidation produced. It is to be hoped that filling material containing a harmless deoxidizing element will be manufactured in the near future, but at the present time the best thing to do is to use good quality Swedish and Norway iron, which at the present time are known as the purest iron, containing the least amount of carbon, sulphur and phosphorus. Beware of material sold as Swedish or Norway iron which has none of the qualities of these materials, but the name only, or which contains too much slag.

The increase of price for a good welding material should be of small consideration, as the percentage of it in the cost of a weld is too small to justify the risk of turning out poor work; consequently, for boiler plate and mild steel work, use the purest iron possible to be obtained, free, as far as possible, from carbon sulphur, phosphorus and slag, and which flows well when melting.

Welding Material for Steel Pieces

The remarks above in regard to sulphur and phosphorus apply just as well for the welding material used for steel pieces. Generally, for such pieces the quality of elongation is not such a requisite as for plate work, and, therefore, the presence of carbon will not be objectionable, and will, on the contrary, increase the tensile strength and the toughness of the weld. In such a case, steel containing as little as possible of sulphur and phosphorus should be selected, and the amount of carbon should correspond to the amount of carbon in the piece to be welded, or be slightly above.

Welding material, such as vanadium steel, chrome steel and nickel steel has been proposed for such work, but experiments so far do not seem to be sufficiently conclusive to justify any superiority for either of these materials. There is no doubt that almost any well-made weld will withstand the stresses it has to support, and mild steel rods of good quality have given very good satisfaction.

In regard to high carbon steel, it is well to mention here, that although it can be welded under the flame of the blowpipe, the results are not very good compared with the strength of the material itself. This is due not so much to the weld itself, but that under the high temperature of the flame of the blowpipe, the parts adjacent to the weld begin to segregate, therefore, the structure of the metal is affected and its properties decreased. Consequently, when high carbon pieces are subjected to heavy stresses, it will not be satisfactory to try to weld them.

In the welding of cast iron the welding material should not contain an excess

of sulphur which, under the flame of the blowpipe, will tend to the formation of blowholes which will decrease the strength of the weld. The manganese should also be low, as it will tend to increase the amount of combined carbon in the weld which will render the weld hard to machine. On the contrary, cast iron filling rods should contain a larger amount of silicon than ordinary cast iron, as this silicon will help to produce a grey cast iron easily machineable.

Cast iron rods should be made with new material altogether without any scrap, should contain no sand, and about 2½ to 4 per cent. of silicon, with less than 0.5 per cent. manganese and sulphur. It is poor economy to try to obtain filling rods made in an ordinary foundry without special care and attention to the percentage of elements contained, just for the sake of a few cents and take the risk of making unsatisfactory work. Experience has shown that such manufacture, by an ordinary foundry, is not satisfactory, except if this manufacture be made a specialty, and in that case, the cost of filling rods will be proportional to the purity and the special care required to obtain good material.

Welding of Brass

To obtain a satisfactory weld in brass, it is essential that a welding material made of absolutely new metals should be used, the composition should be similar to the metal to be welded, and a very small amount of aluminum should be incorporated in the welding material, just in sufficient quantity to destroy the oxide formed during welding and prevent the vaporization of the zinc. The mixing of this small quantity of aluminum is a delicate operation and cannot be performed properly except by specialists.

Welding of Bronze

The above remark will apply also to the welding of bronze, though the element incorporated in the welding material to insure soundness should be phosphorus instead of aluminum. It is well to remark here that the percentage of phosphorus should be exactly verified and homogeneously incorporated in order to obtain good results. No scrap material should be used for making such welding rods so as to avoid absolutely the introduction of any trace of lead or zinc in the metal which would disturb the fusion and produce blowholes.

Welding of Copper

A satisfactory weld in copper, i.e., showing sufficient tensile strength, malleability and elongation cannot be obtained without using a specially prepared copper filling rod. This is due to the fact that copper being heated oxidizes readily and the oxide of copper produced, is dissolved readily in the molten copper, reducing considerably the strength and the ductility, thus rendering the metal brittle.

Provided, that a welder knows how to weld copper and has a suitable equipment, he may obtain very satisfactory results in using a copper filling rod which contains a certain pre-determined quantity of phosphorus which serves as a deoxidizer. To have a suitable copper welding material, it is not sufficient to use any quality of phosphorus copper, but the amount of phosphorus should be accurately controlled and evenly distributed throughout the material. The making of such material is difficult and increases the cost of the products, but enables one to obtain a sound weld, otherwise impossible to produce. Such material permits the manufacture of practically seamless copper articles, instead of apparent brazing, which may become faulty after a period of use.

Welding of Aluminum

Filling material for the welding of pure aluminum should be composed of pure aluminum wire free from silicon which destroys the strength of the weld. For the welding of cast pieces of aluminum, a welding material made of absolutely new metals and about the same composition as the piece to be welded will give the best results. Scraps should be entirely avoided in the making of such material in order to avoid impurities, principally copper and silicium.

Summary

To summarize, we may say that, as under the flame of the blowpipe the metals are liable to be altered, it is absolutely necessary, in order to obtain the maximum results, to use either pure metal or pure metals to which some special beneficial elements have been added. The manufacture of filling material has become a special industry, and consequently, it is recommended that such metals be obtained from firms making a specialty of them, and who are ready to spend the time and money to insure the supply of good products. Even in the case of reliable firms, jealous for their reputation, it is well, if any doubt arise as to the quality of the products they sell, to have same analyzed.

Finally, it is very poor policy to buy welding material as regards price alone, as instead of economizing a few cents on the cost price, one takes a chance, by obtaining poor welds, of losing all the money invested in labor and welding gases, which items are really the main expenses of the cost of welding.

$1,000,000 SHIPBUILDING PLANT FOR CATALINA, NFLD.

W. F. COAKER, head of the Fisherman's Union, of Newfoundland, was in Halifax, N.S., recently, taking initial steps for the establishment of what he says will be a million-dollar shipbuilding plant at Catalina, on the north coast of the colony, to be ready for operation in 1917. Should the enterprise materialize, it will be somewhat serious for the City of St. John's, which previously has been the headquarters of the industrial life of the colony. Mr. Coaker, in speaking of his new enterprise, said: "The sealing industry has long been a great one in Newfoundland, but has dwindled from a million dollars a year to $250,000. The principal reason for this is the scarcity of suitable ships to carry on the industry. The situation has become more pronounced since the war, due to the requisition by the Government of so many of the steamers used for the fisheries. There are only about six or seven ships suitable for carrying on the seal fisheries at present. There used to be a fleet of at least twenty-five. When the shipbuilding industry was booming no difficulty was experienced in keeping the sealing fleet up to maximum, but this, too, has dwindled until it has practically gone out of existence."

Mr. Coaker said wooden ships were more suitable for the sealing industry than iron, some of the latter being too large and the cost of maintaining and operating them too great.

UNITED KINGDOM SHIPBUILDING SUPREMACY

ALTHOUGH its shipbuilding yards were more fully engaged on warship work during 1915 than in any previous year, the United Kingdom is still maintaining the lead as the most important producer of mercantile shipping, being demonstrated by the latest statistics issued by Lloyd's Register of Shipping. The appended table has been prepared in order to show the total gross tonnage of merchant vessels of over 100 tons each launched (a) throughout the world, and (b) in the United Kingdom, while the third column shows (c) the percentage of the world's total output for which British shipbuilders have been responsible during each of the last six years:—

	World	U.K.	%
1910	1,957,853	1,143.169	58.4
1911	2,650,140	1,803.844	68.0
1912	2,901,769	1,738.514	59.9
1913	3,332,882	1,932.153	57.9
1914	2,832,753	1,683.553	59.0
1915	1,201,638	650.919	54.0

In comparing the above figures it should be remembered that the 650.919 tons of merchant shipping launched in the United Kingdom last year only includes those vessels intended for purely mercantile work. It should also be added that the total tonnage launched throughout the world in 1915, as recorded above, excludes those vessels consigned to the water from German, Austrian, and Belgian yards.

PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

GENERAL AND CONDENSER SERVICE CENTRIFUGAL PUMPS

OUR illustrations refer to a line of horizontal and vertical shaft centrifugal pumps for general services and for condenser work, being built by the Wheeler Condenser & Engineering Co., of Cartaret, N.J. This company has been building centrifugal pumps for over two decades, most of them being used, however, in connection with condensers. The new line of pumps is suited for all services.

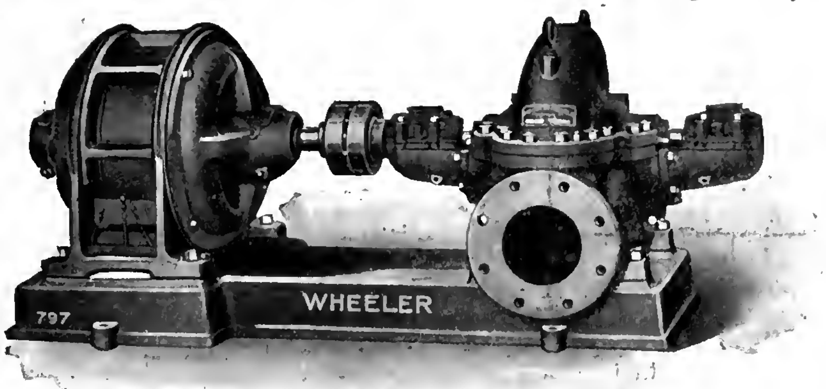

FIG. 1. TYPICAL SMALL MOTOR-DRIVEN PUMP FOR TANK OR STAND PIPE SERVICE. CAPACITY 1000 GALLONS PER MINUTE.

A small motor-driven unit for tank or stand pipe operation is shown in Fig. 1. Referring to the sectional illustration, it will be seen that this pump conforms to the most recent advances in centrifugal pump construction, having a two-part divided casing, with the suction and discharge nozzles in the lower half. The impeller is of the closed double suction type, protected by labyrinth wearing rings. The shaft is protected from the water by bronze sleeves, which screw on to the shaft and extend clear through into the bearing bracket boxes. Bearings are of the ring-oiled type, and in the outboard bracket, there is located a ring-oiled thrust bearing. A feature of these pumps is the large size of the bearing brackets and the fact that they are bolted to the pump casing, instead of being cast integral with them.

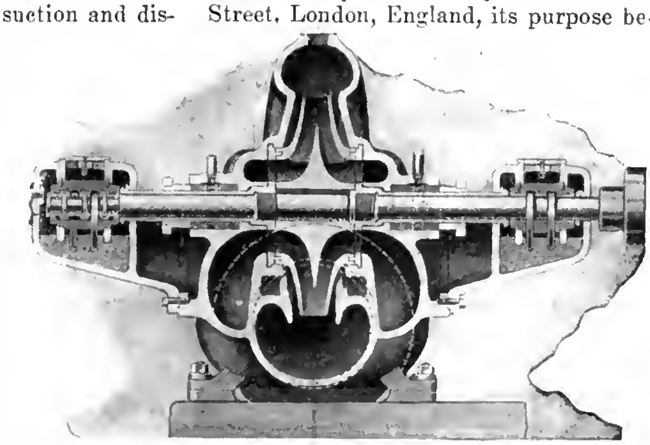

FIG. 2. SECTIONAL VIEW OF CENTRIFUGAL PUMP SHOWING WATER PASSAGES IN CASING AND IMPELLER, ALSO SHAFT PROTECTING SLEEVES.

In the manufacture of these pumps, particular attention is given to the casting of impellers, since the work of the designer in selecting the correct impeller dimensions may be entirely defeated by crude or careless shop work. The impellers are cast in dry sand or skin dry molds, and the cores are made from a core "sand" resembling a fine powder, which when properly mixed, weathered and baked into a core, gives a surface to which the metal adheres perfectly, giving a finished impeller casting true to pattern.

COMBINATION RECESSING AND FACING TOOL

THE combination tool here described and illustrated is a product of the Selson Engineering Co., 85 Queen Victoria Street, London, England, its purpose being the accomplishment of simultaneous recessing and facing operations on small capstan lathes. The tool is especially adapted for cutting the recesses at the back of the threads in "gaines" and No. 100 Graze fuze bodies, and for facing the front of the body at the same time. Additional operations in the manufacture of fuzes, and other small parts, can also be conveniently and expeditiously performed with the tool.

Fig. 1 shows the general appearance of the tool, which consists of a mild-steel shank and body, with a slide carrying the cutting tools. The slide has a cross-travel of ½ in., and is operated by a cam-lever, mounted on the body and bearing against a roller on the slide, as shown; this arrangement provides a sensitive feed for the tools. The internal construction of the apparatus is shown in Fig. 2, but as it is frequently supplied for recessing only, the facing-tool has been omitted from the drawing.

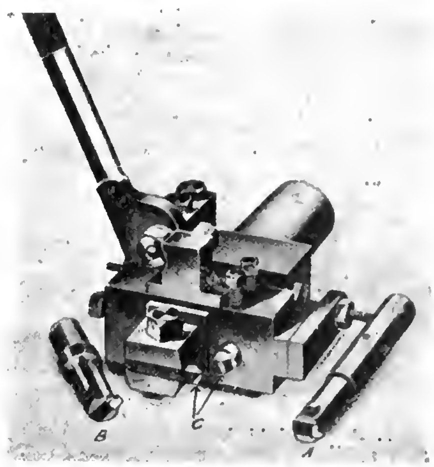

FIG. 1. ASSEMBLY OF COMBINATION RECESSING AND FACING TOOL.

The recessing-tool is mounted in a holder, having a cylindrical shank, which is fixed by a set-screw, and when a facing-tool is used it is made from a rod of circular section, and held in place by two set-screws, as seen in Fig. 1.

It will be noted from the drawing, Fig. 2, that the body contains a helical spring, which bears at the right-hand end on a plug screwed into the body, and, at the other end, on a collar screwed on to a bolt, which passes completely through a lug on the slide, and the lug bears against a stop-nut, so that when the slide is moved to the right, the spring is compressed, and by this means the slide is returned to its original position as soon as the lever is released. The travel of the slide is limited by a pair of lock-nuts, shown on the left-hand end of the bolt in Fig. 2, and these lock-nuts are adjusted to suit the required depth of cut.

In operation the combination tool is

mounted in the turret with its tool-holder in line with the hole in the work, the adjustment being effected by means of the stop-nuts on the right-hand end of the bolt. The turret-slide is then brought forward to a stop, and the cutter fed into the work by the lever as far as the lock-nuts will permit. When this point is reached, the lever is released, to allow the tool to return to its original position, and the turret slide is then brought back.

As illustrated in Fig. 1, the tool is arranged for recessing the internal thread in the base of the No. 100 fuze body, and simultaneously facing the end, these operations being performed by the cutters lettered C. The hole is, in this case, large enough to clear a tool-holder of the form illustrated. For recessing the backs of the threads in smaller holes, a tool of the type lettered B is employed, this tool being used in the screwed hole in the front end of the No. 100 fuze body. The tool lettered A, which, it will be noticed, has two cutters, was designed for recessing simultaneously two internal threads of different diameters in

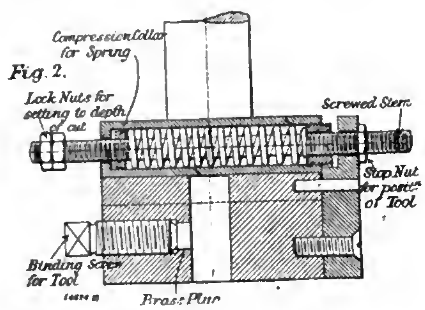

FIG. 2. SECTIONAL DETAIL OF COMBINATION RECESSING AND FACING TOOL.

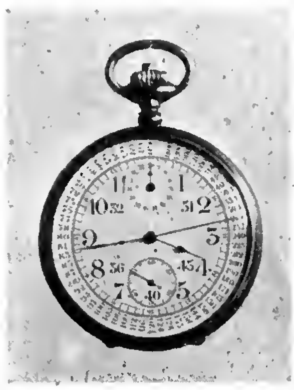
"gaines," but the design of the latter has now been altered, so that this tool is no longer used. The combination tool is, of course, quite suitable for external recessing work, and, by employing a former in the tool-post on the cross-slide of the lathe, it can also be used for taper boring.—Engineering.

TIME AND MOTION STUDY WATCH

WHAT is known as the Master Chronograph—an improved type watch for taking time and motion studies, has been placed on the market by M. J. Silberberg and associates, People's Gas Building, Chicago, Ill. The watch may be used as an ordinary timepiece if so desired.

It operates entirely from the crown, being of the stop, start and flyback type. The timepiece portion of the watch has seventeen jewels and in addition there are divisions in seconds and fifths for the time study feature. The figures on the extreme outside of the dial designate the number of operations that can be performed in an hour where the time for a single operation is less than 1 min., while the figures on the extreme inside of the dial, such as 51, 45, 40, etc., give the same information if the time required for a single operation exceeds 1 min., but is less than 2 min.

In the accompanying illustration, the



TIME AND MOTION-STUDY WATCH

watch is shown with the large black band used in time-study work stopped at 13 sec. and by referring to the outer set of figures it will be seen that the hand is opposite 275, which is the number of operations that can be performed in 1 hr., assuming that 13 sec. is required for a single one.

PNEUMATIC SPRING BANDING PRESS

THE accompanying illustration shows a pneumatic spring banding press, which has been placed on the market by Joseph T. Ryerson & Son, Chicago, with the object of enabling the smaller railroad shops throughout the country to dispense with hand work for this operation. The fact that hydraulic power is not so widely obtainable as pneumatic renders this machine particularly suitable for shops engaged in repair work and other general lines.

This banding machine is operated with 100 lbs. per sq. in. air pressure, the cylinders, which are 16 in. diameter, enabling a pressure of 60 tons to be exerted on the rams. The pressure exerted on the spring band being positive and known, work is turned out with greater uniformity and rapidity than when done by hand.

PNEUMATIC SPRING BANDING PRESS.

The simplicity of design and construction places this machine within reach of the smallest railroad shop and commercial spring manufacturing plant, which, by the adoption of suitable dies, can also produce the bands on the same machine.

Each machine is furnished complete with three-way hand-operated valves and the necessary pressure gauges. The weight of the machine as illustrated is 6,500 lbs.

TRADE OPENINGS IN BRITISH INDIA

THE following information regarding openings for trade in British India is extracted from the official review of the trade of India in the past year. The Director of Statistics to the Indian Government recently reported:—"Electrical machinery for use in connection with water-power plant has great capabilities of expansion. The total number of electrical installations in India is already large and is increasing. All the larger towns and chief ports possess electric light and electric tramways, or are about to use power for these purposes. A gradually increasing market for electrical machinery is anticipated.

In recent years the collieries of India have largely adopted electrical equipment, and here German goods have found an opening. The Calcutta market has in late years been flooded with cheap German materials for electric wiring, such as cables, switches, ceiling roses and cut-outs. Since the outbreak of hostilities this source of supply has ceased, and the United Kingdom and its colonies are likely to capture the German trade in these goods, provided the requirements of the markets are carefully studied."

SHELL PRODUCTION IN BRITAIN

IN another section of the present issue of Canadian Machinery will be found an outline description with illustrations covering one of the many specially erected and equipped munitions plants now doing business throughout the British Isles. We are indebted to our British contemporary, "Engineering," for the privilege of having the material appear in our columns.

The extent and capacity of the plant described are of direct interest to Canadian metal-working establishments engaged in shell production, inasmuch as, that from the outline data given, some idea may be got concerning the organizing forces that have been at work in bringing such institutions to their now high state of utility and proficiency. At the same time, the reason in whole or part, why munitions orders to be filled in Canada are less prolific than heretofore, may possibly be traced.

Shells, it will be noted, are being produced in these plants of all types and sizes—shrapnel and high explosive, from the smallest to the largest in service and for both British and Allied guns. Operation methods and devices and machine tool equipment installed are for obvious reasons but briefly referred to, respecting which we might say that no disappointment need be felt, as the various processes and the means of their successful accomplishment are already well-known to all of our munitions factories and have been specially featured in our editorial and advertising columns, several score times.

We appreciate the opportunity of placing the material at our readers' disposal, believing, that, by so doing, the net result will be a more realistic conception of the earnestness with which the Old Land has set itself to the task of bringing the war to its one and only logical conclusion.

WHAT IS SUITABLE SHELL STEEL?

DISCUSSIONS in contemporary journals indicate that English investigators and manufacturers are not disposed to rest satisfied with the Government's seeming indifference toward the question of suitable shell material. Up till now the War Office has successfully resisted all efforts to have shells made of other material than forged or rolled steel, meeting all arguments and proposals with the stereotyped reply that in the opinion of its advisers it would not be expedient otherwise.

Without in any way detracting from the prestige of the War Office experts or questioning in any way their knowledge of what is suitable shell steel, it might be pertinent to inquire of them what is not suitable shell steel.

The aim of Britain's munitions makers is to largely exceed Germany's reported shell output of one and three-quarter millions per week. Whether that has been done, or will be done is beside the point, but severe official specifications should not be allowed to exercise a restrictive effect on the output and prevent due consideration of other grades of material already in use by certain powers. That eminent authority, Dr. Stead, in a recent paper, discusses actual variations in German shell composition as learned by analysis of actual pieces. Where steel is required to possess great fatigue resisting properties, combined hardness and toughness, or be specially suitable for machining or drawing in presses, the importance of chemical composition is recognized because actual mechanical tests have performed the basis of comparison, and afforded physical proof of the influence of various substances.

The importance of this fact is recognized by Dr. Stead, and his position as an analytical chemist adds weight to his statements—"If a steel is proved by suitable mechanical testing to be satisfactory, on no account should it be rejected on chemical analyses. . . If the results of my mechanical tests are confirmed, then the obvious thing to do is to alter the specifications forthwith. If the mechanical tests are found to be conclusive, then it would be a national crime to reject material on any chemical specification before submitting the steel in question in the form of a finished shell to the more convincing mechanical test."

THE NEW TAXATION FOR WAR PURPOSES

ONE thing that strikes us relative to the proposed new taxation for war purposes is the absolute lack of detail concerning its operative machinery. It has all the appearance of being the result of a "throw of the dice," or at best the maiden effort of an amateur performer. Such opportunity to riddle the Budget proposal of responsible Government with shot and shell rarely presents itself, and indications are everywhere abundant that party friend and party foe will be actively militant in assailing its rawness and lack of essential qualifications.

That the money has got to be raised by some legitimate means, nobody for a moment disputes, and that all concerned realize an obligation with respect to its raising, goes without saying. The proposals submitted define a wide diversity obligation, and presume to state the cash value of each, irrespective of right or reason. The very fact that the main feature of the 1916 Canadian Budget is taxation of profits of our commerce and industry, and therefore in its every feature touching business men, should have been reason enough why some little attention and investigation should have been given the proposals so that presentation of them would have had at least a business air about it.

The whole scheme, it seems to us, is so supremely tentative, that any one of a series of developments may easily be anticipated when the House in Committee proceeds to its dissection, if enough body may meantime or then be found to it. Evidence is, however, accumulating to show that while the ideal aimed at will not fail of accomplishment, the concentration of productive effort will affect to a considerable extent the scope of the original propositions.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents

Montreal, Que., Feb. 28, 1916.—The industrial situation continues to show an upward tendency, but although the limit would seem to be within reach, there is nothing to indicate just when such a condition will come about or how much higher present prices will rise.

One of the chief influencing factors of the present situation is the shortage of ocean vessels. Owing to the extreme scarcity of ship plates it has become almost impossible to construct vessels of sufficient tonnage to begin to meet demands. Wooden shipbuilding has consequently received new impetus, and considerable activity is now going on in the shipbuilding yards of Nova Scotia. Vessels in course of construction there are being fitted with steam auxiliaries, and it is hoped these will assist to some extent in relieving the conditions due to the present scarcity of shipping.

Pig Iron

The situation in pig iron remains unchanged. Producers of steel-making pig continue to work at high pressure, in an effort to keep up with the demands of the steel mills. Difficulty is being experienced in the transportation of raw materials owing to car shortage. However, this is now being relieved, and it is expected that improved facilities in this connection will continue. Coke producers are experiencing some trouble in securing men to operate the furnaces, and in some respects are spending considerable money in obtaining suitable help.

Steel

With the demand for all classes of steel as great as ever, the steel trade continues working at great pressure, in an effort to supply the requirements of the abnormal market, which will, in all probability, continue throughout the present year and well into 1917. The trade in railway material is increasing, and inquiries for 1917 rails have recently been noted, but while no large developments are reported, the price of rails, which has not been advanced, seems very low when compared with those of other steel products. Owing to the advance, a few days ago, of $5 a ton on bars, plates and shapes, it is expected that Montreal prices—in lines affected—will follow those of the United States market. However, local dealers have not yet decided on an advance, but it is intimated that prices may change before the week end.

The demand for plates is exceedingly heavy, and it is practically impossible to meet the requirements for shipbuilding plates. Local quotations show an advance of $8 a ton on plates ¼ to ½, and $9 a ton on heads and 3-16 inch tank plates, the respective prices being $3.40, $3.65 and $3.70 per 100 pounds.

The demand for galvanized sheets continues light and no advance is quoted, but dealers are firm on present prices. The demand for blue annealed sheets is very heavy, and producers are taxed to the utmost in supplying the needs of the trade. Canada plates, dull, are now quoted at $4.50, and all bright at $6.30. Premier No. 28 U. S. galvanized is now $6.65.

Following the expected advance in proof coil chain, local dealers are now asking the prices shown on the selected quotation pages, which is an increase of from about 6 per cent. on ¼-inch to 20 per cent. on 1-inch chain. In view of the existing conditions prevailing, it would not be surprising to see further advances in many lines of steel products.

Metals

The tone of the general market is somewhat easier, but conditions are apparently unchanged. Copper, which has been constantly rising for some time, is, seemingly, quietening down, but it is unlikely that the lull will lapse into a weaker market, as the demand shows no signs of abatement. Without any apparent reason foreign tin markets have taken on considerable strength. Some difficulty is still experienced by shippers in the securing of permits to ship tin. Lead has shown strength with an advance in price. The better grades of spelter are demanding higher prices.

Copper.—The week has passed without any features of exceptional interest having developed in the copper situation, which has been on the whole a quiet market and comparatively void of speculation. Few prompt or early deliveries are reported, and most of the current business is for June and later delivery. Some manufacturers, whose contracts with producers have nearly expired, are experiencing great difficulty in placing further orders, which is causing much uneasiness, as consumers are dealing where supply is available.

The unsettled condition of the political situation across the line is keeping buyers from heavy future purchase, and it is generally supposed that the copper market has about reached its height, for the present; but it is not expected that any great decline will be noted for many months. Local dealers report an advance of ½c per pound, Lake being quoted at 31c, electrolytic 31c, and castings 30c per pound.

Tin.—The situation in the tin market has taken on considerable strength during the past week. Advices from London report continuous advances, but no specific reasons are given, with the exception that buyers are anxious to secure metal, while the sellers are apparently few. The recent advances cannot be traced to any developments on the American market, which has of late been comparatively quiet. It is possible that the report of no available tin for early delivery has stimulated the British market with the resultant advance quoted, which is on an average of £2 per ton.

As there is no indication of any reduction in the Eastern output, it is assumed that the present available supply has been sold to consumers, and it is more than likely that the recent advance will be of short duration. In the wake of the foreign market the local dealers are quoting an advance of 1½c a pound, this week's price being 48c.

Spelter.—Further advances are noted in foreign markets. London reports an extra £2 on spot spelter, but future prices are somewhat lower than recently quoted. However, this foreign movement has not yet affected the markets here, which are little revived from the past week's dullness. Little improvement is shown in the demand for spelter, and no great amount of business is being transacted with the exception of such export trade as has previously been contracted for. The general dullness is largely due to the reduced activity in copper, and it is anticipated that quiet may prevail for some little time. The supply of high-grade metal is now apparently greater than the demand, and various lots have lately been offered for resale. Early and spot delivery on intermediate and brass specials are hard to obtain, and it is only on May or later that producers will guarantee delivery.

Local conditions remain unchanged, with prices firm at 23c per pound.

Lead.—Recent inquiries for spot metal have materially strengthened the market, and the prospects are that early advances may be quoted. Efforts are being put forth to prevent any sharp rise in the price of lead, and although the occasion has arisen several times, the Trust has eventually succeeded in stopping any unnecessary increase.

The supply at present is not any too great for the requirements of the trade, and it is not expected that any weakness will develop for some time. The lack of ocean tonnage is also a serious feature at the present time, and until some solution is arrived at in this connection, no permanent relief can be looked for.

Local business is reported fair, with a slight advance over last week's quotation. An increase of ¼c puts the price up to 8¼c per pound.

Antimony.—The evident scarcity of visible metal has resulted in a stronger market, and New York is quoting an advance of ½c. Munition makers have been large purchasers recently, and in the face of the present shortage, dealers abroad are asking higher prices. However, the situation here is weaker, but the demand is good. Quotations are easier this week at 48 cents per pound.

Aluminum.—A fair demand for immediate shipment is keeping the market firm, and inquiries for future are good. Prices here show a decline of 1c a pound. Present quotation 68c.

CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.

Machine Tools and Supplies

The inquiries for machine tools, especially requirements of munition manufactures, are quite brisk, but the general demand is not as active as a few months back. However, the strength of the domestic market seems to be improving, and additions to plants, to meet the changing conditions, are continually being reported. This is more evident in certain sections of the United States, where machine tool construction predominates. The trade in second-hand machinery is very active at present. The pressure at which many of the munition plants are working maintains a constant drain on all available machine tool supplies. The manufacturers of high-speed steel, drills, taps, reamers, lathe chucks and all special attachments, find their capacity unequal to the demands made upon them, and are unable in many respects to supply a customer with his complete requirements.

Old Materials

The trade in scrap metals has not been very active for the past few days. In view of the continual advance in the price of finished steel, scrap dealers are looking forward to better prices in heavy melting steel and the like. Coppers have advanced ¼c per pound; brass clippings and turnings are up ¼c, and scrap zinc shows an advance of ½c per pound.

Toronto, Ont., Feb. 29.—Trade generally continues in a satisfactory condition the volume of business passing being greater than that for the corresponding period of last year and quite up to expectations. The remarkable expansion in trade is shown in the returns recently issued by the Customs Department. The exports for the first ten months of the fiscal year increased by nearly 80 per cent. as compared with the preceeding ten months while the imports increased by about 15-million dollars for the same period. Exports of manufactured goods for the ten months under review totalled $100,000,000 being an increase of $105,000,000, due of course, mainly to war orders. The local teamster's strike has been settled and the congestion of freight at the railway terminals is being rapidly relieved. The embargo which the railways placed on many classes of shipments consigned to Toronto, has been lifted and conditions are practically normal.

Prices of all steel and ingot metal products are very firm and changes continue in an upward direction. The increasing scarcity of raw materials of various kinds is becoming a serious matter as it is forcing up prices of finished products and at the same time is threatening to cause a shortage of many lines. The extraordinary demand for steel is, of course, affecting all steel products and prices are steadily advancing. Prices of ingot metals have been going up steadily for the past two or three weeks but there are indications that the top of the market has been reached. The present high price of cordage is due to the shortage of fibre and abnormal ocean freight charges. The crude oil situation shows no improvement and prices of gasoline and benzine continue to advance. A new list of discounts on bolts and nuts has been issued.

Steel Market

The market is as strong as ever and prices are very firm with an upward tendency. The demand for steel continues unprecedented and the outlook for the industry could hardly be better. Prices of domestic steel bars, plates and shapes are unchanged at $2.75 but the recent sharp advance in the United States market may affect the local market and result in higher prices here. Prices of boiler plates and tubes are very firm and will be higher in the near future, the demand in the primary markets being very heavy. Makers of boiler

tubes report that they are sold up for six months. Makers of wire rods are quoting $50 to regular customers for deferred deliveries, but rods are very scarce and a compaatively small tonnage is being sold in the open market. Prices of bolts and nuts have advanced about 5 per cent., the new discounts are given in the selected market quotations. Rivets have also advanced, boiler rivets being quoted at $4.35 and structural rivets at $4.10. The galvanized sheet market is very strong and higher prices are looked for in the near future. The recent advance in the price of spelter will tend to further reduce the output of galvanized sheets and also increase prices.

The recent advance of $5 a ton at Pittsburgh on contract bars, plates and shapes was apparently quite unexpected and has disturbed the market. Bars are now quoted at 2.50c, plates 2.75c, shapes 2.25c, and hoops 2.50c, Pittsburgh. Specifications against contracts for rolled steel products are being received by the mills in overwhelming volume. New business offered also is of large proportions, but there is some hesitancy in accepting contracts offered even for delivery during the last quarter of the year. The further advance has not checked buying, and consumers are placing all the business that the mills will accept. Chicago warehouse prices have advanced again, bars and shapes being now quoted at $2.90 and plates at $3.15. Bessemer billets have again advanced and are now quoted at $35 a ton Pittsburgh. Open-hearth and forging billets are unchanged at $35 and $55 per ton, Pittsburgh, respectively. The uncertainty of the future market for ferro-manganese is causing considerable anxiety among steel producers as it is not known how much will be available for the second half of the year. Spot and early delivery ferro-manganese continues to command very high prices, spot being quoted at $225 to $250, and early delivery well over $180 seaboard.

Pig Iron

The situation is unchanged and the market fairly active. The heavy demand for steel making grades continues and there is an improvement in demand for foundry iron. Quotations are firm and unchanged.

Machine Tools

The situation is unchanged and the market is quiet. As the majority of munitions plants are now well equipped, the demand for machine tools has fallen off considerably, although some nice business is being done in special tools for machining shell parts. A local shell making concern recently put on the market a considerable quantity of machinery which it is understood sold well. Disquieting reports come from New England regarding labour troubles at several plants. If the unrest spreads, machine tools builders in that district, doing business in Canada, may be affected.

Supplies

The market continues very firm and prices are higher for some lines of supplies. New and lower discounts have been issued for globe valves, etc. Globe, angle and check valves, brass body, are now quoted at 30 per cent., off, but the same lines with iron bodies are 45 per cent., brass gate valves 30 and 5 per cent., and iron gate valves at 60 per cent. off list. White lead advanced 25c and is now quoted at $11.70 per 100 lbs. in ton lots. Gasoline and benzine are up again being quoted at 30½c and 30c per gallon respectively. The oil market is very strong, all grades of Pennsylvania crude having advanced 5c per barrel recently, bringing Pennsylvania crude up to $2.40. A heavier consumption of gasoline will begin shortly as the weather improves and prices will no doubt go still higher. Castor oil has also advanced and is now being quoted at 44c per lb. Thus is due to the serious shortage and difficulty in obtaining supplies from England. Oakum is higher at 6c per pound. The turpentine market is very weak and quotations have fallen to 78c per gallon. Linseed oil is firmer and unchanged.

CANADIAN PURCHASES FOR FRENCH WAR OFFICE

Philippe Roy, General Commissioner for Canada, Paris, advises the Department of Trade and Commerce, Ottawa, that an order has been issued by the War Department of the French Government to the effect that all purchases made by the Supply Branch in Canada will pass through the Hudson Bay Co. Canadian producers should therefore submit their future offers through the office of that company at Montreal. It is further stated in Mr. Roy's communication that Canadian lumber, steel and meat will find in France an important market for years to come, but it is necessary that Canadian firms should have in Paris representatives entrusted with the necessary authority, especially if it is desired to secure Government contracts.

Metals

The metal markets are very strong and prices continue to advance. The upward movement is not quite so strong, and the top of the market has probably been nearly reached in the meantime. Copper has halted and the market is now generally sold out through May, while some producers claim to be sold up through June. Tin is higher on account of continued strength in the primary market. Spelter is also higher due to an advance in London caused by a scarcity of spot metal. The lead market is very strong, a tight situation for spot metal having developed. Antimony has advanced and the market is very firm with a continued scarcity of nearby metal. There is a continued scarcity of spot aluminum and the market is very strong but unchanged.

Copper.—The upward movement has apparently stopped but the market is very strong and the situation unchanged. Buyers are reported to be well supplied for immediate needs and not inclined to increase their future purchases unless consuming requirements are affected. The position of copper is a sound one and the present price although high is due entirely to actual supply and demand. It is therefore highly probable that the present level will be maintained for some time to come. Quotations are unchanged and nominal at 30½c per pound.

Tin.—The local market is higher due to continued advance in London. The reason for the movement in London is not clear but some importers claim that it is on account of difficulties in obtaining permits, and that there is very little metal for delivery in the next two or three months, for sale. Tin has advanced 1c and is quoted locally at 48c per pound.

Spelter.—Spelter is higher following an advance in the London although the New York market is dull and easy. The demand for spelter from the brass mills continues heavy but the price is too high to interest the galvanizing trade. Spelter has advanced 1c and is now quoted locally at 25c per pound.

Lead.—Prices are unchanged at the "Trust" price of 6.30c New York, but higher in the outside market. The market has an upward tendency and higher prices appear probable, as a tight situation for spot lead has developed in New York. Local quotations are firm at 8¼ per pound.

Antimony.—The market is firm and higher with quotations practically nominal. There are still no large offerings of antimony for any earlier position than March shipment, and all spot metal has been contracted for. Antimony has advanced 1c and quotations are nominal at 48c per pound.

Aluminum.—There is no improvement in the situation. The demand is heavy but supplies are scarce and prices nominal. Quotations are unchanged locally at 68c per pound.

Solders. — Quotations are unchanged at last week's level but the market is firm and higher prices may develop in

the near future guaranteed solder is quoted at 30c per pound.

Scrap

The strength in the scrap copper market has been well maintained and prices are a little higher. There is a good demand for copper but the advance is due largely to the situation in the copper market. Scrap zinc is also higher in sympathy with the upward movement of spelter. Heavy melting steel scrap is in good demand but prices are unchanged. The scrap market has been rather more active lately, although the general situation shows little change.

Tin Higher.—A sharp advance in the tin market is reported as we go to press due probably to the market being disturbed over the possibility of cargoes of tin being lost through submarine attacks. Tin is now quoted at 56c per pound, being an advance of 9c. All solders are correspondingly higher.

Winnipeg, Man., Feb. 26.—Fear is expressed here that the labor scarcity, which is probably more acute in the West than anywhere else in Canada, is liable to have its effect on the machinery market. Scarcity of labor is also blamed for any lack of confidence there is, and consequent disinclination to spend money. The past month has been remarkable for the large number of saw mills which have resumed operations all over the West, this resulting in an almost unprecedented demand for supplies. There is a healthy tone to the lumber industry, and business should be fairly good throughout the year.

The supply trade, which has been exceptionally good during the past two months, is still the best department as far as machinery markets are concerned. Little is heard here now regarding shell contracts, although it is rumored that a number of firms have got further work to do; the conditions under which contracts were placed has not, however, been made public.

Announcement was made last week to the effect that the Manitoba Steel Foundries have been incorporated, and that they would instal an electric furnace at Selkirk for this purpose. It is understood that the products will be used by the Manitoba Rolling Mills, which is the parent concern.

The metal markets during the past week have shown very little change, the principal items affected being nails, wire and galvanized sheets. A revised price has been issued on cut nails, base now being $4 per keg. Planished copper shows a slight advance, and current prices on 14 and 16 oz. is 44c per pound. It is understood here that there is liable to be a shortage of Canada plate, and considerable buying is taking place by those who wish to protect themselves.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

Engineering

Swift Current, Sask.—The Winnipeg Oil Co. propose building a distribution plant here.

Stratford, Ont. — The R. M. Ballantyne Co. propose to make an addition to their power plant.

Shawinigan Falls, Que.—The Belgo-Canadian Pulp & Paper Co. will build an addition to their plant here.

Guelph, Ont.—Alex. Callander will build a foundry here, 50 ft. x 100 ft. The capital involved is about $8,000.

Port Sidney, Ont.—S. Smith is in the market for a marine engine, fore and aft, 6 x 10 or 12 x 9 in., with condenser.

Guelph, Ont.—The Louden Machine Co. purposes making an extension to its factory. Estimated cost, $15,000 and $20,000.

Portneuf, Que.—The Portneuf Hydro-Electric Co. will instal a 50 h.p. water turbine and generator at their power plant here.

Vancouver, B.C.—Pumps & Power, Ltd., 224 Abbott Street, is in the market for a 15-h.p., three-phase motor, also a 5 to 10-h.p. steam engine.

Toronto, Ont.—White & Thomas, 212 Simcoe Street, are building an addition to their plant for the manufacture of galvanized iron products.

Toronto, Ont.—The Harris Abattoir have received permission to make an addition to their engine room on St. Clair Avenue at a cost of $7,000.

Fredericton, N.B.—The Fredericton Gas Light Co .has been taken over by a new syndicate, who will probably make extensions to the plant in the near future.

Sault Ste. Marie, Ont.—The Algoma Steel Corporation will erect a new building, 120 x 350 feet, at a cost of $50,000. The McPhail & Wright Construction Co. are the contractors.

Niagara Falls, Ont.—The Canadian Niagara Power Co. will enlarge its forebay and add several generating units. The work will cost $2,000,000. Philip P. Barton is general manager.

Kincardine, Ont. — The Ontario People's Salt & Soda Co. will receive bids until April 1 for the erection of an addition to its plant to cost about $15,000. John Tolmie is manager.

Hamilton, Ont.—The United Gas & Fuel Co. have purchased a site on Stripes' Inlet, where coke ovens will be built. Plans are being prepared for a plant which will cost about $2,000,000.

Granby, Que.—The F. S. Carr Rubber Co. has taken over the old factory of the Walpole Rubber Co. here, and is installing a complete power system, including steam boilers, engines, generators, etc.

Little Bras D'Or, N.S.—The colliery engine house, briquette plant and mine head, owned by the Colonial Mine Co., have been totally destroyed by fire. Loss is estimated at $50,000. Manager, G. B. Burchell.

ALLIES PURCHASING AGENTS

The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:

International Purchasing Commission, India House, Kingsway, London, Eng.

French.—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendence Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.

Russian. — Col. N. Golejewski, Military Attaché, Room 904 Flat Iron Building, New York City.

Montreal, Que.—Fire caused $30,000 damage to the forge department of the Turcot plant of the Canada Car & Foundry Co., with a loss of about $60,000. The plant will be rebuilt at once.

Shawinigan Falls, Que.—The Canadian Electrode Co., a subsidiary of the Shawinigan Water & Power Co., Montreal, is erecting a large plant here, for the manufacture of carbon electrodes, etc.

Weedon, Que.—The Weedon Chemical Co. is rebuilding its plant, which was recently destroyed by fire with a loss of $60,000. The company will also build another factory, for which it is now looking for a site.

Windsor, Ont.—Plans are being prepared by A. R. Bartlet, of this town, for the erection of a factory at Windsor or Walkerville, Ont., for the Chalmers Motor Co., Detroit, Mich., to cost $65,000.

Chatham, Ont.—The American Well Works Co., of Aurora, Ill., have started putting the local plant into shape for manufacturing operations. The company make well drilling outfits and pumping machinery. F. J. Lukins will be manager of the Canadian branch.

Vancouver, B.C.—The Dominion Government has approved the plans of the Amalgamated Dry Dock & Engineering Co., which will build a drydock and shipbuilding plant on the North shore. It will include a graving dock, buildings, marine railway and equipment, etc. J. L. Davidson is manager.

Niagara Falls, Ont.—The Ontario Power Co. will install two additional units at its plant, and will increase its generating capacity to 180,000 h.p. It will also construct a pipe line 6,000 ft. long by 18 ft. diameter to supply the units. Construction work will be started in the spring, and will cost about $3,000,000. B. G. Converse is manager.

Sarnia, Ont.—The manufacturing interests of Sarnia who use the power of the local electric company for operating their plants are opposing the action of the Hydro Commission, which proposes to install 25-cycle power when the new hydro-electric scheme goes through. Sixty-cycle motors are at present installed throughout the city.

General Industrial

Alvinston, Ont.—The Board of Trade are endeavoring to establish a sugar beet factory here.

Fort William, Ont.—Three firms are looking into the possibility of building elevators here.

Quebec, Que.—The G. A. Vaudry Biscuit Co. factory was recently destroyed by fire, the loss being estimated at $40,000.

Niagara Falls, Ont.—The Pollard Mfg. Co. have purchased a controlling interest in the Dominion Safe & Vault Co., of Farnham, Que., and will remove the plant to Niagara Falls. The Pollard Co. will make the "Midget" flour mill.

North Vancouver, B.C.—The Vancouver Creosoting Co. are building a factory here. Some contracts have been awarded.

Sackville, N.B.—The A. E. Wry-Standard, Ltd., are rebuilding their boot and shoe factory, which was recently destroyed by fire.

Fort Erie, Ont.—The directors of the International Safe Co. at a meeting held here recently decided to build an addition to the plant, which will double the capacity.

Stratford, Ont.—The addition which the Avon Knitting Co. propose building to their factory will be 36 ft. by 60 ft. and three storeys high. Thos. Hepburn is the architect.

Brampton, Ont.—The council have under consideration a proposal to establish a rubber and tire factory here. Frank D. Law is interested in the scheme. A by-law will be voted on.

Chatham, Ont.—The C. & W. Shoe Co., of London, Ont., propose moving their business to Chatham, providing the by-law carries on March 6. The company propose taking over part of the Wolverine Brass Works, now vacant. Edward Hunt, of London, is interested.

Quebec, Que.—It is reported that the Dominion Textile Co., which already has two large mills at Montmorency Falls, will shortly erect another large plant close to the Riverside Mill. The two plants already in existence have been working night and day for some months past, but it is understood that the lines to be manufactured in the proposed new plant will be different from those now turned out at the existing plants.

Toronto, Ont.—The W. K. Kellogg Cereal Co. has purchased the Central Prison broom factory, and work has started on rebuilding the premises. $125,000 worth of new machinery will be installed at once.

Tenders

Toronto, Ont.—Tenders will be received up to Tuesday, March 7, 1916, for furnishing and constructing radial brick chimney and foundations for the refuse incinerating plant on Don Roadway. Specifications and forms of tender may be obtained from the office of the Street Commissioner, City Hall.

Toronto, Ont.—Tenders addressed to the Secretary-Treasurer, Board of Education, will be received until Wednesday, March 8, 1916, for science class electrical equipment for Humberside Collegiate Science Department. Specifications may be seen and all information obtained at the office of the Clerk of Supplies, City Hall.

Toronto, Ont.—Tenders will be received by the Chairman, Board of Control, City Hall, up to Tuesday, March 14, 1916, for the supply and delivery of: One single-truck, double-end street car, completely equipped; one car body, double-end, single-truck; equipment for one single-truck; equipment for one single-truck car. Specifications and forms of tender may be obtained at the Works Department, Room 12, City Hall.

Toronto, Ont.—Tenders will be received by the Chairman, Board of Control, City Hall, up to Tuesday, March 14, 1916, for the supply and delivery of: Special track work, for St. Clair Avenue barn; extension, Toronto Civic Railway. Specifications and forms of tender may be obtained at the Works Department, Room 12, City Hall.

Drummondville, Que.—Tenders will be received until March 15, 1916, for the supply of materials and the construction of a pumping station and mechanical gravity filters. Those interested can obtain specifications and plans covering said works at the office of the town clerk, W. A. Moisan, and also at the office of M. M. Ouimet & Lesage, 76 St. Gabriel Street, Montreal, P.Q.

Municipal

Brantford, Ont.—The council may purchase motor equipment for the fire department.

Weyburn, Sask.—The city will instal an additional unit at its power plant, to cost $35,000.

Waterloo, Ont.—The Town Council will buy a motor truck for the Water and Light Commission.

Quebec, Que.—George A. Johnson, consulting engineer, of New York, has reported to the City Council in favor of the installation of a chlorination plant as a means of improving the quality of the water. A filtration plant will probably be installed later.

EQUIPMENT FOR AUSTRALIAN NAVAL DOCKYARD

Tender forms and specifications have been forwarded by D. H. Ross, Trade Commissioner, Melbourne, for 43 machines of various types required for the equipment of the Commonwealth Naval Dockyard, Cockatoo Island, Sydney, N.S.W. Tenders will be received, subject to the conditions specified, up to May 1, 1916, addressed to the Director of Navy Contracts, Melbourne, Australia. The last mail in time to reach Melbourne on May 1 is that leaving San Francisco on March 22 and due at Melbourne on April 12. The tender forms are open to the inspection of Canadian manufacturers at the Department of Trade and Commerce, Ottawa (refer file No. A-1435). Particulars of the requirements are briefly outlined thus:

Three 50-ton overhead travelling cranes.

One 25-ton overhead travelling crane.

Two 5-ton overhead travelling cranes.

One 10-ton revolving cantilever crane.

Two 5-ton travelling portal jib cranes.

Two 7½-ton jib cranes.

One 5-ton jib crane.

Two 15-ton hydraulic cranes.

One 6-ton hydraulic crane.

One 6-ton wall crane (hydraulic).

Two 3-ton wall cranes (hydraulic).

Two electric passenger elevators.

Two electric goods elevators.

One 2½-ton gauge locomotive with crane attached.

One 2½-ton gauge locomotive without crane attached.

Three electrically-driven air compressors, 1,500 cu. ft.

One 15-ton hydraulic winch.

One 5-ton hydraulic winch.

Nine 10-ton hydraulic capstans.

Two 5-ton hydraulic capstans.

One bar shearing machine.

One double-ended horizontal punching machine.

One 10-ton overhead travelling crane for shipyard fitting shop.

Kingston, Ont.—The City Council have decided to instal a motor-driven blower at the incinerator plant.

Grand Valley, Ont.—A by-law to authorize the installation of a hydro-electric system will be submitted to the ratepayers on March 14.

Petrolia, Ont.—The Town Council have let the contract for equipment for the transformer station to the Canadian Westinghouse Co., Hamilton, Ont.

London, Ont.—The city will make extensive additions to its storm sewer system, to cost $160,000. Chipman & Power, Toronto, are the engineers.

Sarnia, Ont.—The City Council have engaged two expert engineers to examine the waterworks system and report on the possibilities of obtaining the required amount of water.

Trade Gossip

The Russell Motor Car Co. have removed their city sales office from 100 Richmond Street West to 276 King Street West, Toronto.

North Bay, Ont.—The Board of Trade has appointed the officers for the year 1916: President, G. A. McGaughey; vice-president, R. L. Dudley; treasurer, B. M. Mulligan.

Hamilton, Ont.—The Harbor Commission is preparing an industrial area on the water front. The land will be used for industrial sites, and railway switches will be laid down.

Collingwood, Ont.—The Board of Trade has elected the following officers: President, D. L. Darroch; vice-president, F. F. Telfer; secretary, C. T. Stephens; treasurer, D. Williams.

Moose Jaw, Sask.—At a meeting of the Board of Trade the officers elected for the year were: President, John Crawford; vice-president, W. F. MacBean; secretary, E. J. McMillan.

Sackville, N.B.—The Board of Trade has elected the following officers for the ensuing year: President, F. A. Fisher; vice-president, George E. Ford; secretary-treasurer, A. H. McCready.

The Goldie & McCulloch Co., of Galt, Ont., have presented a complete set of instruments to the 111th South Waterloo Battalion for the brass band. The instruments will cost about $1,300.

Saskatoon, Sask.—At a meeting of the Board of Trade, held recently, Malcolm Isbister was elected president for the ninth year in succession; P. Kirkpatrick is vice-president, and A. F. Lenon, treasurer.

The Petrolia Wagon Co., Petrolia, Ont., has received an order from the Dominion Government for 150 heavy transport wagons for use at the front. The value of this order is about $20,000.

Medicine Hat, Alta.—At the annual meeting of the Board of Trade, held recently, the following officers were elected: President, William Rutherford; vice-president, S. T. Hopper; secretary, S. E. McClellan.

Smith's Falls, Ont.—The following officers have been elected by the Board of Trade: Hon. president, Hon. F. T. Frost; president, H. B. Wilson; vice-president, F. W. Banby; secretary-treasurer, Dr. McCallum.

Cornwall, Ont.—The Board of Trade officers recently elected are as follows: President, A. E. Currie, manager of the Bank of Commerce; vice-president, John A. Chisholm; secretary, J. C. Alguire; treasurer, E. O'Callaghan.

The Hare Engineering Co., builders of rolling mill machinery, steel heating furnaces and mechanical stokers, are moving to offices at their new shop, 99-101 King Street West, Toronto, Ont., where enlarged facilities have been provided.

St. Catharines, Ont.—An American firm has opened a plant here for reducing potash from wood ashes. It is altogether likely that in a short while the feldspar from the Frontenac mines, near Kingston, will be shipped to the plant for the same purpose.

Sarnia, Ont.—The following officers of the Board of Trade have been elected: Honorary president, Chester Beldon, president, W. T. Goodison; first vice-president, Harry Neal; second vice-president, W. H. Kenny; treasurer, J. L. Buckan; secretary, T. A. Gordon.

Dominion Wire Rope Co.—The following officers and directors were elected at the annual meeting of the Dominion Wire Rope Co.: F. W. Fairman, president; F. H. Hopkins, vice-president and general manager; J. C. Riddell, secretary-treasurer; George P. Butters, E. E. Fairman, and Dr. C. W. Colby.

Chatham, Ont.—The Board of Trade will shortly ask the Dominion Government to undertake the dredging of the Thames River from Windsor to Chatham to permit of lake steamers navigating the river. The manufacturers of the city are strong in favor of the proposal, as a big saving in freight rates would result.

Port Dalhousie, Ont.—The Port Dalhousie Electric Light Commission has adopted a new schedule of rates as follows:—Six cents per k.w.h. for the first 30 hours' use per month of connected load; three cents per k.w.h. for the next 70 hours' use per month of connected load; six-tenths cents per k.w.h. for all consumption per month over the first one hundred hours' use of connected load.

Vancouver, B.C.—Reports are current here that two large syndicates in the East are to send engineers to the Coast to inquire into the iron ore deposits and the opportunities which exist in respect to water power, etc., with the idea of putting up a modern steel producing plant. A sufficient amount of ore is thought to be available for the purposes of the new industry in the iron ore deposits on the Mainland and on Vancouver Island.

Vancouver, B.C.—Thomas Meredith, of New Westminster, managing director of the Canadian Pacific Lumber Co., has leased the company's mill at Port Alberni to Seattle millmen. The deal involves the transfer of 250,000,000 feet of fir and cedar logs. H. A. Dent, of the Dent Lumber & Shingle Co., and A. W. Mylroi, of the Anchor Supply Co., both Seattle concerns, are the lessees and purchasers.

C. N. E. Officers Elected.—The following is the result of the election of officers of the Canadian National Exhibition, which was unanimous in every case: Hon. president, Joseph Oliver; president, Hon. Lieut.-Col. Noel Marshall; first vice-president, George Booth; second vice-president, T. A. Russell; executive committee, Mayor Church, W. K. McNaught, C.M.G.; W. K. George, Robt. Fleming, Geo. H. Gooderham, J. E. Kent and C. A. Brown.

Canada at Lyons Fair.—Three booths at the Lyons Industrial Exhibition, to be held in Lyons, France, have been taken by the Canadian Pacific Railway. Exhibits will also be shown by the Ontario and Quebec Governments. Eight firms, three of Montreal, four of Ontario, and one of Nova Scotia, will have exhibits in a booth taken by the Canadian Exporters' Association. The Canadian Consolidated Rubber Co. and the Dominion Bridge Co. have engaged separate booths.

C.M.A. Annual Convention.—The Hamilton branch of the Canadian Manufacturers' Association is trying to get the annual convention of the whole Association here during 1916. It is seven years since the greater body met in Hamilton, and the local members think it would be well worth while for the city authorities to go out of their way to have it return. In conjunction with the meeting of manufacturers, it is proposed to hold a conference regarding national foreign trade, the aim being to direct to Canada business which has heretofore gone to Germany or other countries.

Munitions Order.—It is reported on good authority that orders will shortly be placed in Canada for 6-inch howitzer carriages. These will cost about $10,000 each, and it is likely that the first contracts will be given to the C. P. R. shops at Montreal.

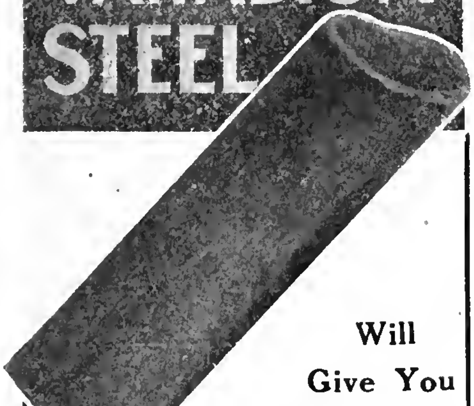
The Fitzhugh-Crowley Corporation, engineers, contractors and railway specialists, has been formed in New York, with offices at 60 Broadway. Mr. E. H. Fitzhugh, the president of the corporation, was formerly vice-president of the Grand Trunk Railway and president and general manager of the Central Vermont Railway. Associated with him is Charles J. Crowley, who is well known in Toronto, and is a railroad engineer of international reputation. Mr. Crowley will act as vice-president and chief engineer of the newly-formed corporation.

No Burlap Licenses.—Burlap trade interests in Montreal have received cable advices from Dundee to the effect that the issuance of further burlap shipping licenses had been postponed indefinitely by the British authorities. Oilcloth and linoleum manufacturers who have contracts with the Scottish mills for substantial quantities of wide goods, were seriously alarmed by the news while the importers of ordinary burlap were also disturbed by reason of bales of Calcutta goods have recently been coming to this country via the United Kingdom.

New Process With Steel.—A new process of coating structural steel or any other exposed metal with zinc is being introduced to those who are interested in such matters, and it is attracting considerable attention because of the ease and thoroughness with which the operation is performed, even after the metal has been put in place. Powdered zinc, compressed air and heat are the three elements which are used in the process, the zinc being driven through a gas burner by the air, where it is instantly reduced to a liquid state, and, as it strikes any surface capable of sustaining the force, it adheres and cools at once.

Ordered to Raise Freights.—For perhaps the first time in the history of the Canadian railroads one has been charging too small a freight rate. The Dominion Railway Commission has decided that the charge of $58\frac{1}{2}$ cents a hundred pounds by the Canadian Northern for taking steel from Sarnia to Regina is too small, and has issued a judgment preventing the company from using this rate. The Imperial Oil Co. has purchased crude steel in Pittsburg for its refinery at Regina. The G. T. R. and the C. P. R. set a rate of $1.04 to take this steel from Sarnia to Regina, and the C. N. R. underbid them. The C. P. R. and the G. T. R., with Winnipeg manufacturers, petitioned the Railway Board to prevent the C. N. R. from charging the low rate.

Peace River Trading & Land Co.—Extending its interests in the north, a syndicate of Old Country capitalists, of which Lord Rhonda (D. A. Thomas), the Welsh coal baron, is head, has acquired the Peace River Trading & Land Co., a concern which has been operating in Northern Alberta and the Peace River districts. The Peace River Tramway & Navigation Co., with which the Thomas interests are also prominently identied, is preparing the right-of-way for the Portage line to be built at Vermilion Falls as a unit of a transportation system that will provide navigation facili-



ties over 200 miles on northern waterways. Oil development work is proceeding briskly around Vermilion. The drillers are now down 450 feet, and are confident of striking oil at an early date.

Ocean Freight Situation.—The volume of business from the Atlantic ports is limited to the amount of ocean tonnage that is obtainable. The present vessel accommodation is insufficient to carry the traffic that is now waiting to be exported. Ocean rates are based on supply and demand, and at the moment the demand so far exceeds the supply that ship owners are almost in a position to make any terms they wish to ask. Some of the United Kingdom ports are not equal to the demand on the other side, consequently the English markets are in many cases bare of supplies, and they are paying relatively high prices to get wheat. The price on this side is not excessively high as compared to what consumers in foreign markets are paying, the extra cost over our prevailing prices is absorbed by the excessive transportation rates that have to be paid.

Personal

A. J. Carroll has been appointed district manager of Eugene F. Phillips Electrical Works, Ltd., with office in Montreal.

W. R. Webb, of Watrous, Sask., has accepted a position with the C. P. R. as manager of their electrical plant at Brandon, Man.

William Casey, who has held the position of assistant general manager, has been promoted to be manager of the Canadian Locomotive Co., Kingston, Ont.

Flight Lieut. Strachan Ince, of Toronto, and at one time with the Canadian Fairbanks-Morse Co., Front Street, Toronto, has been awarded the D.S.O.

P. D. Ross, of Ottawa, has been appointed by the Provincial Hydro-Electric Commission as its representative on the Ottawa Hydro-Electric Commission.

E. Ronan has resigned from the position of manager of the small tool department of H. W. Petrie, Ltd., Toronto, and has enlisted for overseas service.

J. D. McArthur, the well-known Winnipeg railway contractor, will join the board of the Winnipeg Electric Railway Co., in place of the late Sir William Whyte.

W. E. Gorman has been appointed to the position of superintendent for the Excelsior Electric Co., Toronto, on the manufacture of tools and machinery for munitions.

Rates (payable in advance):—2c per word first insertion, 1c per word subsequent insertion. 5c additional each insertion when Box Number is required. Each figure counts as one word.

FOR SALE

18 IN. x 10 FT. BRADFORD LATHE AND countershaft, also 18 in. x 8 ft. Lodge & Shipley, both in splendid condition; immediate delivery. Box 172, Canadian Machinery. (8)

FOR SALE—CINCINNATI ENGINE LATHE, 18" x 6'; taper attachment, hollow spindle, quick-change gears, compound rest, two chucks; also 12 H. P. gas or gasoline engine. Apply Wheeler Needle Works, Paris, Ont. (7)

FOR SALE—ELECTRIC GENERATOR TO run 80 lamps, 110 volts, 300 r.p.m., including switchboard and indicator; in good condition. Richards-Wilcox Canadian Company, London, Ont.

MACHINE SHOP WITH MACHINERY, garage and house, on nine thousand four hundred feet land, with adjacent vacant twenty-eight thousand feet; next railway station; good site; good accommodations; twenty miles from Montreal; immediate possession; bonus expectation to big concern. Box 173, Canadian Machinery. (6)

TURRET LATHES FOR SALE—3—2 x 24 Jones & Lamson Turret Lathes, $500.00 to $600.00 each. 3—19" swing Jones & Lamson Turret Lathes, fitted with Diamond Turret. The above machines are in good condition, also 2 Small Turret Machines, 1¼" hole in the Turret Head. Apply to A. B. C., Box 171, Canadian Machinery. (6)

FOR SALE — COMPLETE LUMBER AND lath mill machinery, daily capacity seventy-five thousand feet, consisting of gang, single and double bandsaws, engine, boilers, etc. Fully equipped blacksmith and machine shops. Silsby fire engine, 2 streams of 2½ inch; good order. Log loader, capacity fifty thousand feet, ten hours; almost new. Exceptional manufacturing site bargains. Address The Rathbun Company, Deseronto, Ont. (18)

FOR SALE—50 GOOD MACHINES. BOLT Cutters, Headers, Pointers, Tappers, Automatic Shavers and Slotters, Presses, Drill Press, Slitters, Small Shears, Plain Bench Lathes, Pulleys, etc. Bargain prices. Immediate shipment. Send for descriptive list and prices. Shelton Company, Shelton, Conn., U.S.A. (9)

SITUATIONS VACANT

JUNIOR DRAFTSMAN, EXPERIENCE ON structural work an advantage; permanent position to right man; give fullest possible particulars. Box 174, Canadian Machinery. (7)

WANTED—ENERGETIC FOUNDRY FOREman for Toronto. Experienced on light and heavy grey iron machinery castings. Apply Box 175, Canada Foundryman.

WANTED — MACHINISTS AND FLOOR hands on heavy and miscellaneous medium work; steady employment, modern shop, good wages. Apply, stating age and experience, P.O. Box 6, Walkerville, Ontario. (6)

WANTED—MECHANICAL DRAUGHTSMAN accustomed to marine engines, boilers and piping. State experience, age and salary expected. Apply Box 176, Canadian Machinery.

FOR SALE

2-Phase Induction Motors.
1 only WESTINGHOUSE Type C—50 H.P.
1 only WESTINGHOUSE Type CCL—50 H.P.
1 only CANADIAN GENERAL Type 10—20 H.P.

In excellent condition. Prices attractive. Full particulars on application.

CUMMER - DOWSWELL, LIMITED
HAMILTON, ONT.

WANTED—ASSISTANT FOREMAN FOR machine shop, working on shells; must be a thorough mechanic with previous experience on the larger sized shells and able to take full control of shop employing up to a hundred men. Apply giving full particulars as to experience, with whom previously employed, age, and salary expected, and enclose copies of references. Only those giving full particulars in the first instance will receive consideration. Liberal remuneration to the right man. Apply in confidence to Box 165, Canadian Machinery. (6)

WANTED

WANTED — ONE TURRET LATHE WITH wire feed, and power feed to turret to take round bars up to 1". J. H. Connor & Son, Ltd., Ottawa, Ont.

AGENTS WANTED

BRITISH HOUSE MAKING SYRINGES AND spraying machines for every possible use, need Canadian agents. The line is the most complete in the world and includes knapsack and ordinary spraying machines for fruit growers, limewashing machines for farms, factories, etc. Disinfecting machines for all purposes. Anything in the way of spraying and washing machines made to suit the market. Agents must be aggressive and ready to work the line thoroughly. Write: Spraying Machines, c|o Canadian Machinery, 143 University Avenue, Toronto.

MANUFACTURERS' AGENTS—IMPORTANT Sheffield (England) firm actually manufacturing high speed steel, twist drills, milling cutters, etc., carbon steel, mining drill steel, shear blades, etc., requires a live firm to act as representatives for this part of Canada, at end of war. Write stating experience of above lines, agency conditions, mode of handling the agency, etc., in confidence, to Box 811, Dorland Agency, Ltd., 16 Regent St., London, S.W., England. (8)

The Locomotive: From Early Efforts to Modern Developments *

By E. T. Spidy **

Modern methods of locomotion are so increasingly numerous and luxurious that the attempts and failures of the pioneers of travel are too apt to be looked upon as interesting incidents, rather than in their true light as stepping stones to the present wonderful state of land travel. The author describes in a lucid and interesting manner the failures and successes of the men whose names are landmarks in the history and development of locomotion.

THE power of steam was known to Hero of Alexandria about 200 B. C., and a book he wrote then treated of the expansive force of steam. He also described in his book the engine cylinder, piston, slide valve, and the common clack valve. Although this power of steam was "known," its value commercially was never appreciated, and no attempts appear to have been made to turn it to useful and practical effect, even for stationary engines, until 275 years ago.

First Built by a Frenchman

In England, in the year 1759, Dr. Robinson suggested to James Watt the idea of steam carriages to run on common roads. Watt made some models without recorded success. The first practical model was made by a Frenchman named Cugnot in 1763, but this model had a small steam boiler that required the vehicle to stop every fifteen minutes to get up steam. It did, however, attain a speed of three to four miles per hour. Cugnot produced a second and better model in 1769, which recorded the very first step in the history of locomotive development.

The first steam carriage produced in England was made by William Murdock in 1784. It had a copper boiler and steam was generated by a spirit lamp. Following Murdock's success, several inventors, notably Thomas Allen, of London, Thomas of Denton, and Dr. Anderson, a friend of Watt, experimented with steam carriages, but it was not until 1802 that Richard Trevithick patented the application of the non-condensing engine to the propulsion of carriages on railroads. The road was constructed in 1803, and his second engine tried in 1804 was a success.

Trevithick is undoubtedly the "Father of the Locomotive;" he employed high pressure steam. He found by experience that flat wheels had sufficient adhesion upon smooth rails, and he conveyed the exhaust steam from the cylinder to the chimney by means of a pipe which he turned upwards, and discovered by observing the practical result, that the blast of steam caused the fire to burn much better; he therefore called it the blastpipe. This engine ran upon four wheels 4 ft. 6 inches diameter, the boiler was 6 ft. in length, and contained a return flue-tube, the chimney being consequently at the same end as the fire door; the engine had one cylinder, placed horizontally, 8 inches diameter, the stroke being no less than 4 ft. 6 inches.

On the 24th February, 1804, it was tried upon the Penydarran cast iron plate way or tram-road, and conveyed trucks containing ten tons of bar iron and about seventy persons to Merthyr Tydvil, a distance of nine miles. The engine worked satisfactorily from a mechanical point of view, but commercially it was not regarded as a success, being more expensive than the horse traction.

Trevithick does not appear to have followed up the development of the locomotive, but left to others the perfecting of these excellent principles which he introduced and discovered; probably it is on this account that he never has received the credit to which he was justly entitled for the construction of the first locomotive which ever ran upon rails.

The First Commercial Success

Blenkinsop, proprietor of a colliery near Leeds, who was next to take up the development of the locomotive, was under the impression that sufficient adhesion could not be obtained between smooth rails and smooth wheels, and he designed his locomotive with a cog wheel and a rack on the track. This engine ran a daily coal service a distance of 3½ miles from Middleton to Leeds, and started in August 1812. The Blenkinsop had four wheels, 42 in. diameter boiler, had one flue 20 in. diameter, 2 cylinders 8 in. diameter by 20 in. stroke placed vertically. It evaporated 8 cubic feet of water per hour, consumed 75 lbs. of coal per hour. Capable of carrying 94 tons at 3½ miles per hour, maximum speed 10 miles per hour was attained at a load of 20 tons. This engine was a commercial success, and the first on record as such, it being cheaper than horses.

Blackett & Hedley's "Puffing Billy," was the next notable success. Their first attempt was not a success because it was not provided with Trevithick's blast-pipe, but the rebuilt locomotive had its two vertical cylinders connected to beams from which a motion was connected by gears to all wheels. On account of the noise made by the exhaust steam discharging in the blast pipes, it was named "Puffing Billy". Blackett had so much trouble on account of the breaking of the cast plate rails that it was necessary to carry half-a-dozen rails on the engine to replace ones broken on the journey. To prevent breaking of rails both Blackett & Hedley changed their engines from four wheelers to eight wheelers on two four-wheeled bogies or trucks, and to overcome the noise a muffler cylinder was placed on the boiler to interrupt passage of steam to chimney. This was completed in 1915.

Stephenson's First Attempt

During the latter period of Blackett & Hedley's experimenting other engineers were taking up the problem. Among these was George Stephenson who turned out his first locomotive in 1914. The engine, the "Bleucher", conveyed a train of eight waggons of coal weighing 30 tons up a grade of 1 in 450 at a speed of four miles per hour, and then continued in daily service on the Killingworth Railway.

The success of Stephenson's engine marked a second real step of progress of locomotive development. Money was now forthcoming and by 1822 five of Stephenson's engines were working, of similar design to his first engine, hauling coal at the Hetton Colliery near Sunderland.

Up to this time no attempt had been made to run trains other than in private collieries.

In 1816 George Stephenson was appointed engineer of Stockton and Darlington Public Railway, and application made to Parliament for charter. Twice the bill was rejected, but it finally passed in 1821, and on September 27th, 1825, the first public railway in the world was open for passenger traffic. The engine that drew the first train (the only engine the company possessed in fact) was constructed by Messrs. Stephenson & Co., and was named the "Locomotion No. 1," and cost $3000 to build. It had a speed of six to eight miles per hour, two steam cylinders 10 in. dia. by 24 in. stroke, boiler 10 ft. long, 25 lbs. per square inch working pressure, driving wheels 4 ft. diameter outside coupled, total weight of engine in working order 6 ton 10 cwt.

The Locomotion had a tender which ran on four wheels, the frame being of wood. A sheet iron tank mounted on

*From a paper read before the Western Canada Railway Club, Winnipeg, Man.

**Assistant General Foreman, C.P.R. Shops, Winnipeg.

same held 240 gallons of water, having also a coal space for 15 cwt. of coal. Total weight of tender in working order was 2¼ ton.

The Stockton & Darlington Railway now commenced building locomotives as fast as possible. Under Stephenson's direction the Company's sixth engine the "Experiment" was the first on record to have six coupled driving wheels. The cylinders on the engine were also changed from the vertical position and placed at an angle of 45 degrees to the track. By 1833 this railway possessed 26 locomotives.

Americans Purchase Locomotives

Early in 1828 the Delaware & Hudson Canal Company of America, having watched the success of the Stockton & Darlington Railway sent over Mr. Horatio Allen to England with instructions to obtain information, purchase rails and three locomotives. These engines were built during 1828 and delivered in New York early in 1829. Thus, the first locomotive to run on rails in America, the "Stourbridge Lion," was tried on August 9th, 1829 on the Old Mohawk & Hudson Railway.

It is to be noted, that up to this time 1829, the locomotive had not gained much public favor, although much progress in invention had been made, and the directors of the Liverpool & Manchester Railway, to be opened in 1830, were divided in opinion as to the best engine. To decide this question a prize of $3000 was offered to induce a contest for the best locomotive which would draw three times its own weight at ten miles per hour. The total weight of engine not to exceed six tons in working order. and the engine was to effectually consume its own smoke.

The now famous "Rainhill" contest took place, and Stephenson's engine the "Rocket" was the only one to finish the stipulated distance of 70 miles. The Rocket won the prize, attaining a maximum speed of 29 miles per hour.

It must be noted that although George Stephenson was not, and never claimed to be the inventor of the locomotive, still it was he who settled the question at the Rainhill contest, and made the locomotive a practical success which led to the introduction of railways throughout the world.

Chronology of Development

Briefly, the development of the locomotive is shown from 1829 as follows:

1830. Inside cylinders under smoke box first placed on Liverpool & Manchester engine No. 7 the "Planet". This engine also had 139 boiler tubes 1⅝ in. dia., was two-coupled and had a small pair of loading wheels.

1830. Liverpool & Manchester official report showed that 50,000 people had been conveyed on 954 round trips between Liverpool and Manchester.

1830. The "Mercury" by G. Stephenson & Co., was first engine to have frame of engine raised above the axles.

1831. Stephenson built the "John Bull" for the Hudson & Mohawk Railway, which was sent to America in 1831.

1831. De Witt Clinton train operated first regular run in New York State between Albany and Schenectady.

1831. The Baltimore & Ohio Railway offered $4000 for best American made locomotive of 3½ ton weight, to draw 15 ton at 15 miles per hour on the level. Messrs. Davis & Gartner of New York, Pa., built the prize winning engine.

1831. Stephenson employed movable eccentrics in his valve gear, operated by a foot treadle.

1832. Timothy Heckforth's "Wilberforce," with larger cylinders than heretofore introduced, same being 14-¼ in. dia. x 16 in. stroke.

1832. Mr. Baldwin built for the Philadelphia, Germantown & Norristown Railway his first locomotive. (Founder of new famous Baldwin Locomotive Co.) Similar to Rocket.

1833. Steam Trumpet introduced by G. H. Cobay.

1833. Stephenson built an engine for the Saratya & Schenectady Railway of America.

1834. 16 in. cylinders x 20 in. stroke built by Stephenson for Leicester & Swannington Railway.

1834. By 1834 the Liverpool & Manchester had 36 locomotives in operation.

1838. Battle of the gauges commenced and lasted 15 years, up to date 4in.-8½ in. was standard—Great Western introduced broad gauge of 7 ft.

1838-40. Several engines with large driving wheels developed up to 10 ft. (one named Thunderer had 6 ft. dia. wheels geared 3 to 1 making in effect an 18 ft. driver—was a failure.)

1840. Birmingham & Gloucester Railway ordered 8 engines from Norris & Co. of Philadelphia.

1842. Link motion developed by Howe with notch quadrant for Reversing. (Known as Stephenson Motion).

1846. Three cylinder engine developed to balance locomotive by Stephenson & Howe.

1858. French Engineer H. Gifford, patented first injector.

1860. Brick Arch used successfully to use coal instead of coke. Steam jet blower used, also firedoor to admit air to consume smoke.

1870. American Pullman cars introduced in Great Britain.

1875. M. Mallet, a Frenchman, designed and built the first Compound Locomotive, also in 1878 he designed a four cylinder tender compound type locomotive.

1880. Von Barries, introduced the well known intercepting valve for compound locomotives.

Modern Locomotives

From the last named period, up to, and including the present day, there has been an ever-increasing demand for more speed and more tractive power, that is to say, engines capable of haulin heavier trains.

Before proceeding with the present day locomotive, it is necessary to briefly outline the principles upon which the distinctive classess depend.

The limitation of the use of the smooth rail has been the controlling consideration in the development of the locomotive. When the limit of the cylinders had been reached, the wheels of course began to slip on the rails. Then more weight of the engine was placed on the driving wheels in order to increase the grip or adhesion. After this limit had been reached the next step was to couple the driving wheels together, thus making more drivers upon which weight could be loaded with additional resultant tractive power. So much weight was added that a limit was reached, it being found, by an English engineer, to be detrimental to the roadbed and track to carry above a certain weight on the driving wheels. This led to the necessity of leading and trailing trucks to carry the surplus weight, also to the necessity for heavier rails. The coupling of the drivers also led to provision being made for rounding curves. The then rigid wheel base was thus transformed into a flexible wheel base to meet this requirement by redesigning the axle boxes. Having now obtained sufficient power on the wheel grip, the next move was to increase the size of cylinders which required a revision of all the other factors to balance same. It was also found necessary to use larger boilers to supply more steam, to supply more steam larger grate area was necessary and so on the cycle was repeated, in each case the word 'more' figured prominently.

Tractive Power

Locomotives are rated by their tractive power. By tractive power we understand the pull the engine exerts on the drawbar that connects the train. Its value is calculated in pounds although different railroads express it in a percentage form as they see fit. Whatever

the expression, it represents the actual maximum pulling power the locomotive is capable of exerting. The tractive power of a locomotive can be increased by decreasing the size of the driving wheels, which of course affects the speed. Thus it is arranged to handle heavy freight trains at a slow speed; while high speed light passenger trains are run with a locomotive with the same size cylinders but larger driving wheels.

It is now readily realized that all this development led to some definite relations being established between the different types of locomotives, and so it is to-day that in considering the requirements for locomotives, it is only necessary to take into consideration all the known factors, such as tractive power required, ruling grades, speed, etc., and to calculate the diameters of drivers, cylinder sizes combined with the boiler power, the ratio of heating surface, coal consumption, efficiency of superheating etc., and a new locomotive is evolved that will fill the particular requirements of the designer.

If the foregoing in connection with the development of the modern locomotive is borne in mind in the consideration of the following classes of service for which they are intended, it will be realized that the trend of to-day is the same as ever, for more power or more speed.

Switching Locomotives

The requirements for switching service are the ability to start heavy trains, therefore a larger amount of adhesion is required, also it is necessary to run over curves of short radius, thus requiring a short wheel base. American practice has established a distinctive type of locomotive for the service with no leading truck and no trailing truck, thus placing the entire weight of the engine on the drivers. Early types were the four-wheel Switcher or 0-4-0 type as it is called, with a tender attached which has now been practically superseded by the Six-wheel Switcher type by reason of power demands. Heavier switchers still, we now have in the Eight Wheel Switcher, and Ten Wheel Switcher types, each of which has greater capacity than its previous type. Ten Wheel Switchers place a total load on the drivers up to 275,000 lbs. and have a tractive power up to 56,000 lbs.

Tank Switchers are also used extensively for lighter yard service. The first tank switchers had four coupled wheels only, these were augmented by a single pair of trailing wheels and later the extension of the cab and coal bunker made a four wheel trailing truck necessary. Further still we have six coupled tank engines without any trailers. As the boiler power was increased so a pair of trailing wheels was added, followed later by a four wheel truck when the power demanded. It is to be noted that private companies rather than railroads use tank type locomotives.

Freight Locomotives

American practice in freight service is distinctive by reason that a leading single pair of wheels is universally provided for guiding purposes as well as to carry some of the weight of the locomotive. Freight engines must also have a high starting tractive effort that is also capable of being sustained for a long period. As high an average as 98 per cent. of the total weight of the engine is carried on the drivers which are relatively small in diameter. Four coupled freight engines are practically gone, being replaced by the Mogul or 2-6-0 type. To-day however, the Mogul type is used only on the moderate weight class of freight service, it having been replaced for main line traffic by the heavier classes of locomotives. Following the Mogul type, a type of engine that is effective for either passenger or fast freight service of moderate weight was brought into service. This type, known as the Priarie or 2-6-2 type, overcomes the difficulty of the Mogul's limitation of small wheels, by extending the firebox towards the rear and placing an additional pair of wheels in the form of a trailer under same. Driving wheels on Prairie types are the same in diameter as used in passenger service. Having a large boiler and leading wheels it is suitable for high speeds for either freight or passenger trains that come within the limit of the starting capacity of six coupled locomotives.

The Consolidation or 2-8-0 type, together with its rival the Mikado or 2-8-2, are the present mainstay of heavy freight service, and present day discussion of these two types shows how keen the railways of this continent are to obtain the highest efficiency from these engines. Following this development further still, we have the Decapod type with ten drivers and a leading truck, and also the Centipede type which has twelve driving wheels and a leading truck At this point it appears that the limit of coupled wheels in connection with a single pair of cylinders is reached on account of length of wheel base, and the development of the four cylinder articulated locomotives naturally followed.

Articulated Locomotives

The Mallet Articulated locomotive is one that has two independent engines combined into one locomotive. This form of obtaining extra tractive power was suggested by M. Mallet, from whence the term "Mallet Articulated" was derived. The largest locomotive of to-day is of the Triplex Articulated type and has three separate sets of engines. Variations of the original have been introduced on the various roads to obtain suitable power for the individual service requirements. The rear engine and set of drivers is usually rigid with the main frame and boiler, and the forward engine is set on a truck containing six or more driving wheels. This truck rotates from a centre pin on the same principle as the usual engine truck. The boiler front end is in sliding bearings to allow for expansion and other movements. Mallet Articulated engines are mostly all compounds, also the use of superheated steam has become general practice. Steam after having passed through the high pressure cylinders, passes through a ball jointed pipe to the low pressure cylinders, from whence it is exhausted, or otherwise employed.

Advantages claimed for the Mallet Articulated form of compounding engines are as follows:

1. A gain of 50 per cent. is made over the simple locomotive having eight driving wheels and same axle load.

2. Fifty per cent. more load can be hauled with the same amount of fuel equivalent to 33 per cent. saving on ten-mile basis with the same effort of the crew.

3. All weight of locomotive can be used for tractive purposes.

4. Shorter rigid wheel base is easier on the track than with use of simple locomotives having eight driving wheels.

5. The compounding gives a reserve power of 20 per cent. by admitting live steam into all cylinders when conditions demand same.

6. Higher tractive power is obtained compared to the axle load than with ordinary locomotives, by reason that the unbalanced accumulated weight does not occur in both engines at the same time. Thus the most frequent cause for slipping with the ordinary locomotive is overcome.

The articulated locomotives are used chiefly for mountain pusher service in the mountains, also by some of the Southern roads for heavy freight service under extra heavy loads. Also this type is used for yard switching and hump service, where the loads are heavy enough to warrant same.

Passenger Locomotives

Passenger locomotives on this continent are also distinctive in their wheel arrangement, it being universal practice to have a leading four- wheel truck, which is for guiding the locomotive at high speeds as well as to carry weight. This practice is not followed in European countries with any regularity, it being the practice of some roads to place the driving wheels in the lead, it being considered that the large wheels were easier on the track and more readily turned on the curves, on account of less friction of the flanges. However, American practice is practically standardized

in this respect, and the first established type was the "American" or 4-4-0 type. This was rapidly followed by the Atlantic or 4-4-2 type, which accommodated a larger boiler. The natural growth of railways, however, demanded greater capacity, and the ten-wheeler or 4-6-0 type was developed. This type has come to be used similarly to the Prairie or 2-6-2 type locomotive, for either fast freight or passenger service. It is seen that the only difference between the two types is in the distribution of the surplus weight not utilized for tractive purposes.

Pacific or 4-6-2 type passenger locomotive next developed on account of necessary support for larger firebox at the rear, more boiler capacity being required to sustain the high speed demanded by the schedules. Passenger locomotives are required to have an excess of power to meet the extra conditions of weather and weight of train, under which a smaller type of engine would fail. The Pacific type of locomotive carries about 60 per cent. of its weight on the driving wheels. It is thus seen that the majority of railways use either the Prairie, the ten-wheel passenger, or the Pacific 4-6-2 types for practically all its main line long distance traffic. Exceptional conditions demand exceptional engines and hence we have heavier types still for passenger and for mountain service. The 4-8-0 type is a twelve-wheel passenger and freight type that has small drivers, but the 4-8-2 or Mountain type provides a larger boiler which allows the regulation passenger size drivers.

Tank passenger engines are not used extensively in this country, because there is very little of the suburban traffic available where they can operate at an advantage. However, they are used to some extent mostly in the larger ratings for local traffic, also for switching service. Suburban traffic is exclusively handled by tank engines in England, the largest of these on record being a Decapod 0-10-0 type which weighs over 90 tons, and is capable of attaining a speed of 30 miles per hour in 30 seconds with a load attached of 400 tons.

Conclusion

Before leaving the subject, it should be added that most all locomotives with six driving wheels or over now built, are equipped with superheater, it being established that a saving of at least 20 per cent. fuel and 30 per cent. water is effected by its use, whether in switcher, freight or passenger service.

Compounding of the cylinders is more extensively employed in Europe than in this continent, and many systems are employed. The tendency in this country has been in latter years to change the compounds into simple engines which with the addition of a superheater gives a locomotive of greater efficiency than before.

Power fed stoking devices are employed successfully now on many types of locomotives especially the larger types. These consist of a small independent engine in the cab that operates a spiral horizontal elevator which pushes the coal towards the fire-box, at which point it is elevated by various different elevating mechanisms and distributed over the grate.

Special fire-boxes and brick arches are now considered essential to complete combustion when heavy loads are being handled. Other items not to be underestimated in value, are the automatic firedoor, flange oilers, oil burners, pulverized coal burner, power reverse gear, coal passer, all these items are being developed in the present day period.

Where the end in the development of the locomotive will be is hard to imagine; it has never ceased yet. The modern mammoth locomotives of to-day look no bigger to us than did the Rocket in Stephenson's day to the populace of those times, when all locomotives were named "Samsons," or other names suggestive of the largest in the world. We do know that perfection is not reached yet, and so the strife will continue until the end of all things.

SHELL LOADING IN CANADA

ON account of difficulties in getting fuses delivered from the United States and the desirability of having everything possible made in Canada, it was decided, about January 1 this year, to establish a plant in Canada for the loading of time fuses, where all of the latter being manufactured in Canada at different points could be sent to be assembled and loaded.

A suitable site for the plant has been procured, of about 50 acres, situated at ——————, just outside the limits of the city of ——————, where it is expected plenty of labor will be available.

The loading of time fuses is quite an intricate and delicate operation requiring a large amount of skilled labor, and the plant indicated will give employment to about 2,000 people. The buildings are now under construction ,and should be finished and ready for occupation by April 15. All the machinery has been contracted for, and will be delivered about the time that the buildings are ready. The main building covers an area of 500 ft. in length by 250 ft. in width; there are also a number of other buildings of lesser proportions surrounding it.

The component parts of the fuses which will be assembled and loaded at this plant have been contracted for, and are now being made at various other plants in the Dominion, including the Northern Electric Co., Williams Mfg. Co., and Russell Motor Co.

After the fuses are assembled and loaded, they will be sent to —————— where two fuses out of every 100 produced will be subjected to firing tests to prove whether they conform to the specifications as to the time of bursting of the shells to which they are attached.

The fuses are then shipped to the plants at which the shells are being fitted to cartridge cases and attached to the shell nose, after which the complete shell is ready to be shipped to the front.

CHAINS AND OTHER LIFTING APPARATUS

A MEMORANDUM by G. S. Taylor, H. M. Inspector of Factories, entitled Chains and other Lifting Apparatus, has recently been issued by the British Home Office. The author deals with the causes of and possible means of preventing accidents arising from the fracture or failure of chains and such metal appliances as rings, hooks, shackles, eye-bolts, and swivels used for lifting purposes. The whole of the fifty-two pages are full of information, and a valuable feature of the work is a bibliography containing forty references.

Amongst the subjects considered may be mentioned the following:—Legislation; types of appliances; materials; methods of manufacture; kinds and proportions of links, hooks, shackles, eyebolts and swivels; use and wear of chains, slings, and other lifting appliances; testing; annealing; examination; marking; records; failures of chains and other lifting appliances; accidents and dangerous occurrences. In addition there are eight plates of illustrations and five appendices.

HYDRO RADIAL PLANS

THE plans of the Hydro engineers for the proposed Toronto-Niagara section of the Provincial Hydro-Radial system are nearly completed and the various municipalities along the line will before long be given an opportunity to decide whether they want to follow the lead of the municipalities between Toronto and London in preparing for construction by passing the necessary by-laws. Meetings have been held in several places along the probable route to discuss the matter, but definite proposals cannot be submitted until the engineers present their report.

In addition to the Toronto-Niagara and the Toronto-London surveys the commission's engineers have made progress upon surveys covering practically every part of the province.

SOME OBSERVATIONS ON THE SHIPBUILDING SITUATION

By C. T. R.

THE demand for merchant ships and the lack of the usual opportunity to not only supply them, but to, in some measure, compensate for their wastage through the ravages of war and their wholesale requisitioning for transport and other duties arising from the latter, are at the moment live issues and becoming daily more intensively so.

As far as I can see the outlook for Canadian shipbuilding is very bright, but I believe that most of the business will have to be tonnage required for salt water service. Two lake shipowners have already indicated that while they want tonnage badly they positively will not pay present prices, as they fear they would be discounted in the future to a considerable extent. This may or may not be true, but personally I believe they are wrong. I think that the price of steel and the price of tonnage will keep up for quite a while, and they will be compelled later on to pay a good price for their ships.

Dearth of Skilled Labor

Canadian shipbuilding is now suffering from a serious handicap imposed by the action of the authorities in Great Britain and in Ottawa sending recruiting agents to this country to pick up all available shipbuilding help, in addition, all the machinists and mechanics they could get together to go over to the Old Country to both build and repair warships and make munitions. There is the additional loss occasioned by skilled help joining the colors.

It can readily be understood that men skilled in shipbuilding cannot be replaced by men off the farms, as it takes years of patient training to produce results. The output, therefore, of Canadian shipyards will be limited by the number of men available and by the supply of raw materials. The steel mills in the United States are now overloaded with orders, and are naming from four to six months' delivery; other than that, if material is required for quick delivery, a very heavy premium must be paid, which makes the ships very expensive to the owners.

Second-hand Tonnage

For some time past there has been a wild scramble for second-hand tonnage, owing to the fact that new ships could not be had quick enough to replace the wastage due to the war and other causes, and to the huge amount of German tonnage which is laid up and out of commission all over the globe. Exorbitant prices are being paid, and old ships have been fitted out again, which in ordinary times would possibly not be allowed to clear from any port. This is evident from the fact that on some of these old vessels, as much as twenty-five per cent. insurance for the trip to Archangel has been paid.

Second-hand dealers, therefore, are reaping a golden harvest, while shipbuilders find it difficult to get owners to agree to a price which covers only a reasonable profit, the claim being that while they are prepared to pay fancy prices for immediate tonnage, conditions may change so rapidly that by the time a new ship is built and ready for commission the war may be at an end. This, of course, is mere speculation, but serves as an argument why they should not pay any big prices.

Skilled Men and Material Delivery

If shipbuilders in Canada had all the men they require and could get reasonable deliveries of material, they could get all the tonnage they want to build at the present time. As stated already, however, the scarcity of the proper kind of men and the long delivery on raw materials limits the output. In these years when reasonable returns might be secured to make up for a great many lean periods, other conditions have loomed up which make it very hard indeed for a Canadian shipbuilder to grasp the opportunities now open. The authorities in Ottawa have shown no desire to discriminate in the class of men they enlist first. It is well known that they must get men, but it would be well for the country's industries if they endeavored to take those first who could best be spared.

Mr. Balfour, the First Lord of the British Admiralty, recently stated in the House of Commons that he considered that merchant shipbuilding should be proceeded with as rapidly as possible, and that he considered that merchant tonnage was now second only in importance to munitions themselves and should be treated accordingly. Men in the yards in Great Britain have been exempt from enlisting, men in Lloyd's Register of Shipping, and men in the insurance department of Lloyd's have also been refused permission to join the forces.

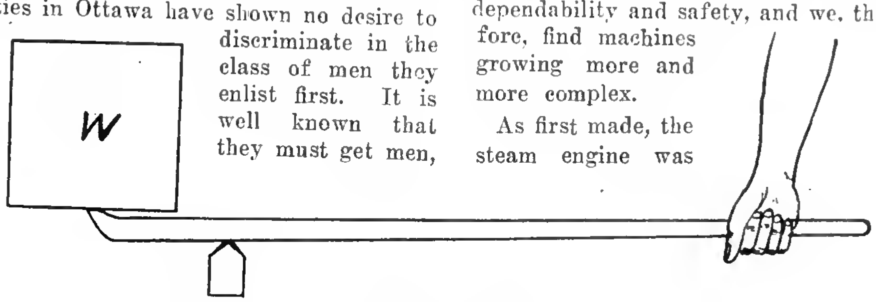
It would appear, therefore, that shipbuilding in Canada, especially where vessels are being built for overseas service, should be given some consideration when men are being enlisted. Lack of discrimination will surely tell in a great many industries besides shipbuilding, but no doubt the authorities at Ottawa who have undertaken to recruit 500,000 men want to make good their promise without taking into consideration what class of men they enlist first.

MECHANICAL SIMPLICITY

By W. B.

THE common crow bar, when used as a lever with a single sharp bearing, as indicated, is the simplest and most efficient machine known. The pulley and shaft, a modification of the crow bar and sharp bearing, becomes a little more complex, and a little more inefficient. With increasing complexity we, therefore, usually find increasing friction, more lost motion, greater up-keep, expense, etc. Complexity is always undesirable.

In our present state of civilization, though, we find complexity a necessity. We are continually striving for greater over-all efficiency, automatic operation, dependability and safety, and we, therefore, find machines growing more and more complex.



SIMPLICITY—CROW BAR AND SHARP BEARING.

As first made, the steam engine was rather cumbersome—complex. The idea was to make a machine that would propel itself and other machinery through the agency of heat. The cost of the energy developed was not considered as worthy of much thought. Inventors bent their principal energies toward simplifying the engine, which they did, and later on, as now, in endeavoring to get the

most work possible out of a pound of coal, the mechanism of the engine has been made more and more complex until we have our present types of steam engines, turbines, gas engines, and other prime movers. Not one can be termed "simple" because they are all made up of many parts.

Every once in a while an inventor produces a change which he says "simplifies the old type," but so far as we can see there is no decided step toward simplicity. Because we are human, we all crave for simplicity in our normal lives. We like simple dress, good speech, manners and so on all the way down to machinery. For a change, one in a while, we like to dabble with complexity, but complexity is not normal. In explaining things we always aim to make the explanation and the thing explained "as simple as possible."

Perhaps when the millennium comes, there will be a one-piece machine with an efficiency of 100 per cent. It will be perfect in every respect, will cost little, will be strong, durable, reliable, simple.

TESTING ARMATURE FAULTS

By W. H. Smith

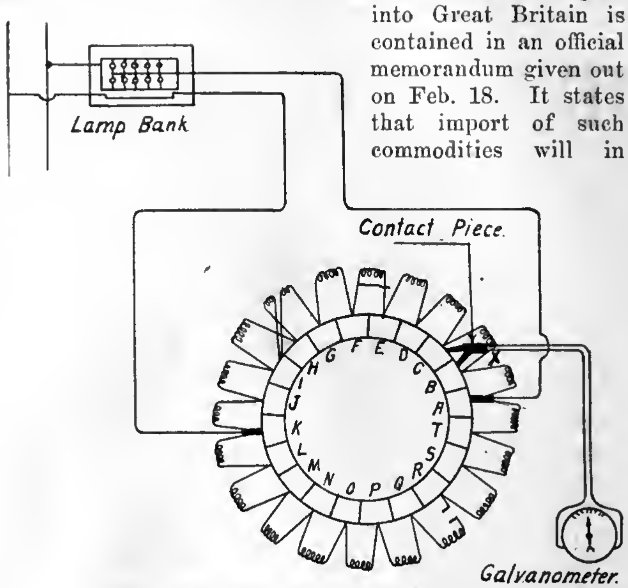
THE bar-to-bar test is, in my opinion, the best that can be carried out by the ordinary operating engineer for detecting armature faults. Briefly, it consists of sending a current through the armature and measuring the drop across adjacent bars. Obviously, if the coils are in good shape, and connected correctly, the drop will be the same between all bars, or at least nearly so.

Referring to the diagram, a current is sent in through the armature at bar A, and out at bar K. The galvanometer is connected to a contact piece in which the contacts are so spaced as to rest on adjacent bars. To make the test, the lamp bank is adjusted so that the galvanometer gives a good readable deflection. Suppose the contact piece is on bars B and C, and a good coil X is between, correctly connected, a standard deflection will be obtained. The latter will also be obtained on each set of bars in moving toward E till bars E and F are bridged, when little or no deflection will be noted as the coil between is short circuited and its resistance lowered thereby.

Bars F and G will give a standard deflection, while bars G and H will give about twice the standard deflection as two coils are connected between. Bars H and I will give a standard deflection but in the opposite direction as the coil is crossed between. Bars I and J will give about twice the standard deflection, due to two coils being between.

In trying the other side of the commutator, we find that bars L and M give no deflection, so the circuit must be open somewhere. No deflection is obtained until we bridge bars Q and R, when a violent throw of the needle locates the open circuit between these bars. Bars P and Q, and S and T show deflection, again proving that the break is in one of the leads to bar R. If these defects are remedied, and all connections are good, about the same deflection will be obtained between all bars, although it will not be the same as the previous standard on account of there now being two paths for the current around the armature where before there was only one.

A temporary remedy for an open circuit is to connect the bars that are open by a short piece of copper wire, but the break should be repaired permanently as soon as possible. A short-circuited coil (except where the turns are short-circuited on each other when temporary repairs are of no avail), may be temporarily repaired by opening the coil at its ends, binding the latter back out of the way, tapping them over, and connecting the bars as for an open circuit. However, a short-circuited coil usually burns itself out, so permanent repairs are in order. The remedy for the crossed or reverse connections is obvious.



TESTING FOR ARMATURE FAULTS.

PRIVY COUNCIL DECISION FAVORS PROVINCES

THE decision of the Privy Council in the companies' case confirming the claims of the provinces in respect to the incorporation of companies will, it is estimated, mean an increase in revenue of $75,000 to $100,000 annually, and removes all fear of the loss of several times that amount now secured by the incorporation of companies.

While the right of the province to incorporate companies doing a portion of their business outside the province has been contested by the Dominion for the past ten years, a large number of charters have been issued in Ontario. Had the decision been against the provinces, this source of revenue would have been largely cut off and the province allowed to incorporate only companies doing business strictly within Ontario. The decision not only removes this fear, but will bring to the Provincial Secretary's Department a good many applications that have previously gone to Ottawa in order to avoid any question of a right to inter-provincial trading.

LICENSES NEEDED TO IMPORT PULP

CONFIRMATION of cable reports of the restriction of paper, paper-making materials and other classes of import into Great Britain is contained in an official memorandum given out on Feb. 18. It states that import of such commodities will in future be governed by license, issued by the British Board of Trade. Presumably, the export of Canadian pulp and paper, through the operation of the license system, will be permitted.

The memorandum states: "Information has been received from London that on and after March 1, 1916, the importation into the United Kingdom of the following goods is hereby prohibited; all materials for the manufacture of paper, including wood pulp, esparto grass and linen, and cotton rags, paper and cardboard, including strawboard, pasteboard, millboard and wood pulp board and manufactures of paper and cardboard; all periodical publications exceeding 16, pages in length, imported otherwise than in single copies through the post; tobacco, unmanufactured and manufactured, including cigars and cigarettes; furniture woods, hardwoods and veneers, stones and slates.

Navy Makes Munitions.—David Lloyd George, British Minister of Munitions, has written Vice-Admiral Beatty, as follows:—"I have been greatly interested in the details of the splendid work done by the officers and men of the battle-cruiser fleet in making munitions. The output which has already been reached is very striking, but more important even than the material results is the magnificent spirit which prompted the men of the fleet to devote their leisure to giving the men in the trenches such loyal and effective support.

MACHINING SPIRAL GROOVES IN RECLAIMING ROLLS

By H. C. F.

THE art of reclaiming old rubber has been practised for some considerable time, but recently, owing to the extensive use of rubber commodities for variety services, and the resulting high price of the material in its crude state, methods of reclaiming the old stock, such as that from vehicle tires, etc., have showed noticeable advancement.

In reclaiming rubber, there are two principal methods in use—the mechanical and the chemical—the former being the most commonly employed. By it the old rubber is run through rolls, being thereby ground to a powder, the latter afterwards passing over magnetized plates, to remove any particles of iron that may be mixed with it. The powder is further subjected to a current of air, which removes the felt or canvas, these having in the meantime taken the form of fluff and easy of elimination.

The rolls on the reclaiming machine—commonly called shoddy rolls—consist of a suitable iron core heavily sheathed with brass. They are made in a variety of sizes, the average being about 12 inches in diameter by 4 feet long, and having a series of spiral V-shaped grooves cut longitudinally along the outside diameter.

The machining of these grooves requires a certain amount of ingenuity, especially when it is considered that the rolls are often too large to be accommodated on a milling machine table. In such cases the grooves are machined on a planer by means of a special fixture, which is similar in many respects to the ordinary taper attachment found on the majority of modern lathes.

Views of the planer arrangement, together with the necessary attachments, are shown by the accompanying sketches, Figs. 1 and 2. The roll is rigidly supported between the centres, a worm gear A of suitable proportions having been previously fitted to one end of the mandrel. The gear is driven by means of the worm B and the connecting rod C. The connecting rod is supported in two suitable boxes as shown, being made a sliding fit for same, while one end is flattened and connected directly to a suitable cross-head D. The former block or plate E, which is firmly supported on three brackets bolted to the side of the planer bed, has a tapered slot of the desired proportions to accommodate the cross-head, and machined along its entire length.

The process of forming the spiral slots may be followed by referring to Fig. 1, in which the attachment is in the position it assumes at the beginning of the cut. The tool, having been locked centrally in position, is then ready to take the first cut, and, as the work moves in the direction of the tool, the roll is gradually rotated, enabling the tool to cut the desired spiral. This is accomplished by means of the cross-head following the tapered ways in the former block, and causing the attached connecting rod to operate the worm. It must be noted that the worm does not revolve, but simply acts or slides in a horizontal direction—similar to a rack, causing the worm gear to revolve through the required distance. On the return stroke the gear is revolved in the opposite direction, the travel of the spiral being the same as in the cutting stroke. The tool is next fed down by hand, and another cut taken, this being the procedure until the desired depth of groove is reached.

Upon the completion of the first groove, the cross-head pin is removed and the worm revolved by hand through one complete revolution. The roll is by this means turned until it is in position for the second cut. The cross-head pin is again replaced and the next groove machined. It will be noted that no indexing plate is necessary with this attachment, the spacing of the grooves being previously determined, and the teeth of the worm gear being cut in accordance with the number of grooves on the roll.

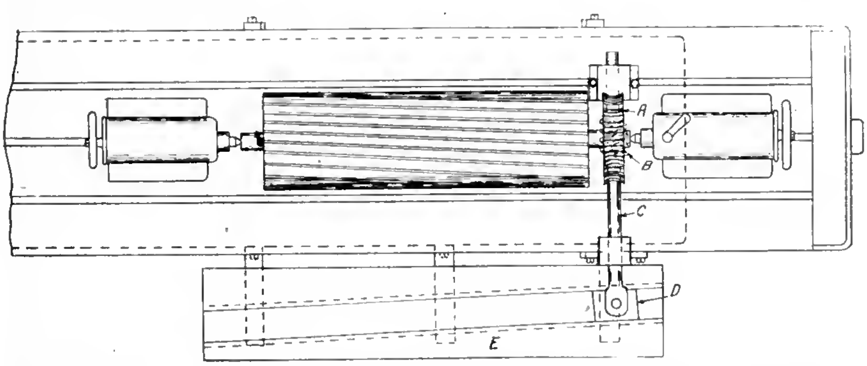

FIG. 1. MACHINING SPIRAL GROOVES IN RUBBER RECLAIMING ROLLS.

METHOD OF LAYING OUT AND BORING JIG PLATES

By A. E. Granville

ALMOST every shop doing a general line of work is called upon, at least occasionally, to make some special jig or fixture requiring a fair degree of accuracy. Drilling jigs, where the accurate laying out of the holes is not imperative may be laid out with a scale and prick punch, but only approximate distances can be obtained in this way.

The button method of laying out a jig plate, while accurate, is more difficult than the one described in this article. A centre indicator must be used to correctly set for a hole after the button or buttons have been correctly placed. The buttons used are a bother to make and are of no earthly use for anything else, while the adjustable parallels employed as described here, may also be used for numerous other toolroom jobs, provided good care is taken not to bung them up

so as to make them untrue. If the parallels are made with care in the first place, and well kept, perfect satisfaction will result for years. Parallels of this type may be obtained from tool makers at a very reasonable cost if it is not desired to make them in the shop where they are to be used.

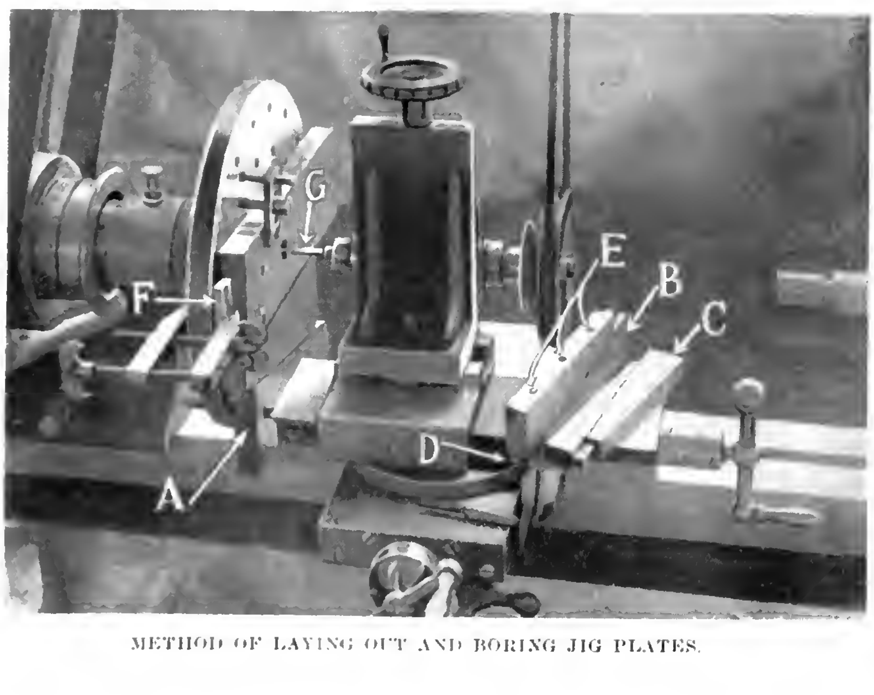
Sets of adjustable parallels are shown in the accompanying halftone at A, B and C. These give a good idea of the construction. A set should consist of enough of the parallels to cover all ordinary distance ranges, and they should be made in sizes that overlap enough so as to not require being pulled out too far in order to reach the next larger size. As shown, the two parts of a parallel are held together by means of a tongue and T-strip working in a T-slot. The T-strip is so placed that it may be tightened by means of screws like E. The angle of the sliding surfaces may be from 10 to 20 degs., although 15 degs. is a very satisfactory angle and has little tendency to slip even when set without tightening the locking screws.

How Parallels are Used

In using these adjustable parallels to lay out and bore a jig plate, the plate itself should be machined on both sides and at least one edge lengthwise. If it is square, any edge will do. One end should also be finished approximately at right angles to the other machined edge. As a rule, it is better to finish the plate all over, but the foregoing will do in many cases, and saves the time that many toolmakers like to spend "truing up," where it is not absolutely necessary.

The method of procedure will vary somewhat according to individual ideas, but a good way is to place the plate about as shown in the half-tone, with the hole nearest to the upper right hand corner prick-punched approximately true. This first hole may be measured off from the edges with a scale if desired. After the plate has been set for the approximate height by adjusting the parallel set on the lathe bed, the strip F is butted snugly against the finished end and clamped solid when the centre punch mark is opposite the centre of the drill G. The plate is now clamped securely and the hole drilled, bored out and reamed to size.

The plate is afterwards removed and the parallel under it slid up high enough to bring the next hole exactly in line with the centre of the drill, the width of the parallel being measured with a micrometer and locked in exact position. If the hole is to be directly under the first one, the plate should be carefully butted against the end strip and clamped. The hole is then finished like the first one. If the second hole is to be nearer the left end than the first, then a parallel of the proper thickness should be inserted between the end and the strip, micrometer measurements on the parallel being of course used. If the distance of the second hole is only slightly to the left, it is better to start with an adjustable parallel between the end of the plate and the vertical strip in the first place, as it is easier to adjust the parallel than to insert one small enough.

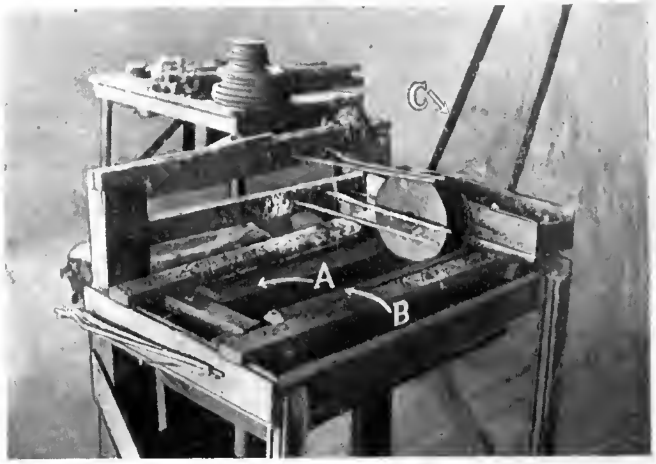


METHOD OF LAYING OUT AND BORING JIG PLATES.

A little thought will quickly show any good mechanic the idea. The beauty of the method is that the parallels can be set by using outside micrometers and the width adjusted exactly. The same method may be used on a drill press by locking the table and clamping two strips on the table at right-angles to each other for the adjustable parallels to rest against. In fact for all-around accuracy and application, I know of no other method that approaches it. Where a micrometer of the desired size is not available for setting the parallels, a Vernier caliper may be used with very good results.

SOAKING WORN POLISHING WHEELS

By G. Lock



SOAKING WORN POLISHING WHEELS.

IT is often a nuisance to properly soak the old abrasive off worn polishing wheels, preparatory to recoating, without soaking the whole wheel, which in many cases is undesirable. The device shown obviates this, and the soaking is done automatically after the wheel is placed in the machine. Two rollers A and B are provided for the wheel to rest on as shown. The roller A is driven by means of a pulley from the belt C. It revolves slowly and the water is high enough in the tank to just submerge the lower rim of the wheel as it revolves. A number of wheels can be placed in the tank at once, as holes are bored in the brackets at the back into which rods are thrust for guides.

One of the chief uses of magnesium is as a scavenging alloy: i.e., clearing up oxides of other metals and making far denser, cleaner, stronger, and more homogeneous alloys. It is valuable in aluminum, nickel, copper, brass, bronze, etc., and special steels, because of its intense avidity for both oxygen and nitrogen.

CONTEMPORARY WAR ARTICLES

Embracing Information and Data Drawn from a Variety of Sources Relative to and Arising from the Prosecution of this Many-Sided European War

ONE OF BRITAIN'S NEW PROJECTILE-MAKING PLANTS—II.

In order to convey an idea, especially to the layman, of the advantage of concentrating shell manufacture in such establishments, some details may be given regarding the extent of the work on each shell, and the direction in which labor and time can be saved. In the case of the small shells, the press operations number seven, and the machining operations — done entirely by female labor—seventeen, up to and including the fixing on of the copper band to conform to the rifling of the gun. In the process of filling there are twenty-one operations in the case of shrapnel shell. This does not include the making and fitting of the fuse and the filling-in of the explosive contents; these operations number forty-five.

Thus, from beginning to end there are nearly one hundred operations, and each shell may pass through the hands of one hundred workers. Although there is an immense multiplicity of tools suitable for each operation, the shell, from the time it enters the shop as a bar until it leaves ready to be put into the breech of a gun, travels only 400 yards. Here, in itself, is a justification for the aggregation in one building of the plant to complete the whole process of manufacture. The same holds to an even greater extent with the heavier shells.

Similar notes may be given, largely for the benefit of the inexpert, with regard, say, to the medium-sized high-explosive shell. In this case, a large part of the work is done by partially-skilled labor. In the press-shop there are eight operations; the shell-body is then transferred to another bay, where it is machined, the operations numbering twenty-two, from the rough turning to the fitting of the copper band; after which the shells are screwed at the nose and a brass bush fitted. The shells are finally gauged all over and taken to the scales to be weighed; the margin for more or less weight than the standard being exceedingly small.

Before the brass bush is finally fitted, the shells are transferred to the washing department, where they are dipped into tanks containing hot caustic soda, to remove grease and dirt from the inside surface. They are next immersed in hot clean water, and subsequently allowed to dry. After this, they are coated internally with copal varnish and then transferred to gas-stoves having a temperature of about 300 degs. Fah., in order that the varnish may be dried effectively.

Finally, the copper band is fitted in position in a press and the brass bush screwed in position. The shell at this stage is ready to be filled with explosive

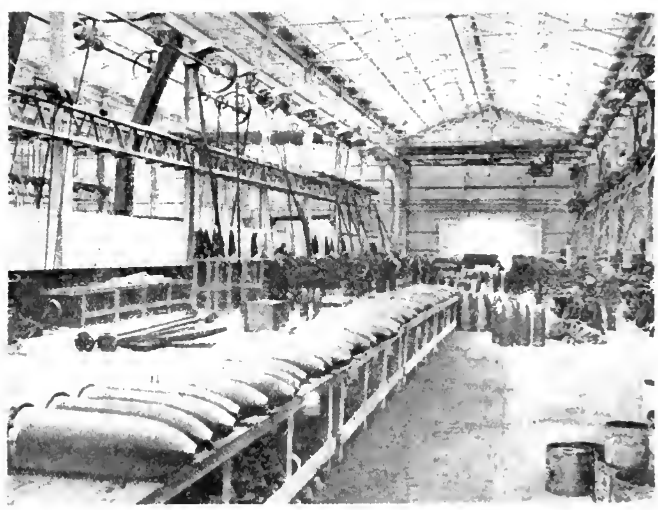
LARGE SHELL INSPECTION DEPARTMENT.



SHOWING LARGE SHELLS COMPLETED.

and fitted with a fuse. Similar processes are carried out in connection with even the largest of the high explosive shells.

Crane Equipment

An essential to rapid work is the provision of a sufficient number of cranes. The enormous amount of work to be dealt with may be appreciated from the fact that there are no fewer than twenty-nine electric overhead travelling cranes, twenty-eight of these having a lifting capacity of 2 tons, and one of 5 tons, for handling the heavy parts of the presses. All the cranes are of the three-motor type, and have lifting speeds of 25 ft. per minute, cross-traverse of 100 ft. per minute, and longitudinal travel of 275 ft. per minute. Each crane is controlled from a cage suspended under the crane-girders, from which the operator has an uninterrupted view of the shop floor which he is serving. In addition to these cranes, jib-cranes are installed for handling the large billets from the furnaces to the presses.

Female Labor Feature

The small shells are machined entirely by female workers. In the shop described there are 1,800 of them, all imbued with the spirit of serving in emergency in the interests of the nation. Indeed, if in any day the output is a little down, a gentle appeal from the manager is enough to reawaken the workers to the needs of the Army. A girl commencing in the department is able to work a machine after three days' teaching, and becomes quite an efficient machine-worker after seven days, while at the end of two months' experience she attains the highest efficiency. As a rule, one skilled worker can supervise and set the machines for twelve of the female operatives. The work is well done. The accuracy to which the work has to be completed is 4-1000 part of an inch, and it says much for the care taken that not more than 1 per cent. of the shells made are rejected.

We do not propose to describe the various tools used, as they are all more or less of standard type. Nor is it desirable, in the national interest, to say more of the processes, but to promote the education of the general public, it may be said that in the manufacture of the 3 in. shell the cutting tools of the successive machines travel over 1,000 feet, and the average speed is 55 ft. per minute. It is not, therefore, in the actual machine that time is required, but in the movement of the shell from point to point, so that it is in at the highest degree important to have the machines for the successive operations as close to each other as space will admit, and not to have them in different factories.

It need scarcely be said that the women workers are specially circumstanced so far as dining-rooms and cloak-room facilities are concerned. The 24 hours are divided into three equal portions, so that the female workers are only eight hours at work, but the machines are kept going for the full 24 hours. Under the matrons they work enthusiastically, and earn large wages on the premium-bonus

LARGE SHELLS INSPECTION DEPARTMENT.

LARGE SHELLS READY FOR DESPATCH.

system, while absent time is rarely over 2 per cent. of the total for each week.

A Meritorious Achievement

This general description of one of th many new shell factories brought into complete operation within six months, or at most eight months, of the clearing of the ground, goes some way to prove that however unprepared we were for a great European war, the authorities have not been idle in making a thoroughly adequate arrangement for ensuring that the fullest possible demands of the Army shall be met, and the requirements will be continuously supplied in full measure. At the same time great help is being given to our Allies in supplies of ammunition. The one need is for the supply not only of unskilled and partially-skilled men and of women, but also of skilled workers to supervise the operations of the others.

There has been difficulty in securing an adequacy of experts for the running of these factories; but this is now being met, and as the trade unionists are taking a wider view and more satisfactory attitude with regard to the national needs, the people of the country may rest assured that in the immediate future the supply of shells, if not of all ammunition, for the prosecution of the war to a successful end will be continuously abundant and also that it will be secured at a highly reasonable expenditure.—Engineering.

TAXATION OF WAR PROFITS IN FOREIGN COUNTRIES

IT is quite comprehensible that in deciding to impose a tax on war profits each country should adopt that particular method which is best adapted to meet its own interests, says the Engineer. In the case of France the Government has recently introduced a scheme for the levying of a progressive tax on the profits of every firm or company concerned. The preamble cites a typical case of an establishment which earns excess profits amounting to £24,000 in a year. It is proposed to levy 5 per cent. on the first £400; the second stage is 10 per cent. on £1,600; the third stage is 15 per cent. on £2,000; the fourth 20 per cent. on £4,000; the fifth 25 per cent. on £12,000, and the sixth and final stage is a tax of 30 per cent. on £40,000.

As the typical establishment has not earned any excess profits to which the final stage applies, but only £24,000, the total amount which it is required to pay on this sum is £5,080, or an average of slightly over 21 per cent. Of course, when the profits are much greater than the sum in question the percentage thereof payable will increase, but as the maximum proposed is 30 per cent., it cannot exceed this rate. As in Great Britain, provision is also made in France before arriving at the net profits for extra wear and tear of machinery, buildings, etc., due to the poduction of war materials.

Italy's Taxation

Turning now to the kingdom of Italy, we find that the tax on war profits, which was sanctioned last November, has been arranged in the form of an addition to the existing income tax, and is divided into two sections, one dealing with manufacturers and the other with merchants or other intermediaries who are realizing excess profits though the war. As the amount of the super-tax is precisely identical in each division, and the merchant section is rather difficult to explain, it will be sufficient to refer merely to the other.

The law exempts excess war profits up to 8 per cent. of the capital employed on the production of war material, but where the excess profits range from 8 per cent. to 10 per cent. of the capital the super-tax amounts to 4s. per £4; from 10 to 15 per cent. 12s. per £4; from 15 to 20 per cent. 16s. per £4; and over 20 per cent., which is the maximum, the amount payable for every £4 of excess profits is £1 4s. In other words, the highest precentage leviable, also after having allowed for exceptional depreciation of plant and machinery, is 30 per cent., which rate is now being followed in France, as previously mentioned.

Russian Taxation

We are not quite certain whether the Russian tax has yet been imposed, but the Bill prepared by the Minister of Finance at the end of last December creates two classes of contributors towards the Treasury. The first consists of those particular companies and individuals who are not under any obligation to publish their accounts. In these cases, and where the annual net profits reach at least £150, and they are at least £50 more than in 1914, the tax amounts to 20 per cent. of the sum in excess of the £50.

The companies which have to submit to public accounts are to be subject to a graduated tax on account of profits which are greater than in 1914. If these excess profits are superior to 3 per cent. of the capital employed the tax is 20 per cent. on the profits amounting to between 3 and 4 per cent. of the capital, 31 per cent. for profits representing 10 per cent. of the capital, and 50 per cent. for profits of over 30 per cent. of the capital employed.

Summary

It will be seen that the French proposal is for a maximum tax of 30 per cent., and the Italian law already in operation is also for an identical percentage applicable to war profits, while the Russian maximum is also considerably lower than the rate to which British controlled establishments have been subjected by law. Even the German system is more advantageous to the native producers of war materials. The regulations issued at the beginning of this year to give effect to the law passed by the Reichstag provide for the allocation to a special reserve fund of 50 per cent. of the profits realized in excess of the average of the three years preceding the war, and the amounts represented by these funds are to be invested in German Imperial or Federal State loans. Apparently, then, the tax is not a war profits tax, as the contributors are to receive Government paper in exchange for their money, paper or otherwise; but the prospective value of the paper at the conclusion of the war is quite another matter.

MAGNESIUM IN FOUNDRY WORK

THE use of slightly less than 2 per cent. of magnesium in aluminum castings cleans up the aluminum and leaves 0.75 to 1½ per cent. in the casting, almost doubling its strength and quadrupling its resistance to shock or jar. It reduces the cost of machining more than 50 per cent., halving the number of resets on the cutting tool, giving clean cut machine surfaces, and permitting a polish to be secured with the last cut instead of a separate operation. With care, 1½ per cent. of magnesium at $5.50 per pound is all that is needed: i.e., 8¼ per pound of casting actually required to do the same work. The increase in strength means, in some cases, a reduction in weight of casting of 50 per cent.

The reduction in casting weight is generally not less than 25 per cent. The weight of a pure aluminum casting may therefore be reduced, if this 1½ per cent. of magnesium is used, by from 25 to 50 per cent. This is a great saving even at normal prices of aluminum, since it amounts to about one-fourth of 20c, or 5c. With aluminum at 60c per pound, it amounts to 15c worth of aluminum saved, with a stronger and more stable mechanical result. The saving in machine work alone, when the casting is to receive much machining, more than pays for the use of magnesium.—Dr. W. H. Grosvenor.

The Department of Trade and Commerce, Ottawa, has received the following inquiries:—No. 123—A commission agent in Calais, France, desires to get in touch with manufacturers of galvanized barb wire and copper wire. No. 129—A concern in Paris, France, would like to hear from manufacturers of electrical and mechanical equipment, such as are used by railways, etc.

PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

HEAVY DUTY MANUFACTURING LATHE

A HEAVY duty manufacturing lathe, swinging 20 inches over ways and 11 inches over-bridge, has been placed on the market by H. W. Petrie, Montreal, Ltd. The object aimed at in designing this machine was to provide a lathe which would be capable of producing work at a speed equal to that of larger machines having a greater swing, but without their increased cost and reduced rigidity. By reducing the swing to a size slightly larger than the work, a design is secured which not only possesses all possible stiffness and more convenience of operation, but whose output is limited solely by what the cutting tools will stand when operating on forgings, projectiles and similar work with a finished diameter of 8 in. or less.

Renewable bronze bearings, with ample lubrication, are fitted to all headstock journals. The end thrust bearing is made with hardened steel washers alternating with bronze, and is provided with an adjustment for taking up wear.

The bed is of liberal proportions, the walls being extra thick and tied together by heavy box girths at close intervals. An improved type of wide angle vee on the front shear takes the thrust of the cutting tool, the rear shear being entirely flat. Planed pads on the back of the bed are provided for attaching taper and forming attachments.

The carriage has a width of 12 in. across the bridge, which is made very deep to avoid springing. Lifting of the carriage is prevented by gibbing under the rear of the bed. A double plate type of apron affords a support for both ends of all feed gear shafts. The friction feed is engaged by a hand wheel and seats the friction with slight effort on the part of the operator.

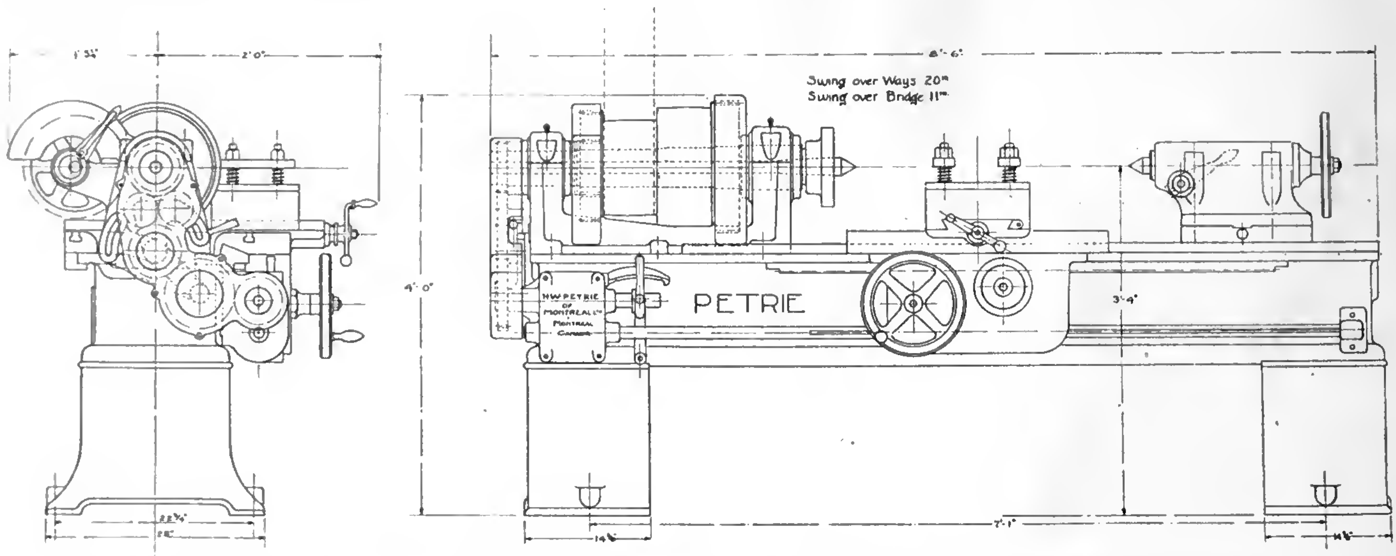
All feeds are positively gear-driven from headstock spindle, three rates of feed—$\frac{1}{8}$in., 1-16 in. and 1-32 in., being obtained through feed gear of the sliding key type.

The tailstock casting is clamped to the bed by four large locking bolts extending to the top of the barrel. A simple binding clamp is located at the extreme front end of the tailstock, where it grips the spindle with the greatest security and an entire absence of distortion. The spindle screw is of suitable proportions, while a set-over adjustment is provided for taper work.

The standard bed is 8 ft. long, and regular equipment includes one driving plate, heavy duty plain rest, with hand cross-feed, the necessary wrenches and two-speed countershaft.

Extras furnished are forming attachment ,turret tool post, hand or power-feed bed turret, oil pan, pump and connections.

Principal particulars are as follows:-- Distance between centres on 8-ft. bed, 40 in.; front spindle bearing, 4 15-16 in. x $6\frac{3}{4}$ in.; rear, 4 in. x $5\frac{1}{2}$ in.; hole through spindle, 1 5-16 in.; Morse taper centres, No. 5; driving belt, 6 in. wide; back gear ratio, 6.7 to 1; countershaft pulleys, 16 in. x $6\frac{1}{4}$ in. x 110 revs. per min.; approximate weight, 4,800 lbs.



HEAVY DUTY MANUFACTURING LATHE, SWINGING 20 INCHES OVER WAYS AND 11 INCHES OVER BRIDGE

AUTOMATIC STEAM TOWING WINCH

THE annual outlay for renewing Manila tow-line is an item of considerable importance in the towing business, and any means whereby such expense can be reduced safely and profitably will be welcomed by all engaged in this business.

The Corbet double steam cylinder automatic vessel towing winch has been designed to use steel cable, which has a useful life of many years, this feature, along with the saving of manual labor, resulting in considerable reduction of operating costs.

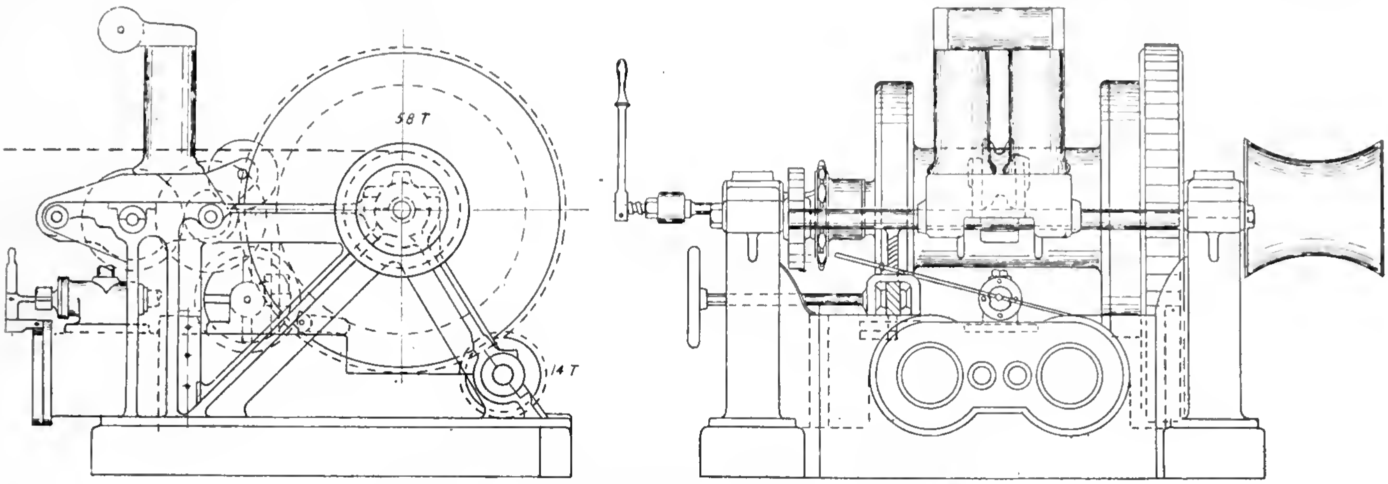
The machine, two views of which are shown in the accompanying illustration, has accommodation for 1,200 feet of 1-in. steel hawser, which passes through the automatic hawser leader which travels to and fro across the front of the machine, thereby preventing the hawser from climbing on top of itself on the drum. This leader is traversed by means of a shaft having right and left-hand screws, and it is geared to the drum, so that the sideways movement of the leader is in proportion to the speed of the drum. It further enables the hawser to be drawn in when the tug-boat is at any angle with the object in tow.

The entire operation is controlled by one lever, which starts, stops, and reverses, one man operating it with ease. The engine is located between the side frames and consists of two 8 in. x 8 in. cylinders ,operating the drum and spool by a 10 in. diameter pinion on the crank shaft meshing with a 52 in. diameter

gear on the drum shaft, both of 4 in. face. The spool can be operated independently of the drum by means of a friction between the gear and the drum, thereby enabling the winch to serve two purposes at one and the same time.

The location of the cylinders to the rear of the drum allows the winch to be placed nearer the centre of the tug, so as to facilitate steering, while the whole design is kept as low as possible to reduce the tendency to tip when the tug is at right angles to the direction of the tow. In the case of the largest size machines, this effect is obtained by putting the cylinders outside of the frame, thus allowing the reduced height to be maintained.

The Corbet Foundry & Machine Co., Ltd., of Owen Sound, Ont., are the builders of these winches.



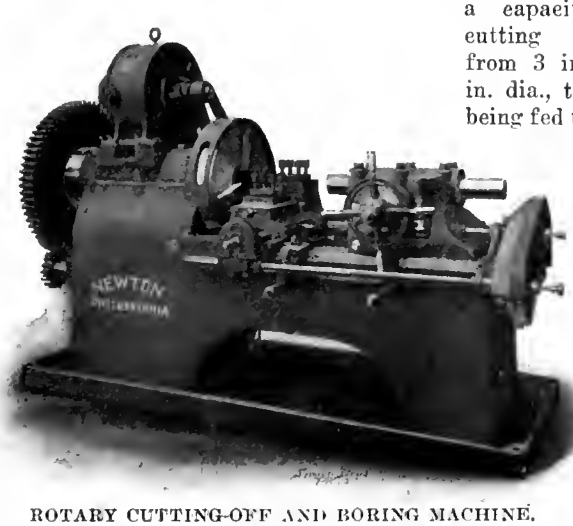
STEAM TOWING WINCH WITH AUTOMATIC HAWSER LEAD.

COMBINED CUTTING-OFF AND BORING MACHINE

A COMBINED cutting-off and boring machine, having a capacity for boring shells 8 in. diameter, is shown in the accompanying illustration, being the product of the Newton Machine Tool Works, Inc., Philadelphia.

Individual electric motor drive is provided, the drive from motor being through silent chain to the gearing which drives the hollow spindle by means of the large spur gear on the end. The spindle admits bars 8 in. diameter, and is provided with a heavy three-jaw chuck.

The bed of the machine is of rugged design, and is surrounded by a floor pan. A substantial boring bar carriage, with power feed, is mounted on the bed, which also carries the cutting-off attachment, the feed gears being so arranged that cutting-off and boring are both done at the one operation.



ROTARY CUTTING-OFF AND BORING MACHINE.

RAPID PRODUCTION MULTIPLE CUTTING-OFF MACHINE

THIS machine consists of a head stock with quick acting chuck mounted on a substantial cast iron bed, with the necessary gearing for direct connection to a motor. The accompanying illustration shows the machine fitted with four cutting-off heads, the gearing referred to being the rear end of the bed. It has a capacity for cutting rounds from 3 in. to 5 in. dia., the bars being fed through the hollow spindle. For the smaller diameter rounds one or two heads are used, and for the larger sizes up to six heads may be employed.

The chuck is air controlled, and the stock is fed through by power operated rolls, which along with a stop are also air controlled. The heads are adjustable on the bed so that slugs of various lengths may be cut, and each head carries three tools, which are fed into the revolving bar by air pressure in the cylinders, one of which is provided for each tool. The air pressure being supplied from a common source and admitted to all of the cylinders simultaneously, all of the tools are put under the same pressure. As the tools vary in sharpness, the sharper ones cut more cleanly and rapidly than the dull ones, which are not crowded into the material as would be the case if fed by positive mechanical gearing.

The resultant freedom from breakage, and increased output due to the proper distribution of the work among the

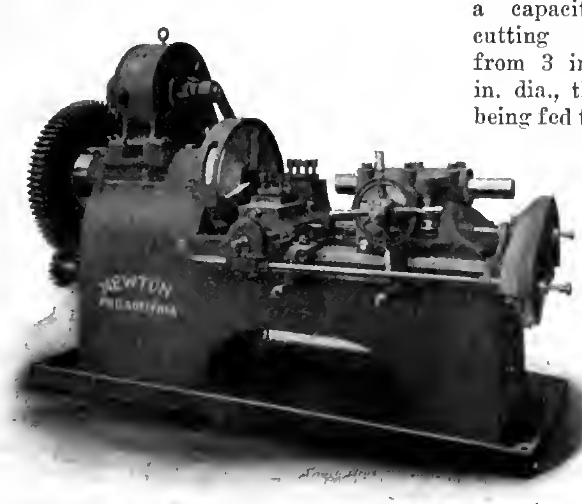
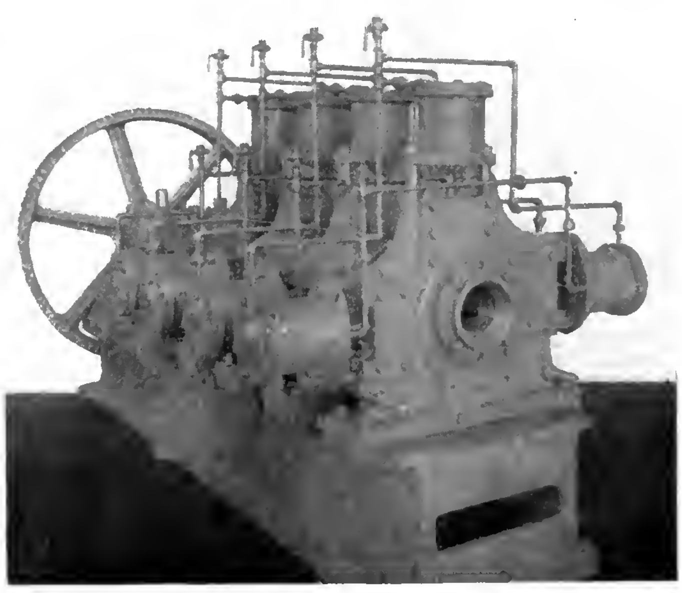
lengths may be cut, and each head carries three tools, which are fed into the revolving bar by air pressure in the cylinders, one of which is provided for each tool. The air pressure being supplied from a common source and admitted to all of the cylinders simultaneously, all of the tools are put under the same pressure. As the tools vary in sharpness, the sharper ones cut more cleanly and rapidly than the dull ones, which are not crowded into the material as would be the case if fed by positive mechanical gearing.

The resultant freedom from breakage, and increased output due to the proper distribution of the work among the



ROTARY CUTTING-OFF AND BORING MACHINE.



RAPID PRODUCTION, MULTIPLE CUTTING-OFF MACHINE.

tools makes these machines very efficient. 3 in. bars being cut in thirty seconds and 5 in. bars in ninety seconds. The total number of slugs produced in these times depends of course on the member of heads employed.

The machine has been developed by the Southwark Foundry & Machine Co., Philadelphia, Pa., and in the design shown required approximately 15 to 20 horse-power per head employed. A number of sizes are built, the largest having a capacity from 9½ in. to 14 in. diameter, producing six slugs of the smaller size in 4½ minutes, and the larger size in 10 minutes. This machine has a bed 15 ft. long and requires a 125 hourse-power motor to operate it.

NEW MARKET FOR ASBESTOS

THE effects of the war are being revealed in some surprising situations. Before the outbreak of hostilities, over 50 per cent. of Canada's asbestos found its way into Germany and Austria, and as a result when war broke out the two big asbestos corporations doing business in Canada found matters almost at a standstill.

In a surprisingly short time they found a new and larger market for their entire output with the result that the Asbestos Corporation of Canada shows an increase of 12½ per cent. over its sales for 1914, while the Black Lake Asbestos Co. turned a deficit of $32,000 in 1914 into a profit of $20,000 in 1915.

Previous to the war, asbestos was used very largely for industrial purposes, such as the making of shingles, fireproof boards, fireproof curtains for theatres, covering for machinery, etc., etc. To-day Canadian asbestos is finding a market in Great Britain where it is being used as packing in guns, for the covering of boilers and piping in the many new ships which are being built as well as for other purposes associated with war.

After practically closing up at the outbreak of the war, our asbestos companies are now working overtime in an effort to supply the demand, but so far have not been able to produce enough to overtake the market requirements of Great Britain.

It is somewhat significant of German tacties that shortly after the outbreak of the war, one of the companies operating in Canada was requested by its former German customer to ship large supplies to a firm in Holland. Needless to say, the other was not filled.

DOMINION RAILWAY SUBSIDIES

WHAT Canada has paid its three transcontinental lines in the way of subsidies or bond guarantees was told to the House of Commons, Ottawa, on Feb. 23, in replies given by the Acting Minister of Railways, Hon. Dr. Reid, to questions by Mr. Jameson (Digby). The total amount paid by way of subsidies to the Canadian Paific Railway is $30,369,374; in land grants, 19,816,010 acres, and in bond guarantees, $3,093,700, asumed directly by the Government, December, 1906.

To the Canadian Northern Railway the total cash subsidy has been $26,155,360, and land subsidies, 3,422,528 acres. The bond guarantees have been as follows: 1903, £1,923,287 three per cent. bonds; 1908, £1,622,586 three and a half per cent. bonds; 1910, £647,260 three and a half per cent. bonds; 1911, £7,493,835 three and a half per cent. bonds; 1912, £733,561 three and a half per cent. bonds; 1914, $45,000,000 four per cent. bonds. Of this list mentioned bond guarantee, the C. N. R. has sold securities valued at $17,500,000, and a portion of the remainder has been pledged for purposes set out under the act.

To the Grand Trunk the only subsidy paid was $500,000 for the Victoria Jubilee Bridge. There have been no land grants, and no bonds guarantees.

This makes a total of a little more than $57,000,000 in direct cash subsidies, while land subsidies total more than 22,000,000 acres, and bond guarantees approximately $124,000,000, of which the share of the C. N. R. is about $110,000,000.

THE MARINE FREIGHT RATE SITUATION

IN the British House of Commons on February 17, a score of members attacked the Government method of dealing with the mercantile marine. Arthur J. Balfour, First Lord of the Admiralty, and Walter Runciman, President of the Board of Trade, replied to the attacks, and explained that while the situation was admitted to be far from satisfactory, the Government was doing its utmost to make things better.

Our Mercantile Marine Task

The complaints of the members of Parliament were mainly to the effect that the high freight rates were largely due to waste of tonnage caused by Government mismanagement. Mr. Runciman, in reply said:

"The shipping difficulties of the present time are due not to mismanagement, but to our trying to pour a quart into a pint pot. This and nothing else. The general upward tendency of ocean freights is caused by the fact that the mercantile marine, which is limited in size, has to carry out a task far greater than in time of peace. The shipping problem has become the greatest economic problem of the day. Where we had a hundred ships before the war, we must now do with 67, of which 24 are under neutral flags.

Dependence on Neutral Ships

"We are dependent to an enormous extent on the services of neutral shipping, and if we drive it away by any system of low maximum rates, or a similar device, we shall starve. If we fix maximum rates below the world level we shall drive neutral shipping to ports where higher rates are obtainable.

"There has been no laxity in management or control on the part of the Government. The Board of Trade has made the largest possible use of expert advice. Lord Curzon's committee has control of shipping to the fullest extent. In fact, the control is now so wide and adequate that no British vessel can go anywhere or trade anywhere without permission of one kind or another.

Will Alleviate Difficulties

"Certain steps are being taken to alleviate the difficulties of the shipping problem. The first necessity is to get rid of the congestion in our ports, and measures are now under way to achieve this. Then there is shipbuilding, in which respect the navy has been the greatest competitor of the mercantile marine. The Admiralty has, however, already permitted us to build forty-five merchant ships, while a number of others which are under construction have now been classified as war work. We also have done a little to make ends meet by restricting imports."

A. J. Balfour, First Lord of the Admiralty, said he thought ship owners could not complain of hardships, as rates were not only high, but preposterously and dangerously high. He denied that Great Britain was acting selfishly regarding tonnage or making money out of the allies, arguing that a country which prepared to deprive its people of certain imported goods in the interests of an efficient working merchant service could not be accused of acting selfishly.

Referring to waste, Mr. Balfour thought that matters might be improved by giving commercial training to admirals and generals, but that was a matter of a lifetime. It was not through any action of the transport department that there was a shortage of tonnage, he declared, and whatever might be said about the policy of temporary Governmental appropriation of the whole shipping strength of the country's mercantile marine, he hoped nothing would be said in criticism of the navy in this connection.

Vol. XV. MARCH 9, 1916 No. 10

THE NEW TAXATION FOR WAR PURPOSES

THE changes in the original war taxation proposals of Canada's 1916 Budget which Sir Thomas White, Finance Minister, announced in the House of Commons on March 2, are such as to merit and receive to a large extent the whole-hearted approval of the parties interested, the retroactive and capitalization features having been modified and brought to a more equable basis of assessment respectively.

The retroactive period has been advanced to January 1, 1915, tax payments falling thereby in the individual years 1916, 1917 and 1918. Capital will be taken as the actual unimpaired reserves of each company or corporation, and watered stock will be eliminated for taxation purposes by taking the cost value of the stock on January 1, 1915, and deducting from same the liabilities of the company or corporation on that date.

Other modifications are, that holding companies will not be taxed on profits received from their subsidiaries when the latter pay under the Act, and all concerns who may make tax payments to Great Britain or her Allies will have the amount of same deducted from that otherwise payable to the Dominion Government. As regards non-Canadian concerns, the capitalization basis of assessment will be such portion of the amount paid upon their entire capital stock as the value of the Canadian assets bears to the total assets.

OUR MUNITIONS MANUFACTURING PROGRESS

IN spite of the manifest disposition by interests for the most part, if not wholly, out of touch with the munitions situation existent to-day in Canada, to belittle the work and achievement of our Imperial Munitions Board, it can be authoritatively stated that at no time since shell manufacture was inaugurated here, has the administration feature been so comprehensive in its scope and effective and efficient in securing satisfactory results. We are in a position to affirm that absolute harmony prevails within the Board and that in matters of management of contracts placed by the predecessors of the latter, and in securing and distributing additional British orders, the administration is at once well ahead of its work, and fully organized to meet and handle any contingency demand that may be made upon it—satisfactory alike to the British Ministry of Munitions and to our own manufacturers.

Scarcely a day passes, we are advised, without orders from Britain for munitions of one sort or another, large and small, being received, abundant evidence surely of the missionary activity that characterizes the personnel of the Board. These orders are for the most part urgent as regards delivery—this being natural. As a result, it is of the utmost importance that our manufacturers be not only in intimate touch with what is transpiring, but be, in addition, prepared to take advantage of these offerings by preparedness of equipment. Quite recently orders were received from Britain for a particular size and type shell with which many of our metal-working plants are not unfamiliar relative to production; unfortunately, however, plant congestion, due to similar shells previously ordered precluded any possibility of Canadian concerns securing a contract, with the result that the orders went to the United States.

Much has been made of this circumstance of British munitions orders being so placed, not alone with respect to the foregoing instance, but with respect to many others, and it may possibly be urged that while those firms engaged in the production of the particular size and type shell referred to were meantime and for some considerable time to come taxed to their maximum output capacity, other firms with shell experience and at the moment operating more or less below capacity might have been favored. We are apt to forget, however, that such reasoning falls short of meeting a normal situation—much less does it provide for urgency of delivery.

It is a well-known fact that we have got well past the experimental stage of shell-making, that shell prices—any size and type, do not now carry the substantial profit margin of the initial and immediately succeeding contracts to cover factory extension and equipment installation. The plants therefore which were equipped to make the particular shells recently required were of course the only probables in the matter, and if they found it impossible to take on the work as stipulated, there was little use in others not properly equipped even considering contracts.

It may interest our readers to know that munitions contracts amounting to two hundred million dollars, placed at various periods as far back as eleven or twelve months ago, still await completion, and that as a result of conferences held between Sir Thomas White, Dominion Minister of Finance, Ottawa, the Imperial Munitions Board, and our leading bankers, arrangements have been practically concluded whereby the latter will extend a credit of $75,000,000 to the British Government, and further munitions contracts for Canada amounting to in the neighborhood of $100,000,000, will become available as a result.

In another section of this issue some interesting data will be found covering the first of the new "loading" factories to be established in Canada by the Imperial Munitions Board. From the details given it will be abundantly evident that neither indifference to nor ignorance of our national industrial possibilities much less incapacity to take hold of every opportunity offering, may be charged to that body.

We may not at this stage say more, either concerning further developments advantageous to our metal-working industries or relative to other and intensely interesting war-time manufacturing activities now in progress. Enough has been said, we believe, to show that the efforts and energies of those, to whom has been deputed the task of bringing Canada's metal-working industries into line for filling the requirements of our Empire, to the mutual benefit of all concerned, have been brimful of highly progressive and satisfactory results.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents

Montreal, Que., March 7, 1916.—The gradual upward movement of all steel and steel products is the outstanding feature in the abnormal situation at present prevailing throughout the metal working industries. Conditions are such that it is impossible for anyone to predict the extent to which the prices of steel will ultimately advance. In the opinion of certain American authorities, future developments may prove that the apparent high level of to-day will not only be surpassed, but will appear low in comparison with future conditions.

The activities in every branch of metal working industries continue with unceasing energy.

Pig Iron

The local situation is unchanged, with business generally reported good. A general advance of 50 cents is noted on all grades of American iron. No change of price is reported from Montreal dealers.

Steel

The demand for steel of all kinds and grades remains abnormal. Prices of manufactured steel continue to increase and the climax is not yet in sight, and further advances may be expected in the very near future. Current quotations show an advance on unfinished steel, f.o.b. maker's mill Pittsburg, of $3 a ton on Bessemer billets and sheet bars; $2 a ton on open-hearth billets and sheet bars. Forging billets and wire rods have advanced $5 a ton, being quoted at $60 for billets and $55 for wire rods, Pittsburg. However, local dealers have not advanced their prices yet, but suggest that a change may be made at any time, as all prices on steel goods are nominal. Light rails are quoted $3 a ton higher. Iron bars have advanced $2 to $3 a ton, the Chicago price being now $40. Tank plates are up 2-5 cents a pound, and structural shapes are 1-10 cent higher. The prices on black and galvanized sheets have advanced 10 cents a hundred. Pittsburg prices for wire products are 10 cents per hundred higher. Cold rolled strip steel is now quoted at $5 to $5.50 Pittsburg; this is an advance of 1½ cents a pound. Montreal quotations are expected to advance soon in many lines.

Metals

The general situation in the metal markets remains unchanged, and conditions are comparatively quiet. Copper has, during the past week, shown slight signs of weakness, and in some instances quotations have fallen off a little, but it is not considered probable that any pronounced decline will result from this weakness. A feature of the week's market was the sudden jump in the price of tin to 50 cents, New York. However, the advance was of short duration, and quotations are again firm at last week's figures. Spelter is not active, and foreign markets are unsettled. London reports an advance, while United States quotations are lower than last week. The price of lead has again advanced in the States, but quotations here are unchanged.

The London and Glasgow metal markets have reopened for business in all metals. With the exception of tin, trade in the metals had been suspended awaiting the result of a conference between the members of the exchange and the Munitions Minister. The regulations referred to will not be enforced until the metal purchased reaches the home market. Export orders and sales to allied or neutral countries through authorized channels will be treated as consumers' orders.

Copper.—Quiet prevails in the market, and the dullness has had a tendency to lower prices, but as producers are, in most cases, sold well ahead, the prices are remaining firm, as the general situation is practically unchanged.

It is reported that German interests have closed orders for 2,500 tons at 26½ cents, to be delivered at New York warehouse during the last quarter. This metal to be shipped to Germany at the termination of the war. The local situation is unchanged, with prices firm.

Tin.—The quotation on tin about ten days ago reached the high figure of 50 cents, New York. Several sales are reported to have been made at 48 cents during the recent decline from the sudden advance above noted.

Montreal dealers are holding firm in their prices of 48 cents. Recent sales were reported by one dealer at 46 cents per pound.

Spelter. — The situation in spelter is showing signs of weakness and the market at present is very quiet. The Lon-

don market however, has steadily advanced until a week ago, spelter was quoted at £110, a figure never exceeded on the British market. Trading in this country is dull. An interesting fact of present conditions being the increase in the number of sellers now on the market. The possibility of an unlooked for supply of spelter is causing some uneasiness among buyers, and consumers are undecided upon placing future orders.

No change is recorded in local conditions and dealers are quoting the nominal figure of 23 cents per pound.

Lead.—The United States market is becoming stronger and an advance of $2 a ton has just been added. The Trust price of lead is slightly lower than independent producers. Local conditions are unchanged with quotations nominal at 8¼ cents per pound.

Aluminum.—The trade is reported as quiet with no change in the general situation. Very little metal is available for spot or early delivery as producers are booked several months in advance. No change is reported in local conditions by Montreal dealers and prices are firm at 68 cents per pound.

Antimony.—The situation is quiet and prices remain unchanged at 48 cents per pound.

Machine Tools and Supplies

The situation in this branch of industrial activity remains unchanged, and while the demand is not as great as some time ago, there is still considerable inquiry for certain tools required in munition factories.

The near approach of May Day is causing some uneasiness among machine tool builders, and it is expected that some trouble may eventuate, thus affecting to some extent the production of machines and accessories.

The demand for supplies continues heavy and it is often difficult to get sufficient to meet the needs of the factories. The price of gasoline is constantly advancing and this may go still higher as the approach of spring will doubtless increase the demand. Oils are very strong and prices are going up.

Old Materials

Quiet prevails in the scrap metal market and very little trade is reported. Prices on most of the metals are unchanged. Wrought iron pipe, with an advance of one cent is quoted at 9½ cents per pound. Stove plate scrap shows a similar increase and quoted at the same price, while No. 1 wrought iron has advanced to 13¾ cents, being an increase of 2 cents per pound.

Calgary, Alta.—J. C. Boyle, of this city, will build a large packing plant here at an estimated cost of $250,000.

Toronto, Ont., March 7.—The business tax resolutions have been amended by the Minister of Finance and the terms are now more specific although further revision may be necessary to insure equable application of the proposed tax. Trade generally continues active and collections have improved considerably. The outlook for business is good, but the steady increase in cost of raw materials is affecting the situation and creating a feeling of uncertainty among manufacturers. The cost of production is increasing, with the result that prices of practically all finished goods are advancing. Trade is being seriously hampered by the shortage of tonnage and high ocean freight rates, with no prospect of any immediate relief. Shipments are not only being delayed but the prices are being materially increased on this account. Satisfactory progress is being made toward providing credits to help finance the purchase of munitions by the Imperial Government in Canada. This means that further large orders for munitions will be placed with Canadian manufacturers. These orders in addition to those already in hand will keep the plants busy for the rest of the year.

CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.

Steel Market

There is no change in the situation and the upward trend of prices continues with no indication that the top of the market has been reached. The mills have more orders than they can handle and deliveries are getting further behind. Boiler plates have advanced 15c and are now quoted at $3.40, heads $3.65, and tank plates 3-16 in, at $3.70 per 100 lbs. Boiler tubes are unchanged but higher prices are anticipated as an advance of $2, per ton has recently gone into effect in the States. Prices of shafting are very firm and an advance is probable. There is a heavier demand for shafting in the States than was ever known and deliveries are now being extended from six to eight months from date of order. Wrought iron and galvanized pipes are firm and higher prices are looked for following an advance of $2 per ton at Pittsburgh. Other products which have been advanced in the States and which may affect the local market include wire products, $2 per ton, shafting $5, spikes $2 to $3, cold rolled strip steel $5 per ton. These advances show that the general trend of the market affects all products at one time or another. There is no change in the galvanized sheet situation, prices are very firm and are expected to advance.

The market in the United States is very strong and the price changes given above are only a few of the advances that have been made during the week. There is nothing in sight as yet to indicate any halt in demand or in advance in prices, on the contrary, all signs point to higher levels. The mills are so congested with business that they are unable to satisfy customers in deliveries. Steel bars are unchanged at 2.50c, plates at 2.75c, and beams at 2.25c, Pittsburgh. Shortage of the supply of semi-finished steel has resulted in further prices. Bessemer billets are now quoted at $37, and open hearth billets at $38; Pittsburgh forging billets are unchanged at $55, and wire at $50, Pittsburgh. Prices of wire rods are however purely nominal as some makers have not been selling in the open market except to regular customers for several months.

Pig Iron

There is no change in the pig iron situation and prices remain at last week's level. The market is fairly active with an improved demand for foundry grades of pig iron.

Old Materials

The situation in the scrap metal market is much the same as last week. A steady volume of business is reported for brass, copper and heavy melting steel, the market for these metals is firm and quotations unchanged. The recent advances in the pig lead market have improved the position of old lead and prices are a little stronger. Aluminum is also strong but scrap zinc is weaker. Boiler plate, axles, tires, etc., have all an upward tendency but quotations are unchanged meantime.

Machine Tools

The market is keeping steady with a fair demand for machine tools, principally in replacements for munition plants. There are signs that ordinary business is picking up although the main demand is still for shell-making tools. A number of makers of machine tools in the States recently advanced their prices about 10 per cent. Prices may now be said to be approximately 25 to 50 per cent. higher than they were a year ago. Although the demand for machine tools is quieter than it was, the export demand having fallen off considerably, the cost of production has increased and prices of machinery will

therefore keep at the present high level for some time to come.

Supplies

The market is keeping steady with fewer price changes than usual. Coe's monkey wrenches are higher, the new discount being 20 per cent. as against 36 per cent. formerly. Lead wool is now 12c per pound being an advance of 1c. Cordage prices are unchanged but very firm, and higher levels may be looked for. Leather belting is also expected to advance. Castor oil has advanced 1c and is now 45c per pound. Black oil has also advanced and is now quoted at 14½c per gallon. Lead sheets are higher, 3 lbs. being quoted at 11c; 3½ lbs. at 10½c; and 4 to 6 lbs. at 10¾c per pound. Both the turpentine and the linseed oil markets are weaker with quotations unchanged.

Metals

An important development has taken place on the London market during the week. The British Government last Thursday issued regulations prohibiting speculative transactions in the various metals required in the production of war material. The object of the new orders was to prevent inflation in prices and was due to the high prices reached in all the markets. The metals covered in the order included among others, copper, zinc, brass and antimony. Tin was not included in the order as it only enters incidentally in the manufacture of munitions. If this regulation had been enforced for any length of time it would have meant a virtual stoppage of trading operations of the London market and would have also stopped all manipulation and speculation. At this writing, however, cable dispatches state that the regulation has been rescinded, but no information is to hand as to the reason of the Government's action. We understand that the metal exchanges in London opened Monday for trading under conditions authorized by the Minister of Munitions. Although the regulations are not in force, it indicates that the British Government intend to control prices of metals more effectively than heretofore, and the effect of this will be felt locally by less fluctuation in prices. The American market has invariably followed London so it will be interesting to see how prices in New York are affected under the new arrangement.

Copper

The market is unsettled following developments in London, but quotations are unchanged. The demand for copper is still exceptionally strong and producers are so well sold ahead that they do not find it necessary to reduce prices. Indications point to the present high level being more or less maintained for some months as there is a possibility of the consumption increasing rather than decreasing. Quotations are nominal at 30½c per pound.

Tin. — The sharp advances reported last week has not been maintained and the market has declined. As tin was only metal not included in the British Government regulations, later rescinded, this metal will perhaps not be affected by other restrictions on metals generally that may be imposed by the Minister of Munitions. The tin position is a good one, particularly for spot metal. Tin is now quoted at 50c per pound.

Spelter.—The market is unsettled and weaker being affected by the London market. There appears to be a wide difference of opinion in the trade as to what effect the action of the British Government will have on prices, and many consumers are holding back until the situation develops. Zinc ore is quoted at $100 to $120 at Joplin, Mo. Spelter has declined 2c locally and is now being quoted at 23c per pound.

Lead.—The market is strong following an advance by the "Trust" of $2 per ton, being quoted 6.40c New York, with the outside market at 6.50c to 6.60c. There is a scarcity of spot lead but the demand continues good. Local quotations firm and higher as 8½c per pound.

Antimony.—The market is quiet and unchanged. The antimony market has been under the control of the British Government for many months so that new regulations or restrictions would have little effect. Quotations are unchanged at 48c per pound.

Aluminum.—The market is strong and the metal is scarce. Quotations are firm but unchanged at 68c per pound.

Solders.—Quotations are a little easier than last week following the decline in the tin market. Guaranteed is quoted at 28½c and strictly at 26¾ per pound.

ALLIES PURCHASING AGENTS

The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:

International Purchasing Commission, India House, Kingsway, London, Eng.

French.—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendence Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.

Russian. — Col. N. Golejewski, Military Attachè, Room 904 Flat Iron Building, New York City.

CANADIAN TRADE SHOWS LARGE GAINS

FIGURES of Canadian trade for the first ten months of the fiscal year, as issued by the Customs Department on February 23, show a remarkable increase in exports as compared with the corresponding period of 1914, while imports also show a small gain. For the ten months ending with January, exports of domestic products totalled $595,265,000, an increase of $260,847,000, or nearly 80 per cent. as compared with the preceding ten months. Imports totalled $394,093,000, an increase of $15,046,000. The balance of trade for the ten months is a little over $200,000,000 in Canada's favor.

The total trade in merchandise for the ten months has been nearly $990,000,000, an increase of $275,000,000 as compared with the corresponding ten months of 1914-15.

Big crops and war orders account in the main for the phenomenal increase in exports. The exports of agricultural products for the ten months totalled $218,000,000, an increase of $104,000,000, or nearly 100 per cent. as compared with the preceding year and reflecting last year's big crop and the high prices obtained for it. Exports of manufactures for ten months totalled no less than $166,000,000, an increase of $105,000,000. This big jump in the export of manufactures is ,of course, mainly due to war orders, a considerable part of which Canada must herself pay for in taxes.

Other branches of export also show satisfactory gains. Exports of the mine for the ten months totalled $53,682,000, an increase of $11,000,000; exports of animals and their produce totalled $88,763,000, an increase of $24,000,000; exports of the forest totalled $45,428,000, an increase of $9,000,000; exports of fisheries totalled $18,541,000, an increase of nearly $3,000,000.

FERROMANGANESE EXPORTS FROM GREAT BRITAIN

BRITISH exports of ferromanganese, spiegeleisen and ferrosilicon in 1915 are officially reported at 103,077 gross tons, but probably most of this was ferromanganese. In 1914 these exports were 111,788 tons and in 1913 they were 173,919 tons. Of the 103,000 tons exported in 1915, the United States received only 55,201 tons, showing that considerable quantities went to other countries.

In 1913 about 10,000 tons was imported from Germany by the United States.

PAPER INDUSTRY ACTIVE

CANADIAN paper mills, according to trade authorities, are experiencing a strong demand for all lines of their output, the demand being in part a natural sequel of the strong market that has developed in paper in the United States. Exports of newsprint from Canada in November, according to the latest statistics available, were valued at $1,753,013, a new high record for any month, and of the total more than $1,400,000 went to the United States. Chemically-prepared pulp has been notably strong recently. With exports rising and imports virtually cut off, American paper authorities are talking now of a paper famine in the United States. As long as this condition continues Canadian mills can count on a continuance of the present capacity operations.

CANADA'S WEALTH

AN official estimate of Canada's wealth has never been prepared, says a writer in the Journal of the Bankers' Association of Canada. Our Census Bureau is not required, as the United States Bureau is, to make such a compilation each decade. From the very nature of our development and of our fiscal systems, it is harder for unofficial estimaters to compute the total than in the case of other countries. However, a rough, provisional estimate may be attempted. Only primary or tangible wealth is included; claims to tangible wealth in Canada itself, such as mortgages or stock, would, if included, clearly mean counting double.

Wealth of Canada

Farm values (lands and buildings), 1911 census	$ 3,343,000,000
Mines and forests based on value of products), 1911	800,000,000

	$11,160,000,000

PANAMA CANAL SUSPICIONS

THERE is an uneasy feeling that the closing, or continued closing, of the Panama Canal is not due to "natural causes," says the Practical Engineer of London, England. The waterway has now been closed since the beginning of October, except for a few small ships allowed to pass. The first estimate of reopening was Nov. 1, the second estimate was about Jan. 1, and finally came the gushingly worded announcement, that although there is now a free way for ships they will not be allowed to pass. The reason given is that they could only pass by delaying the work of the dredgers, and that it is in the best interests of all to keep the dredgers at work till they have made a satisfactory clearance. The cause of the suspicion is that some ships bound for Vladivostock with war supplies for Russia are held up in the Canal and that it is to the German interest to prevent them from getting through.

This fact would not in itself carry us far, but there are other facts which give color to it. In the early months of the war, when it was thought that the United States would take sides against Germany, threats were made in open print that Germans would block the Canals. These threats were taken so seriously that special military guards were put on. A further cause of uneasiness is that Germany conducts a campaign of arson and murder quite regularly in the States, and although it is quite evident—in many cases it has been proved in court—that the cost of the campaign comes from German State funds, an elaborate pretence is kept up that the crimes are committed by irresponsible enthusiasts. The Canal delays, therefore, call for explanation. The obviously fair thing is to let the waiting ships pass through as soon as possible and the unfair thing is to keep them waiting by giving out time-to-time promises.

CANADIAN PURCHASES FOR FRENCH WAR OFFICE

Philippe Roy, General Commissioner for Canada, Paris, advises the Department of Trade and Commerce, Ottawa, that an order has been issued by the War Department of the French Government to the effect that all purchases made by the Supply Branch in Canada will pass through the Hudson Bay Co. Canadian producers should therefore submit their future offers through the office of that company at Montreal. It is further stated in Mr. Roy's communication that Canadian lumber, steel and meat will find in France an important market for years to come, but it is necessary that Canadian firms should have in Paris representatives entrusted with the necessary authority, especially if it is desired to secure Government contracts.

BRITISH TRADE AFTER THE WAR

THE White Paper recently issued by the Board of Trade on "British Trade after the War," is a document of the greatest possible interest to the industrial and commercial community. It comprises the report of a Sub-committee of the Advisory Committee to the Board of Trade with respect to measures for securing the position, after the war, of certain branches of British industry. The members of the sub-committee are business men of the highest standing, belonging to various political parties.

It is a significant sign of the times that these gentlemen were able to approach their subject from a purely business point of view, and to agree upon certain recommendations which two years ago would have aroused fierce party conflict. The question of giving Government assistance to various branches of British industry, it is evident, is no longer in dispute. The only question is the way in which it should be given. It is now recognized by men of all parties that it is the bounden duty of the Government to protect British industries from unfair competition, and to advance in every legitimate way the interests of British commerce.

The Protection Feature

Various recommendations are made by the sub-committee as a result of their inquiry. They advise that more money should be devoted to scientific industrial research, that the copyright law should be amended, that transport and banking facilities should be increased, that a Ministry of Commerce should be established, and so forth. All of these, however, are subsidiary to the main recommendation, which reads as follows:—

"We are of opinion that where the national supply of certain manufactured articles, which are of vital importance to the national safety or are essential to other industries, has fallen into the hands of manufacturers and traders outside this country, British manufacturers ready to undertake the manufacture of such articles in this country should be afforded sufficient tariff protection to enable them to maintain such production after the war."

The significance of this recommendation is enhanced by the following remarks in the body of the report: "We are bound to say that, so far as our particular inquiry has gone, though some amount of weight has been attached to the various proposals put forward under the preceding heads, they were regarded as of secondary importance in compari-

son with one question, and that is the possibility or otherwise of tariff protection after the war. Practically all the representative firms and associations consulted by us asked for a measure of protection."

Widely-Spread Import Duties

This question of a tariff, it is obvious, lies at the very root of the problem of how to advance the interests of British industry, for we cannot expect increased production unless it is encouraged by security for enterprise. We cannot protect our manufacturers against the underselling tactics of the German dumper without it. Nor can we give preferential terms of entry into our markets to our overseas kinsmen and our Allies without a tariff. On this point the sub-committee report "that there exists a strong desire to respond to the feeling in our Dominions in favor of an Imperial preference in trade, and that there is also a strong desire to arrange preferential trading with those who are our Allies in the present war."

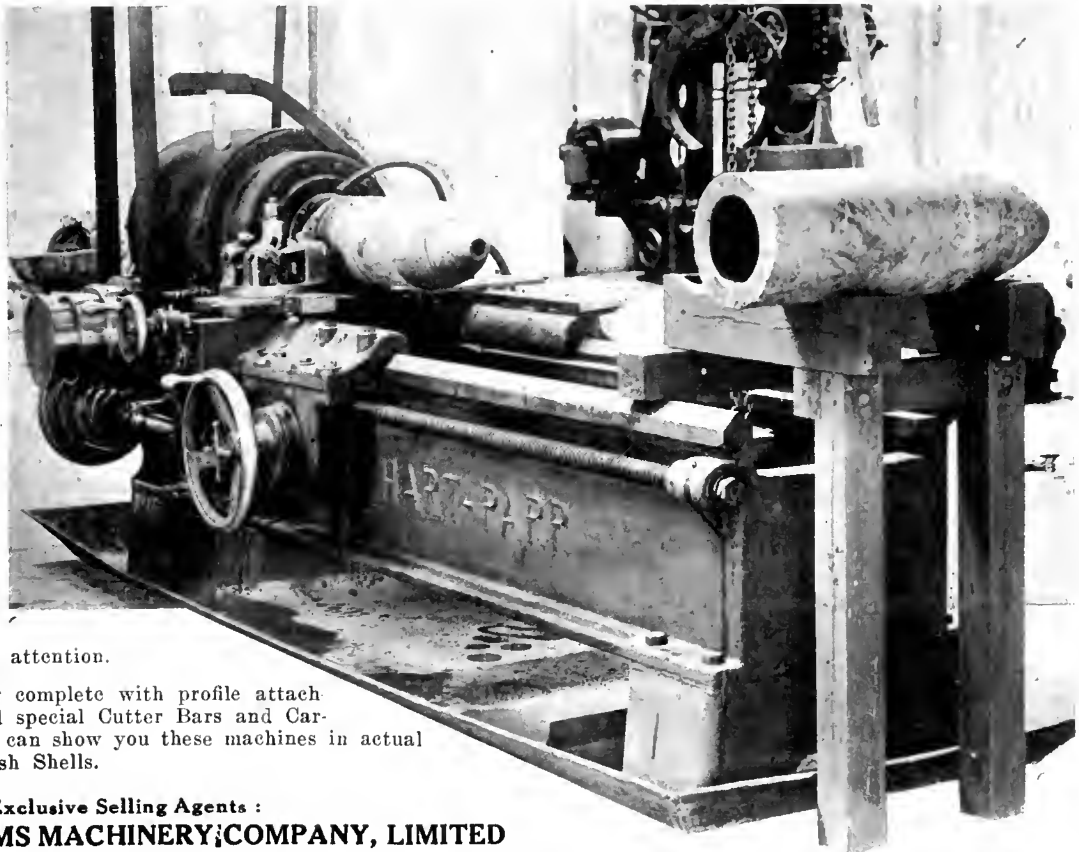
They further state that "cheap and abundant capital for the employment of their labor is of the greatest importance to the working classes." Taking these two considerations together, the sub-committee express their opinion that "it will be necessary to impose some widely-spread import duties, and we are therefore prepared to recommend that a larger proportion of the revenue should be raised by reasonable import duties. We are of opinion that such import duties would go a long way towards satisfying the requests for special protective treatment for the industries which we have had under consideration."

Prompt Action Wanted

Business men, and thoughtful men of all classes, will agree with the Board of Trade Sub-Committee that "widely-spread import duties" provide the only practical means of giving protection to our vital industries and enabling us to arrange mutually preferential tariff terms with our Dominions and our Allies. Not only so, but these duties would produce a large revenue to assist in financing the war. Even those who have hitherto opposed an extension of our tariff because of their adherence to effete economic dogmas are now convinced that, under the new conditions, their objections can no longer be maintained. The pressure of circumstances and the logic of necessity have brought about a change of opinion which no amount of public speaking or writing could have effected. It remains now for the Government to take prompt action upon the lines of the sub-committee's report, and thus demonstrate both to friend and foe what our future fiscal policy will be.

HART-PARR LATHE

for producing SHELLS from 6 in. to 9 in. diam.



This tool possesses enormous stiffness and great durability, and is wonderfully easy to control.

It has the accuracy that's so highly essential in the manufacture of munitions, and requires very little attention.

Fitted up with tooling complete with profile attachments for turning, and special Cutter Bars and Carriages for boring. We can show you these machines in actual operation on 9.2" British Shells.

Engineering

Mount Brydges, Ont.—The Canadiau Crow-Elkhart Co. may build an addition to their motor car plant.

Medicine Hat, Alta.—The Medicine Hat Pump & Brass Mfg. Co. is in the market for a universal milling machine, as well as considerable other equipment.

Welland, Ont.—J. C. Diffin has been awarded the contract for a two-storey addition to the drum shop of the Union Carbide Co. The additiou will be of fireproof construction, and will cost $20,000.

Montreal, Que.—The asphalt refining plant, which the Imperial Oil Co. propose establishing here, will be located at Point aux Trembles. Work has already started on the foundations for the refinery, which is expected to cost nearly $1,500,000.

Electrical

Cobalt, Ont.—The Northern Ontario Light & Power Co. has decided to instal a power line into Kirkland Lake Camp. The line will be completed by about June 1, it is expected.

Sudbury, Ont.—Some extensions to the street lighting system sanctioned last year, but not installed, will be proceeded with. A number of 600-c.p. bracket lamps will be installed.

Sarnia, Ont.—Engineer J. J. Jeffreys, of the Ontario Hydro-Electric Commission, advises that when Sarnia instals a street lighting system a good set should be put up. The system suggested by Mr. Jeffreys would cost $12,000 a year, in place of the present $7,000 a year.

General Industrial

London, Ont.—The Middlesex Mills Co. contemplate building a factory here.

St. Jerome, Que.—The St. Jerome Mfg. Co. will build an addition to their factory here.

Sarnia, Ont.—It is reported that a syndicate will establish a flax mill here in the near future.

Quebec, Que.—Fire recently destroyed G. A. Vandry's factory. The loss is estimated at $42,000, which is covered by insurance.

Sarnia, Ont.—The Dominion Salt Co. is building an addition to the factory here, which is expected will increase the production of salt by about 250, to 300 barrels per day. The cost is estimated at $15,000. The company will start operations on drilling another well shortly.

Fort William, Ont.—The Ogilvie Milling Co. will build another mill here to cost $150,000. Barnet & McQueen are the contractors.

Municipal

Lethbridge, Alta.—The City Commissioners have decided to purchase a motor-driven fire pump ,which will cost about $4,000.

Burlington, Ont.—The Town Council are considering the question of purchasing a motor hose truck for the fire department. A by-law will be submitted to the ratepayers.

Montreal, Que.—Plans for the construction of a tunnel under the Lachine Canal at the Wellington Bridge have been submitted to the Board of Control. Estimated cost, $1,200,000.

Kingston, Ont.—It is understood that the Seymour Power Co. will accede to the request of the Kingston Utilities Commission and withdraw from the proposed agreement for power supply because of the clause that the local power plant must be used only during an interruption in the service. The Utilities

EQUIPMENT FOR AUSTRALIAN NAVAL DOCKYARD

Tender forms and specifications have been forwarded by D. H. Ross, Trade Commissioner, Melbourne, for 43 machines of various types required for the equipment of the Commonwealth Naval Dockyard, Cockatoo Island, Sydney, N.S.W. Tenders will be received, subject to the conditions specified, up to May 1, 1916, addressed to the Director of Navy Contracts, Melbourne, Australia. The last mail in time to reach Melbourne on May 1 is that leaving San Francisco on March 22 and due at Melbourne on April 12. The tender forms are open to the inspection of Canadian manufacturers at the Department of Trade and Commerce, Ottawa (refer file No. A-1435). Particulars of the requirements are briefly outlined thus:

Three 50-ton overhead travelling cranes.

One 25-ton overhead travelling crane.

Two 5-ton overhead travelling cranes.

One 10-ton revolving cantilever crane.

Two 5-ton travelling portal jib cranes.

Two 7½-ton jib cranes.

One 5-ton jib crane.

Two 15-ton hydraulic cranes.

One 6-ton hydraulic crane.

One 6-ton wall crane (hydraulic).

Two 3-ton wall cranes (hydraulic).

Two electric passenger elevators.

Two electric goods elevators.

One 2½-ton gauge locomotive with crane attached.

One 2½-ton gauge locomotive without crane attached.

Three electrically-driven air compressors, 1,500 cu. ft.

One 15-ton hydraulic winch.

One 5-ton hydraulic winch.

Nine 10-ton hydraulic capstans.

Two 5-ton hydraulic capstans.

One bar shearing machine.

One double-ended horizontal punching machine.

One 10-ton overhead travelling crane for shipyard fitting shop.

Good Business Advice: "Meter Your Time"

Time costs you money. You buy it just as you buy a raw material. Why not check its delivery, its use, and the profits on its re-sale with the same accuracy that you check these factors in the working up of a raw material.

Checking time is even more important because time lost can never be regained.

Time losses can be prevented, however, by accurately metering all of your Time factors.

International Time Recorders are Time Meters

They give you an accurate check on all the phases of your Time investment.

They aid discipline, promote co-operation and prevent disputes.

Made in 260 styles.

There is an International that will meet your requirements. A post card will bring more complete details.

Don't Keep It--Sell It!

If you have a lathe
a drill
a milling machine
a planer
a chain block
a chuck
a motor
a crane
a stock of belting
an engine
a compressor
or any other machine shop equipment for which you really have no further use, why not turn it into *cash?*

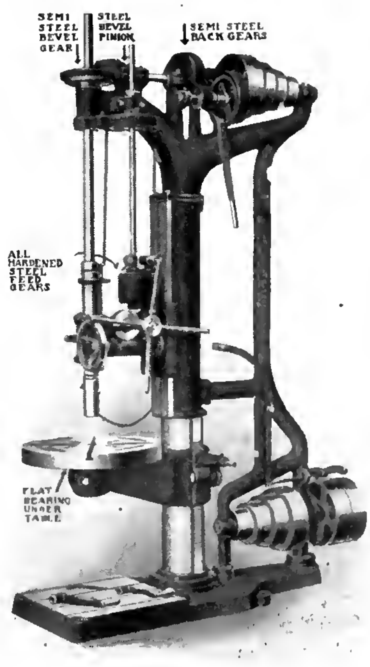
Someone may be looking for just the machine you may want to sell. Let us bring you together.

A "classified" ad. in CANADIAN MACHINERY, costing a few cents per issue, has done wonders for others. Why not try it?

—wide range

The range of work that can be handled on this machine is surprising.

But that is not all—the construction ensures **strength, accuracy** and **speed** seldom found in a machine tool of this kind.



AURORA Drilling Machines

These machines are splendidly adapted to the production of high explosive shells.

The work done by them is always at the highest stage of perfection—and the labor cost is comparatively low. Write for full details.

Stationary head—Sizes 20"-21".

Sliding Head—Sizes 22"-44".

The Aurora Too Works
AURORA IND.

Commission demanded that it have the right to operate the plant at any time.

Windsor, Ont.—By a vote of 342 to 290 the by-law to give tax exemption to the Maxwell Motor Co., of Detroit, Mich., in exchange for the erection of a $65,000 factory in the municipally-owned industrial district, was carried last Saturday.

Windsor, Ont.—A by-law, carried on March 4 to authorizze an expenditure of $15,000 on a tractor for the aerial fire truck, a service truck and another motor-drawn waggon. All the horse-drawn apparatus used by the Fire Department will be discarded.

Sarnia, Ont.—Three engineers, F. W. Thorold, of Toronto; W. S. Lee, of Montreal, and Engineer Dallyn, of the Ontario Board of Health, will examine the waterworks system and report to the City Council as to the possibility of improving defects in the supply.

Port Moody, B.C.—The City Council have passed a by-law authorizing an initial expenditure of $40,000 on waterworks extensions. The work will include the construction of a pipe from Noon Creek, the contract having been let to the Robertson-Godson Co., of Vancouver. The construction of a storage reservoir will not be proceeded with at present. This part of the work will cost about $40,000.

Tenders

London, Ont.—Tenders are being received until March 13 for iron castings, rubber supplies, hardware, road oil, manholes, catch-basins, etc. Specifications may be obtained from H. A. Brazier, city engineer.

Toronto, Ont.—Tenders will be received by the chairman, Board of Control, City Hall, up to Tuesday, March 14, 1916, for the supply and delivery of: One single-truck, double-end street car, completely equipped; one car body, double-end, single-truck; equipment for one single-truck; equipment for one single-truck car. Specifications and forms of tender may be obtained at the Works Department, Room 12, City Hall.

Ottawa, Ont.—Tenders will be received until Monday, March 13, 1916, for the construction of timber lock gates and their equipment for the East River Lock, near New Glasgow, Pictou County, N.S. Plans and forms of contract can be seen and specification and forms of tender obtained at the Department of Public Works, Ottawa, and at the offices of the district engineers at Antigonish, N.S.; Halifax, N.S.; Shaughnessy Building, Montreal, P.Q.; Confederation Life Building, Toronto, and on application to the postmaster at New Glasgow, Nova Scotia.

Toronto, Ont.—Tenders will be received by the chairman, Board of Control, City Hall, up to Tuesday, March 14, 1916, for the supply and delivery of: Special track work, for St. Clair Avenue barn; extension, Toronto Civic Railway. Specifications and forms of tender may be obtained at the Works Department, Room 12, City Hall.

Drummondville, Que.—Tenders will be received until March 15, 1916, for the supply of materials and the construction of a pumping station and mechanical gravity filters. Those interested can obtain specifications and plans covering said works at the office of the town clerk, W. A. Moisan, and also at the office of M. M. Ouimet & Lesage, 76 St. Gabriel Street, Montreal, P.Q.

Personal

George Gilbert Sheldon Williams, editor and proprietor of the B. C. Mining Exchange and Engineering News, died at Victoria, B.C., on February 13, aged 49.

C .D. Garner has succeeded J. A. Day as manager of the Cleveland Pneumatic Tool Co., of Canada, Ltd., Toronto. Mr. Garner was formerly assistant manager of the company.

Frank G. Wallace, of Pittsburgh, Pa., for many years a director of the Canadian Locomotive Co., Kingston, Ont., has accepted the position of managing director of the company.

Col. David Carnegie, expert ordnance adviser to the Minister of Militia and a member of the Imperial Munitions Board, has returned to Ottawa after two months' absence in England.

Thomas Tomlinson, head of the firm of Thomas Tomlinson & Son, iron founders, Frederick Street, Toronto, died on Feb. 22 in the Western Hospital, following an accident. The deceased was 45 years of age.

E. P. Plewes, of the E. P. Plewes Co., Winnipeg, has returned from an eight weeks' trip down East, where he was buying tools, etc., for shipment to Great Britain. On his return he called at Chicago and other American points.

J. E. MacArthur has been appointed to fill the position of superintendent of the No. 1 plant of the Russell Motor Car Co., Toronto. Mr. MacArthur was formerly superintendent of the Robinson Fire Apparatus Mfg. Co., of St. Louis, Mo., and also was with the Pierce-Arrow Co., of Buffalo, and the Brown & Sharpe Co., of Providence, R.I., for some time. He has had wide experience in the manufacture of small interchangeable parts.

E. E. Forgeus has been appointed purchasing agent of the Eastern Car Co., New Glasgow, N.S.

Dr. T. H. Crottey, Winnipeg, has been appointed Western secretary of the Canadian Manufacturers' Association, succeeding Chas. P. Webster, now Industrial Commissioner at Winnipeg.

D. H. McDougall, superintendent of the iron ore mining operations of the Dominion Steel Corporation, Sidney, N.S., has been appointed to the position of general manager of the company. Mr. McDougall, who is a Nova Scotian, is 36 years of age, and has been associated with the Corporation for a number of years.

Trade Gossip

The John Inglis Co., Toronto, have been awarded a contract for a boiler and pump by the City Council of Cornwall, Ont., at a cost of $2,800.

The International Acheson Graphite Co., Ltd., Niagara Falls, N.Y., has changed its name, and hereafter will be known as Acheson Graphite Co.

Wallaceburg, Ont.—The Board of Trade has elected the following officers: John Zavitz, president; H. A. Stonehouse, vice-president; Ray Martin, secretary.

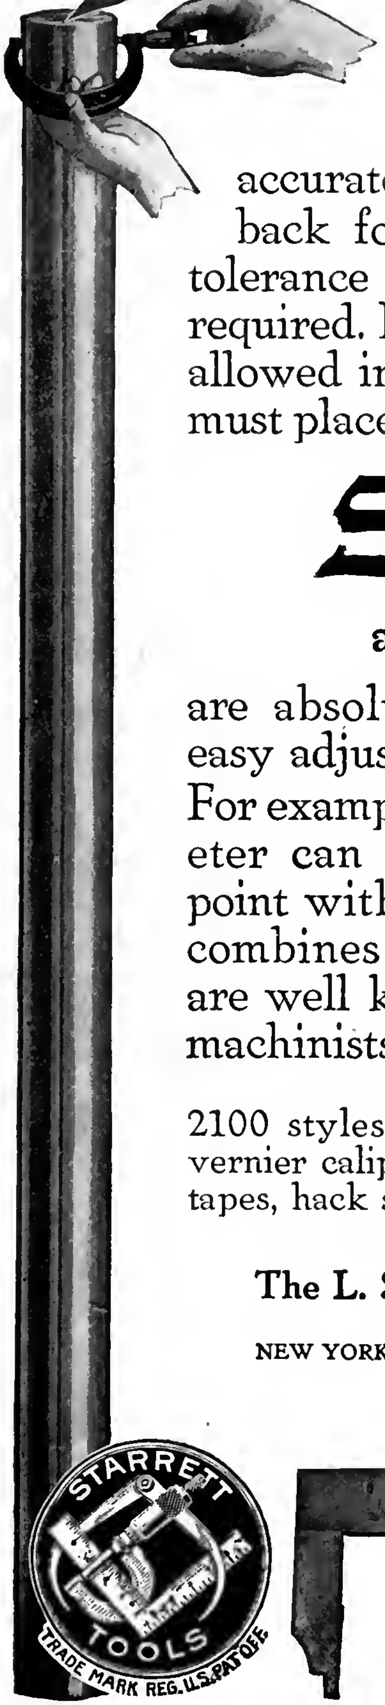
Goderich, Ont.—The Board of Trade has elected the following officers for the ensuing year: President, M. G. Cameron; vice-president, C. L. Moore; secretary, G. L. Parsons ;treasurer, Wm. Campbell.

The Wabi Iron Works, New Liskeard, Ont., have been appointed sole manufacturers for Canada for a machine for treating sand and slime in connection with mining operations.

The Canadian Brakeshoe Co., Sherbrooke, Que., is operating four 2½-ton basic-lined 3-phase electric furnaces. The furnaces run continuously and turn out four heats each every 24 hours.

The Electric Steel & Metals Co., Welland, Ont.—The following directors have been appointed for the year:—E. Carnegie, president; W. L. Renton, vice-president; Sir Charles Ross, Col. R. W. Leonard, and William Carnegie.

The Consolidated Engineering Co., Chicago, Ill., have purchased the complete plant of the Massachusetts Fan Co., Watertown, Mass. John E. Anderson, late with the B. F. Sturtevant Co., Boston, Mass., will be in charge of the heating and ventilating department



THE best machinist is the one who can caliper his fits so accurately the jobs never come back for refitting. The limits of tolerance are so small that the greatest accuracy is required. In forced fits 1-1000 of an inch is the limit allowed in many cases. This means the machinist must place great dependence upon his instruments.

Starrett Tools

and Instruments of Precision

are absolutely true and are designed for quick easy adjustment.

For example—the Starrett quick adjusting micrometer can be instantly opened or closed to any point within its capacity. This saves time and combines speed with accuracy. Starrett Tools are well known as standard by all expert machinists and engineers.

2100 styles and sizes—including micrometers, vernier calipers, dividers, combination squares, steel tapes, hack saws. Write for free catalog No. 20-3.

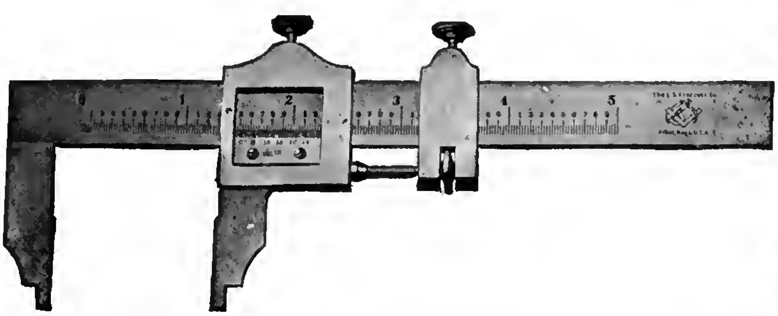
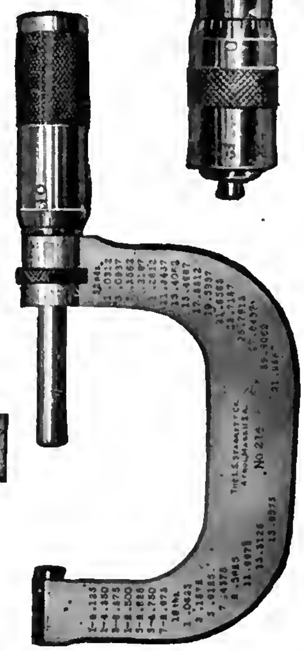
NEW YORK LONDON CHICAGO





STARRETT TOOLS TRADE MARK REG. U.S. PAT. OFF.

If any advertisement interests you, tear it out now and place with letters to be answered.

The Gurney Scale Co., Hamilton, recently shipped a 6-ton dump scale to Spirit River, which is located well up in the Peace River country. This is the furthest north point in Canada that a dump scale has ever been shipped or operated.

Controlled Munitions Plants in Britain.—A total of 2,834 establishments for the manufacture of shells and munitions are now under control of the British Minister of Munitions. The first factory was taken over by the Imperial Government on July 12, 1915.

Soldiers Honored.—On February 26 the H. W. Petrie Machinery Co., Toronto, bade farewell to four more of their employees who are leaving for the front, and presented them with soldiers' wrist watches. The four are: E. I. Ronan, S. D. Bremner, H. R. Beer, and J. C. Scanlon. Twelve from the firm have now gone.

Toronto, Ont.—Definite action is likely to be taken in the near future for inaugurating a big publicity campaign with the object of making widely known the great advantages of Toronto as a tourist resort and its magnificent opportunities as a field for new industries. A committee has been appointed to prepare a plan of campaign of publicity, with President Arthur Hewitt, of the Board of Trade, as chairman.

Ottawa, Ont.—A deputation from the Trent Valley recently visited Ottawa to request that Eastern Ontario be given the opportunity now enjoyed by Western Ontario in the matter of power from the Hydro Commission for the farm, factory and transportation. The obstacle lies in the disputed jurisdiction between Provincial and Federal Governments. The source of power is mainly on the Trent Valley Canal.

Flax Industry Development.—The Department of Agriculture, Ottawa, is studying the needs and possibilities of the flax growing industry in Canada. Prof. Grisdale, director of the Central Experimental Farm at Ottawa, has recommended that a flax division of the Department of Agriculture be established for the purpose of carrying on experiments as to the best methods of cultivation and handling the flax, and the varieties best suited to the soil and climate of Canada. Prof. Grisdale also suggested that a small but complete plant be erected at the Experimental Farm to separate the fibre from the flax straw.

Canada's Gold Output.—Preliminary estimates of the gold production in Canada in 1915 give a total of 962,664 ounces, an increase of 189,486 ounces, or about 25 per cent. over 1914. In dollars,

the value of the output was about $19,-300,000, against $15,500,000. The high record was 1,350,475 ounces in 1900. It is evident from the report of the Ontario Bureau of Mines that the Porcupine and Kirkland Lake districts have been responsible for a greater part of the increase. Final figures for Ontario show a total of 411,588 ounces, worth $8,501,391, produced in 1915, against 269,942 ounces, worth $5,529,767, the previous year. The increase of 141,646 ounces for Ontario for the year compares with a total estimated increase of 189,486 for all Canada.

Book Reviews

"Advanced Machine Work" is the title of a new text book, by Robert H. Smith, a well-known director of shop work at the Massachusetts Institute of Technology. The book treats of the many important phases of shop practice, and has already been adopted in a number of schools and colleges. Among the subjects treated are engine lathe work, cutting tools, turning, fitting, threading, chucking, reaming, broaching, drilling jigs, boring bars and machines, grinding, planing, milling, tool making, and gearing. The price of the book is $3, and there is a special discount to teachers and instructors.

Catalogues

Cold Storage Doors.—The Jamison Cold Storage Door Co., Inc., Hagerstown, Md., have issued a bulletin dealing with the "Jones" and "Noequal" doors for cold storage installations. The principal constructional features of these doors are described and illustrations show the general design.

Nonpareil Corkboard Insulation, is the title of a catalogue being issued by the Armstrong Cork & Insulation Co., Ltd., Montreal, Que. The catalogue deals with the production and application of cork for insulating purposes and contains a great deal of interesting information of both a practical and scientific value. A number of pages deal with the heat conductivity of "Nonpareil" corkboard and other insulating materials and also includes reports on tests of these materials. The fire-resisting properties of "Nonpareil" corkboard are described, accompanied by illustrations, showing fire tests and a number of installations of this material. Several specifications for erection covering various types of building are included with sectional diagrams showing the corkboard construction. The concluding pages deal with miscellaneous uses for "Nonpareil" corkboard, illustrated. This is a high class catalogue containing a considerable amount of useful information for refrigeration engineers. The press work is good and the illustrations are very clear. Copies will be sent to interested readers on application.

Centrifugal Pumps for all purposes, including condenser circulation, irrigation, drainage, dry docks, and general mill and power plant service, for motor, engine or belt drive, are now being built by the Wheeler Condenser & Engineering Co., of Carteret, N.J., and are described in their new bulletin 108—A. These pumps are of the single-stage, double-suction, split-casing type, for heads from 0 to 300 feet. Particular stress is laid in this bulletin to the adequate testing facilities in the Wheeler hydraulic laboratory, provided with calibrated motors, gauges and tanks with V-notch and rectangular weirs for measuring the quantity of water, and secondly, to the accurate casting and machining of pump parts, particularly the impellers. A short description of foundry methods is given. Among the designs of pumps shown, several are of particular interest, such as, a combined motor and geared turbine-driven centrifugal pump, a typical complete surface condenser auxiliary, with geared circulating pump direct connected to turbo air and condensate pump driven from a common turbine, a large vertical shaft dry dock pump, etc. Several pages are devoted to vertical shaft pumps, and excellent illustrations show the design of the vertical thrust bearing with self-contained lubricating oil pump, of the lower self-lubricating guide bearing, and the design of impeller and casing.

INDEX TO ADVERTISERS

The Technical Journal a Factor in Personal Advancement

By J. H. R.

To the young man starting life or to the man of mature years directing the efforts of numerous subordinates, the trade journal of repute is of incalculable benefit in bringing to attention new developments, keeping abreast of current practice, and preparing for future efforts in a particular line. As a means of moulding the youthful mind, the trade journal is daily becoming more universally recognized and highly valued, in all branches of industry.

ONE of the most pressing problems confronting our young men to-day, and which they must give heed to and solve, affecting materially, as it does, their future prospects, is that of the choice of a trade or profession. Many young men at present employed in our metal working industries have been deprived of the elementary theory pertaining to their daily labor, and their struggle for advancement is, therefore, made proportionately difficult.

Those who have had the privileged opportunity of continuing their studies from the public school to the high school, and thence to a technical college or university, form a very small percentage of the human element that strives day in and day out to keep the innumerable wheels of industrial activity constantly in motion. The great majority after a public school course find their conditions such that it is almost imperative for them to seek employment, and assist in the maintenance of themselves or their families.

Initial Ventures Usually Unsatisfactory

Under these circumstances, very few find their first remunerative position suited to their taste or inclinations, yet the compensation is invariably sufficient to meet their immediate needs. However, the possibilities are that in a short time the young man will either, from lack of interest or want of efficiency, relinquish his position, with the expectation of improving conditions in some other direction. Thus it is that the average youth is liable to wander from one job to another, giving little thought for the most part to the choice of a permanent vocation. Many men to-day are hanging their clothes up on the wrong hook—in other words, they are not qualified for the work at which they are employed. They are in their present position largely by accident or chance. Once in a while accident or chance have been the means of placing a man in his proper niche, but more often he will be found making what a mechanic might term "a very poor fit." However, by individual initiative and persistent effort to acquire all possible shop knowledge, many men will by constantly applying themselves to the practical side of their work be able to master the whole raft of intricate details connected therewith, but which to those less energetic would be almost impossible.

Generally, the man who can adapt himself most readily to existing conditions, devising ways and means to lighten his manual efforts has had a varied experience, acquired from working in different plants, where the class of product and equipment require a diversity of operative methods.

Acquiring Technical Knowledge

In the absence of opportunity to acquire engineering knowledge from practical experience no better method is available than through the pages of the technical or trade papers. This class of educational medium which is constantly being developed contains the result of long years of study and experience in the shop, laboratory and class-room. Few engineering feats of to-day—however insignificant—pass unrecorded. Even the smallest details are duly featured.

Information to be found in trade or technical books is neither acquired, nor even desired, generally speaking, by the average artisan, whose duty it is to perform certain work previously planned and arranged by those who have studied the fundamental principles of theoretical and practical engineering. The man, however, be he old or young, who finds employment at a trade requiring a certain amount of technical knowledge, and who is making no effort to become better acquainted with the theoretical side of that trade, is failing both in his duty to himself and in his obligation to those whom he is called upon to serve.

A workman's chief asset is his ability to adapt himself to existing conditions, applying all his knowledge and skill to the successful carrying out of the duties that are daily placed before him. However, the large majority of industrial workers find their store of knowledge limited to the conditions prevailing in probably one or at most a few particular shops. To these, more than any others, perhaps, the study of up-to-date methods and devices through the agency of books or periodicals is here suggested.

Text Books and Trade Papers

Obtaining the necessary technical information with the minimum expenditure of time and money is one of the problems that confront the workman, who, in many cases, finds it difficult, if not impossible, to attend a technical school, or supply himself with the necessary books containing the data pertaining to his particular calling. True, the shelves of most libraries contain a multitude of text-books on every subject, but for the average mechanic many of these books would be entirely beyond his limited understanding.

However, it is almost necessary—in fact, essential, that the young man entering a workshop to learn a trade should become conversant with the fundamental principles which underlie his manual efforts. For this reason it is advisable to secure a few suitable books on the elementary principles of mechanics, as these are subject to little or no change. Shop practice, on the other hand—due to the development of modern methods—is changing so rapidly that a large percentage of scientific publications may in a short time become obsolete.

To be conversant with the best practice pertaining to a certain branch of a trade is one of the chief elements in proficiency. It has often been said that "the technical and trade papers of to-day become the text-books of to-morrow." By the systematic study of good reliable technical and trade papers, no one can avoid being impressed by the wide range of valuable information contained within their pages, both from a theoretical and practical viewpoint; but unless such publications are deemed to be part of one's business, it is doubtful if the desired end will be attained. The leisure hours of the average young men of to-day are so well filled with pleasure-seeking that little thought or time is given to the improvement of the mental faculties. The question of keeping posted in the latest developments of one's business should be equally important with the drawing of one's pay at the close of the week.

The Exceptional Employee

While the average man is content to plod along, doing just what he is told to do and no more—the exceptional man, the man who is always on the look out to improve his position, will be found, not only accomplishing his allotted task with sustained effort, but will also be ready and able to offer suggestions for improving or changing existing plant equipment, for the purpose of facilitating and supplementing output.

It is the exceptional employee that

loses no opportunity of studying the methods of the other fellow, and applies them to his own work, if by so doing he can eliminate unnecessary detail, reduce the time of operation, etc. It is to the exceptional employee that other workmen will come for information; pointers on screw-cutting, gear-cutting, spiral milling and a hundred-and-one other questions; and it is this same employee to whom the boss will come to discuss the advisability of certain changes in production or equipment.

It is the exceptional employee who keeps constantly posted on the trend of the trade. By careful study of the trade papers he is always familiar with any changes in machine shop methods, development of new devices, or changes in equipment, which, with modification, can often be successfully applied to local shop conditions.

Every young man should be alive to the rapidly developing changes throughout the industrial field. The possibilities of a man's latent abilities can never be fully realized until he comes face to face with new problems; questions that require more than ordinary thought; difficult situations that necessitate careful consideration. It is true that the more we learn, the less we think we know. To the man who is performing routine work in a factory, one of the best methods of developing his latent faculties is by the study of other men's ideas, through the agency of the trade paper, pertaining to his particular trade or calling.

Recognizing Ability

Does the employer recognize the fact that a man will be of greater service to himself and also to the firm from the study of suitable trade papers?

Heretofore, many engineers and employers have been averse to accepting the opinion of any of their workmen; very often on the ground that by so doing they were admitting their inability to successfully administer their responsibilities. However, it is gratifying to note that those in authority are now more fully appreciating the value of the subordinate, who is not only making the effort to increase his own store of knowledge, but is willing to use same to the advantage of the firm with whom he is employed.

The progressive superintendent will speedily recognize that it is only by mutual co-operation between himself and his foremen and between the foremen and their men that the best work can be accomplished and complete harmony prevail.

No man has yet acquired sufficient knowledge that he can claim a monopoly of any trade or profession. The field of engineering is so large that it is impossible for anyone to assume that they "know it all." The competent foreman will not "call" a man for arguing or discussing a shop problem, but, on the other hand, will encourage his spirit of individuality. The man who has no original ideas of his own cannot be expected to fit in with the policy of any enterprising and progressive establishment.

Even the so-called "fool" suggestions are not so numerous that they should try the patience of the foreman. No two persons have been endowed with the same capabilities, and, although the thought of the operator may not agree with the ideas of his superior, the very suggestion shows that the mind of the former is alert to the possibilities of his physical and mental effort. Many a promising career has been retarded by the "chief" ridiculing some well-meant offering of one of his employees. Some foremen go so far as to ignore the offered suggestion, and yet propound the same idea to the superintendent as one of their own. However, it is interesting to note that this (dog-in-the-manger) type of foreman is gradually being eliminated, and a spirit of all-round co-operation being displayed instead.

Expressing Mental Development

What men require to-day is encouragement towards and appreciation of their mental development. The awakening of a young man's dormant intellect enlarges his vision and broadens his mind. His view of the future gradually changes, and in place of uncertainty and lack of determination, there comes to him the mental conception of untold possibilities and opportunities. However, it is necessary that impressions on the mind should also find expression through the tongue or the hand, otherwise the constant accumulation of knowledge will make the mind a storehouse instead of a transmission station. What advantage is it in knowing how to do a thing if we never have to do it? How many of us have benefited by seeing an interesting "kink," an unusual method, a certain device illustrated and described in the pages of a trade paper, which has enabled the elimination of many an irksome duty and effort? It is through the agency of the trade paper that many developments and improvements in the industrial world receive their first publicity.

LABOR BRANCH, ONTARIO PUBLIC WORKS DEPARTMENT

THE labor branch of the Public Works Department, Province of Ontario, which will be established, is to be constructed on the lines suggested by the committee on unemployment in their report, according to the Hon. Finlay G. Macdiarmid, Minister of Public Works. Mr. Macdiarmid intends appointing a superintendent to preside over the branch, and it is understood that he has the man in mind. The salary will not be less than $2,500. Mr. Macdiarmid introduced his bill last week. The principal work of the department will be to:

Duties Outlined

Collect such statistical and other information respecting trades and industries in Ontario as may be deemed necessary or expedient from time to time.

Ascertain the localities in which mechanics, artisans, or workmen in any particular trade or industry are required, and, where practical, assist in supplying the demand for such work or labor.

Ascertain and report upon sanitary and other conditions relating to the health, comfort, and well-being of the industrial classes.

Establish, and maintain in the various centres of population throughout Ontario, employment bureaus and similar agencies for obtaining suitable employment for working men.

Ascertain and report upon the rates of wages paid to employees in the various trades and industries carried on in Ontario.

Inquire and report as to the establishment of new industries in Ontario, particularly in cases where, by reason of the production of raw material for such industry in Ontario, or the immigration of persons skilled in the particular industry or other circumstances, it appears that such industry can profitably be carried on.

Report on Laws

Inquire into, consider, and report upon the operation of laws in force in other parts of the Empire and in foreign countries having for their objects the protection, technical training, and welfare of the industrial clases, and make such recommendations and suggestions thereon as may be deemed advisable.

Consider and report upon any petition for, or suggestion of a change in the laws of Ontario relating to labor and wages, or any matter affecting the industrial classes presented or made by any Trades and Labor Council or other organization representing those classes, or by any other person.

Prepare and transmit to the Lieut.-Governor-in-Council annually a report containing the reports of the officers employed in the administration of the various Acts assigned to the branch, and upon the work of the branch during the preceding year, together with such statistical and other information as may have been collected in the branch.

PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

PAPER CUTTING KNIVES

By D. A. Hampson

A RECENT excellent article in "Canadian Machinery," dealt with the sharpening of paper cutting knives, and as the subject is of such widespread interest it is worth further light. Every little hamlet in these days has its printing office, if not its newspaper, and in each of these the paper cutter is an essential factor. It

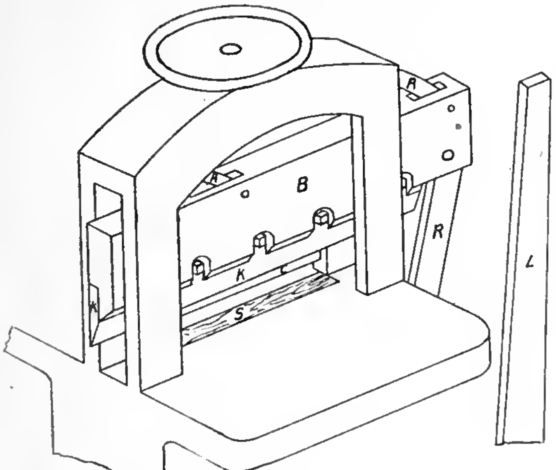

FIG. 1.

has been estimated that there is one paper cutter for every 1,500 inhabitants and where binding and a considerable amount of publishing is done, the proportion is greater. To do good work, each cutter must have a blade or knife of almost razor sharpness, thus it will be seen that the sharpening of these knives must ever be a live subject to mechanics engaged in the repair business.

Working Principles

Paper cutters may be hand or power operated; the cutting principles being, however, the same in both cases. An idea of the mechanism of the machine may be obtained by referring to the sketch Fig. 1. A heavy casting or knife

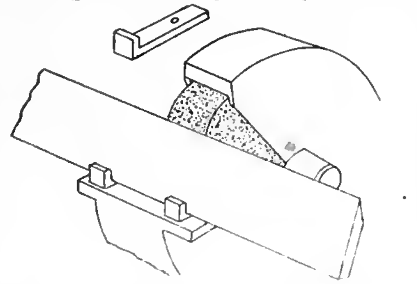

FIG. 2.

bar B, to which is bolted the knife, swings on the links AA, and is moved up and down by means of the lever L, actuating (through a shaft not shown), the link R. The stack of paper is clamped in place by means of the bar C, which is operated by means of the large hand wheel. A piece of hard maple S, is inserted in the table as shown immediately beneath the cutting-edge of the knife. This insures protection to the sharp edge, since the knife on the completion of the cut enters the wood instead of coming down on the iron table.

Grinding the Knives

Keeping the knife sharp is the secret of success in paper cutting, it means a larger output of better work, with less fatigue to the operator, and in order to keep the knives in the best condition practically all machine shops are called upon at some time or the other to sharpen them. In a great many instances, however, such work has been turned down as being of a too special or particular a nature for the equipment on hand. This is in reality an illogical idea, for such a job can be made to pay even better than the average run of small jobs. A 36-inch knife costs about $1 to have it ground, yet this work can be done on a regular tool grinder, which is found in even the smallest shops in a very short space of time, providing there are no big nicks in the knife. The necessary equipment required for this work is shown by Fig. 2, and consists of two angle pieces which are clamped to the flange in place of the usual tool rest. The knife is moved back and forth by hand; the position of the angle pieces giving the desired level.

The writer's experience has been that grinding knives "wet" is by far the best—best for the cutting wheel because it is kept clean and best for the pocket-book because the same work is accomplished in half the time. Experience in grinding on a tool grinder as described above was proved years ago when this was the only type of grinder made to work with water. The revolution which water has brought about in manufacturing grinding is evidence of the soundness of the claim for wet grinding of knives.

Special Grinding Machine

The method of grinding just described produces a hollow or concave face, but the commercial knife grinding machine will grind either straight or hollow face. The main details of this machine can be obtained by referring to the plan view Fig. 3. The wheel used is of cup-shaped construction and should preferably be of a soft, medium coarse grade. The desired reciprocating motion is imparted to the machine table by means of a shifting belt arrangement working similarly to that employed on planers. Slots are provided on the table T by which means the knife can be bolted in position. The table can be swivelled to obtain any desired level and is also made adjustable to the wear of the wheel. The table and supporting bed are mounted on the plate P, which can be turned through a slight angle; the posi-

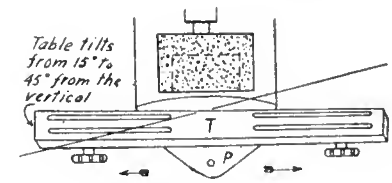

FIG. 3.

tion shown producing a straight ground knife and that indicated by the dash line producing the hollow ground.

Paper Cutting Knife Oddities

An interesting method was noted in a plant having several cutting machines but situated far from any grind centre and having no grinder of their own. A lead "tread" two inches thick was cast around an old pulley and, when turned true, was charged with fine sand. Mounted on an arbor running in boxes on a home-made wood frame and having a "V" in which the back of the knife rested as it was moved along, it made a cheap but very efficient grinding apparatus. A hose leading out from a hogshead of water overhead formed their cooling system. The men in this plant, instead of finishing the edge with a whetstone, used burnishers just as a butcher uses his "steel" for edging. There were six one-inch lengths of 5-16 inch Stubbs' steel rod, hardened and

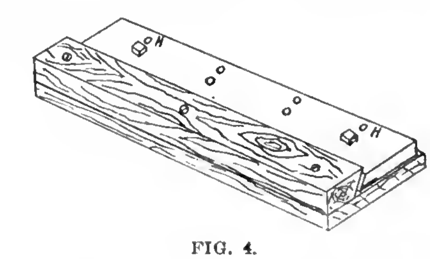

FIG. 4.

polished to almost a mirror surface. The class of cutting was the finest and most particular, and the burnisher seemed to be the correct edging tool.

Safety Devices

Handling a piece of steel of the size and weight of paper cutting knives with their razor-like edge is attended with considerable risk, and the only safe way to carry them or to store them is to have the edge completely covered as shown by Fig. 4.

This device is cheaply and easily made, and it should be used wherever possible as protection is thereby afforded to both the workman and the sharp edge. The knife is fastened in place by the bolts as shown and, when a knife is "packed" in this manner, transportation companies will accept such a package without further boxing.

Another safety precaution which should be considered in working with these knives is to have some means of holding them while they are being removed from the machine. A couple of eyebolts should be screwed into the bolt holes and all handling done by means of these. Many a nasty cut or even a more serious injury will be prevented if such precautions are taken.

Commercial Opportunities

By the installation of a special knife grinder or by providing an attachment to the grinding machine, the small machine shop can substantially increase its income. Advertising must, however play an important part in procuring such business. If the fact is brought to the attention of every cutting machine user within a radius of fifty or one hundred miles, that the shop is in a position to sharpen knives and return them within a day, and stating also a standard price for such work, the user would not hesitate giving his preference to such a shop, rather than send his work to a type foundry or large shop in a distant city. In the latter the work, is in many cases done grudgingly, and the charges made in accordance, while the knife is not generally returned to the user for a considerable time. Then, too, the field may be broadened by getting other machine knives to sharpen—knives from wood planers, knives used in leather and rubber industries, binderies, paper box factories, etc.

Various attempts to enable the printer to do his own grinding have been made but with one exception they have not been conspicuous successes. It is not an unusual sight in a printing office to see a man spend an hour or two whetting up a knife with an oil stone—so much does the printer dislike to have the knife sent away for a few days even though he needs it sharpened. A little device has recently been placed on the market which sharpens a knife right in the paper cutter itself. The cutting stick is removed and the device clamped in this slot. An emery wheel is then moved along by hand thus sharpening the blade. This is so effectual that in cities having knife grinder service this tool is used and though it does not take the place of an occasional machine grinding, it will save four out of five such trips from the office.

A SELF-CONTAINED RADIUS TURNING DEVICE

By George Armstrong

A FORMING attachment of the radius rod type which, with the exception of a small stop bracket fixed on back of lathe bed, is carried on a special cross slide and permits of all necessary adjustments being accurately and quickly made, is shown in Figs. 1, 2 and 3. The regular cross slide is removed from the lathe carriage and a special slide A is fitted, at the back end of which is formed an elongated frame as shown in Fig. 1. Bosses formed in the ends of this frame support rod F, one end of which is provided with adjustment where it comes in contact with bracket I, which is fastened to the bed of the lathe.

The part E, which corresponds to the ordinary tool box is carried in the front end of a radius link, which is formed so as to provide a slideway for tool box E, adjustment being obtained by screw J. The front end of the radius link is pivoted in, and rests on a block L, which slides in guides on the top of cross slide A. The back end of the radius link is pivoted on block D, which is an accurate sliding fit in the frame guides. Rod F is provided with a threaded portion of suitable diameter which screws in block D and also carries lock nuts H. The extended portion to the right carries a strong coil spring which keeps the lock nuts in contact with the frame. A slight relative adjustment of the lock nuts and pivot block enables the radius link to be set exactly at right angles to the centre line of the lathe as shown in Fig. 1.

With the parts in this position the carriage may be moved to either side

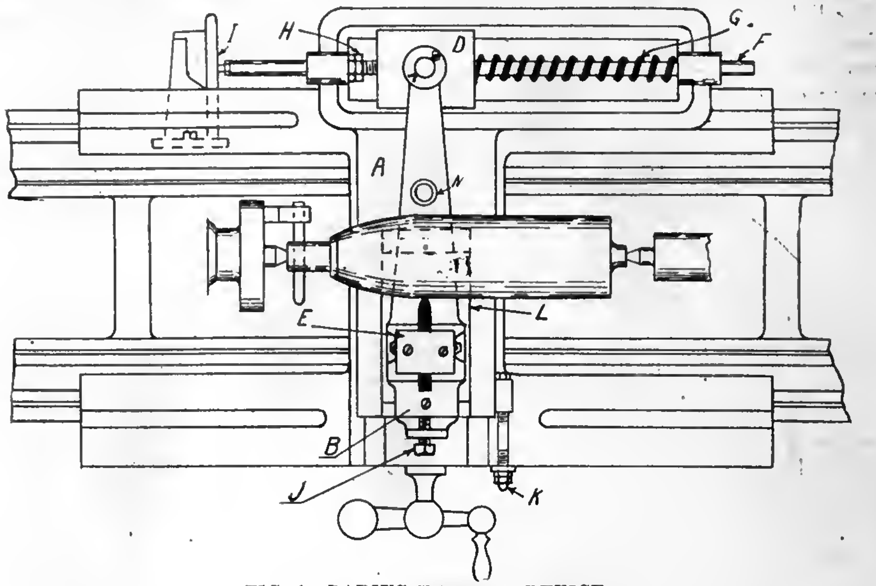

FIG. 1. RADIUS TURNING DEVICE.

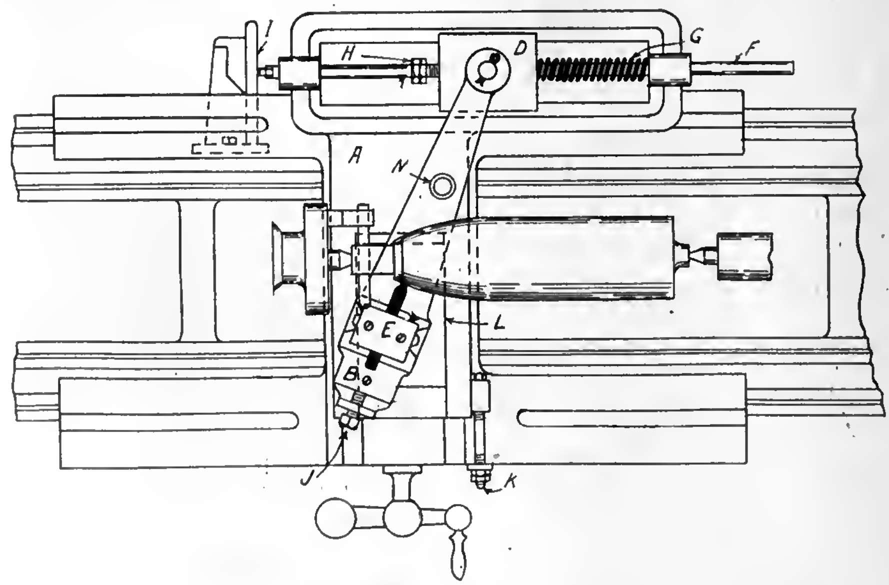

FIG. 2. RADIUS TURNING DEVICE.

and parallel turning done, the diameter being controlled by the ordinary feed screw retained in place. The carriage having traveled to the left and reached the position shown in Fig. 1, the rod F comes in contact with bracket I, and remains stationary, while the carriage continues traveling. Block D being fastened to the rod F, now becomes a fixed point from which the radius link swings, till it reaches position shown in Fig. 2.

The actual length of radius imparted to the curve is controlled by adjusting screw J, while the setting of the tool to a definite size is quickly done with the gauge M, Fig. 3, which fits over stud N, and gauges the point of cutting tool.

In returning the carriage to base end of shell, the coil spring G keeps rod F against bracket I, until the movement of the carriage to the right brings the end of the frame in contact with the lock nuts after which parallel cutting proceeds in the usual manner.

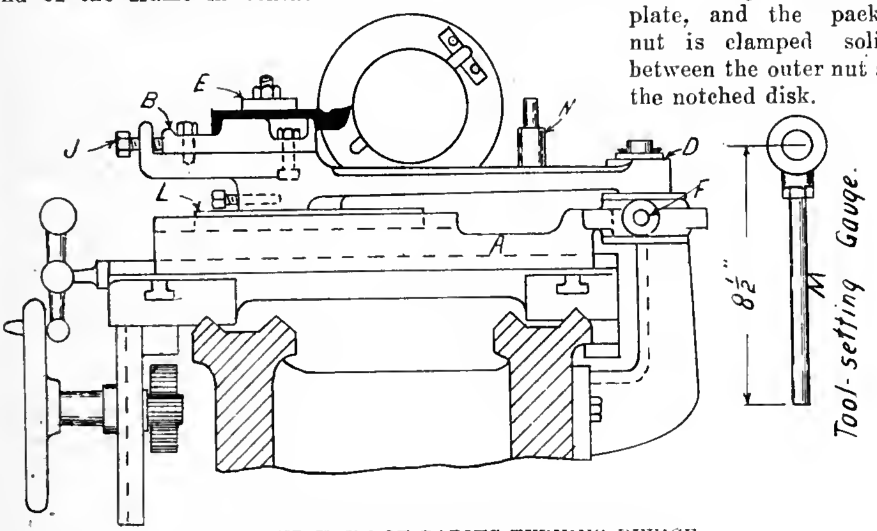

FIG. 3. END VIEW OF RADIUS TURNING DEVICE.

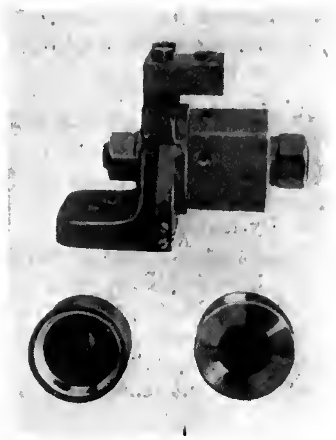
A feed stop K provides means for accurate duplication of diameter.

DRILLING PACKING NUT SPANNER HOLES

By A. E. G.

THE little jig shown has saved us a good many dollars. Before we made it we used to prick punch the holes approximately all around, and then hold the nut by hand on the small sizes, and on the larger ones we used a vise. The jig shown was made large enough to accommodate all the sizes we make. Two of the nuts are shown in the foreground and another in place in the jig. A shouldered disk next to the angle plate of the jig serves to locate the nut central over the holding stud around which it revolves. This shouldered disk is notched around the edge to correspond to the holes to be drilled. A spring latch engages these notches strongly enough to hold the disk and work securely in place while drilling, yet it is easily sprung out while indexing for the next hole. The stud itself is shouldered so as to turn easily in the angle plate, and the packing nut is clamped solidly between the outer nut and the notched disk.



DRILLING PACKING NUT SPANNER HOLES.

AN INEXPENSIVE LATHE GUARD

By D. S. Mann.

FOR a cheap and at the same time effective lathe guard, that shown in the photo has worked out very nicely, and all the lathes in one shop are thus equipped. The frame is constructed of 1 in. by 10 in. planed lumber, or narrower, for the smaller lathes. This is hinged to the floor at the bottom, the strap hinges being attached to the bottom cross bar. Heavy mesh screen is placed over the upper portion protecting the gears. To the middle cross bar is attached a ⅜ in. rod fitted with an eye at the upper end, and held in place by a staple. When the frame is pushed outward, this rod, of course, remains vertical and comes in contact with the floor, thus supporting the guard without the operator having to give the matter any attention. The guard is caught by the rod at an angle of about 45°, and there is thus no danger of the guard being tipped clear over and broken even if given a violent push. In order to better show the construction the guard in the photo has been pushed slightly outward.

INEXPENSIVE LATHE GUARD.

CONTROL EQUIPMENT FOR MACHINE TOOLS

THE increasing employment of the electrical drive in industrial establishments has brought with it special problems. In a majority of cases the workman who is in charge of a machine tool is not an electrician, and now that so many partially trained workmen are being employed on work previously carried out by skilled men, the need for simplifying the control equipment of machine tools has become more urgent.

One great advantage of driving machine tools by individual motors is that speed variation is made possible. It is essential, however, that the control gear should be of the simplest character or else the ordinary operator would be frequently in difficulties. Several equipments of this character have been developed by the British Thomson-Houston Co., London, England.

Four main types have been evolved a non-reversible form without dynamo-breaking, a similar control with dynamo breaking, a reversible control without dynamo breaking, and a similar control with dynamo breaking. One feature common to all these is the accelerating unit which is automatically devised to give full protection to the motor, and to ensure that the machine stops or starts in the shortest possible time.

Although the equipments are for constant speed machines they can be used for variable speed motors in conjunction with a field rheostat and relay. The system is designed for capacities in the case of reversible control up to 10 h.p. at a pressure of 550 volts. The non-reversible equipments are supplied in powers ranging from 15 to 25 h.p. at varying pressures. The controllers for the equipment are three-way drum controllers fitted with magnetic blow out coils.

Series of Practical Questions and Answers for Mechanics

Every care is being taken to include only pertinent practical questions, and give same direct, reliable answers. Catch questions will be avoided. Arithmetic, consisting of simple addition, subtraction, multiplication and division will be found a useful companion study.

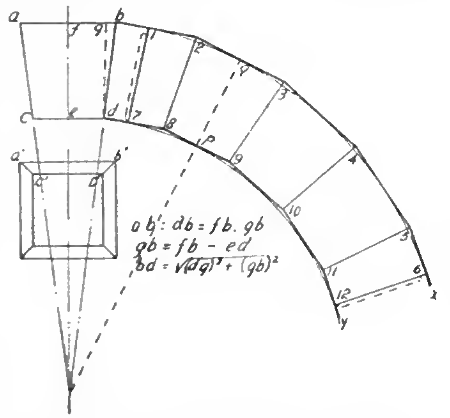
Question.—The ram of a large slotter with its parts weighs approximately 235 lbs. If the arms of the balancing lever are of equal length, what must be the diameter of the balance weight if its length is 18 inches?

Answer.—As the arms of the lever are of equal length, the weight of the balance will be equal to that of the ram, or 235 lbs. The volume of the weight will be $235 \div .26 = 903.846$ cubic inches, and the area of the cylinder end will be $903.846 \div 18 = 50.213$ sq. in.; therefore, the diameter will be $\sqrt{\frac{50.213}{.7854}} = \sqrt{63.93} = 7.995$, or approximately 8 inches.

• • •

Question.—We have a sheet metal tank to construct, the body of which is to be of one piece, and forming the frustum of a square pyramid. The dimensions are to be one foot high, one foot square at top and nine inches square at bottom, with the seam on the centre of one of the sides. What will be the shape of flat blank?

Answer.—To obtain the development of the blank by the graphical method, it is first necessary to have an elevation of the tank a, b, c, d. The intersection o



of the centre line e f and the slope line b d will be the centre of the arc from which the blank is obtained. To find this radius by calculation, we first extract the square root of the sum of the squares of g d and g b; or from the equations shown in the cut, we have $gb = fb - ed = 6 - 4.5 = 1.5$, then $bd = \sqrt{(dg^2 + gb^2)} = \sqrt{(12^2 + 1.5^2)} = \sqrt{146.25} = 12.09$. Therefore, from the proportion $ob : db = fb : gb$, we have $ob = \frac{db \times fb}{gb} = \frac{12.09 \times 6}{1.5} = 48.36$ inches. Now, with radius o b, describe the arc b x, and with radius o d, describe the arc d y. Draw the radial line o q, and from the points p and q draw lines tangent to the respective arcs. By laying off the distance a b around the outer arc and drawing the radial lines 2, 8 and 3, 9, etc., also the lines 1, 7 and 6, 12, the development of the blank is obtained. Allowance for seam (as shown by the dotted lines) should be made at each end of the blank.

• • •

Question.—We have a number of blocks to cup-out on the lathe, the cup to form the segment of a sphere; the chord of the segment or diameter of the cup to be 12 inches, and the depth $1\frac{1}{2}$ inches. What will be the radius with which to strike a gauge, and is there any method that can be employed to operate the tool, so as to develop the correct shape?

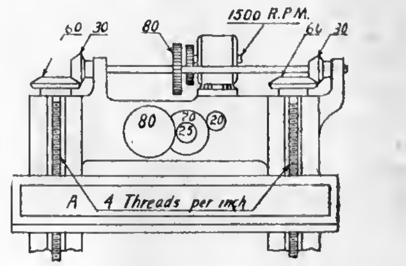
Answer.—The desired radius can be obtained by the formula in which the height of the segment is to half the chord, as half the chord is to the diameter minus the height of the segment, or $1.5 : 6 = 6 : (d - 1.5)$. Then $(d - 1.5) = \frac{6 \times 6}{1.5} = \frac{12}{.5} = 24$, and $d = 24 + 1.5 = 25.5$ inches. The radius will, therefore, be $25.5 \div 2 = 12.75$ inches.

To shape the bowl, a single-pointed tool will require to travel through an arc formed by a $12\frac{3}{4}$ inches radius. A simple, yet fairly accurate method to perform this operation is to make a deep centre punch mark in the tailstock and one in cross slide of the saddle; these should be in the same horizontal position and as close as possible to the centre of each when the cutting tool is in the centre of the work. To operate, have the compound rest set parallel to the lathe spindle for tool adjustment. Obtain a rod of about half-round iron, well pointed on the ends (to enter centre marks) and equal in length to the desired radius, and, with the tool set at the outer end of the arc, secure tailstock in position, so that the rod will enter both centre holes. Advance tool to the work with compound rest, and feed over the cross slide. The action of the radius rod will gradually advance the saddle (which is free to move), causing the tool to cut the desired arc.

• • •

Question.—With the motor running at 1,500 revolutions per minute, and the other dimensions as shown in the sketch, what time would it take to raise the cross bar A 3 feet?

Answer.—The speed of the driving shaft multiplied by the number of teeth in all the driving gears will equal the



speed of the elevating screws multiplied by the number of teeth in all the driven gears; or, taking x as the speed of the housing screws, we have $1{,}500 \times 20 \times 25 \times 30 = x \times 70 \times 80 \times 60$, or $x = \frac{1{,}500 \times 20 \times 25 \times 30}{70 \times 80 \times 60} = 67$ r.p.m. Therefore, the time required in raising A 3 feet would be $\frac{4 \times 12 \times 3}{67} = 2.15$ minutes.

• • •

Question.—What are the specific purposes of the shrapnel and high explosive shells as now being manufactured in Canada and elsewhere?

Answer.—The chief object of the shrapnel shell is that of human destruction, while that of the high explosive is the destruction of material. The action of the shrapnel shell is that of an aerial gun. When the shell is discharged from the field piece, the fuse is ignited by the action of suitable mechanism, and when the burning fuse reaches the powder at the base of the shell chamber, the charge is exploded. This explosion takes place behind a steel diaphragm, which acts as a piston in its movement towards the mouth of the shell, forcing the charge of small lead bullets and resin through the open end of the shell, in a similar manner to that of an ordinary shotgun. At the moment of shrapnel discharge the velocity of the bullets is increased over that of the shell about 600 to 800 feet per second. Adjustments for range are made so that the discharge takes place a short distance in front of the troops or trenches.

High explosive shells are usually discharged upon striking the desired object, and the construction is such that when the high explosive charge is ignited the shell is shattered into fragments, causing

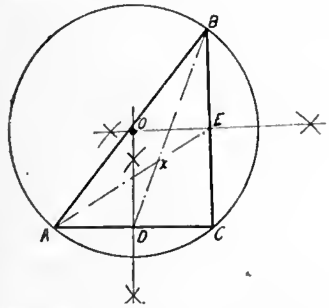
destruction to all material within a certain area.

* * *

Question—(a).—We have a large cast iron beam, several feet long and triangular in cross section, with sides of 14, 11 and 9 inches; where would we put a centre on the ends, so that the cutting tool would take an equal amount off each edge?

(b).—Where would this centre be placed so that the casting would be evenly balanced in any position?

Answer—(a)—This comes under the geometrical proposition of describing a circle about a triangle. The intersection



o of two perpendiculars erected from the middle points D and E of two of the sides will be the point equally distant from the three corners A, B and C.

(b)—Where the cross section is the same throughout the entire length, the point of suspension will be the centre of gravity of the triangular end. To find this point, draw lines from the apex of the angles to the middle point of the opposite sides. The intersection x will be the point desired.

* * *

Question.—In the series of questions and answers there arise many solutions involving the extraction of the square and cube root. Enlightenment is wanted for the method employed for finding these roots?

Answer.—To become familiar with the method of extracting the roots of numbers, it would be necessary for a beginner to obtain a treatise on this subject, as it is only by frequent practice that one can become thoroughly conversant with the processes. However, to illustrate the method generally adopted, we will first square a number and then reverse the process. To find the square of 213 we multiply it by itself, or $213 \times 213 = 45{,}369$. Now to extract the square root of 45,369, or by using the sign (called the radical sign) $\sqrt{45{,}369}$, we divide the number into divisions of two periods each, commencing from the unit or right-hand digit, thus: 4|53|69.

We then find the nearest number whose square is less than 4 and place it to the extreme right, as the first figure of the quotient, also to the left for a divisor, thus:

```
2   4|53|69   2
```

Now multiply the divisor by the quotient and place below the first period in the number and subtract, thus:

```
2   4|53|69   2
    4|
    —
```

Afterwards bring down the next two figures of the number, add the last figure of the quotient to the divisor, and multiply by 10 for a trial divisor, thus:

```
 2   4|53|69   2
 2   4
 —   ——
40   53
```

Divide the new dividend by the trial divisor, and add the result to the trial divisor to get the true divisor; then proceed as in common division, thus:

```
 2   4|53|69   21
 2   4
 —   ————
40   53
 1   41
 —   —
41   12
```

Add the last figure of the quotient to the last divisor and multiply by 10 for trial divisor, and bring down the next period of the number, thus:

```
  2
  2
  —
 40      4|53|69   21
  1      4
  —      ——
 41       53
  1       41
 ——      ——
420      1269
```

Proceed as before, trial divisor into new dividend, add to trial divisor for true divisor, and so on as before, thus:

```
  2
  2
  —
 40
  1      4|53|69   213
  —      4
 41      ——
  1       53
 ——       41
420      ——
  3      1269
 ——      1269
423      ——
```

The process is now complete, and the $\sqrt{45369}$ equals 213. This may seem a lengthy method, but when familiar with the principle, the time of solution is quite short. The method of extracting the cube root will appear in an early issue.

* * *

Question.—The accompanying sketch shows the layout of the rolls on a three-high, two-pass mill. If the stock, as it comes from the rolls D is of 1 inch diameter and is produced at the rate of 220 feet per minute, with a reduction in each case of approximately 25 per cent. in cross sectional area, what would the various roughing diameters of stock be, and the speed of the three sets of rolls, mean diameter of rolls being 14 inches?

Answer.—To deliver stock from the lower rolls D at the rate of 220 feet per minute, mean diameter of rolls being 14 inches, the speed of this set would be:

$$\frac{220 \times 12}{14 \times 3.1416} = 60.02, \text{ or approximately } 60$$

revolutions per minute. With a finished diameter of one inch, the volume of stock passing through the rolls would be

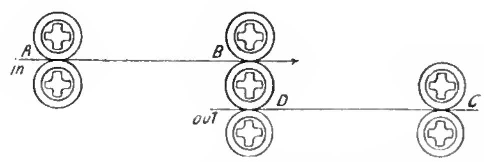
$.7854 \times 220 \times 12 = 2{,}021$ cubic inches.

Now, to avoid any undue pull or buckle between the two sets of rolls C and D, it will be necessary for the rolls C to revolve at a certain speed, so that the volume of stock delivered will be the same as that from the set D, or 2,021 cubic inches. As the reduction in each case is 25 per cent., the cross sectional area of stock between the set C and D will be

$$\frac{.7854 \times 100}{75} = 1.0472 \text{ sq. in.}$$

Length of stock delivered per minute $= 2021 \div 1.0472 = 1{,}929$ inches, or 160 feet per minute. Therefore, the speed of set C would be $1{,}929 \div 43.98 = 43.86$, or 44 revolutions per minute.

With a similar reduction the cross sectional area of stock coming from set B would be 1.396 sq. in., and the length of stock delivered per minute would be the



same as the finished material, as the three-high set is running in unison. Cross sectional area of stock as it comes from rolls $A = \frac{1.396 \times 100}{75} = 1.861$ sq. in.

Length of stock delivered per minute $= 2021 \div 1.861 = 1{,}086$ in. $= 90.5$ feet.

Speed of set $A = 1086 \div 43.98 = 24.6$ rev. per minute.

Cross sectional area of stock as it enters first set of rolls will be $\frac{1.861 \times 100}{75} = \frac{7.444}{3} = 2.481$ sq. in.

I am operating a steam plant but find it almost impossible to keep the boiler from foaming. The boiler feed water is drawn from a deep well bottomed on rock. The water is clear, little sediment or matter in suspension being apparent. The boiler is an old-fashioned affair. Suggestions as to preventing the foaming trouble are requested.—Service.

The "Fairbanks-Morse" 26-Inch H.D. Manufacturing Lathe

Staff Article

A machine capable of efficiently utilizing all of the power which an 8-inch belt will transmit, and possessing interesting features of design and construction calculated to extend its productive existence for an indefinite period, with a constant degree of accuracy, a minimum cost for upkeep and maintenance, and a relatively high ultimate value.

FOR the past eighteen months the machine tool builders of Canada and the United States have been subjected to a demand for their product which has never before been equalled in the history of either country either as regards urgency of delivery, or quality required. During the past year, developments in domestic trade of the States have added largely to this demand, throwing delivery dates so far back that firms in other engineering lines have found it desirable to engage in the production of certain machine tools the demand for which still largely exceeds the supply. Amidst the plethora of single purpose machines for shell work, and manufacturing lathes for general requirements, a few outstanding examples of skillful design and thorough workmanship have shone forth, particularly in the production of heavy duty lathes possessing sufficient power and rigidity to utilize high speed steels to their limit, and accurate enough to produce work within required limits.

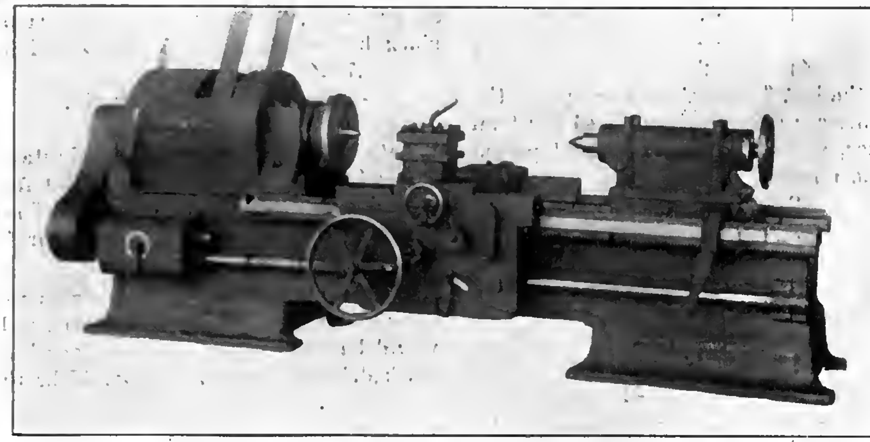


FIG. 1. 26-IN. HEAVY DUTY MANUFACTURING LATHE EQUIPPED FOR PLAIN AND SPECIAL TURNING OPERATIONS.

Requirements and Capacity

One of the more recent entrants into this field is the Canadian Fairbanks-Morse Co., Ltd., who for some time have been producing a 26 in. lathe which, while primarily adapted to special purpose requirements, is eminently suited for general production work requiring power and precision. This latter feature has been kept strongly in view throughout the entire design so that, however well the machine may be suited to the special requirements of immediate customers, its value at a later date will be enhanced by the features referred to. Through the courtesy of the Company we are able to place before our readers particulars regarding the design and construction of this machine.

The capacity of the lathe is 26 in. swing over shears, 18 in. swing over carriage, with a length of 5 ft. between centres on a 12 ft. bed. Weight approximately is 15,000 lbs., while floor space required is 13 ft. x 4 ft. 6 in.

Headstock and Countershaft

Headstock is of the single pulley type with two back gear sets which, along with the open spindle drive, give three self-contained speeds. The countershaft is provided with two friction drive pulleys which render available a total of six spindle speeds. These pulleys take a 9 in. belt and have a special driving flange provided for engaging with the expanding metal driving band. The anchor bracket which carries the expanding gear is keyed to the shaft, and has a sleeve extension which forms a bearing for the pulley, thus avoiding that excessive wear of the shaft which almost invariably happens when loose pulleys are run on the bare shafts.

Compression grease cups insure ample lubrication for the loose pulleys. The cups being mounted on the anchor brackets so that they can be tightened up at any time when the countershaft is at rest. Where the cups are fitted to the pulleys, they can only be tightened when the line shaft is stopped at meal hours, or else the belt must be thrown off. Much can be said in favor of the arrangement adopted, not the least being the increased safety for the workman, and the ability to supply extra lubricant immediately any trouble arises.

The headstock driving pulley takes an 8 in. width of belt, and has a diameter of 20 in. Fig. 3 shows the principal details of the headstock from which it will be seen that the pulley is mounted on a bronze sleeve carried by the spindle. Two integral pinions having 40 teeth and 33 teeth, are formed on this sleeve and when meshing with their corresponding back gears, provide intermediate and low speeds having approximate spindle ratios of 8 to 1 and 11 to 1 respectively. The intermediate speed back gear is carried on the extended boss of the low speed sliding back gear, which is feathered to the quill and has a groove on its opposite side engaging with a lever on the end of the speed change shaft. The quill gear is cut from the solid, the quill itself being bronze bushed at both ends, while the eccentric shaft on which it revolves is operated by a hand lever with spring plunger for accurately locating the gears when in mesh.

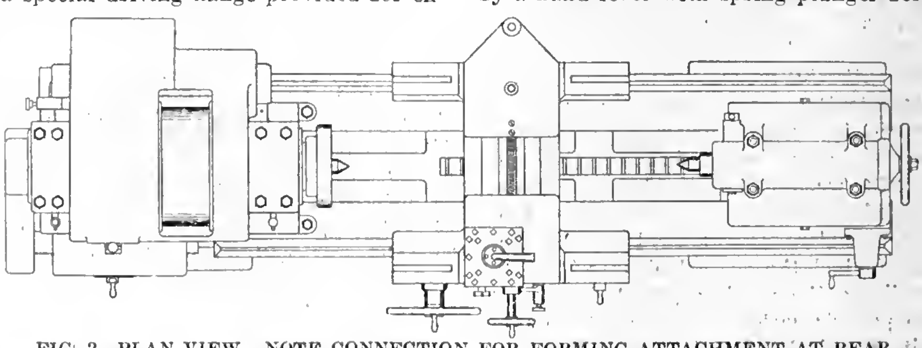

FIG. 2. PLAN VIEW. NOTE CONNECTION FOR FORMING ATTACHMENT AT REAR OF CROSS SLIDE.

The spindle is of exceptionally liberal proportions, the diameter of the front bearing, 8 in., being almost 1-3 of the

maximum swing. This bearing is 10 in. in length and is provided with two oil rings and a well of large capacity. The rear bearing is 6 in. diameter x 8 in. long with one oil ring. Both bearings have check grooves which prevent the oil from creeping along the spindle. The drive to the spindle is through a 67-tooth 3-pitch gear having 4½ in. width of face. When running with direct drive this gear is locked to the pulley with a 1 and 17-16 in. pin which engages with a driving ring mounted in the side of the pulley. By this arrangement the power is transmitted directly from the belt to the spindle without subjecting the pulley or sleeve to stresses such as are liable to occur through the operation of clutches and similar mechanism. The intermediate and low speed gears are 4-pitch x 4 in. face, of forged steel. A thrust bearing of steel and bronze plates is provided at the near bearing, while a is provided at the rear bearing, while a No. 6 Morse taper centre with adapter being fitted.

Feed Changes

Four changes of feed are provided, these being obtained through four pairs of gears as shown in Fig. 4 .

The upper or drive shaft carries four fixed gears, and is driven from the spindle by spur gears mounted on a quadrant of conventional design. The lower or feed shaft derives its motion from the drive shaft through a double sliding gear provided with clutch teeth on each end. Two of the four feeds are obtained by meshing either of the sliding gears with its mate, while the other two feeds are obtained by engaging either clutch with the end gears on the feed shaft, these gears being free on the shaft and constantly in mesh with the end gears on the drive shaft. The sliding gear is operated by a rack and pinion as shown, neutral positions for the hand lever being provided between each feed.

Feeds regularly fitted are 1-32, 1-16, 3-32, and 1-8 in., any desired maximum up to ⅜ in. being obtained through changing the gears on the quadrant.

Carriage

The carriage has generous proportions in keeping with the remainder of the lathe, having a width of 16 in. over the bridge and 40 in. length of bearing on the vees. It is scraped to a bearing over the full width of the shears. A double gib-plate under the bridge, in addition to the regular plate under the back vee enables back cutting tools to be used to advantage. The cross slide screw is specially arranged to permit of rapidly altering its action when doing contour work. The back end of the screw is supported by and secured to a bearing attached to a movable plate gibbed to the cross slide, the plate being positively located by a stop pin when using the cross slide in the ordinary way. When used for forming contours such as shell noses, etc., the stop pin is withdrawn and the portion of the plate which projects over the back of the lathe is connected up with the copy bar by means of a roller and pin.

Power feed through a friction drive is provided for the cross slide block which carries a four-sided revolving turret tool post. This post is shown clearly in the photograph, Fig. 1, and also the arrangement of handwheels and levers on the apron. The tool post will accommodate tools up to 2 in. x 1 in.

Carriage Feed Gear

The feed gear drive is through a 1 11-16 in. shaft, with reverse gear in the apron, see Fig. 5. The bevel pinions are free to revolve on feed shaft and are constantly in mesh with the large level gear. Each pinion is formed on the outer end of a separate sleeve, the inner ends of these sleeves having flanges which fit between the bearings as shown and prevent end play of the pinions. Clutch teeth on the end of pinions engage with sliding clutches on the feed shaft. These are operated by forks carried on two rods, the lower one being operated by the lever in front of the apron.

Feed stops are provided in either direction, the clutch knock out being actuated by an adjustable collar on the feed shaft, between which and the clutch frame is placed a suitable length of tubing to keep the collar in view at the end of the apron. Provision is made for installing a split nut for use with a splined lead screw. The lower rod of the clutch frame is utilized for interlocking with the nut to prevent simultaneous engagement. The apron is of the double type, providing a support at each end of the various gear shafts, including the rack pinion. The carriage is clamped in position by a lever on the front of the carriage operating by means of a cam. The cross feed screw if fitted with a graduated hub, and large handwheel 20 in dia., is provided for carriage traverse.

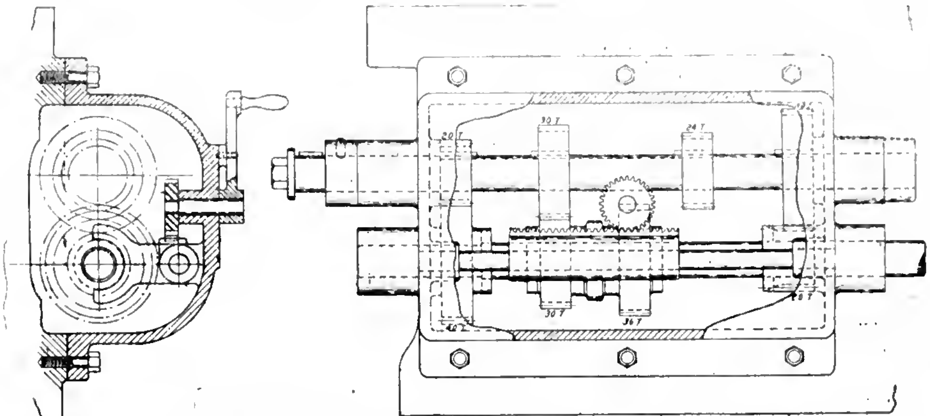

FIG. 4. FEED CHANGE GEAR BOX SHOWING SLIDING GEARS ON FEED SHAFT.

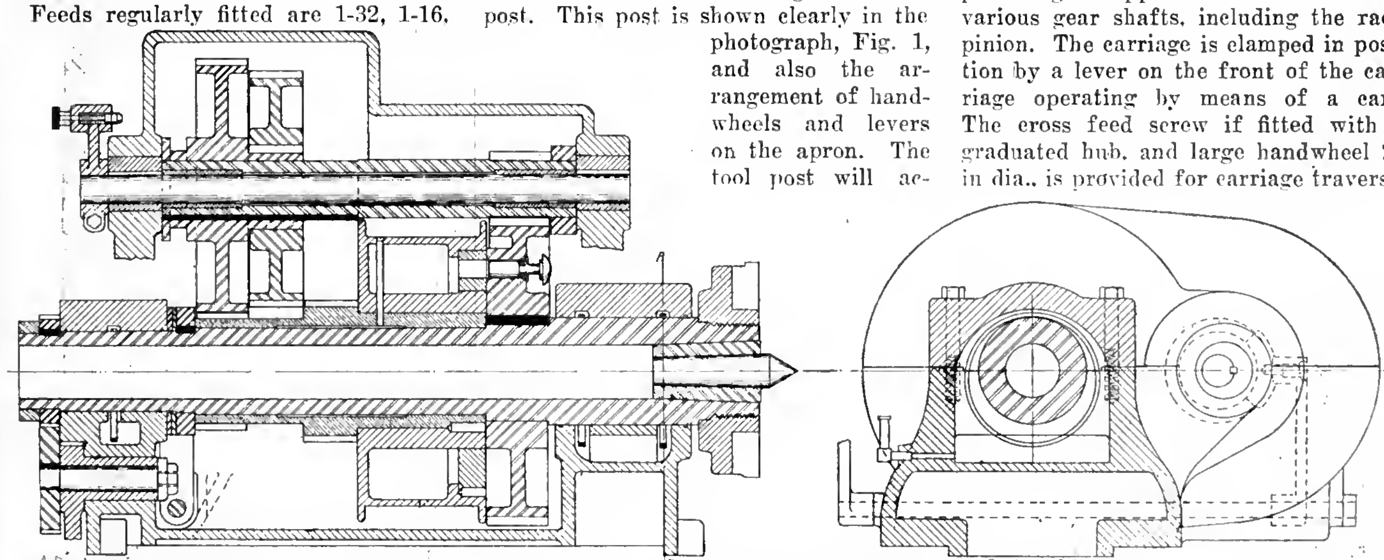

FIG. 3. SECTIONAL ELEVATION AND END VIEW OF HEADSTOCK WITH ELEVATED PLAN OF BACK GEARS.

Tailstock

The tailstock spindle has a diameter of 4 in. with a total length of 25 in., the useful travel for operating purposes being about 14 in., and a No. 6 Morse taper centre being fitted. A renewable bronze nut is provided for the screw to operate in, the latter being 1 1-16 in. diameter x 4 threads per inch. The tailstock casting is tongued to the base for offsetting in taper work and is clamped in position by four 1⅛ in. bolts, located close to the ends. Additional security is obtained by the hinged sprag engaging with the rack cast on the bed girder. The clamping arrangement for the spindle employs two cylindrical wedge blocks drawn together by the screw shown in Fig. 6, thus avoiding splitting the end of the casting as done in many cases. A 12 in. lever on the screw shaft enables this clamp to hold against any pressure likely to occur in use. Rack and pinion traverse is provided for moving tailstock.

The lathe bed is of excellent proportions being 31 in. wide over the vees, and 20 in. deep. Three box section cross girths along with the longitudinal girder stay referred to, provide stiffness calculated to insure a maximum degree of accuracy.

Particular attention has been given to lubricating facilities. The bronze sleeve on spindle is chambered out to form an oil reservoir which is replenished through a tube in the belt pulley as shown in headstock drawing. All change gear studs have drilled passages for conveying oil to the required places. A similar arrangement is applied to the back gear quill, oilers, sight feed lubricators, etc., being applied wherever they are best fitted to insure continuous operation and minimum depreciation.

BRASS FINISHING

AT a recent meeting of the North-Western Section (England) of the Junior Institution of Engineers an informal discussion on "Brass Finishing" took place. Steam engine, boiler and ship work fittings were dealt with, the chief advantages enjoyed by a firm possessing its own foundry being defined as follows:

The mixings, pouring temperatures and pouring "heads" may be carefully controlled with a view to the obtaining of high tensile strength, fine-grain metal which may be machined to a good finish and toughness (10 p.c. elongation being the Admiralty minimum, but 20 p.c. often being obtained in practice). During the mixing, it was stated, the following facts should be borne in mind:

Excess of copper results in hardness, tin gives tensile strength, lead cheapens and softens, and other metals or substances other than zinc or arsenic result in risk of porosity and blowholes.

The author described light direct (not back-geared) driven lathes and capstan lathes as the brassfinisher's most useful tools; the most essential point, where good tooled accurate finishes are necessary being extreme rigidity of all parts of the machines. Bearing shells were exhibited, these being finished to plus or minus 0.0005 inches in such a way that any two halves would pair.

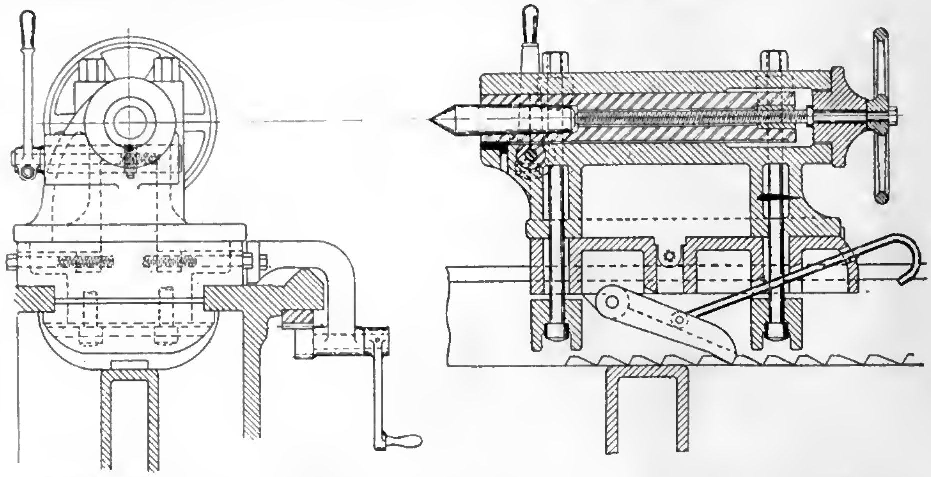

FIG. 6. FOUR BOLT TAILSTOCK WITH SPRAG AND HAND TRAVERSING GEAR.

Montreal Harbour Development. — Under a Federal Act passed some time ago, the Harbor Commission of Montreal are entitled to loans from time to time from the Government to defray the cost of increased facilities for handling the growing trade of the port. The Government recently authorized a small advance to provide for the continuance of the work under the statute. An Act passed in 1914 authorized the making of advances up to a total of nine millions, which was stated at that time to be sufficient to meet the requirements of the port till 1918. Only a part of the total has been advanced. Previous legislation in 1910 and 1912 had provided for advances up to $12,000,000.

PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

MECHANICAL BELT SHIFTING DEVICE

LATHE users are becoming more and more alive to the necessity of using tool steels at the highest speed suitable for the work being done, and the frequent shifting of belts involved has created a considerable demand for belt shifting appliances which operate quickly and safely.

The Diamond Speed Shifter shown in accompanying illustration will move a belt from any one step to any other in a few seconds by means of the two levers which the workman is shown operating. In operating this device for increasing the speed, the right hand lever is moved to the left thus slipping the belt on to a smaller step of the cone, after which the left hand rod is revolved so that the fork at its upper end swings round and causes the belt to mount up the steps of the cone till it reaches the speed desired. In reducing speed, the operations are performed in reverse order.

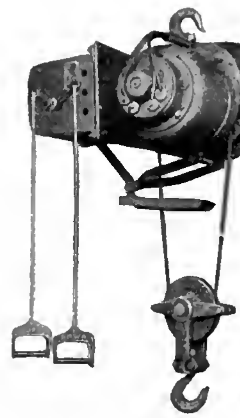
The action is positive and eliminates the use of a pole with its frequent delays, and troublesome effort. The operator does not touch the belt with his hands, consequently the possibility of accident is removed. The capacity of the machine is largely increased as the ease of changing persuades the operator to vary his speed as required with greater frequency than when using the pole.

The Dearborn Steel & Iron Co., Chicago, are distributors of this device which can be quickly and easily attached to any existing lathe, and is accepted in lieu of guards by many state factory inspectors.

MECHANICAL BELT SHIFTING DEVICE

PORTABLE ELECTRIC HOIST

THE accompanying illustration shows a portable electric hoist designed for use in locations where it can be suspended by a single hook, or when required can be attached to an overhead trolley or crane and moved from place to place.



PORTABLE ELECTRIC HOIST.

Owing to the limits imposed on such machines by the requirements of portability and compactness, the makers have used straight standard cut spur gears throughout. These gears are forged steel, heat treated, and completely enclosed, permitting ample lubrication during operations. An enclosed mechanical disc brake and a motor brake are used on all sizes. An automatic limit device stops the hook at top of lift.

The Northern Crane Works, Ltd., Walkerville, Ont., supply these hoists in a variety of types for use with either alternating or direct current.

NEW TYPE WORM GEARING

TO obtain a more perfect contact between the thread of the worm and the teeth of the worm wheel and increased load carrying capacity between the two gears, Percy Brown, of Park Gear Works, Huddersfield, in conjunction with F. J. Bostock, has designed and patented the arrangement shown in Figs. 1-3, the former being an elevation of the worm; Fig. 2 a similar elevation of the worm partly in section and of a fragment of a worm wheel in mesh therewith, the worm wheel being in section taken midway across the width of the teeth; and Fig. 3 an end elevation of the worm.

The invention consists in providing the thread of the worm with a surface every part of which contains a straight line passing from the root to the crest thereof and forming an oblique tangent to a cylinder along a helical line of contact at a constant angle, as indicated on each side of the worm thread by the dotted lines A and B in Figs. 1 and 3. The cylinder may be that of the worm at the base of the thread or may be of smaller or larger diameter. The teeth of the worm wheel C at a point midway across the width of the teeth are in cross-section formed with substantially straight side or surfaces D at the desired angles, as shown at Fig. 2. The thread of the worm shaped as above set forth admits of a more perfect contact being obtained between the thread of the worm and the teeth of the worm wheel, because when such a tooth shape is in working contact with a wheel whose tooth sides are substantially straight in medial section, these two shapes very closely approximate each other; hence when a load is applied, the elasticity of the metal provides for a contact of greater area than is ordinarily obtainable, and consequently gives an increased load carrying capacity between the two gears.

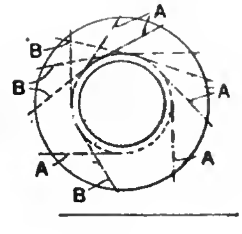

FIG. 3.

OUTPUT OF MUNITIONS IN FRANCE

THE British Ministry of Munitions recently issued as a White Paper the report of the Commission appointed by the Director-General of Recruiting for Munition Works on the output of munitions in France. The members of this mission were:—J. T. Brownlee, chairman of the Amalgamated Society of Engineers, and member of the National Advisory Committee and Central Munitions Labor Supply Committee; two members of the Ministry of Munitions, Alexander Duckham and D. J. Shackleton (Labor Adviser), also Allan M. Smith, Secretary of the Engineering Employers' Federation and Member of the Central Munitions Labor Supply Committee. Attached to the mission were two engineers of wide experience in the manufacture of war munitions.

The object of the mission, which had the hearty approval of M. Albert Thomas, the French Minister of Munitions, was to visit the industrial districts of France and report on the causes which have contributed to the enormous increase which has taken place in the production of munitions in that country, notwithstanding that one-eighth of the country and five-eighths of the former metallurgical productivity are in the hands of the enemy. The general conclusions at which the mission have arrived are: — The people of France realize that they are at war. The one idea in the mind of all is to bring the war to a successful issue. The spirit which dominates the nation has prevented difficulties arising in the manufacture of war material. Loss of time is practically negligible. No trade union restrictions exist at the moment. Everything is done to increase production. No limitation of profits exists, and no question in this respect has been raised by the workpeople. The manner in which the employers of France have been able to acquire machinery and the initiative and energy displayed by them are beyond all praise.

No factories have been subsidized by the Government, nor have loans of any kind been made to the owners. The owners have, at competitive prices, taken orders from the Government, and on the strength of these orders have purchased land, built factories, procured machinery and now depend on the contract prices for re-imbursement of their outlay and for gaining the profit to which they are entitled. Remarkable success has attended the efforts of a number of employers who have abandoned their normal manufacture and adapted their machinery for the output of munitions.

A feature of the French system is the fostering of the small producer for machine operations.. Of these there are about 1,800 in the Paris district. The work let on sub-contract is paid for at the price the main contractor receives from the Government, and no profit is made by the main contractor out of the work sub-contracted. Many small shops are manned by various members of a family and work day and night shifts.

Practically all the factories run night shift as well as day shift. In some cases the hours are divided into three shifts. Those on the two-shift system have one break in the day. The usual starting times are 6 a.m. to 7 a.m. A break of one to two hours (averaging one and a-half hours) takes place at noon, and the day shift continues until 6 or 7 p.m. The long break in the middle of the day enables the women to look after the meals and comfort of their children at home and is highly valued on this account. On night shift usually 10 hours are worked, one hour is generally allowed for a meal, but this is usually taken at the machines, and where the period is half an hour it is paid for, and in few cases is the machinery stopped.

In most cases the shifts change over every fortnight, and on the change the workpeople get 24 hours off. No difference is made in the case of Saturdays, the same hours being worked as on other week days. In some cases no work is done on Sundays after noon. This gives an additional time for carrying out necessary repairs, etc. In the form of an appendix the report gives a statement showing the number of hours worked per week in munition factories in France as follows:—

Two-Shift System

Day shift. — Morning start varies from 6 a.m. to 7 a.m., mean 6.30 a.m.; morning period, 4½ hours to 5½ hours, mean, 5 hours 6 minutes; mid-day break, 1 hour to 2 hours, mean, 1 hour 30 minutes; afternoon period, 4½ hours to 7 hours, mean, 5 hours 30 minutes; stopping time, 6 p.m. to 8 p.m., mean, 6.45 p.m.; number of hours worked per day, 10 hours to 12 hours, mean, 10 hours 45 minutes.

Night shift:—Starting time, 6 p.m. to 8 p.m., mean, 7.10 p.m.; supper time, usually 1 hour, about midnight; stopping time, 5 a.m. to 7 a.m., mean, 6.15 a.m.; number of hours worked per night, 9½ hours to 11 hours, mean, 10 hours 10 minutes.

Three shift system.—4 a.m. to 12 noon, or 6 a.m. to 2 p.m.; 1 p.m. to 9 p.m., or 2 p.m. to 10 p.m.; 8.45 p.m. to 4.15 a.m., or 10 p.m. to 6 a.m.

Two shifts.—Shifts change over each per fortnight with 24 hours off.

Three shifts.—In some cases the shifts do not change over; in others they change each fortnight, with 24 hours off. There are no breaks for meals on the three-shift system, but in some cases light refreshment is taken whilst work proceeds.

We commend the above details to employers of labor on munition work; there is much in the report of value and interest.*

WOMEN OPERATORS MACHINING SMALL SHELLS IN ONE OF BRITAIN'S NEW PROJECTILE-MAKING PLANTS.

*Note.—Copies of the Report of the Mission will be sent post free on receipt of stamps to the value of 10 cents.

Scrap silver should be carefully sorted before undergoing the process of remelting and, if possible, all foreign substances should be removed. It may, if preferred, be melted into a separate bar, or otherwise used as an addition to a new mixture. As a flux for brittle and troublesome alloys, one authority states that a flux of charcoal with a small proportion of borax is extremely useful.

18-PDR. H.E. SHELL OUTPUT IN AUSTRALIA

SOME interesting information has just come to hand relative to shell manufacture in our sister colony, Australia. Much prominence has been given to her shell output achievement—a prominence no less than that of presentation of the data connected therewith before several sittings of Canada's Federal House of Commons at Ottawa, and so staged as to reflect somewhat unfavorably on the shell production of our own metal-working plants. Distance may have lent enchantment to the view of Australia's sponsors on Parliament Hill; on the other hand it has undoubtedly provided opportunity for much exaggeration and much wild imagining, to express ourselves mildly.

Broadly speaking, and by virtue of our intimacy with shell manufacture in Canada since its inception, we are perhaps more familiar than most with what has been actually achieved by our metal-working plants. In addition, it is on record that the editorial columns of this journal furnished the first reliable data on the manufacture of high explosive shells to Australia. One of our special Shell Numbers—July 1, 1915, was reprinted in booklet form in toto, together with the accompanying illustrations, by the Australian Commonwealth Munitions Committee, Melbourne, for the information of Australian manufacturers of munitions. Sufficient evidence is therefore at hand to show that the odious comparison set up and sought to be drawn between the two Colonies was ill-conceived.

Shell manufacture in Canada has not by any means progressed by leaps and bounds, neither have its many activities been characterized by smoothness of operation. The desired end has not in every instance been satisfactorily attained. Taking it all-in-all, however, and even at its lowest value—"blundering through" if you will, our record is no mean one, and perhaps may look even less mean when the following statement from our Australian contemporary—"Australasian Engineering and Machinery" has been read and digested:

"The situation regarding shell manufacture in Australia is far from satisfactory. It is no fault of those who undertook to make the cases that their efforts have resulted in a pile of provisional rejects, with deliveries practically nil.

"A great fuss was made at the beginning, and for that matter is still being made, about what the Federal Government was going to do. We are repeatedly assured that all is going on favorably, a piece of bluff that ought to be dropped. It is time that departmental tardiness and blundering in this matter received an exposure. The latest ridiculous decision is to increase the diameter of the bar with the strange notion that the extra metal will eliminate microscopic flaws, due to faults in manufacture. The price of the shells has been fixed and contracts taken on the original diameter. Who is going to recoup the manufacturers for the extra work involved in removing this superfluous stock?

"The irony of it all lies in the praise of Australia's handling of the shell business by a member of the Canadian Parliament, who was out to criticize his own country's efforts, and of the Commonwealth Minister for Defence complacently quoting this uninformed comparison in reply to his critics. All who know anything of the facts—and Senator Pearce should be among them—know that in the production of munitions Canada has shown a promptitude and a power of organization which leaves every other British community hopelessly behind. From her hastily-adapted shops she landed satisfactorily shell cases in Great Britain even before the private factories of that country got going on munitions, and by now she has delivered them to the tune of many thousands of pounds. The Toronto correspondent of a daily paper sums up the position thus:—'Shell orders which have been filled or which are being filled in Canada, have reached the tremendous total of $500,000,000. More than 300 manufacturing firms are engaged upon the work in one way or another. These firms have installed $30,000,000 worth of special machinery, and employ 100,000 skilled workers.'

"Not a single shell has yet gone from Australia. These newspaper complaints are useless. The shell contractors should discuss the difficulties among themselves and make united representations to the Minister and the War Committee."

OUTPUT OF MUNITIONS IN FRANCE

ATTENTION is directed to an article under the above title appearing on the opposite page covering the output of war material in France. Out of the mass of detail given, the first impression to be formed is that of the terrible earnestness of the French nation in this war struggle, and as a result, the refutation of the often expressed belief that our Ally will waver in her determination and seek a separate peace. In spite of the fact that one-eighth of the country and five-eighths of its former metallurgical productivity are in the hands of the enemy, the production of munitions has increased enormously and continues to develop in that direction.

Through the medium of a British Mission of Investigation, the information has become available, and while it is possible that as regards spectacular achievement, the sons of France in the trenches may, while the war lasts, claim pride of place, in the final balance, her sons and daughters at work in her factories may just tilt the scale.

Copies of the Report will, we understand, be sent post free by the British Ministry of Munitions, London, England, on receipt of 10 cents in English currency.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents

Montreal, Que., March 14, 1916.—Abnormal conditions continue to prevail throughout all branches of the steel and metal-working industries. Present indications point to still higher levels being attained by the present upward movement. Domestic construction does not seem likely to be proceeded with to any great extent this year unless circumstances warrant. Several plants are changing over to larger sizes of shells on completing their 18-pdr. contracts, additional area being necessary in some cases. The ocean freight situation remains unchanged, the cost of material and scarcity of suitable labor making remote any prospect of relief from new construction in this country.

Pig Iron

The pig iron situation is unchanged and quotations are firm, with a possibility of an advance in the near future. The demand for steel making pig continues, and production is being taxed to the utmost to meet requirements. A sharp advance is noted in ferromanganese, the price having advanced $100 on prompt and $25 on contract order.

Steel

No recent developments have transpired to change the general conditions. The unceasing demand for steel continues to advance prices in many lines. The shipping problem has been somewhat relieved recently by the raising of embargoes. Local dealers report no change in quotations, but intimate that further advances of American markets will likely effect prices here. Bessemer billets are quoted at $40, an advance of $2 per ton. Open-hearth billets and sheet bars are quoted at $44, an advance of $4 a ton; these prices are f.o.b., makers' mill, Pittsburg.

Forging billets, Pittsburg, show an increase of $5 a ton, and are quoted on the New York market at $65 a ton. Iron bars, Chicago, have been advanced $3 a ton, and Pittsburg steel bars are higher by $5 a ton. Steel mills are so heavily sold that early requirements can only be taken on at very high prices. Even at the advancing prices orders are flowing in for future delivery. The market in sheets is taking on strength, and prices are again going up. The demand for blue annealed sheets is increasing, and to some extent the output of black sheets is being curtailed. The automobile requirements are also crowding the sheet mills, and producers have been forced to add an average of $3 a ton to sheet prices. Chicago quotations on black sheets are $3.39; blue annealed, Pittsburg, $3.00. The weakness of spelter, with the light demand for galvanized sheets, has considerably relieved the price on galvanized sheets, which are lower by $2 a ton. Terne plate, I.C., Pittsburg, shows a decline of $5 a ton, present quotation being $3.75 per hundred. Considerable business is reported in fabricated steel.

Metals

Several changes have developed in the metal situation during the past week, but it is not thought that conditions will be materially affected, as nothing has transpire to indicate any great change in either direction. The American copper market shows slight signs of relaxation, but this is apparently due to the fact that many of the large consumers have covered their requirements for several months in advance. For a certain period dullness may prevail, but with the producers being in a position where they are required to deliver their entire output, it is unlikely that a supply of stock material can be accumulated, and this will prevent any noticeable decline from the present high prices. The shortage of nearby tin has developed a strong market, and the tendency is for higher prices. Spelter is dull, but showing signs of improvement. Lead is erratic and taking on strength, forcing prices up. The raising of embargoes on some of the Eastern roads will somewhat relieve the situation by permitting shipments of metals from points of production to destination.

Copper.—The advance recently quoted on the London market of £5 per ton has had no strengthening effect upon the local or New York situation; in fact, the condition prevailing at present is somewhat easier, with an appreciable drop in current prices on the New York market; lake showing a falling off of .375 cents and electrolytic .625 cents per pound. The recent action of the British Government in prohibiting the transactions in future delivery of war metals—which

had the effect of closing the London Metal Exchange from March 1 to 4—has not resulted in any noticeable development. Certain new regulations are believed to involve a maximum price, but, despite this ruling, the quotation on electrolytic continues to remain at £136. It is the opinion of the trade that Britain will be forced to pay the price that the war conditions will impose on all purchasers of copper. Local conditions remain unchanged with prices firm, but dealers report that further declines on the American markets would ultimately weaken the market here, and tend to lower prices. Lake and electrolytic are steady at 31 cents, and castings unchanged at 30 cents per pound.

Tin.—The market is considerably excited over the apparent shortage of available tin, and unless the market is advised of considerable shipment en route from London, the outlook for the remainder of the month may develop into a serious situation. The British Government is continuing very firm in its regulations regarding shipping permits of tin, either from London or the Straits Settlements, and buyers are becoming very anxious. The temptation to resell metal is very strong, but consumers are holding firm to their agreement not to dispose of any of their supply after it has been released to them through the British Consul. Any confirmation of consumers profiting through this method would prevent them securing further supply, and it is believed that no case has yet been recorded of a resale since the order was first established. Purchases are recorded for last quarter delivery 41 and 42 cents New York. The local market is very strong, and dealers report good business, but available supply appears short. This week's quotation, 50 cents, shows an advance of 2 cents per pound.

Spelter.—The situation in spelter here remains unchanged. The New York market shows a decline of 1½ cents ,and the London cables report a drop of £8 per ton. The demand for spelter, however, continues to improve, and it is possible that the market will assume a firmer tone within a short time. Montreal dealers are holding firm, and quotations are unchanged at 23 cents per pound.

Lead.—The market is very strong and prices continue to advance. Trust prices have advanced 20 cents per hundred, while outside quotations show an increase of ½c per pound. Foreign advances have had the effect of strengthening the market here, and dealers have advanced their quotation to 8¾ cents, being a rise of ½ cent per pound.

Antimony.—No change is reported in the situation, and dealers are asking last week's price, 48 cents per pound.

Aluminum.—The market is unchanged, and quotations are firm at 68 cents.

Machine Tools and Supplies

The market for machine tools continues fairly active, the principal business being in the changing of equipment necessitated by the falling off of the smaller shell requirements. In some instances almost the entire equipment is being replaced by heavier tools in order to successfully handle the larger shells. The domestic demand is improving, but the greater percentage of present business can be traced, directly or indirectly, to the abnormal conditions of the war situation. The demand for all kinds of supplies continues, and in many cases the inability to obtain sufficient material and small tool supplies results in serious delay in production. The steady advance in prices of all grades of steel has materially affected many accessories of machine tools, and prices of drills, taps, reamers, cutters, etc., have been constantly advancing.

CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.

Old Materials

Dealers report considerable activity in many lines of scrap. Heavy melting steel is in good demand, with prices firm. All old steel is moving readily, and prices have advanced on rails and shafting 1 cent and 2 cents respectively, and are now selling at 14 cents a pound for old rails and 17 cents for old shafting. No. 1 composition turnings are now 14½ cents, and new brass clippings are bringing 15½ cents a pound, being an increase of 1 cent a pound. Old lead is up ½ cent, heavy quoted at 6½ cents and tea lead 5½ cents a pound. All coppers are in good demand, and prices are very firm.

Toronto, Ont., March 14.—The steady advance in prices of raw materials has been for some time, and will continue to be a matter of vital importance to manufacturers. The difficulty in obtaining raw materials is causing considerable anxiety and threatens to curtail production, not so much for war supplies as for goods for domestic consumption. The difficulty of obtaining iron and steel except on late deliveries is the principal cause, and the situation is becoming more acute as time passes. Shortage of tonnage and high freight rates is also increasing the cost of some materials and causing considerable delay to shipments. Cost of production is going up, and consequently all prices have an upward tendency. There are not many price changes to announce this week, but the market is very firm and indications point to higher levels for many products in the near future. The changes include higher prices for wrought iron and galvanized pipe, wood screws, wrought iron nipples, "Trimo" tools, gasoline, benzine, tin and lead.

Industrial conditions continue to steadily improve, and a large number of manufacturing and industrial plants are engaged in making ammunition and other war supples. The prevailing prosperity in the country is due largely to war orders, although domestic business is showing signs of a revival. The Dominion revenues continue to increase, which is a very satisfactory feature. The total revenue for the last eleven months of the fiscal year was over 134 million dollars, being an increase of 34 millions over the corresponding period of the last fiscal year.

Steel Market

The mills continue to receive orders for steel in large volume and deliveries are getting more behind than ever. The situation is becoming serious, as the steel companies anticipate some difficulty in filling orders for all the steel required for munition purposes. An enormous quantity of shells will be turned out this year, which will require a large tonnage of steel. In addition to this, there is a very large and profitable export business to take care of. The Canadian Steel Foundries have resumed operations at their Welland plant with their 12 in. rolling mill, and the 22-in. mill will be running very shortly.

The market continues very strong, and quotations have an upward tendency. Makers of wrought iron pipe have again raised their prices on both black and galvanized. Black pipe has advanced two points and galvanized three points. Boiler tubes are unchanged, but the mills report a heavy demand for locomotive and merchant tubes. Prices of shafting have advanced $5 a ton in the States, but are unchanged locally. The new demand for shafting is reported to be heavy, and none of the makers has any to sell for delivery inside of six or eight months. Boiler and tank plates are unchanged, but higher prices are anticipated. A sharp advance of 25c in wire nails took place during the week. Wire nails are now quoted at $3.50 per keg base, with cut nails unchanged at $3.20 per keg base. Smooth steel wire advanced 15c, and is now quoted at $3.60 base per 100 pounds, No. 0 to 9 gauge.

Prices of iron and steel bars are very firm at $2.75 per 100 lbs. base.

The sheet market has strengthened in the past few days, and quotations are firm, but unchanged. The sheet mills in the States have advanced prices, which will in due course affect the local market. The galvanized sheet market is strong and prices unchanged. The weakness in spelter has affected the sheet market, and makers are waiting until the spelter market assumes a definite course.

The tremendous pressure on the mills in the United States continues, and, despite the heaviest outputs recorded, they are getting further back on deliveries. The U. S. Steel Corporation, on Feb. 29, had unfilled orders on its books, amounting to 8,568,966 tons, compared with 7,922,767 tons on January 31. Steel bars are unchanged at 2.50c, iron bars 2,35c, plates 2.75c, and shapes 2.25c, Pittsburg. Billets have advanced due to the shortage of supply, and are quoted as follows at Pittsburgh: Bessemer and open-hearth billets $40, and forging billets $60 per ton. Wire rods have advanced $5, and are now quoted at $55 per ton Pittsburgh. Mills delivering rods to Canada have to declare their market value, which has lately been $50, but this will probably soon be raised to $55. Deliveries on wire rods are very backward, running into the second half. Chicago warehouse prices are unchanged, but firm.

Pig Iron

Quotations are unchanged, and the situation in the market is much the same as last week. As the steel companies make their own pig iron, the market has not been affected much by the heavy demand for steel. A revival in the foundry business would have a beneficial effect on the pig iron market.

The total production of pig iron in Canadian blast furnaces in 1915 was 913, 719 short tons valued at approximately $11,592,819. The production in 1914 was 783,164 tons, and valued at about $10,-002,856. A large proportion of the production in 1915 was used in the manufacture of steel for munition purposes. The production this year will no doubt exceed last year's tonnage, as the steel mills are more active owing to a greatly increased demand for steel products.

Old Materials

The market is weaker and depressed with quotations practically unchanged. Ordinary business is very quiet, the demand being almost entirely in connection with munitions. Heavy melting steel is quiet, but in good demand. The embargo on the export of wrought iron and steel scrap is depressing this market. Copper and lead are firm, particularly the latter, although there has been no change in quotations. Aluminum is very scarce and prices are firm.

Machine Tools

The market has been more active this week, and quite a number of inquiries have been received by local machinery houses for tools for machining 4.5 in. and 6 in. shells. Orders keep coming along for single tools for shell plants, and there will no doubt be steady business of this nature throughout the year. Representatives of the Gray-Dort Motor Co. have been in town buying equipment for their new plant at Chatham, Ont. It is reported that the Canadian Hoskins Co., of Walkerville, Ont., are in the market for various kinds of wire drawing machinery.

Supplies

Business continues good, and prices are still advancing. "Trimo" wrenches are higher, the new discount being 62½ per cent., as against 65 per cent. formerly. New and lower discounts on wood screws have been issued, representing an advance of 20 per cent. There is a big demand for certain sizes of wood screws for ammunition boxes. The expected advance in gasoline and benzine has been made. Gasoline is now quoted at 32c per gallon and benzine ½c less. Another advance may be looked for in the near future. Wrought nipples have advanced, the new discount being 72½ per cent.

ALLIES PURCHASING AGENTS

The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:

International Purchasing Commission, India House, Kingsway, London, Eng.

French.—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendence Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.

Russian. — Col. N. Golejewski, Military Attaché, Room 904 Flat Iron Building, New York City.

Metals

The chief item of importance this week is a sharp advance in the tin market and the steady upward movement in lead. The strength of the tin market is due to a scarcity of spot metal, but quotations are purely nominal. The lead market is strong, with outside quotations higher than the "Trust" price. There is a heavy demand for lead, and a scarcity has developed. The copper market is firm, but quiet, the demand for this metal having fallen off temporarily. The spelter market is weak and lower, there being little buying to speak of. The spelter market declined in London as well as New York. The antimony market is quiet, but firm, with the situation unchanged. The aluminum market is dull and weaker.

Copper.—Prices of copper are entirely nominal for all deliveries and the market is dull. The situation, however, is unchanged, and the quietness is due to an absence of business, consumers being well covered meantime. The producers have control of the market. There is no sign of weakness in the situation, and there appears to be little possibility of prices being depressed materially. Local quotations are unchanged and nominal at 30½c per pound.

Tin.—Quotations have advanced sharply on account of a scarcity of spot metal and the market is strong. The tight situation in New York has been caused by consumers not being able to sell owing to restrictions applied by the British Government. Consumers under the British restrictions cannot carry heavy stocks or re-sell the tin, and the spot situation is liable to be affected any time on account of these restrictions. Tin has advanced to 6c, and is purely nominal at 56c per pound.

Spelter.—The market is weak and the decline continues. Buyers, however, are showing more interest than for some time, and this has given the market a better tone, despite the lower prices. Spelter has declined 2c, and is quoted at 21c per pound.

Lead.—The market is strong and higher, due to the heavy demand and acute scarcity of supplies, notwithstanding the fact that the production is the highest ever known. The "Trust" has advanced the price of lead to 6.60c New York, but outside quotations are even higher, ranging from 6¾c to 7c New York. Lead has advanced ½c locally, and is quoted at 9c per pound.

Antimony.—The buying movement appears to have stopped, and consumers are well covered in the meantime. The situation is unchanged, and quotations nominal at 48c per pound.

Aluminum.—The market is a little easier owing to freer offerings of metal. Quotations, however, are unchanged at 68c per pound.

U. S. SULPHURIC ACID EXPORTS

EXPORTS of sulphuric acid from the United States in October, 1915, the latest published data, were 8,561,147 lb., making the total 71,997,192 lb. to Nov. 1, 1915, the largest on record both for a month for ten months. The total to Nov. 1, 1914, and 1913, was 8,068,743 lb. and 7,202,110 lb. respectively. For the fiscal year of 1910 the total exports were

only 5,081,038 lb. and in that of 1914 they were 12,131,750 lb.

Before the war, 60 deg. sulphuric acid sold at about \$10.50 to \$11 per ton in tank car lots, with \$12 to \$13 obtained for 66 deg. acid. While as high as \$110 is said to have been received for tank car lots, some makers are now selling regularly at \$40 to \$45 for 60 deg. acid in tank car lots. Another producer is understood to be obtaining \$75 per ton in tank car lots and \$80 per ton for acid in carboys for 66 deg. acid. Commercial acid obtained as a by-product in zinc smelting is reported to be sold at \$24 to \$30 per ton.

ZINC SOURCES WITHIN BRITISH EMPIRE

THE large amount of zinc required for war purposes, and the resulting enormously increased demand for the metal known commercially as spelter, lend special interest to an article in the current number of the "Bulletin of the Imperial Institute" on "The Occurrence and Utilization of Zinc Ores." The chief zinc minerals are described, and a brief account given of the more important occurrences in the United Kingdom, the colonies and India.

Zinc ores have been mined in many parts of the United Kingdom, notably in Cumberland, Northumberland, Durham, Derbyshire, Shropshire and the Isle of Man, but a large proportion of the production has for several years past been shipped to the Continent for smelting. By far the most important zinc deposits in the British Empire are those of Broken Hill Mines, New South Wales, the output of which alone is sufficient to supply the entire demands of the United Kingdom for metallic zinc. The Broken Hill ore before the war went mainly to Germany for smelting, but the Australian Government has adopted measures which will prevent this in the future. Zinc is also found in South Australia, Queensland, Tasmania, New Zealand and Newfoundland. Canada contains a number of workable zinc deposits, particularly in British Columbia, and there is every prospect of Burma becoming an important producer. In Africa there are zinc deposits in Egypt, Nigeria, Rhodesia and the Transvaal, as to which more information is needed.

Stratford, Ont.—The Public Utilities Commission have decided to purchase three transformers with a capacity of 900 K.W. The cost will be about \$6,000.

Ottawa, Ont. — Tenders will be received by the Board of Control, up to Tuesday, March 28, for two motor driven street flushers. Specifications may be obtained on application to the city engineer's office, City Hall, F. C. Askwith, acting city engineer.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

Engineering

Joliette, Que. — The Joliette Steel Co., are making extensions to their plant.

Three Rivers, Que. — The Canadian Iron Corporation will build an addition to its plant.

London, Ont.—The London Foundry Co., contemplate making an extension to their plant.

Drummondville, Que. — The Aetna Chemical Co., will build an acid plant at a cost of $300,000.

Owen Sound, Ont. — The Durham Cement Co., will make extensive alterations to their plant. Hydro power will be installed.

Drummondville, Que. — Walter A. Moisan, town clerk, is calling bids for the construction of a pumping station and mechanical gravity filters.

Trenton, Ont. — The Ireland McCall machine shop, and the garage owned by Graydon & Clegg at this place have been totally destroyed by fire with a loss of $10,000.

Brandon, Man.—The city council have granted the Continental Oil Co., permission to build two large storage tanks on the C. N. R. The tanks will hold 24,000 gallons and the company intends to make this their distributing point for the large area of Western Manitoba and Eastern Saskatchewan.

Walkerville, Ont. —. The Canadian Hoskins, Ltd., is in the market for machinery for the manufacture of wire goods to cost about $10,000. R. H. Cunningham is manager.

Welland, Ont. — The Canadian Steel Foundries Ltd., have started operations at their plant here. The 12 in. mill is now in operation and the 22 in. mill will be started very shortly.

Granby, Que.—The F. S. Carr Rubber Co. has taken over the old factory of the Walpole Rubber Co. here, and is installing a complete power system, including steam boilers, engines, generators, etc.

Toronto, Ont.—Kerry & Chace, Ltd., 550 Confederation Life Building, are in the market for the following machinery: One alternating-current generator, 300 to 600 kv., sixty-cycle, three-phase, 6600 volts; two belted induction or synchronous motors, 300 to 400 hp., sixty-cycle, three-phase, 6600 volts; two belt-driven air compressors of 2000-cu ft. capacity each, to give 100-lb. pressure, etc., to be delivered to Cardova Mines, Ont.

Sarnia, Ont.—The Imperial Oil Co., which a short time ago increased its capital from $15,000,000 to $50,000,000, will construct a big addition to its plant here this summer. The plant affected is the motor spirit department, which is known as No. 2 plant. More stills and tanks will be added to increase the output. The company has on hand 6,000 tons of steel for the new structure building here and at other points, and this will be manufactured here. Plants will be built in Montreal this summer and at Regina.

Municipal

Emerson, Man. — The Town Council contemplate the installation of an electric light plant.

Campbellton, N.B.—The Town Council will probably spend $5,000 on a street lighting system.

Chatham, Ont.—The ratepayers have voted in favor of a by-law to assist the Chatham Shoe Co. who propose locating here.

St. Marys, Ont. — Blanchard Township, one of the few municipalities that defeated the London-Toronto Hydro radial proposition in January last, indorsed it last Monday, the ratepayers carrying it at the polls by a majority of 23.

EQUIPMENT FOR AUSTRALIAN NAVAL DOCKYARD

Tender forms and specifications have been forwarded by D. H. Ross, Trade Commissioner, Melbourne, for 43 machines of various types required for the equipment of the Commonwealth Naval Dockyard, Cockatoo Island, Sydney, N.S.W. Tenders will be received, subject to the conditions specified, up to May 1, 1916, addressed to the Director of Navy Contracts, Melbourne, Australia. The last mail in time to reach Melbourne on May 1 is that leaving San Francisco on March 22 and due at Melbourne on April 12. The tender forms are open to the inspection of Canadian manufacturers at the Department of Trade and Commerce, Ottawa (refer file No. A-1435). Particulars of the requirements are briefly outlined thus:

Three 50-ton overhead travelling cranes.

One 25-ton overhead travelling crane.

Two 5-ton overhead travelling cranes.

One 10-ton revolving cantilever crane.

Two 5-ton travelling portal jib cranes.

Two 7½-ton jib cranes.

One 5-ton jib crane.

Two 15-ton hydraulic cranes.

One 6-ton hydraulic crane.

One 6-ton wall crane (hydraulic).

Two 3-ton wall cranes (hydraulic).

Two electric passenger elevators.

Two electric goods elevators.

One 2½-ton gauge locomotive with crane attached.

One 2½-ton gauge locomotive without crane attached.

Three electrically-driven air compressors, 1,500 cu. ft.

One 15-ton hydraulic winch.

One 5-ton hydraulic winch.

Nine 10-ton hydraulic capstans.

Two 5-ton hydraulic capstans.

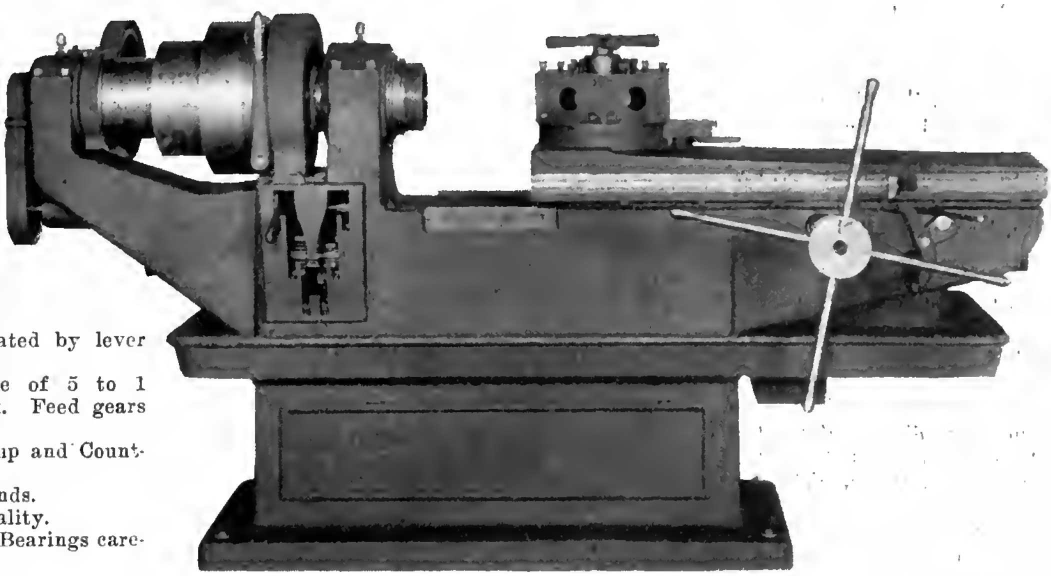
One bar shearing machine.

One double-ended horizontal punching machine.

One 10-ton overhead travelling crane for shipyard fitting shop.

GREENSBORO TURRET LATHE

For Boring and Recessing Base of 4.5 and 6" Shells



Spindle is made of Carbon Steel, 8" diam. in front bearing and bored 6¼" diam. 8" deep, so part of shell is held within bearing to prevent overhang.
Spindle runs in heavy bronze bearings.
Head has friction back gear, 5½" belt.
Turret is bored for 3" Bars, has power feed with automatic stop.
Quick-change feeds operated by lever under head.
Turnstile has a leverage of 5 to 1 though gearing into rack. Feed gears made of steel.
Equipment: Oil Pan, Pump and Countershaft.
Weight: About 6,000 pounds.
Workmanship of Best Quality.
All Spindles ground. All Bearings carefully scraped.

THE A. R. WILLIAMS MACHINERY CO., LIMITED
TORONTO **CANADA**

There is Absolute Satisfaction

In Geometric Self-opening and Adjustable Screw-cutting Die Heads.

We specialize on Threading Tools, and manufacture nothing else.

All our efforts are directed to building Screw-Cutting Tools a little better than anyone else builds them.

Take up your Threading proposition with us. Get acquainted with our products now. Order when you please.

The Geometric Tool Co.

New Haven, Conn.

Canadian Agents:
Williams & Wilson, Ltd., Montreal. The A. R. Williams Mchy. Co., Ltd., Toronto, Winnipeg, St. John, N. B.

Calgary, Alta. — The purchasing of new equipment needed at the city power house will be proceeded with immediately some contracts have already been awarded.

General Industrial

St. Jerome, Que.—The St. Jerome Mfg. Co., Ltd., will enlarge their factory. Tenders will be called shortly.

Calgary, Alta.—The west end incinerator was destroyed by fire on March 10. with a loss of $50,000.

Moose Jaw, Sask.—Fire caused damage to the extent of $50,000 to the Gordon Ironsides packing plant here on March 4.

Brantford, Ont. — Fire from an unknown cause did about $10,000 damage to the plant of B. Bell and Son, Co., at St. George, on March, 11.

St. John, N.B.—Fire on March 4, caused a loss estimated at $35,000 to $40,000, in the Prince William street building of Dearborn & Co., wholesale spice company.

Kincardine, Ont. — The Ontario People's Salt and Soda Co., contemplate making extensions to their plant J. R. Mckay has been appointed manager of the company in succession to the late John Tolmie.

Port Arthur, Ont.—It is reported that two new grain elevators will be built here during the coming season. One of them, for the Saskatchewan Co-operative Grain Association, will have a capacity of 2,500,000 bushels. The other will probably be built by the C.N. R.

Berlin, Ont.—Doon Twines of Doon, Ont., have closed negotiations for the purchase of the new plant erected last year by the Regal Auto Co. The Doon Co will take possession of a portion of the building almost immediately. The plant in Doon will be closed down owing to the difficulty experienced in securing necessary help. It is reported that the Regal Auto Co., will build another factory here.

Hamilton, Ont. — The Ontario Yarn Co. of Markham, Ont., will establish a branch factory here for making knitting and hosiery yarns. The old customs House has been rented for a term of years and $20,000 will be spent in equipment principally carding, spinning and winding machinery. J. A. Kammerer of Toronto is president of the company and A. M. Morrison of Markham is managing director.

Contracts Awarded

St. Thomas, Ont.—The Petrolia Bridge Co., of Petrolia, Ont., have been awarded the contract for a bridge at Wardsville to cost $4,100.

Montreal, Que.—The Board of Control has awarded the contract for the installation of a pump at Papineau Avenue pumping station to the Canadian Allis-Chalmers, Ltd.

Calgary, Alta. — The City Commissioners have awarded a contract to the Canadian Westinghouse Co., for electrical apparatus for the city power house at $9,770.

Sarnia, Ont.—The City Council has accepted the tenders of Mackenzie, Milne & Co., the H. Mueller Mfg. Co., and the National Iron Works for supplies for the waterworks.

CANADIAN PURCHASES FOR FRENCH WAR OFFICE

Philippe Roy, General Commissioner for Canada, Paris, advises the Department of Trade and Commerce, Ottawa, that an order has been issued by the War Department of the French Government to the effect that all purchases made by the Supply Branch in Canada will pass through the Hudson Bay Co. Canadian producers should therefore submit their future offers through the office of that company at Montreal. It is further stated in Mr. Roy's communication that Canadian lumber, steel and meat will find in France an important market for years to come, but it is necessary that Canadian firms should have in Paris representatives entrusted with the necessary authority, especially if it is desired to secure Government contracts.

Ottawa, Ont.—The City Council have awarded the following contracts: Pipe. The National Ironworks Ltd., Toronto; valves, McDougalls Ltd., and General Supply Co., Ottawa; brass work, the General Supply Co.

New Incorporations

J. E. Edwards & Sons, Ltd., has been incorporated at Toronto with a capital of $50,000 to manufacture leather goods, harness, etc., at Toronto, Ont. Incorporators, L. A. Lillico, G. G. Beckett and J. G. Leckie all of Toronto.

Beemer & Co., has been incorporated at Toronto with a capital of $55,000 to manufacture automobiles, motors, engines, at London, Ont. Incorporators, J. C. Beemer, and F. D. McLachlin, or London, Ont.

Jacob Kaufman, Ltd., incorporated at Toronto, with a capital of $250,000, to carry on a wood-working business at Berlin, Ont. Provisional directors are: Jacob Kaufman and Milton R. Kaufman. of Berlin, Ont.

The Anglo-American Talc Corporation has been licensed at Toronto, with a capital, not exceeding $50,000, to acquire and develop lands and deposits. Thomas Carswell, of Madoc, Ont., is the attorney for the said company.

The Toronto Chemical Co. has been granted a provincial license at Toronto, to manufacture benzol and other hydrocarbons. The capital of the company is not to exceed $150,000, and their attorney is Leighton McCarthy, of Toronto

The Toronto Builders Supplies, Ltd., has been incorporated at Toronto with a capital of $50,000 to manufacture builders' supplies of all kinds. Head office to be at Toronto. Incorporators, G. McLaughlin, W. B. Milliken and F. Lane, all of Toronto.

The Dominion Dustless Sweepers, Ltd., has been incorporated at Ottawa, with a capital of $200,000 to manufacture street cleaning machinery. at Peterborough, Ont. Incorporators, W. H. Hamilton, W. M. Lang and W. H. Buller all of Peterborough, Ont.

The John V. Gray Construction Co., has been incorporated at Toronto with a capital of $40,000 to carry on the business of general contractors. Head office to be situated at Toronto. Incorporators, J. V. Gray, J. C. McKay, MacBeth, and R. Wherry.

The Whitlock Printing Press Mfg. Co., has been granted a provincial license at Toronto to manufacture printing presses and similar machinery. Head office is at Toronto and the capital does not exceed $40,000. Frank W. Manton of Toronto is attorney.

The Hughes Electric Heating Co., has been granted a provincial license at Toronto to manufacture electric heaters and other electric appliances. The capital is not to exceed $50,000 and the head office is at Toronto. Frank M. Dusenbery of Toronto is attorney.

The Mattagami Pulp & Paper Co., has been incorporated at Toronto with a capital of $4,000,000 to manufacture pulpwood and all kinds of paper. Head office to be situated at Toronto, Ont. Incorporators, W. J. Boland, J. F. Boland and E. Knox all of Toronto.

The Standard Marble & Tile Co. has been incorporated at Ottawa, with a capital of $150,000, to quarry marble, stone, granite, etc. Head office to be situated at Toronto. Incorporators are: Frank C. Dunham, George R. Sproat, and Franklin M. McDowell, all of Toronto.

The Wilson Scale & Machinery Corporation, Ltd, has been incorporated at Toronto with a capital of $100,000 to manufacture, scales, tools, machinery implements, utensils, hardware, etc., at Toronto, Ont. Incorporators, J. T. Lauder, F. J. Norris and C. Stanley ali of Toronto

The National Woollwear Co. has been incorporated at Ottawa, with a capital of $45,000, to carry on the business of spinning, manufacturing wool, silk and cotton, woollen goods, at Hamilton. Incorporators: John R. Marshall, Stanley R. Jefferess and George A. Young, all of Hamilton.

The Overland Tire & Rubber Co., has been incorporated at Ottawa with a capital of $50,000 to carry on the business of manufacturers of rubber and rubber tires. Head office to be situated at Montreal. Incorporators, J. J. O'Reilly, N. F. MacNeill, and W. R. McKay all of Montreal.

The Burrows Refining Co., has been incorporated at Ottawa, with a capital of $1,500,000, to carry on the business of producing, reducing, and refining ores, metals, oils, etc. Head office to be situated at Ottawa. Incorporators. W. C. Perkins, and W. D. McCormick of Ottawa, Ont.

The Cornwall Pants Co., has been incorporated at Toronto with a capital of $25,000 to manufacture clothing, shirts, etc. Head office to be situated at Cornwall. Incorporators, J. D. Bissett, T. H. Peine and A. L. Williams, all of Toronto.

The Canadian Germicide Co., has been incorporated at Ottawa with a capital of $40,000 to manufacture germicides, disinfectants, antiseptics, etc. Head office to be situated at Toronto. Ont. Incorporators, D. I. Grant, M. MacDonald, and E. Smily, all of Toronto.

The Modern Heating and Engineering Co., has been incorporated at Ottawa with a capital of $49,000 to carry on the business of mechanical engineers, founders, smiths, etc. Head office to be situated at Montreal. Incorporators, J. E. Aron and J. U. Archambault, all of Hull.

The Powers Accounting Machine Co. of Canada, Ltd., has been incorporated at Ottawa with a capital of $25,000 to manufacture perforating, tabulating, adding, calculating machines, etc. Head office to be situated at Montreal. Incorporators, G. W. MacDougall, L. MacFarlane and W. B. Scott, all of MMontreal, Que.

The Stanley Steel Co., has been incorporated at Ottawa with a capital of $250,000 to carry on the business of iron and steel makers, smelters, engineers, sheet metal and rail rollers, etc. Head office to be situated at Hamilton, Ont. Incorporators, A. F. Hatch, F. M. Hatch and T. C. Haslett, all of Hamilton.

Trade Gossip

Belleville, Ont. — Word has been received here that the rolling mills which have been idle for some time, will resume work immediately.

Woodstock, Ont.—The Linderman Co., recently shipped a dovetail glue jointing machine to Newport, Tenn. The machine weighed 20,000 pounds.

L. K. Comstock & Co., contracting engineers have opened a Canadian office in the New Birks' Building, Montreal, with Douglas-Milligan Co., in charge as their representatives.

Kingston, Ont.—The following officers were elected by the Kingston Board of Trade: Honorary presidents, W. E. Nickle, M.P., and Col. A. E. Ross; president, Francis King; first vice-president. William Cook; second vice-president, J. M. Campbell; treasurer, George B. Mackay.

The Dominion Machinery Co., Toronto, have moved to larger offices in the Stevenson Bldg., Lombard and Church Streets, thus affording better facilities for handling their increasing business. The company is putting on the market a heavy duty single purpose lathe for 6 in. shells.

Great Lakes Shipping.—The volume of tonnage on the Great Lakes is so large that owners of vessels are contemplating breaking a channel through the ice to reach Escanaba on Lake Michigan. It is estimated that 55,000,000 tons of ore, 30,000,000 tons of coal and 14,000,000 tons of grain will be moved.

Canadian Locomotive Co.—At a meeting of the directors of the company at Kingston, Ont. The resignation of A. W. Wheatley was confirmed, but he will retain his position on the Board. J. J. Harty was appointed vice-president and sales manager, and elected to the board of directors. Wm. Casey is the new manager and J. H. Birkett secretary-treasurer.

C. N. E. Munitions Exhibit—Gen. Sir Sam Hughes, at the request of the Canadian National Exhibition Association, has instructed his officials to give whatever assistance is required in the preparation of a munitions process exhibit for this year's Exhibition, at Toronto, Ont. It is intended by the association to show in this exhibit every phase of the manufacture of shells, thus giving the patrons of the fair a knowledge of Canada's newest and largest industry.

A Steel Trade Anomaly—Steel trade authorities at New York note as an interesting fact that the smaller steel companies making finished products could sell all of the ingots and billets they can produce for months at relatively higher prices than can be realized for finished rolled products, so great and so urgent is the demand for crude and semi-finished steel. Such sales, however, would mean that the merchant plants would lose their organizations and be forced to give up the customers that they have secured through years of hardship and of painful effort. Consequently, in the long run, sales of ingots or billets in any magnitude, even at the highest prices ever recorded, would not only prove profitless but would be a suicidal policy. A great foreign and domestic demand for steel, therefore, goes unsatisfied.

Canada's Pig Iron Production.—The total production of pig iron in Canadian blast furnaces in 1915 was 913,719 short tons, valued at approximately $11,592,819, as compared with a production of 783,164 short tons in 1914 valued at approximately $10,002,856. A large proportion of this production is used directly in the manufacture of steel. and the values are in part estimated. The 1915 output shows an increase of 130,555 tons, or 16.67 per cent. over that of 1914, and compares favorably with the average of recent years. Of the total production in 1915, 13,692 tons were made with charcoal and 900,027 tons with coke.

Serves More People In More Ways Than Any Institution Of Its Kind In The World.

WHEN we claim that J-M Products are "Reliable" we use the word in its severest interpretation. We mean the strictest adherence to constant, consistent goodness.

And even more than this; for as a second line defence, we re-inforce this Reliability with J-M Responsibility, the personal promise of a National Institution.

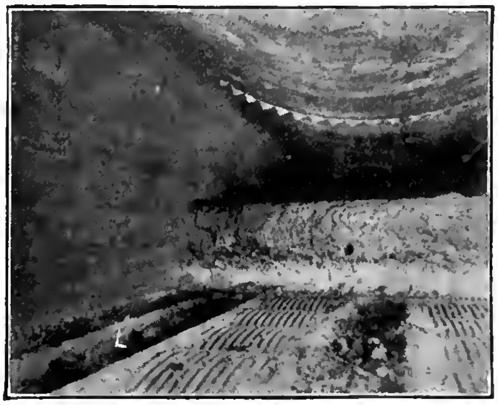
J-M High Temperature Cements prevent many a boiler shut down

—by protecting fire-brick edges

Any unprotected space between fire-bricks will start serious trouble with your fire box lining. And little openings exposing the edges of a brick here and there cannot be avoided when your bricks are dry. Expansion and contraction too, opens further cracks between the bricks even when the best grade of fire clay is used. These conditions allow furnace heat to concentrate at the brick edges and produce excessive temperatures familiarly known as "soaking." Every engineer knows that the fusion and spawling or cracking that follows sooner or later means **shut-down**—costly delays—expensive repairs.

Why not stop this annoying chain of troubles once for all, by setting up your fire-bricks with J-M No. 31 High Temperature Cements?

Vitrified by the heat, this cement fills every interstice and protects the brick edges with a perfect heat-reflecting surface—a fire box lining without weakness. J-M High Temperature Cements pay for themselves over and over by saving the cost of repairs and by eliminating shut-downs. Try them. There is a J-M High Temperature Cement for every refractory use.



Boiler furnace wall set with J-M No. 31 H. T. Cement in boiler-room of Christian Science Publishing Co., Boston. In continual use under stoker conditions for nearly a year and still good for an indefinite period.

J-M Fire-Proof Cold Water Paint makes shops and factories brighter.

Euclid Garage, 13th St., near Euclid Ave., Cleveland. "Largest in the World." J-M Fireproof Cold Water Paint.

J-M Fire-Proof Cold Water Paints are in demand for both inside and outside work. They increase the light reflecting capacity of interior walls to a point where lighting bills are often cut 25 per cent.

Easy to apply—by brush or spray. They are widely specified and every specification is backed by J-M Responsibility

They contain no oil, alkali, lime or chemicals and are mixed with ordinary water. They are endorsed by Underwriters as an approved fire retardant. Spreads farther and better than oil paints and does not discolor.

Service and Responsibility

Mussens Ltd., Montreal, has resigned having accepted a similar position in the machine tool department of the Canadian Fairbanks-Morse Co. of Montreal.

F. W. Evans has been appointed manager of the Toronto sales branch of the Canadian Fairbank-Morse Co., on Front St. Mr. Evans was until recently in charge of the machine tool department at Toronto and previously to that held a similar position at the head office in Montreal, moving to Toronto, when this department was moved to that city.

Wood-Working

Kedgwick, N.B.—The Richard Mfg. Co. lumber mill was destroyed by fire recently, but will be rebuilt.

Stratford, Ont.—A large addition will be built to the McLagan Furniture Mfg. Co.'s plant here.

New Westminster, B.C.—The Sidney B. Smith Lumber Co., will build a saw mill at Lombard near here.

Loretteville, Que.—The Joseph Boule & Co. planing mill has been destroyed by fire. The loss is estimated at $6,000, with no insurance.

Welland, Ont.—S. L. Lambert's planing mills were destroyed by fire recently. Loss is estimated at $25,000, which is partly covered by insurance.

Niagara Falls, Ont.—Reid Bros. will build a new planing mill near their present one. The new mill will be 26 ft. x 40 ft., and new machinery will be installed.

Orillia, Ont.—The Orillia Realty & Building Co's., planing mill, on Front Street, was destroyed by fire on Feb. 26. The building was totally destroyed with all the machinery. The loss, estimated at $10,000, being partially covered by $2,500 insurance. The Canada Builders, Ltd., of Toronto, owned the mill.

Building Notes

Toronto, Ont.—The Automobile and Supply Co. will build a showroom and garage on Simcoe Street at a cost of $24,000.

Winnipeg, Man. — The City Council has granted the T. Eaton Co. permission to erect bridges over certain streets in connection with the new building which they propose erecting here.

Toronto, Ont.—The Sheet Metal Products Co. have obtained a building permit for an addition to the factory on Oak Street, to cost $11,300.

Hamilton, Ont.—An addition will be made to the Robert Sand school at a cost of about $30,000.

Mount Dennis, Ont. — A new public school will be built here at an estimated cost of $25,000. Building operations will be commenced shortly.

Toronto, Ont.—The Hamilton Carhart Co., overall manufacturers, will build an addition to the factory on Queen Street East, at a cost of $4,000.

Toronto, Ont.—The Gutta Percha & Rubber Co. have been granted a permit from the city architect to erect a one-storey storage shed on West Lodge Avenue at a cost of $4,000.

Winnipeg, Man.—The T. Eaton Co. have submitted plans for a proposed twelve-storey warehouse to be erected on Graham Street. It is also planned to erect a new twelve-storey main building, the two buildings costing in the neighborhood of $3,000,000.

Railways—Bridges

Montreal, Que.—Work on the reconstruction of the burned Bonaventure Station has been begun by the G.T.R. It is understood the re-building is to meet temporary needs, pending the ultimate elevation of the G.T.R. tracks through this city and the building of a new station in connection therewith.

Montreal, Que. — The Montreal and Southern Counties Railway expects to be able to run to Granby by the end of March. The new machinery will shortly be installed in the sub-station. Granby will be the furthest objective point this coming summer; but that does not exhaust the original programme of development.

Chatham, Ont.—Extensions of the hydro network of lines in Kent County are being contemplated, and it is quite likely that many lines will be installed during the spring and summer. Many of the important towns in the county, including Wallaceburg, Dresden, Ridgetown, Blenheim and Thamesville are now served with hydro.

C. N. R. Plans Revised.—The Canadian Northern Railway had decided to drop its proposal of a line between Toronto and Hamilton, so as not to interfere with the Hydro Radials scheme, but will operate between Hamilton and St. Catharines and thence to the border. The application of the Toronto, St. Catharines and Niagara Railway, a subsidiary line of the C. N. R., for an extension of its franchise, which has been made at Ottawa, has revived interest in the activities of the C. N. R.

Catalogues

The Vislok Co., London, England, have sent us literature dealing with the "Gauge-All" expansible double boring cutter. The cutter has been designed to reduce the wastage in high speed steel, when used for internal work. How this is done is fully described in a booklet, and the illustrations show how to adjust the cutter. A price list for standard sections is also included.

Anodes and Plating Salts made by the Munning-Loeb Co., Matawan, N.J., are dealt with in bulletin No. 300. The bulletin contains much interesting information covering the manufacture of anodes and quality of raw material employed. Several different types of anode made of various metals are illustrated and described, while the sizes and approximate weights are also included. The concluding pages deal with various kinds of plating salts and their principal features.

The National Machinery and Supply Co., of Hamilton, Ont., have issued a catalogue illustrating and describing a full line of machinists' and woodworkers' tools. The products include several types of vises, planes, screw drivers, hand-screws, clamps, etc. A table accompanies each type and contains the weight and principal dimensions for each size. The prices are given in English currency as well as Canadian for the benefit of Old Country consumers.

Book Reviews

Magnetic and Other Properties of Iron-Silicon Alloys, Melted in Vacuo, is the title of bulletin No. 83 by Trygve D. Yensen, issued by the University of Illinois, Price 35c. The bulletin contains the investigations of Mr. Yensen in connection with a new material discovered by him. This material possesses properties particularly valuable in electrical industries and these properties are fully and carefully described in the bulletin accompanied by full particulars of tests and data obtained. This material is an iron-silicon alloy melted in a vacuum and annealed. It possesses remarkable magnetic properties which, are claimed to make it superior to any known metal for use in the manufacture of transformers, dynamos and electromagnetic machinery. The bulletin contains a number of tables giving results of tests, several diagrams, and also over 50 photomicrographs of this iron-silicon alloy. Copies of the bulletin may be obtained from the Engineering Experiment Station, Urbana, Ill.

FOR SALE

18 IN. x 10 FT. BRADFORD LATHE AND countershaft, also 18 in. x 8 ft. Lodge & Shipley, both in splendid condition; immediate delivery. Box 172. Canadian Machinery. (8)

FOR SALE—FIFTEEN HUNDRED GALLON Duplex Steam Pump, used sixty days. Size twenty x twelve x sixteen stroke. Apply Fraser & Chalmers of Canada, Limited, Montreal. (12)

FOR SALE—CINCINNATI ENGINE LATHE, 18" x 6'; taper attachment, hollow spindle, quick-change gears, compound rest, two chucks; also 12 H. P. gas or gasoline engine. Apply Wheeler Needle Works, Paris. Ont. (7)

FOR SALE—ELECTRIC GENERATOR TO run 80 lamps, 110 volts, 300 r.p.m., including switchboard and indicator; in good condition. Richards-Wilcox Canadian Company, London Ont.

FOR SALE OR TO EXCHANGE FOR A smaller tool—Bertram gap lathe, 16-ft. bed, swing 40 inches in gap, two face plates, one 4-jaw chuck, one steady rest, one turret head, and countershaft. All in first-class condition. Offered at a big reduction. Shipment could be made in ten days. Box 182, Canadian Machinery.

FOR SALE—THE FOLLOWING CANADIAN General Electric motors: 1 KT 8-5-900 C, 550 V., less base with pulley; 2 MTC 5200, 5 H.P., 900-500 V., 60 cyc., A.C., 3-phase, with solenoid brakes mounted, with controller and rheostat; 1 MTC 5200, 5 H.P., 900-500 V., 60 cyc., A.C., with controller and rheostat; 1 MTC 5200, 5 H.P., 900-550 V., 60 cyc., A.C., with controller and rheostat. Whiting Foundry Equipment Co., Harvey, Ill., U.S.A.

FOR SALE — COMPLETE LUMBER AND lath mill machinery, daily capacity seventy-five thousand feet, consisting of gang, single and double bandsaws, engine, boilers, etc. Fully equipped blacksmith and machine shops. Silsby fire engine, 2 streams of 2½ inch; good order. Log loader, capacity fifty thousand feet, ten hours; almost new. Exceptional manufacturing site bargains. Address The Rathbun Company, Deseronto, Ont. (18)

FOR SALE—50 GOOD MACHINES. BOLT Cutters, Headers, Pointers, Tappers, Automatic Shavers and Slotters, Presses, Drill Press, Slitters, Small Shears, Plain Bench Lathes, Pulleys, etc. Bargain prices. Immediate shipment. Send for descriptive list and prices. Shelton Company, Shelton, Conn., U.S.A. (9)

FOR SALE, AT A SACRIFICE—SAW MILL outfit, A1 condition; 50 H.P. stationary boiler, 45 H.P. "Leonard" engine, "Green" carriage, Simonds saw, edger, planer, lathmill, etc. Easy terms. Write quick. R. Parker & Sons, Uno Park, Ont. (12)

FOR SALE—2-PHASE INDUCTION MOTORS, 1 only WESTINGHOUSE, Type C, 50 H.P.; 1 only WESTINGHOUSE, Type CCL, 50 H.P.; 1 only CANADIAN GENERAL, type 10, 20 H.P. In excellent condition. Prices attractive. Full particulars on application. Cummer-Dowswell, Limited, Hamilton, Ont.

FOR SALE—PLANING MILL AND FACTory, doing good business. Terms $2,000.00 cash. Balance to suit buyer. Address O. Ribble, Bronte, Ont. (13)

AUTOMOBILE BUSINESS AND NEW Garage for sale. Overland agency; lots of repairing; also Overland roadster, new tires, $300.00; 10 light D.C. generator, $25.00; K.W. magneto (new), $15.00. W. E. Hawes, Otterville, Ont. (13)

SITUATIONS VACANT

JUNIOR DRAFTSMAN, EXPERIENCE ON structural work an advantage; permanent position to right man; give fullest possible particulars. Box 174, Canadian Machinery. (7)

WANTED — MACHINISTS AND FLOOR hands on heavy and miscellaneous medium work; steady employment, modern shop, good wages. Apply, stating age and experience, P.O. Box 6, Walkerville, Ontario. (6)

SITUATIONS WANTED

MECHANICAL SUPERINTENDENT, EFFICIency engineer and master mechanic having twenty years' experience in all lines of general machine, blacksmith, carpenter and pattern shop practice, foundry work, power plant, refrigerating and electrical engineering, is open for engagement. Box 177, Canadian Machinery. (11)

CHIEF ENGINEER — 26 YEARS' EXPERIence. Factory and Central Station, Alternating and Direct Current, Gas or Steam Engines, efficiency guaranteed, own instruments, best of references. Box 181, Canadian Machinery. (12)

AS MAINTENANCE ENGINEER OF FACTory, power or lighting plant, where economy is a factor, wide experience, best of references. Box 180, Canadian Machinery. (12)

WANTED

WANTED TO RENT — SMALL MACHINE shop, two or three small lathes, miller, drill, motor, furnace, usual small tools. Full particulars and terms. Box 179, Canadian Machinery. (13)

AGENTS WANTED

BRITISH HOUSE MAKING SYRINGES AND spraying machines for every possible use, need Canadian agents. The line is the most complete in the world and includes knapsack and ordinary spraying machines for fruit growers, limewashing machines for farms, factories, etc. Disinfecting machines for all purposes. Anything in the way of spraying and washing machines made to suit the market. Agents must be aggressive and ready to work the line thoroughly. Write: Spraying Machines, c/o Canadian Machinery, 143 University Avenue, Toronto.

FOR SALE

Two 96-horse-power Gas Engines.

Complete with producers.

Made by the largest English manufacturers.

WILL SELL CHEAP

Empire Mfg. Co., Ltd.
London, Ontario.

POSITION WANTED

Electric-Hydraulic-Steam Engineer

of high calibre is open for position. Experience in Great Britain and America.

Box 178,
Canadian Machinery.

AGENCY WANTED

A firm in England is desirous of securing the sole agency for Great Britain for twist drills, taps, stocks, dies, reamers, milling cutters, etc. Please communicate full particulars to

Box 175
Canadian Machinery

20 precede pp. 253

INDEX TO ADVERTISERS

Mineral Production of Canada for Calendar Year 1915--I.

By John McLeish, B-A. *

The accompanying statistics have become available through the issuance of a preliminary report by the Department of Mines, Ottawa. Although subject to slight additions or modifications of detail pending final compilation at a later date, we believe a more than ordinary interest will be taken in the data presented, particularly on account of the war-created activity which has marked almost every section of Canada's mineral resources development.

As a result of the demand created by the war, our metal mining industry has, in 1915, shown the highest production ever recorded and notwithstanding the greatly decreased production of materials of construction, such as cement, clay and stone quarry produces, a very large increase is still shown in the total mineral output, over that of the previous year. The total value of the metal and mineral production in 1915, as shown in the preliminary report here presented, was $138,513,750, compared with $128,863,075 in 1914, and $145,634,812 in 1913, the latter being the highest production recorded. The increase in 1915 over 1914 was thus $9,-650,675, or 7.49 per cent., but the output is still less than that in 1913 by $7,-121,062.

Development Scope Enlarged

Without attempting to discuss at length the effect of the war upon the Canadian mining industry, it may be remarked that the demand for the metals, copper, lead, nickel and zinc, led to great activity in the operation of the already developed deposits of these metals, and also, later in the year, to the opening up of old and the exploitation of new deposits. The capacities of steel furnaces were taxed to the utmost to meet the demand for shell steel. The fact that under war conditions it was desirable that our metals should become available for commercial or national use entirely within the country, and that we should be less dependent, even upon a friendly neutral for their recovery in smelters and refineries, has stimulated the development of our smelting and refining operations.

Amongst non-metallic minerals the recovery of benzol and toluol in by-product coke oven operations was a direct result of the war, as was also the activity in the mining and shipment of magnesite and of chrome ores. The limitation placed by the Government upon the export of certain minerals and metals may have caused inconvenience and interruption to certain industries but these were usually adjusted by the issue of special licenses for export where it could be shown that such export was not for enemy destination but was in the interest of Great Britain and her Allies.

*Chief of Mineral Resources and Statistics Division, Mines Branch, Department of Mines, Ottawa.

The mining and metallurgical industries include a great variety of products so that in dealing with the industry as a whole the total value presents the only means of comparison, nevertheless quantities of production and prices are at all times the items of essential importance.

Metals Production

There has been an increased production in all metals with the exception of silver. The total value of the metallic production in 1915 was $77,046,082 as compared with $59,386,619 in 1914, and $66,361,351 in 1913, the increase over 1914 being nearly 30 per cent., and that over 1913 the highest previous year, about 16 per cent. The production of nickel, copper and zinc are the highest that have been recorded in these metals. The quantity of nickel was 50 per cent. greater than in 1914, copper over 35 per cent. greater, lead nearly 25 per cent. greater, gold over 18 per cent. and pig iron nearly 17 per cent. The falling off in silver was only 48,000 ounces or less than two-tenths of one per cent. Owing to the high prices of copper and lead, the total values of these metals show increases of 72 per cent. and 56 per cent. respectively.

Although the prices of nearly all metals have been high they have in most cases been exceeded in comparatively recent years except possibly in antimony and zinc, and some of the rarer metals. Compared with 1914, the average price of copper shows an increase of 27 per cent., lead an increase of 27 per cent. spelter an increase of 154 per cent., antimony (ordinaries) an increase of 246 per cent., silver a decrease of 9.4 per cent. and tin an increase of 12.2 per cent.

Non-Metals Production

The total value of the non-metallic production in 1915 including clay and quarry products, etc., was $61,467,668 as against $69,476,456 in 1914; $79,273,461 in 1913. Compared with 1914 the decrease was $8,008,788, or 11.5 per cent., while compared with 1913 the falling off was $17,805,793 or 22.5 per cent. It will be seen that the largest decreases in 1915 occurred in materials of construction such as cement, clay products, lime, sand and gravel, and stone and quarry products, the falling off varying from 16 to nearly 34 per cent. There was, however, also a smaller production of coal, natural gas and gypsum. On the other hand there were increases in the shipments of asbestos, chromite, graphite, magnesite, pyrites and salt.

Mineral Production by Provinces

The record of mineral production by provinces shows the relative importance of the provinces in the same order as in the previous year with the exception that Quebec and Alberta change places, the former having the larger production in 1915. An increase in production is shown in the provinces of Nova Scotia, Quebec, Ontario, and British Columbia, and a decrease in New Brunswick, Manitoba, Saskatchewan, Alberta and the Yukon district.

Ontario again has the largest output with a value of $61,800,178, or 44.6 per cent. of the total, and showing an increase over 1914 of $8,765,501, or 16.5 per cent. British Columbia occupies second place with a value of $28,932,-658, or 20.9 per cent. of the total and showing an increase of $4,768,619, or 19.7 per cent. over 1914. Nova Scotia is third with a production valued at $18,-126,672, or 13.1 per cent. of the total and showing an increase of $542,033, or 3.1 per cent. over 1914. Quebec comes fourth with a value of $12,159,436, or 8.8 per cent. of the total, and an increase over 1914 of $322,507, or 2.7 per cent. Alberta occupies fifth place with a production of $9,915,282, or 7.2 per cent. of the total and showing a decrease of $2,768,952, or 21.8 per cent. compared with 1914. The Yukon district mineral production including copper and coal, as well as gold, is sixth, with a value of $4,915,863, or 3.6 per cent. of the total and a falling off from 1914 of $502,-322, or 9.3 per cent. Manitoba's production was $1,351,604, a falling off of $1,-061,885, or 44 per cent. New Brunswick's production was $916,329, a decrease of $98,241, or 9.7 per cent. and the production of Saskatchewan was the smallest, being $395,728, or less than that of 1914 by $316,585, or 44.4 per cent.

Gold

The total production of gold in placer and mill bullion and in smelter products in 1915 is estimated at 916,076 fine ounces valued at $18,936,971, as compared with 773,178 fine ounces valued at $15,983,007 in 1914, an increase of $2,953,964 or 18.5 per cent. Although

the production has more than doubled since 1907 it has not yet reached the high mark attained during Klondike's best years. The 1915 output was exceeded during each of the four years from 1899 to 1902. Of the total production in 1915 about $5,550,987 was derived from placer and alluvial mining, $9,195,307 in bullion and refined gold, and $4.230,677 contained in matte, blister copper, residues and ores exported.

The production in Nova Scotia was about $137.178, or over twice the output of the previous year. The pyrites ores of Quebec carry small quantities of gold and silver, though the producers are not paid therefor. No placer recovery was reported from this province. Ontario has now become the largest gold producing province in Canada, the production in 1915 from fifteen properties being reported as $8.386.956, or 44 per cent. of the total production in Canada, as against a production in 1914 of $5,545,509, an increase of $2,841.447, or 51 per cent. The Hollinger and Acme Mines contributed about one-half of the output in 1915 and the Dome nearly one-fifth of the total. No production of gold has been reported in either Manitoba or Saskatchewan although some development work has been done. From Alberta record has been obtained of the recovery of about $4,000 of alluvial gold.

The production in British Columbia was $5 628.982, including $755,000 estimated by the provincial mineralogist as being the output of placer workings, and $4.873.982 recovered from milling and smelting ores. In 1914, the production was $5.224.393, including $565,000 from placer workings and $4,659.393 from milling and smelting ores.

The Yukon production in 1915, including a small recovery from copper ores, was $4.755.721, a decrease of $369,653 from the 1914 production. The amount of gold on which royalty was paid during the year 1915 according to the records of the Mining Lands and Yukon Branch, Interior Department, was 287.254.15 ounces, as against 309,691.17 ounces in 1914, and 352,900.04 ounces in 1913. For purposes of the royalty this gold is valued at $15 per ounce although the actual value is probably nearer $16.50. The receipts at the Dominion of Canada Assay Office, Vancouver, were 87,284.35 ounces, valued at $1.421.292.37 or an average of $16.28 per ounce. The exports of gold bearing dust, nuggets, gold in ore, etc., in 1915 are reported by the Customs Department as $16.528.143.

Silver

The production of silver was 28.401,735 ounces valued at $14.088.397, as against 28 449 821 ounces in 1914, valued at $15.593,630. Silver is the principal metal that did not show an increased production in 1915. The falling off in quantity was very small, however, amounting to only 48,086 ounces. Owing to the lower price of silver, the decrease in total value was $1,505,234 or over 9.6 per cent. Of the total production in 1915, 24,653,057 ounces, or about 86.8 per cent. is credited to Ontario.

The production from the ores of Cobalt and other silver camps was 23,568,147 ounces including 19,893,639 ounces in bullion recovered in smelters and cyanide plants in Canada and 3,674,508 ounces estimated as recovered from ores exported to United States smelters. The quantity credited to gold ores was 84,910 ounces. The total production in 1914 was estimated at 25,139,214 compared with which the 1915 recovery shows a decrease of 1,571,067 ounces. Of the silver in bullion, 10,623,307 ounces were produced in smelters in Southern Ontario, and 9.270,332 ounces in the mills at Cobalt, the total in bullion being over 84 per cent. of the production of the district.

The production in British Columbia, representing refined silver, silver contained in smelter products, and estimated recoveries from ores exported, was in 1915, about 3.628,727 ounces as compared with 3,159,897 ounces in 1914, an increase of 468,830 ounces, or over 14 per cent.

In Quebec province there is a small silver content in the pyrites ores shipped, while in the Yukon 58,382 ounces are estimated as being contained in the placer gold produced and recovered from copper ores. The exports of silver bullion and silver in ore, etc., as reported by the Customs Department, were: 27,672.481 ounces valued at $13,812,038.

Copper

The copper output in 1915 was the highest recorded. The production in smelters together with the estimated recoveries or amounts paid for in ores exported amounted to 102,612.486 pounds which at the average New York value of refined copper would be worth $17,726.307. The highest previous production was in 1912 when an output of 77,832,127 pounds was reached. Compared with the production in 1914 which was 75,735.960 pounds valued at $10,301,606, an increase is shown of 26,876,526 pounds or 35 per cent., and in total value of $7,424.701, or 72 per cent.

Of the total 1915 production, 42,050,347 pounds were contained in blister copper, 44.230,052 in copper and copper nickel matte, and 16,332,087 recovered from ores exported.

The production in Quebec from pyrites ores was 6,082,003 pounds as against 4,201.497 pounds in 1914. The Ontario production is derived chiefly from the nickel-copper ores of the Sudbury district and of the Alexo mine, although there is a small amount of copper contained in the silver ores shipped from Cobalt, some of which is paid for. There was also a small shipment from the old Massey mine which was re-opened during the year. The production in 1915 is reported as 39,303,279 pounds as against 28,948,211 pounds in 1914 an increase of 10,355,068 pounds or 35.7 per cent. Further detail respecting production will be found in the remarks on nickel.

British Columbia also shows a largely increased production in 1915, the total being 56,692,988 pounds as against 41,219,202 pounds in 1914, an increase of 15 473,786 pounds or 37.5 per cent. The 1915 production in this province included 47,064,234 pounds recovered in blister and matte, etc., and 9,628,754 recovered from ores shipped to smelters outside of Canada. The Coast mines including the Britannia, Texada Island and Anyox mines, etc., are credited with 33.980.508 pounds, and the Trail Creek and Boundary mines with 22,712,480 pounds. The Yukon production is reported as 534,216 pounds as against 1,367,050 pounds in 1914.

Exports of copper according to Customs records were:—Copper fine in ore, etc., and copper in pigs 102.729,579 pounds valued at $12,460,356; there were also exports of old and scrap copper amounting to 4,161,600 pounds valued at $616,553.

The total value of the imports of copper in 1915 are recorded as $3.467,586 as against $4,256,901 in 1914. The imports in 1915 included $16,818,116 pounds of copper in pigs, ingots and manufactures, valued at $3.104,382; other manufactures valued at $263,922, and copper sulphate 1,854,850 pounds, valued at $99.282. The imports in 1914 included 26.280,815 pounds crude and manufactured copper valued at $3,983,322, copper sulphate 1,143,039 pounds valued at $53,802, and other manufactures of copper valued at $219,777.

Nickel

Refined metallic nickel is now being recovered in Canadian refineries but only in small quantities and as a by-product in the smelting and refining of the silver-cobalt-nickel ores of the Cobalt district, nickel oxide having been recovered in these smelters for several years. The nickel-copper ores of the Sudbury district supplemented by a small tonnage of similar ores from the Alexo mine in Timiskaming, north of Cobalt are the main sources of nickel production which in 1915 increased nearly 50 per cent. as compared with 1914, and is greater than the production in 1913, the largest previous record, by over 37 per cent.

The nickel-copper ore, derived from 12 separate mines, is reduced in smelters and converters to a Bessemer matte con-

taining from 77 to 82 per cent. of the combined metals and shipped in that form to Great Britain and the United States for refining, the product of the Canadian Copper Co. going to New Jersey, and that of the Mond Nickel Co. to Wales. A portion of the matte produced by the Canadian Copper Co., is used without the intermediate refining of either metal for the direct production of Monel metal, an alloy of nickel and copper.

The total production of matte in 1915 was 67,703 tons, containing 39,216,165 pounds of copper and 68,077,823 pounds of nickel and valued by the producers at $10,352,344. The tonnage of ore smelted (part being previously roasted) was 1.272.283. The production in 1914 was 46.396 tons of matte containing 28,-895,825 pounds of copper and 45.517,-937 pounds of nickel and valued at $7,-189,031. The reported recovery of nickel from the ores of the Cobalt district was 55,325 pounds of metals and 200,032 pounds of nickel oxide. The recovery in 1914 was 392,512 pounds of nickel oxide.

The exports of nickel are reported by the Customs Department as 66,410,400 pounds valued at $7,394,446 or an average of 11.13 cents per pound. Since about 80 per cent. of the Canadian nickel production is exported to the United States, it may be of interest to add to the Canadian statistics a record of the imports (eleven months only in 1915) of nickel into and the exports from the United States.

The exports of nickel from the United States during the eleven months ending November were 24,503,585 pounds valued at $9.299,234 or an average of 37.95 cents per pound. More than 50 per cent of these exports went to the United Kingdom. The value of the United States exports in 1914 ranged from 31 to 39 cents per pound ahd averaged about 34 cents. It will be noted that a larger quantity of nickel finds its way to the United Kingdom through United States refineries than is exported directly from Canada.

Lead

Although there was an increase of nearly 25 per cent. in the production of lead, the 1915 output has been exceeded in six of the past 15 years. The production of lead in 1914 was 45,377,065 pounds, which valued at 5.60 cents per pound, the average price of pig lead in Montreal for the year, would be worth $2,541.116. The production in 1914 was 36.337,765 pounds valued at $1,627,568, or an average of 4.479 cents per pound. The 1915 production consists chiefly of pig and manufactured lead produced at Trail, B.C., but includes also an estimate of the lead probably recoverable from ores shipped to smelters outside of Canada. The entire output of the Surprise mine in the Slocan District, B.C., was shipped to the United States, refined in bond, and sold in London.

The exports of lead in ore, etc., in 1915 are recorded by the Customs Department as 1,845,100 pounds valued at $40.273, and of pig lead 2,066,929 pounds valued at $79,067. Exports in 1914 were 246.100 pounds of lead in ore and 510,-573 pounds of pig lead.

The total value of the imports of lead and lead products in 1915 was $2,479,-261 as against $1,042.538 in 1914. The 1915 imports included 42,616,200 pounds valued at $2,010,006, manufactured lead 3,102.838 pounds valued at $184,581, other manufactures valued at $102 439, litharge 1,579.800 pounds valued at $89,-232 and lead pigments 1,709,035 pounds valued at $93,003. The imports of litharge and pigments would contain approximately 1,565 tons of metallic lead and the total import of lead would therefore exceed 24,425 tons as shown by this record. The imports in 1914 were equivalent to about 10,869 tons.

Zinc

Complete returns of zinc shipments have not yet been received but the tonnage is estimated at 15,553 tons containing 12.400,000 pounds of zinc. Shipments include several hundred tons from Notre Dame des Anges, Quebec, but the greater part is from fifteen properties in British Columbia. Zinc shipments in 1914 were reported as 10,893 tons containing 9.101,460 pounds of zinc.

The Consolidated Mining & Smelting Co., at Trail, B.C., after successful experimental development has installed at Trail a zinc recovery plant, having an initial daily capacity of 35 tons of refined zinc, and has entered into a contract with the Shell Committee for a considerable tonnage of zinc to be delivered during 1916. A small quantity of zinc was recovered during 1915 in connection with the experimental work. The Electric Zinc Co. has constructed a plant at Welland, Ont., for the recovery of refined zinc from zinc oxide. It is intended eventually, to treat the zinc ores from Notre Dame des Anges, Quebec, at this plant. At Silverton, B.C., a demonstrating plant, using the French process for the recovery of zinc, was operated during 1915 and satisfactory results are claimed.

Other Metals

Antimony.—After several years of no production the demand and high prices in 1915 caused a renewal of activity in mining antimony ores at West Gore, Nova Scotia, and Lake George, New Brunswick. About 1.288 tons of concentrates were shipped to England from the former locality. The antimony smelter at Lake George was operated toward the end of the year with a small production of refined antimony, and there was also some recovery of refined antimony at the lead refinery at Trail, B.C. Antimony ores are also reported to have been shipped from Carpenter Creek, Slocan, from Bridge River District, Lillooet, B.C., and from the Yukon but no record has been obtained. The total production reported is estimated at about 961.040 pounds of antimony refined and in concentrates. The recorded exports of antimony ore in 1915 were 1.149 tons valued at $82,990, while the imports included antimony or regulus of, etc., 1.962,194 pounds valued at $344.918 and antimony salts 67.956 pounds valued at $10,320.

Cobalt.—Metallic cobalt is now being recovered as well as cobalt oxide at the smelters at Deloro and Thorold. The silver-cobalt-nickel ores of the Cobalt district are reduced in these smelters, silver being the principal product with arsenious oxide, metallic cobalt and nickel, cobalt oxide and nickel oxide as by-products. Returns received show a production in 1915 of 211 610 pounds of metallic cobalt and 379.219 pounds of cobalt oxide, equivalent to a total of 477.063 pounds of metal. In 1914 the production was reported as 899.027 pounds of cobalt oxide and 242 572 pounds of cobalt contained in residues sold outside of Canada or equivalent to a total of 871.891 pounds of cobalt. The price of cobalt is seldom quoted.

Molybdenum.—A production has been reported of about 28.600 pounds of molybdenite valued at $28.460, including cobbed molybdenite and molybdenite contained in ore shipped to concentration plants. There were also about 50 tons of low-grade ore sent to the Mines Branch Ore Testing laboratories for experimental concentration. The export of molybdenite was prohibited to other than British destinations except under license, and from September 23rd the British Government requisitioned all molybdenite arriving in the United Kingdom at a price of 105 shillings per unit of MoS_2, C.I.F. Liverpool and appointed H. A. Watson & Co., Liverpool, as buyers.

Platinum.—Efforts are being continued to recover platinum from the gravels on the Tulameen river in the Similkameen district of British Columbia, and there is also occasional recovery of small quantities from the gold gravels of Quesnel division, Cariboo district. A recovery of about 20 ounces is reported in 1915. There was no recovery of platinum from the Sudbury nickel-copper mattes. Customs records show an export of platinum of 236 ounces valued at $11,052, but this may possibly include old metal.

PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

MACHINING AND ASSEMBLING ENGINE PISTON VALVES

By George Black

THE methods herein described may prove of interest and profit to readers of "Canadian Machinery," being, as they are, the result of careful thought and planning in a shop with which the writer was connected. Not the least important factor in the situation was the routing or progress of the component parts through the shop, and a new layout of the machine tools and benches was arranged in order that they should be in the correct position to receive the work and perform the operations in the sequence required, thereby saving much time and labor; as material, once issued from the rough stores, automatically progressed along a definite path, in one direction, towards the assembling benches, unnecessary trucking being eliminated.

This arrangement relieved the foreman from "chasing material" and enabled him to devote a greater proportion of his time to the supervision and quality of the work.

Before proceeding to deal with the machining of the component parts, it may be of interest to state that the shop was handled on a piece-work basis with a guaranteed pay rate. no limit being set upon an operator's earnings, who also had the assurance that no price, once set, would be reduced, unless a change in method was adopted. The machine operations were first of all selected by the tool and jig department, then carefully tried out in the shop. improvements effected if possible, and the whole operation firmly established. With the knowledge of the capacity of the machine and a suitable allowance for tools, gauging and the addition of a "fatigue factor," the piece-work rates were then set for the average operator and from the records kept it was shown that 20 per cent. of the operators increased their earnings by 70 per cent.; 60 per cent. earned an increase of from 35 to 50 per cent. over their day-work rates, while the balance averaged from day rate to 25 per cent. increase; the net result was a satisfied crowd of operators and an equally satisfied management.

Type of Valve.

The type of piston valve under consideration is shown in Fig. 1, where A is the body or spool, BB' are the bull-rings. e e e e the packing rings and D D' are the followers. The material used in the construction of the valve is a good close-grained cast iron. with the exception of the followers, and these are made of wrought iron or mild steel in drop forgings or stampings; the heavy first cost of the dies being very largely offset by the fact that a stamping invariably makes a good piece. When made from either cast steel or iron, there is always a proportion of scrap, which represents valuable machine hours. caused chiefly by blow-holes developing when partly machined; this is a complete loss, not to mention the inconvenience, which is so much greater when the follower is made of malleable cast, due to the length of time required for the process, and which is generally aggravated by late delivery of material.

In actual service, the balance is again in favor of the drop forging, for with the inherent strains due to cooling in the case of the castings, further magnified by the removal of the outside skin in machining, it is not unusual to find cracks developing, principally in the fillets, at the points where the arms join the rim; see Fig. 2, which is a sketch of the follower, and represents a section taken through the centre.

First Operation.

The first operation is to rough drill the valve rod hole, and is expeditiously handled in a No. 2 Baker drill. See Fig. 3. The detail operations are:

	R.P.M.	Feed per rev.	Min.
Set and clamp follower			1.0
Drill 1—1¾" hole	105	.005	7.5
Remove job. Clear chips ...			.5
		Min.	9.0

Note: Not necessary to spot and draw hole. Bottom die leaves a center for drill.

Second Operation.

The follower then passes to a 24-in. Bullard vertical turret lathe, where the 2nd operation. as indicated by f finish marks in Fig. 2 is performed. Fig. 4 shows the piece in the machine and indicates the method of chucking same. The usual time for this operation is .45 hours, the detail operations being:

Operation—	Rev. per min.	Feet per min.	Depth of cut.	Feet per rev.	Time in Min.
(1)—Chuck and true up					2.00
(2)—Set center head and cut					.25
(3)—Face at A	31	100′	⅛"	.014"	
(4)—Set side head, tool and cut					.25
(5)—Turn O.D., face flange at B	31	115′	3-16"	.014"	3.00
(6)—Reset side head and cut					.5
(7)—Rough turn dia C.	31	100′	5-16"	.014"	7.00
(8)—Set center head and cut					
(9)—Bore valve rod hole	31	15′	3-32"	.014"	
(10)—Reset side head and cut, change speed.......					.5
—Turn dia. C, 2nd cut	38	120′	3-16"	.014"	6.0
(12)—Reset side head and cut, change speed.......					.5
(13)—Finish turn flange at B	45	150′	1-32"	.014"	1.5
(14)—Reset side head and cut					.25
(15)—Square out corner	45	140′	1-64"	H.F.	1.5
—Reset center head and cut					.5
(17)—Face at A to depth	45	140′	1-16"	.014"	.75
(18)—Remove piece. Clear chips					1.00
				Mins	25.50

Third Operation.

The third operation to the follower (see f marks, Fig. 2) is handled by the same type of machine and is chucked by dia. C in a universal chuck, but to avoid distorting the work a heavy dog is bolted to the face plate which engages one of

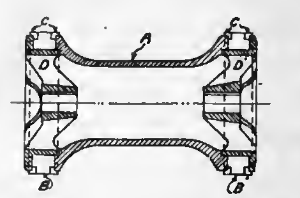

FIG. 1. SECTION THROUGH PISTON VALVE.

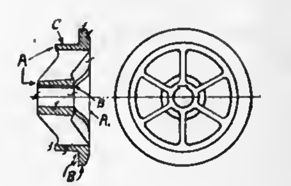

FIG. 2. SECTION THROUGH CENTRE OF FOLLOWER.

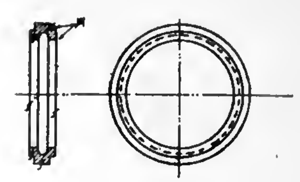

FIG. 6. BULL RING.

the arms of the follower, thus giving a strong and positive drive.

The detail instructions in this case are:

	Rev. per min.	Feet per min.	Depth of cut.	Feet per rev	Time in Min
(1)—Chuck					.75
(2)—Set center head and cut					.5
(3)—Face flange A, 2 tools in head	25	90′	¼″	.014″	5.0
(4)—Face flange B, 2 tools in head					
(5)—Reset center head and cut, change speed and feed.					.5
(6)—Face flange A, 2nd cut					
(7)—Face flange B, 2nd cut	31	110′	1 16″	.027″	2.25
(8)—Set side head and cut					
(9)—Turn O. D. of flange					
(10)—Reset center head	31	110′	¼″	.027″	1.00
(11)—Radius edge of bore					
(12)—Reset side head and cut					
(13)—Bevel edge of flange					.5
(14)—Check work. Remove burrs	31	110′	1-16″	H.F.	1.5
(15)—Remove piece. Clear chips					1.0
				Mins.	13.50

Note: When time is omitted two heads are working. Time for one only given.
H.F.=Hand feed.

Fourth Operation.

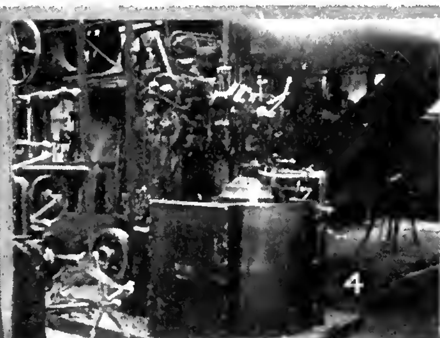
The next operation is that of cutting the ⅛ in. x ⅜ in. keyway in a Baker keyseating machine, which is seen in Fig. 5. The follower is located from the O.D. by a vee plate and clamped in the usual way. The details are:

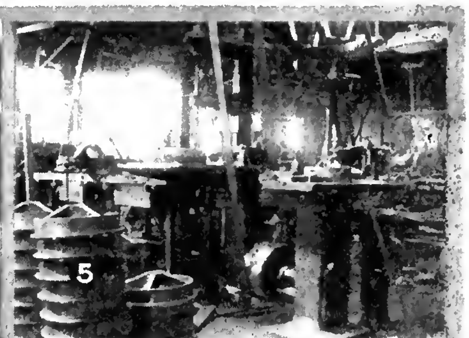
	No. of strokes	Feet per min.	Feed	Time in min.
(1)—Set and clamp follower				1.00
(2) Cut keyway	30	18	H.F.	2.5
(3)—Remove and clear chips				1.00
			Total time:	4.50

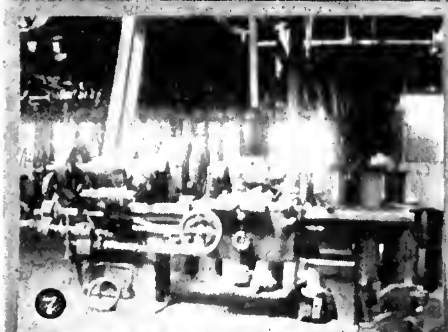
The follower now passes to the assembly bench for a burr-filing operation before being assembled.

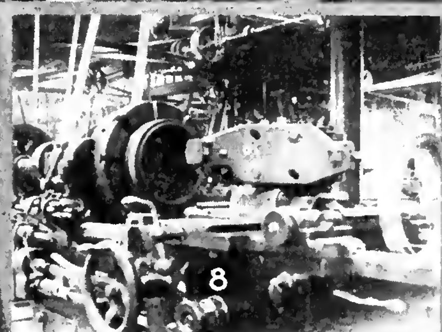
Bull Ring.

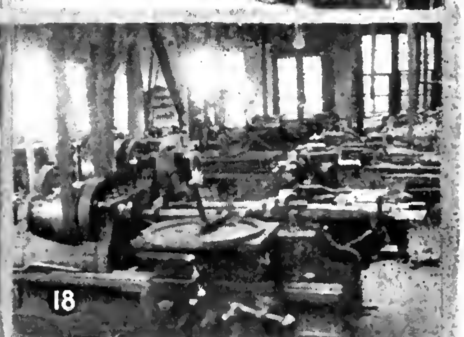
In the meanwhile the bull-ring, see Fig. 6, is turned and bored complete in two operations, on a 22-in. Bullard horizontal turret lathe, which is equipped with











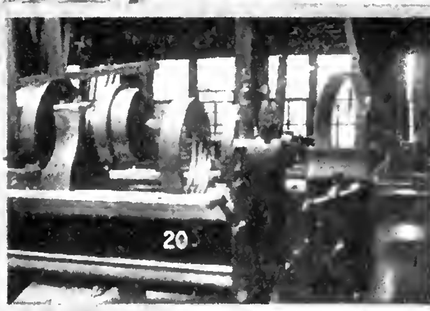


Fig. 3—Rough drilling valve rod hole in follower on "Baker" drill.

Fig. 4—Machining follower on "Bullard" vertical turret lathe.

Fig. 5—Cutting follower keyway on "Baker" key-seating machine.

Figs. 7 and 8—Turning and boring bull ring on "Bullard" horizontal turret lathe.

Fig. 9—Drilling body or spool on "Slocum" drill.

Fig. 10—Turning, facing and recessing body or spool on "LeBlond" lathe.

Figs. 12, 15, 18 and 20—Progressive stages in machining valve rings.

both cross and longitudinal stops, A A, in Fig. 8.

A feature of this operation is the special tool-holders with which the turret is equipped, and which may be recognized in place in both Figs. 7 and 8, while in the Fig. 7 several are seen on the floor to the right hand of the lathe. These tool holders are very rigid and enable the operator to take "sweeping" cuts on face A, Fig. 6, and in addition, the bore or outside diameter can be machined by the tool which is carried in the projecting lug or arm.

First Operation.

Fig. 7 illustrates the first operation, the bull-ring being gripped on the outside in a four-jawed chuck, and the operation consists of:

	Rev. per min.	Feet per min.	Depth of cut.	Feet per rev.	Time in Min.
(1)—Chuck and true up					2.0
(2)—Rough bore and turn step	18	57′	3-32″	.037″	4.0
(3)—Change speed					
(4)—Rough face step	12	38′	Sweep	H.F.	1.0
(5)—Reset tools and cut stack jaws and change feeds..					1.5
(6)—Finish bore and face step	18	57′	1-32″	.015″	8.0
(7)—Face step	18	57′	Sweep	H.F.	.5
(8)—Reset tool and cut					.5
(9)—Finish face step	18	57′	1-64″	.015″	2.5
(10)—Remove addage, check work					.5
(11)—Remove work. Clear chips					.5
					Min. 21.0

Second Operation.

The second operation on the bull-ring is handled on the same type of machine, but in this operation a cast iron plate is bolted to the face-plate and has a shallow spigot turned to just fit the bore of the bull-ring; this spigot centres the bull-ring, which is secured by three clamps to the face-plate. These clamps "take" upon the cored recess in the bull-ring and a glance at Fig. 8 will show that the arrangement insures the outside diameter being concentric with the bore and that the method of clamping, while holding firmly, does not distort the ring at all. Fig. 8 also illustrates the use of the tool-holder very well, for in the holder marked 5 will be seen three tools, which will machine respectively the outside diameter, the face and the step at one operation. The items in this operation are:

	Rev. per min.	Feet per min.	Time in Min.	Feet per rev.	Depth of cut.
(1)—Clamp on jig					1.5
(2)—Set tool and cut					.5
(3)—Rough turn O. D. and step	15	52′	3-32″	.037″	3.0
(4)—Change speed. Rough face step	12	42′	Sweep	H.F.	1.0
(5)—Reset tools and cut. Change speed and feed..					1.5
(6)—Finish turn O. D. and step	15	52′	1-32″	.015″	6.0
(7)—Face step	15	52′	Sweep	H.F.	.5
(8)—Reset tool and cut					.5
(9)—Finish face step	15	52′	1-64″	.015″	2.5
(10)—Remove addage. Check work					.5
(11)—Remove work. Clear chips					.5
					Min. 18.0

Assembling.

After the work has been viewed or inspected the ring is ready for the assembling bench, where the dowel pin hole will be drilled and the pin applied.

HYDRAULIC PRESS RATING

IN the last question appearing in the Feb. 17 issue of Canadian Machinery, page 150, the solution of the problem appears satisfactory; in fact, manufacturers of these presses designate them as of 150 tons. In reality, however, the term is not correct. The pressure, while acting at six equidistant points, is evenly distributed around the circumference, and each cylinder is resisting the pressure of the cylinder opposite. To illustrate, Fig. 1 shows a sectional view through the centres of two opposite cylinders of a hydraulic press. When the spring A is completely compressed, the gauge registers 500 lbs. per sq. inch; this will be the pressure in all the hydraulic connections, from the pump to the cylinder chamber. With a diameter of 8.75 inches, the pressure on each of the two cylinders B and C, acting in the direction of the arrows will be $500 \times 8.75^2 \times .7854 = 30{,}066$ lbs., or about 15 tons.

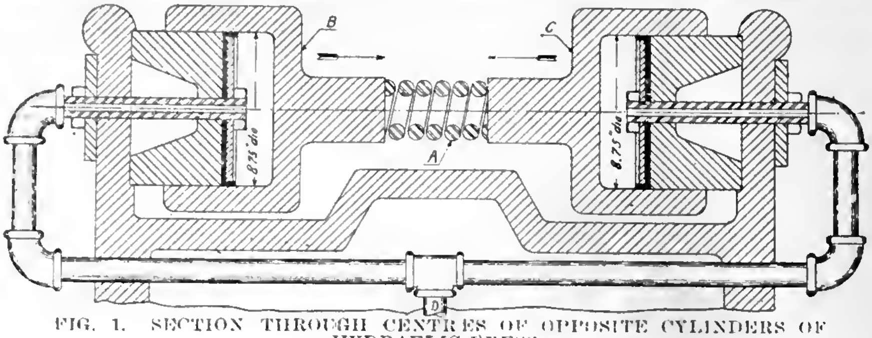

FIG. 1. SECTION THROUGH CENTRES OF OPPOSITE CYLINDERS OF HYDRAULIC PRESS.

It might appear that this force of 15 tons acting on each piston exerts a pressure of 30 tons upon the spring, but in reality the force of 15 tons is only acting against a similar resistance from the opposite cylinder.

To further illustrate this principle, take the single cylinder hydraulic press shown in section in Fig. 2. It is quite evident that with a pressure of 500 lbs. per sq. in. showing on the gauge, the force acting in the direction of the arrow will be the same as that in Fig. 1, and the pressure on C, due to the action of the spring under compression will equal the diametrical opposed press shown in Fig. 1.—J.H.R.

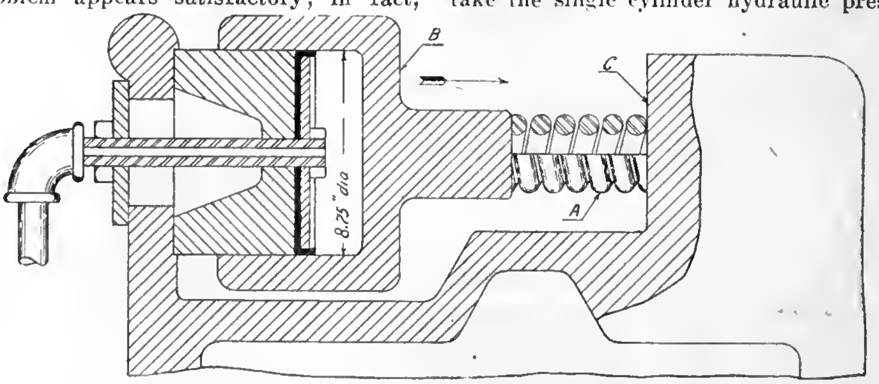

FIG. 2. SINGLE CYLINDER HYDRAULIC PRESS SECTION.

Galt, Ont.—The Board of Trade has elected the following officers for the ensuing year: Hon. president, F. S. Scott, M.P.; president, C. E. A. Dowler; vice-president, W. W. Wilkinson; treasurer, W. Philip; secretary, J. H. Hancock.

NEW PROCESS DEVELOPMENTS

Inventive Genius and Research Operate to a Dual End — They Aim to Improve What We Now Possess and Bring to Our Service Commodities Before Unknown

BAKELITE—AN ACCESSORY MANUFACTURING MATERIAL

THE debt which civilization owes to students of applied science can only be understood, and that very slightly, by endeavoring to picture the conditions under which we would have to exist, should many well-nigh indispensable products suddenly cease to be available. The requirements of chemical and physical research have resulted in numerous substances and materials being evolved, which after fulfilling their original purpose have become intimately associated with existing industrial processes by reason of their superiority over various existing materials.

Origin of the Material

A material of this nature has been in course of commercial development for some years and its various advantages over several existing materials renders it unique amongst the products of modern science. Bakelite takes its name from its inventer, Dr. L. H. Baekeland, a native of Belgium, and for many years resident in the United States. His discovery of so-called "gas-light" photographic papers broght him international fame, which has been considerably enhanced by the everspreading use of bakelite, the ultimate applications of which are not yet in sight.

Bakelite is a distinct, well-defined chemical substance, resulting from the union under certain conditions of carbolic acid and formaldehyde. These two odorous and unpromising liquids form a transparent, amber-like solid, possessing the chemical name of oxy-benzylemethyl-englycol-anhydride, or phenol gum, i.e., Bakelite.

The combination of qualities possessed by this substance suggests its usefulness in many manufacturing lines. Briefly enumerated they are these, no smell, no taste, strong, durable, heat resistant, non-inflammable, unaffected by water, steam, oils, solvents, and most chemicals, while as a dielectric or insulating material it has few, if any, superiors.

Electric Applications Numerous

The great extent to which electricity has entered into modern living conditions has been one of the reasons that electrical applications of this material are more numerous than others. The fact that a temperature of 600 deg. Fahr. is necessary to produce bakelite, and that suitable grades withstand almost as high a temperature in use, gives it a decided advantage over hard rubber for insulating purposes, especially as it retains its shape at all temperatures up to the limit mentioned.

In using it for insulating purposes, the transparent gum has suitable binding or filling materials incorporated with it which add greatly to its strength. While in a plastic state it is put into molds and submitted to pressure at a high temperature for a few minutes. Exactness of shape and size is a characteristic of these moulded pieces. Each one comes from the die an exact duplicate of every other one, the edges and lines are sharp and clean, and the piece fits in place as in interchangeable machine construction.

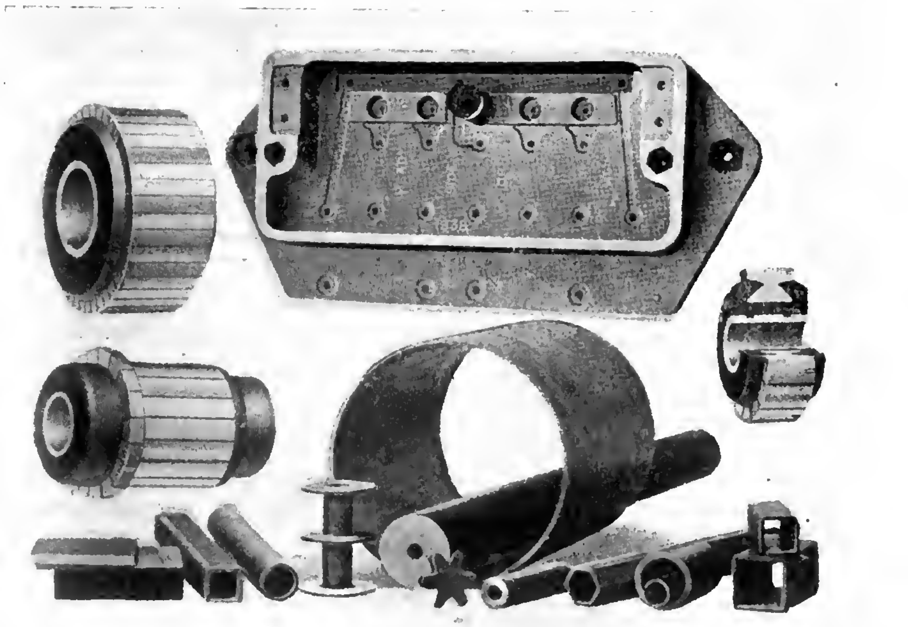
Die-Casting Advantages Obtainable

All the desirable features of die-casting are obtainable with this process, the principal differences being that bakelite is lighter — about one-third the weight—it is perfectly homogeneous, does not lose its mechanical strength nor deteriorate with age, is unaffected by most liquids and vapors, and has a finish of any desired fineness which is permanent in any climate, dispensing with enamelling, plating, or any other method of surface coating.

Commutators for electrical apparatus are now assembled in position and the bakelite moulded into place along with bushings, and any other desired parts. The cost of small and medium sized commutators is thus largely reduced through the elimination of mica in any shape or form. A bakelite molded commutator is impervious to oils and dust; and cannot work loose in service. Armature coils impregnated with bakelite are bound together in a solid mass of high electrical insulation, and entirely unaffected by water, heat, etc. Apparatus so treated may be operated at higher temperatures and run at great speed without distortion.

Diversity of Applications

Goods of many kinds may be made, from electrical instrument covers, switch fittings, terminal blocks, etc., to automobile radiator caps and steering wheel rims, while articles such as transparent fountain pens, pipe stems, cane handles, cigar holders, buttons, etc., serve to indicate the more ornamental applications.



ELECTRICAL, MECHANICAL AND MISCELLANEOUS PARTS MOULDED IN BAKELITE.
Switch boxes are moulded with metal terminal posts in position; commutators are moulded in one piece, dispensing with mica, and possessing great mechanical strength, while tubes, bars and stock shapes are obtainable in great variety.

While the completeness of the manner in which it displaces hard rubber will be understood from the foregoing remarks, it has remained for mechanical applications to offer what promises to be a wide field of application. In the form of sheets, rods, tubes, etc., it is fast taking the place of hard rubber, fibre, press board and similar materials.

Mechanical Uses Numerous

Gear pinions made of bakelite are as near perfection as possible. This is due

to the fact that bakelite is a non-organic substance, and does not deteriorate with age, swell, warp or otherwise betray its organic origin like rawhide, fibre, etc. When cloth or paper is impregnated with bakelite and moulded under heat and pressure, the resultant product is a chemically different substance from the originals, the base materials assuming all the properties of the bakelite.

Pump valves, ammonia valves, valve wheels, switch handles, thrust bearings, oiless bushings, gear pinions, small machine parts previously die-cast, friction blocks and discs, etc., are a few applications which indicate the sphere of usefulness which this material is destined to fill in the near future. In addition to molded articles, it is obtainable in the form of sheets, rods and tubes of standard sizes which can be readily machined when required. The two principal colors are brown and black, but beautiful colors and stratified effects can be produced in connection with fancy goods and ornamental articles such as have hitherto been made of celluloid, xylonite, and similar fragile or inflammable materials.

Designers in many lines of manufacturing are daily becoming more aware of the value of bakelite in solving certain construction problems, the real usefulness of this new and unique material being due to its remarkable combination of qualities, which, previous to the advent of bakelite, were distributed amongst several different substances, but now for the first time are obtainable in a combined form capable of meeting all demands.

ELECTRIC STEEL

SOME statistics which have been recently issued show that the electric furnace is making steady headway. It is stated that the total number of furnaces now employed for steel making and in service has increased to over 300, and it is a significant fact, that recent progress in England has proceeded by greater strides than in any other country. Even in Sheffield, where a few years ago it was imagined that local conditions would preclude anything like an extensive employment of electric furnaces, a considerable number have now been installed.

Special Steels Feature

It is the increasing demand for special steels which has led to this increasing use of the electric furnace by Sheffield steel makers. For motor car construction and for aeroplane parts the need for special varieties of steel has increased very rapidly since the outbreak of war, and it has been found by experience that these steels can be best produced in the electric furnace. No fewer than fifteen furnaces have been put in operation in Sheffield during the past twelve months.

Furnace Types

The type of furnace most commonly employed is the arc type, mainly of the Heroult form, and those now in service vary in capacity from 3 to 10 tons. It is reported that Hadfields have already five such furnaces at work, while Vickers, John Brown & Co., and Thomas Firth & Sons have each two in operation, and Arthur Balfour & Co., Samuel Osborne & Co., and the metallurgical department of the University one each. The demand for special steels for motor car manufacture has induced some of the leading motor manufacturers—including the Daimler Co.—to instal an electric furnace in their own works, and this is a tendency which is likely to increase. Whereas in England, as already indicated, the electric furnace has been mainly employed for the production of special steels, in the United States electric melting has been largely employed for the production of ordinary steels, although, of course, alloy steels are included in the output.

World Statistics

Turning to world statistics, it appears that the number of furnaces working in the United States, which was 30 at the end of 1914, has now increased to a total of over 70, so that America has displaced Germany, which has about 50 in service, from first place in the list. It should be pointed out also that many of the Germany furnaces are now being employed for the production of ferromanganese. The Heroult furnace is that most favored by steel-makers — more than one-third of the total being of this type, the number of induction furnaces being less than 40.

WAR EXPENDITURES STIMULATING CANADIAN INDUSTRIES

THE expenditure for war purposes in Canada during the current calendar year will aggregate $600,000,000 according to the Canadian Bank of Commerce. In its monthly commercial letter for March, the bank says:

"At the close of 1915, the total orders placed by the British Government in Canada for ammunition was $303,000,000, on which up to the end of the year $80,000,000 had been paid out. Orders on a large scale for other requirements of the Allies are in course of execution. To this volume of business will be added that arising from the equipment of the forces in process of enlistment in all parts of the Dominion, to provide for which Parliament has voted a credit of $250,000,000.

"On our own account and that of the Allies, if the war continues, the expenditure for war purposes in Canada will aggregate $600,000,000 within the present calendar year. The output of ammunition, which at the commencement of the present year was valued at $30,000,000 per month, is steadily increasing as a result of greater efficiency. That still heavier demands will be made upon our industries is foreshadowed by the announcement that at the request of the Government the banks are preparing to provide a further credit of from fifty to seventy-five millions for Imperial purposes. It is hoped that this will result in bringing new orders of at least $150,000,000 to this country.

"Expenditure on an unprecedented scale cannot fail to sustain the prevailing business activity while it continues. The profits of our fields and industries will in the meantime constitute a material set-off against our indebtedness, but we shall still have to provide for our increased annual obligations, and the as yet unforeseen and indeterminable conditions which will prevail when the war comes to an end."

U. S. STEEL AND CANADA

THE report that the United States Steel Corporation was about to make a large appropriation for the building of a plant on its Canadian property is again revived. It has cropped up from time to time for a good many years back, and when the steel business was looking rather ragged, it was a bogey of some influence on the nerves of the Canadian steel stocks.

Just now, with the Canadian mills operating to capacity and turning away business, the prospect can be viewed philosophically and time taken to decide whether this report of early construction is to pass into oblivion like the others.

The plausible side to the story this time is that with the talk now current in London of closer trade relations between the Mother Country and the Colonies after the war, the U.S. Steel Corporation may consider that the psychological moment to enter Canada has arrived.

Metallic zirconium and its alloys have recently been employed in metallurgy. The oxide is not reduced by the aluminum but ferro-zircon can be prepared by reducing the oxides of iron and zirconia together with powered aluminum, and have been used to a limited extent in place of ferro-titanium for the purification of steels. Zirconium is also claimed to be excellent as a deoxidizer of copper and its alloys, but this has not been proved.

CONTEMPORARY WAR ARTICLES

Embracing Information and Data Drawn from a Variety of Sources Relative to and Arising from the Prosecution of this Many-Sided European War

75 mm. H.E. SHELL PRODUCTION IN FRANCE

THERE are two principal methods of making shell cases in France, the first consisting of forging so as to obtain roughly the necessary shape, afterwards finishing by machine; and the second that of turning from the rough solid bar. For some shells, cast steel is used, but, generally speaking, a

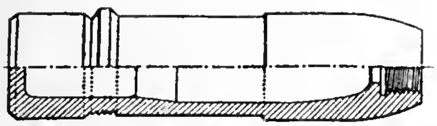


FIG. 1. FRENCH 75 MM. HIGH-EXPLOSIVE SHELL.

moderately hard acid Martin steel is used having the following characteristics:—

	Breaking load tons per sq. in.
In annealed condition ...	35 to 40
After quenching in water at 64.6 degs. F., and retreating at 977 degs. F.	54 to 67

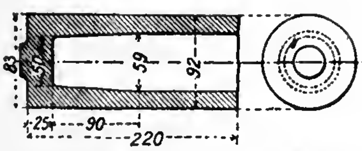

FIG. 2. BLANK AFTER PUNCHING.

The 75 mm. shell cases are made from bars which are 82 mm. in diameter, the length cut off for each shell to be forged being 195 mm., and for each bored shell 310 mm., or perhaps a little more.

The relative merits of the forging and boring are discussed in, as will be noted, no uncertain terms. The former is declared to be much more advantageous than the latter from all points of view, and particularly as regards output, quality and economy. It is pointed out

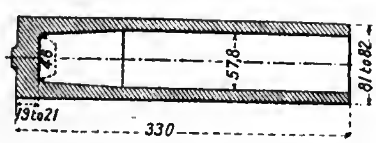

FIG. 3. BLANK AFTER DRAWING.

FIG. 4. CENTERING.

too that the weight of a blank used for forging is just under $17\frac{1}{2}$ lbs. as compared with the weight of just over $27\frac{1}{2}$ lbs. in the blank to be bored, and that the whole of the difference in weight is lost in turnings.

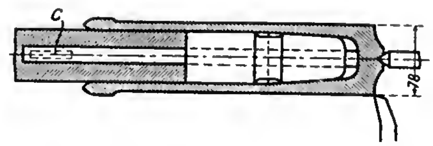

FIG. 5. TURNING.

The forging process, however, requires the installation of heavy hydraulic machinery such as, at the beginning of the war was possessed by comparatively few French shops. However, the necessary presses, etc., are being quickly made and put into service, and it is said that in quite a short time they will be operating in sufficient numbers to permit the abandonment of the boring method, which it is stated "has never been considered as being anything but a provisional solution of the problem." Both methods as they are carried out in France are, however, briefly described here.

The Forging Process

The forging process comprises two operations—punching and drawing. For the punching operations the 75 mm. blank is 195 mm., or roughly $7\frac{5}{8}$ in. long, and 82 mm., say $3\frac{1}{4}$ in., in diameter. It is heated in a furnace to a temperature of between 1,000 and 1,050 deg. Cent. It is then taken out and, after

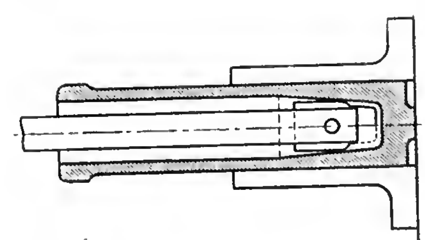

FIG. 6. SMOOTHING BOTTOM OF HOLE.

being carefully brushed to remove the scale, is inserted while hot vertically into a matrix arranged in the base of a vertical hydraulic press. The matrix is slightly tapered from top to bottom, and is rather larger in its smallest diameter than the blank. When the blank is in the matrix, a cylindrical plunger which is attached to the piston of the press is immediately forced down on to its centre. The plunger has a diameter in its largest part of 59 mm., and is parallel for the major portion of its length, but in the last 90 mm.—that is in the portion which is pressed on to the blank—it tapers down to a diameter of 50 mm.

The first result of the application of pressure is to make the metal spread out and completely fill the matrix, and on the pressure being continued the metal is squeezed out in annular form around

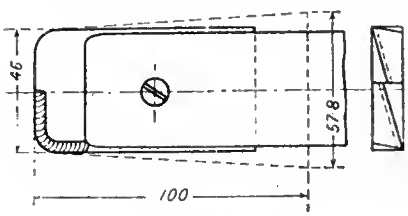

FIG. 7. SMOOTHING TOOL.

the plunger, so that, when the stroke of the press is completed, the blank has assumed the shape and size shown in Fig. 2. It will be observed that the length has now become 220 mm., that the outside diameter varies from 92 mm., to 83 mm., and that there is a projection at the closed end, the object of which will be described later.

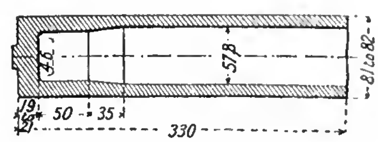

FIG. 8. ALTERNATIVE SHAPE OF HOLE.

As the thickness of the metal when the punching comes from the press is considerably in excess of that which is required in the finished article the process of drawing is resorted to so as to avoid an excessive amount of machining. In the drawing process, which is accomplished in the same heat as the punching, the punched blank is placed on the end of a horizontal plunger, which is considerably smaller in diameter than the punched hole. The plunger then

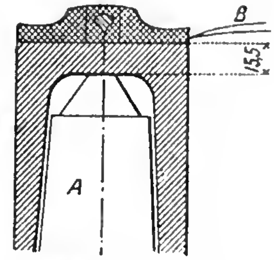

FIG. 9. MARKING OFF THICKNESS OF BASE.

forces the metal through one or preferably two dies, so that the half-finished shell case, as we may now call it, has

assumed the shape and size shown in Fig. 3.

It will be observed that it is now accurately cylindrical, that the diameter

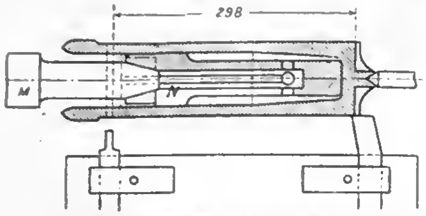

FIG. 10. MACHINING BASE AND CUTTING TO CORRECT LENGTH.

has been reduced to from 81 mm. to 82 mm., and that the length has increased from 220 mm. to 330 mm. The central hole has also been reduced in diameter. With careful working, it is explained, this central hole may be made so exactly to gauge in the drawing press that it may even sometimes be allowed to go without any machining or, at any rate, all it should require is a slight milling at the bottom. The drawing press may be either hydraulically or mechanically worked. At Creusot the work is partly done by electrically operated presses,

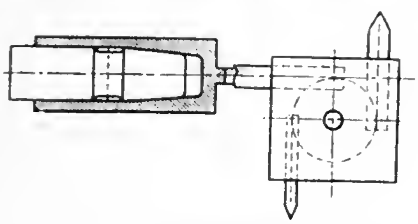

FIG. 11. RE-CENTERING.

which, apparently, are operating most satisfactorily.

The Boring Method

If the boring method be employed, the first process is to cut the blanks to the correct length. This, of course, may be done in several ways, and in one works the oxy-acetylene flame is being employed successfully, the 82 mm. bar being cut off in thirty seconds. The next operation is to mark on one end the correct axis of the blank. The other end is then polished and treated with an iodide solution so as to discover any porosity or defect in the metal.

Next a central hole 46 mm. in diameter is bored in a horizontal boring machine for a depth of 268 mm., which leaves the base with a thickness of about 27 mm. This, with the addition of some 15 mm. for the projection to be used for a centre makes up the total of 310 mm. mentioned above as being the length of the original blank. A conical hole 7 mm. in maximum diameter is then bored in the centre of this projection, the operation being shown in Fig. 4, after which the shell is mounted on a mandril chuck, as shown in Fig. 5, and a cut is taken off along the length of the case, so as to reduce its diameter to slightly more than it is to be in the finished shell to about 78 mm.—see Fig. 5. The edges at the end are also chamfered off.

The succeeding operation is the smoothing of the bottom of the hole. This is done as shown in Fig. 6, a special tool such as that shown in Fig. 7 being employed. Occasionally the interior of the cases is formed as shown in Fig. 8, instead of as in Fig. 3, that is with two parallel portions connected by a conical portion. In this case the whole of the interior may be machined at one operation with three tools. One firm uses for this purpose a Potter turret lathe, which operates automatically. A mark is then

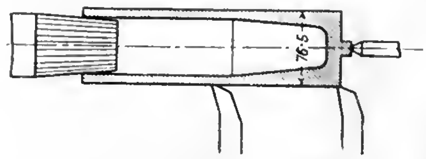

FIG. 12. REDUCING DIAMETER.

scribed on the outside of the case at the base or closed end, to indicate where the metal must be cut off in order to leave a thickness of 15.5 mm. This is done, as is shown in Fig. 9 by means of a gauge spindle A and a scriber B. Following this, an internal spindle chuck M with an expanding arrangement N is inserted into the case, see Fig. 10, so that the latter may be mounted in a lathe to be cut exactly to length by two tools, one a parting tool and the other a tool which will remove the surplus thickness at the base, only a projection for the centre being allowed to remain.

In the next operation, the length of this projection is reduced, as shown in Fig. 11, and a fresh centre hole made. Another cut is then taken along the length of the case, as shown in Fig. 12, the diameter being reduced to 76.5 mm. Thereafter the processes followed are the same, no matter by what method the shell was originally formed.

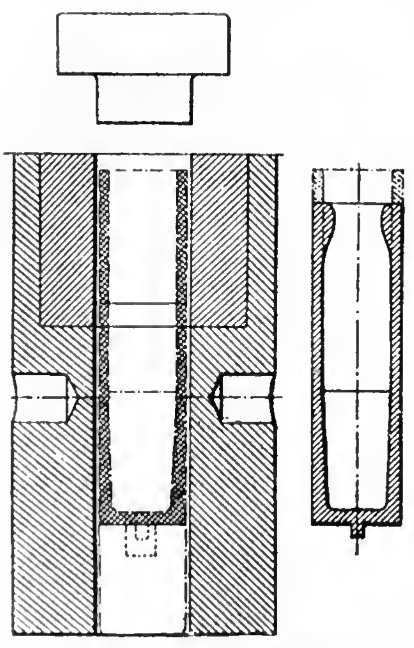

FIG. 13. SETTING UP EDGES ROUND MOUTH OF CASE.

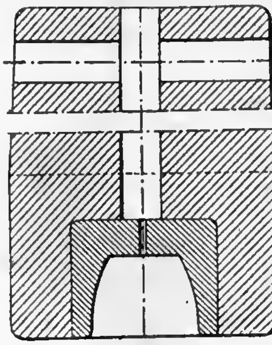

FIG. 14. MATRIX FOR FORMING OGIVAL HEAD.

Succeeding Operations

Up to this point, the shell case has remained cylindrical. It now has to be given an ogival head. This can be done in two ways, but in both of them it is necessary to thicken or set up the edges of the metal round the mouth of the case. For this purpose the open end of the case is inserted into a special type of furnace provided with round holes just large enough to admit it. When a temperature of some 900 deg. Cent.—1652 Fah. is reached, the case is taken out and dropped, base downwards, into a matrix as shown in Fig. 13, and a plunger made to descend on to the heated metal. Since the case fits the matrix quite tightly, the pressure exerted causes the metal to bulge inwards, as shown in the right-hand view, the length of the case being, of course, correspondingly lessened during the process.

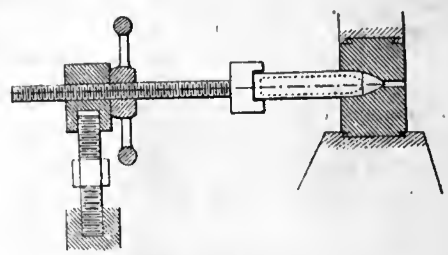

FIG. 15. FORMING OGIVAL HEAD WITH POWER HAMMER.

The case is then ready to be given its conical end, and to do this the open end is heated in a furnace very similar to that employed in the preceding process, and then either inserted into a recess in the base of an hydraulic press, so that the heated end may be subjected to pressure by the descending ram, which is furnished with a matrix shaped like that shown in Fig. 14, or the required form is brought about by means of a power hammer. In the latter case the arrangements are as shown diagrammatically in Fig. 15. There are two half matrices, one being mounted on the anvil and the other being carried by the

tup. The shell case with its heated end is mounted in a chuck fixed to the end of an adjustable horizontal screw, by means of which it can be rotated and gradually be advanced further and further into the jaws of the matrix as the hammer delivers its blows.

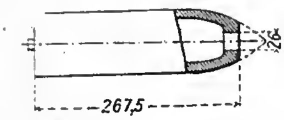

FIG. 16. PART SECTION SHOWING HOLE BORED IN HEAD.

It is necessary to confine the length of case heated for the process of forming the head between fairly narrow limits, so that the minimum number of rejections may be experienced. When using a press the length heated should only be from 50 mm. to 60 mm., but when using a power hammer this length has to be increased to between 80 mm. and 90 mm. The process of forming the ogive is rather a delicate one, but if all the arrangements are well planned few failures should occur. Indeed, there should certainly not be more than 1 per cent.

As regards the relative merits of the two methods of forming the nose, it is pointed out that both have their advantages and their disadvantages, and the choice as to which is to be used must depend largely upon attendant circumstances. It is said, however, that with the press there is a greater output in a given time than with the hammer.

Heat Treatment

After these processes the pointed end —if there be one—is removed, and a hole bored through the metal into the interior of the cavity, as shown in Fig. 16. The cases are then ready for heat treatment. For this purpose it is not unusual to employ a gas furnace such as that shown in Fig. 17, though other kinds of furnaces may, of course, be used. The temperature to which the cases are raised is about 850 deg. Cent. or 1,562 deg. Fah., and when they are removed from the furnace they are allowed to remain in the air for a few seconds, so as to permit the temperature to fall some 50 deg. Cent. They are then quenched in a special bath in which first of all the liquid is squirted at both

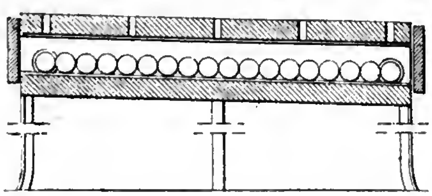

FIG. 17. GAS FURNACE FOR HEAT TREATMENT.

the inside and the outside of the case, and are then totally immersed, the temperature of the liquid being about 20 deg. Cent. or 68 deg. Fah. The re-treatment is carried out at a temperature of between 500 deg. Cent. and 550 deg. Cent., or 932 to 1,022 deg. Fah. The hardness aimed at is such that a 10 mm. —just over 3/8 in. Brinell ball acting under a total pressure of 3,000 kilos.—just under three tons, will make an imprint between 3.5 mm. and 3.7 mm., or practically 1/8 in. wide. Every case is subjected to this test, and all those which are too hard are re-treated.

Centre of Gravity

The operations carried out subsequent to the heat treatment are not always

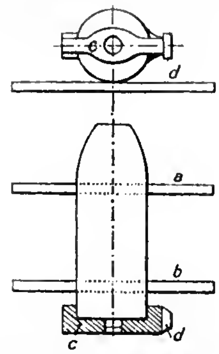

FIG. 18. TESTING CENTRE OF GRAVITY.

made in the same order, but that indicated, may be taken as being more or less normal. First of all it is necessary to ascertain whether the centre of gravity of the case falls within the required limits transversely. This is done by specially skilled workmen, who place the case on two parallel straight edges, a and b—see Fig. 18. If there are signs that the case is heavier on one side than the other a cap c is fitted on the end of the case, this cap being provided with a small counterpoise d, which is of such weight that it will accurately counterbalance the largest permissible displacement of the centre of gravity — which is 0.5 mm. If the case then rolls accurately on the straight edges, or if it comes to rest with the counterpoise lowest, then the limits of tolerance have not been exceeded.

If it does not do so, then it is necessary to ascertain by how much the limits have been exceeded. This is done by the aid of the special balance shown in Fig. 19. The case A is placed on the scale of the balance in such a manner that the bias of its weight is in the vertical plane and equilibrium obtained by moving the cursor C along the rack B until the pointer F is brought to the zero mark. The case is then turned through a right angle, and this, of course, upsets the equilibrium, which may be re-established by running the cursor E along the rack D.

These operations should be carried out before any further machining is done, so that any correction necessary may be effected during it. As a matter of fact, the correction is frequently made in the two next operations, which are the giving of the aperture in the nose a touch with a countersinking bit, and the reforming of the centre hole in the projection at the base. By slightly altering the position of the latter the centre of gravity may be readjusted. The outside of the cylindrical part of the case is next finished off to correct diameter in two operations, one fine cut and a still finer cut being taken. For this purpose an ordinary lathe with a carriage capable of taking four tools, as shown diagrammatically in Fig. 20, is employed.

The thickness of the base is now gauged, and if necessary a shaving taken off it. As will be remembered, it was left 15.5 mm. thick. The minimum thickness allowed is apparently 14.5 mm. The channel for the driving band is then cut and smoothed, and its rear edge chamfered off. Circular ridges are then formed in this groove, and by the aid of one or more knurling tools these ridges are moulded into numerous diamond-shaped projections, which take the place of the waved grooves in the British shells for preventing the band from turning.

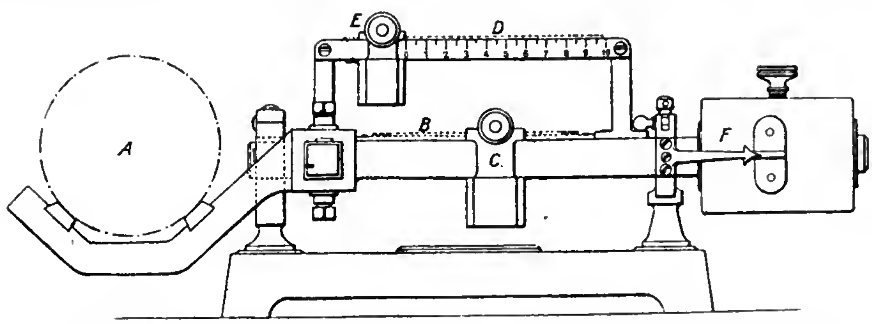

FIG. 19. SCALE FOR ASCERTAINING VARIATION IN CENTRE OF GRAVITY.

Final Operations

The proper ogival curve is next given to the nose by means of a lathe provided with a former, and at the same time the swelled portions behind the nose and behind the driving band are brought accurately to standard diameter. After this the fuse aperture is bored to two diameters, as shown in Fig. 21, and a channel is formed between them. This work is divided up into five distinct operations. The aperture is then screwed to receive the screw plug. Finally the projection at the base, which has served as a centre during the pre-

ceding operations, is removed, great care being taken in doing so not to interfere with the thickness of the material of the base, which has been already brought to standard.

These operations completed, the shell case is submitted to a test to verify the correctness of its centre of gravity longitudinally, and is weighed. The first process consists in gently placing the shell in correct position on two knife edges arranged 5 mm. apart. If the displacement of the centre of gravity is within the tolerated limits the case remains balanced on these edges; if not it is sent back to be readjusted. The case is then weighed, and if too light it is rejected. If too heavy it is returned to have the necessary weight removed.

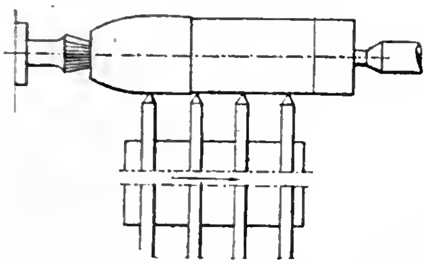

FIG. 20. FINISHING TO CORRECT OUTSIDE FORM.

Every shell case, without exception, is afterwards submitted to an internal hydraulic test of 1,400 kilos. per square centimetre, say nine tons per square inch, for ten seconds. The base, which has previously been well polished, it carefully examined with a magnifying glass during the test, and there must be no trace of sweating. The permanent enlargement in the diameter of the shell case when the test pressure is taken off must not exceed 0.1 mm.

After the hydraulic test, the copper band is fitted, this being generally done by the aid of an hydraulic press, and in three operations:—

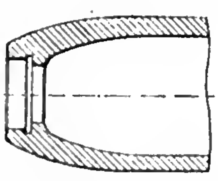

FIG. 21. SECTION SHOWING FUSE APERTURE.

1.—Forcing the band into its groove by squeezing it between to half matrices.

2.—Forcing a channelled ring over it. and forcing a smooth ring over it.

Sound Test

The ring is then machined in two operations. the results of which are shown in Figs. 22 and 23. It should be mentioned that, before the bands are put on, all the shell cases are submitted by the military authorities to a sound test, and any one which does not give out a correct ringing note is rejected. The tooling of the band completed, a plate of copper, or preferably of tinned iron, is soldered to the base, so as to make certain that any porous place which has not become evident during the tests is effectively covered up. Finally the shell has stamped on it various data, including the places of manufacture and tempering of the steel, the number of its batch, and its proof pressure.

After every operation in the course of manufacture, each shell case is carefully gauged, this course being necessary so that no unnecessary work may be done to any case which might be defective after any one operation. When completed. the perfect shell cases are arranged in groups of 1.000 or 2.000 for inspection of the military authorities, who choose at random a certain number generally about twenty, from each group. The cases chosen are then carefully tested for dimensions and centre of gravity. After being passed as correct, they are all washed in petroleum, sometimes greased inside. and the end then closed with a wooden stopper. They are then ready for dispatch to the place where they are charged. This may either be carried out in special works, at the various arsenals, or even in some cases at the rear of the army using the shells.

FIG. 22. FIG. 23.

The foregoing article is from the columns of our British contemporary. "The Engineer," and embodies the substance of a much more comprehensive description of high explosive shell manufacture in France which appeared in the French Journal "Le Geni Civil," a few months ago.

SHELL VARNISHING TROUBLE AND ITS CURE.

A MEMBER of our staff, says Alfred Herbert Ltd., in their Monthly Review, who was recently starting up a number of turret lathes in a large munition factory was discussing with the works manager the question of shell rejections and their causes. In the course of conversation he was told that trouble had been experienced with the varnishing of 18-pounder shells. After these had been in the drying oven some of them came out with the varnish unaffected in colour and transparency, whilst on others the varnish had become very dark in colour and opaque. These latter were being rejected, necessitating the removal of the spoilt varnish, a very tedious process, and subsequent re-varnishing. A visit was paid to the drying room, in order that the matter might be further investigated, as it seemed difficult to imagine what could cause some shells to come from the drying operation in a different condition to others which had undergone an exactly similar process.

The shells were loaded on to a truck, carying several tiers of compartments, and were supported in a vertical position. They were quite close together, so that when the truck was loaded up, it represented an almost solid mass of metal. It was then wheeled bodily into the stove, and the shells left there for the varnish to harden. Our representative did not have time to actually see the process caried out, but was informed that the shells from the middle of the truck were always affected in the manner above described, those on the outside coming out alright.

After thinking the matter over, he came to the conclusion that the trouble was due to a want of sufficient air space between the shells, this having the effect of causing the varnish to be changed in colour by the action of the heat. He, therefore, suggested that only half the number of shells be placed in the truck, having every alternate compartment blank. Since doing this the varnish trouble has been entirely eliminated. It would, however, be interesting to know if any of our readers have ever experienced similar difficulty with varnish, and if so, whether it has been overcome in a similar way.

Another little difficulty that crops up in the varnishing of shell interiors is how to prevent varnish from getting into the threads at the mouth of the shells. It is usual to screw a bush into the shell mouth for the purpose; but this does not entirely obviate the trouble, as varnish gets into the bottom thread or two, necessitating the use of a hand tap to remove it after the varnish has dried.

A wrinkle adopted by a Coventry firm may prove of use to others. The men who screw the bushes into the mouth first daub a small quantity of a vaseline-like mixture of beeswax and tallow round the bottom threads. The shells are then warmed and the mixture softens, running round the junction of the bush and the shell. The varnish forms an even coating in the warmed shell, while the beeswax-tallow mixture effectually prevents it from entry to the threads. The mixture is in no way detrimental either to the varnish or to the explosive which is put in later. No effort is made therefore to remove it after varnishing.

Sidney, N.S.—At the deferred annual meeting of the Board of Trade, held recently, the following officers were elected: President, C. P. Moore; first vice-president, Rod. McDonald; second vice-president. V. W. Merchant.

PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

SPECIAL AND MANUFACTURING FURNACES

THE necessity for correctly heat-treating dies, tools, cutters, etc., has been long recognized by toolmakers and skilled workmen, and within recent years the desirability of extending such treatment to many kinds of manufactured products has become strongly apparent in various lines of manufacture. The Stewart line of furnaces built by the Chicago Flexible Shaft Co., Chicago, has been developed to meet all requirements of forge, tool room, or manufacturing work, and a variety of designs and sizes is offered.

The special combination furnace shown in Fig. 1, consists of a crucible section in the centre with a forge section on the right, and a muffle section on the left which can be used as an oven when required. The crucible section is especially adapted for lead or cyanide hardening, oil tempering, melting soft metals, etc., and is arranged with a cylindrical combustion chamber into which the flame is projected at an angle so that it imparts a circular motion to the gases around the crucible, and maintains an even heat in all parts of the chamber,

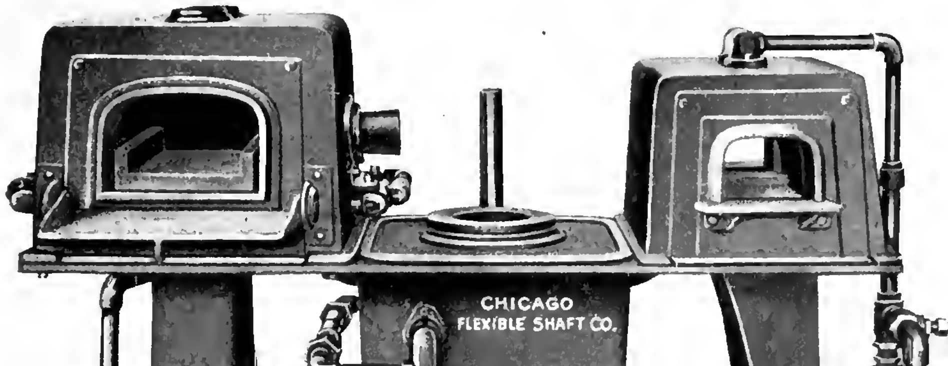

FIG. 1. SPECIAL COMBINATION FURNACE, INCLUDING OVEN, CRUCIBLE, AND FORGE SECTIONS.

the products of combustion escaping through a vent in the rear.

The forge section is open right through so that bars may be heated on any part of their length. The flame is projected down from the two burners and is under

FIG. 2. NO. 1 OVEN FURNACE WITH U-SHAPED BOTTOM SLAB.

perfect control. Tool dressing, light forging, and a great variety of work where direct contact with the flame is not a disadvantage, can be performed in this section.

The muffle section is used when the products of combustion must be kept from the work as when heating finished

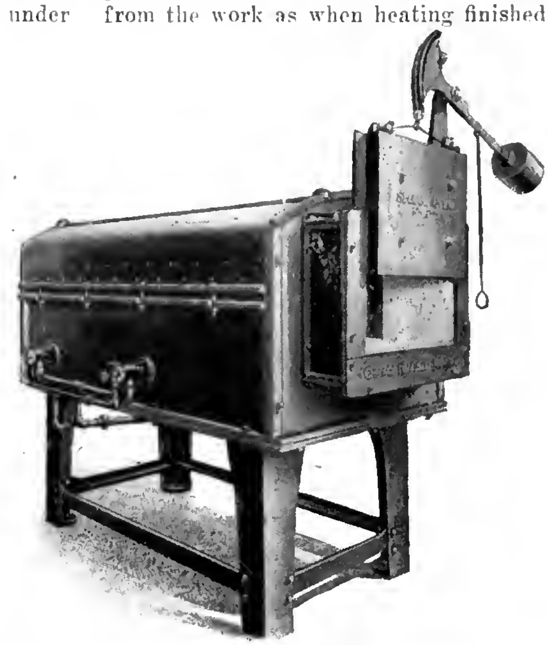

FIG. 3. NO. 25 CASE HARDENING AND ANNEALING FURNACE.

dies, cutters, etc. For ordinary hardening, or annealing, the muffle is removed and a U-shaped slab inserted, thus converting the furnace to the regular oven type. The opening of the muffle section is 4 in. high in centre, 7⅝ in. wide, 13¼ in. deep. The forge section is 4 in. high, 5¼ in. wide, and 10¼ in. deep, and the crucible is of pressed steel with a diameter of 6 in. at the top and a depth of 12 inches.

Approximate gas consumption per hour: Muffle section, 90 cubic ft.; crucible section, 70 cubic ft.; forge section, 60 cubic ft. The net weight is 1,500 lbs., and floor space is 4 ft. x 3 ft. 6 in.

The furnace illustrated in Fig. 2 is No. 1 Oven Furnace, and is particularly suited for all ordinary hardening purposes. A V-shaped bottom slab, with sides which project 1½ in. upwards, gives a semi-muffle effect, keeping the flames off the work, and giving a livelier heat than a muffle without the expense of replacements. Fire clay linings, 4 in. thick, are provided, and when so ordered, this furnace can be arranged for high-speed steel. The chamber is 5 in. high, 9 in. wide, and 13½ in. deep. Net weight 950 lbs., and floor space 28 in. square.

Special Oven No. 25 is specially adapted for case hardening, annealing, and similar work where quantity production demands economical equipment. The hearth is 22 in. wide x 60 in. long, with a door opening 14 in. high, net weight 6,700 lbs.

All Stewart furnaces are supplied with burners for use with artificial gas, but can be fitted for using natural gas, producer gas, or oil as desired.

THE "GEORGE" AUTOMATIC ROLLER BEARING.

AUTOMATIC ROLLER BEARING

A COMBINED roller and ball bearing, in which the radial load is taken by tapered rollers, and the end thrust by balls, is now being produced by the George Automatic Roller Bearing Co., Cincinatti, O. The idea of tapered rollers is not new, but the manner of combining the rollers and balls is new, the result of the construction being that rollers with an appreciable variation in size may be used, and they will adjust themselves so as to distribute the load equally on large and small rollers, the adjustment being automatically brought about by means of balls located between the ends of the rollers.

It is claimed for this bearing that in mounting great accuracy in machining is unnecessary. As will be noticed in the sectional drawing, the inner and outer surfaces of the bearing are tapered, hence concentricity is obtained by moving the bearing laterally in the housing. Both ends of the rollers are ground to a concave form, of slightly larger radius than the corresponding ball. When the bearings are tightened in place a wedging action occurs on the rollers, so that by the time the bearing has made a half turn, any rollers which may happen to be a trifle large are forced endways, causing the balls at that end to spread and act upon the ends of such rollers as may be slightly under size. These smaller rollers are thus forced back toward the smaller end of the bearing until they make proper contact with the working surfaces. Both rows of balls act as spacers, while the row of larger balls also acts as a thrust bearing to counteract the tendency of the rolls to creep laterally.

The bearing is easily assembled and disassembled by means of a small slot in the periphery of the large race which allow the last ball to be put in place when assembling, or taken out when disassembling. When in normal working position the slot does not interfere with the action of the balls.

The makers state that they are prepared to furnish bearings to fit parallel holes, interchangeable with the long series type of other roller bearings.

NOSING SHELLS.

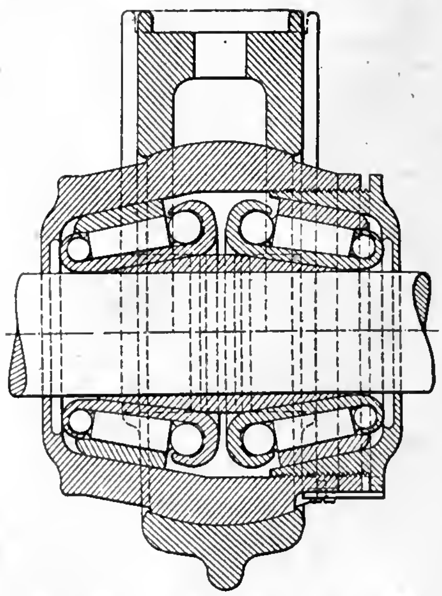
THOSE firms who are manufacturing the bottled type of shell, in which the nose has to be closed in after boring, may have experienced trouble with the upper closing die of the press picking up the shell on the up stroke of the ram It is then necessary to hammer the shell sides to release it, thus taking up valuable time and retarding production.

If a small handful of coal dust or wet sawdust be thrown inside the heated shell before the die is brought down, the gas or steam which is generated inside the shell forces it off the upper die without any external assistance. This wrinkle has been found eminently satisfactory.

It is, of course, obvious that any other medium can be adopted as alternatives to wet sawdust or coaldust provided it will generate some sort of gas or steam under pressure through the action of heat.

SHELL MANUFACTURERS AND ENLISTMENT.

RESOLUTIONS were passed at a recent meeting of shell manufacturers and munition makers in the office of the Canadian Manufacturers' Association, expressing the belief that the work of manufacturing war munitions was being interfered with more and more each week, until there was an apparent danger that a shortage of war supplies for shipment abroad would result unless some plan is adopted to prevent the enlistment of men whose services in the factories are of vital importance.



SECTION OF LINE SHAFT BEARING.

It was voted to send copies of the resolution to the Minister of Militia and Defence, also to members of the Dominion Parliament and the Legislatures of the various provinces, with a request for some action to meet the necessities arising from the conditions.

The resolution calls for a registration of the men skilled in the making of shells and other munitions, so that they may be exempt from enlisting.

INTER-EMPIRE TRADE

AS a result of her development as a manufacturing country, Canada, at the present moment, is probably the most highly favored of all the British Colonies with respect to future participation in inter-Empire trade. South Africa and Australia are so isolated geographically that their progress in manufacturing has heretofore been limited. In addition, the smallness of their home markets, the high cost of factory equipment, and the comparative scarcity of raw materials and fuel, have militated against their industrial upbuilding. There has, however, always been available to our manufacturers, all the materials and conditions necessary to the development of a manufacturing industry on permanent healthy lines.

Manufacturers throughout Canada are alive to the importance and desirability of securing a share of the Empire's requirements in manufactured products, commensurate with our now proven ability to produce. The present stages of development attained by the two colonies mentioned, closely parallel the state of Canadian development some years ago, when agricultural and allied interests overshadowed all other activity. There, as well as here, however, the war has stimulated home production in many lines to a degree which must not be overlooked by our people in the near future.

The President of the Johannesburg Chamber of Commerce, Ernest Chappell, recently said: "Generally speaking, the condition of affairs at present prevailing.... provides a strong stimulus to all South African manufacturers already established, and is giving them an impetus which cannot fail to be of the greatest service to them when they will again have to face competition from outside sources. It may fairly be stated that in this respect the war has constituted the finest assistance for our local manufacturers that they could possibly have had."

Such a statement from such an authority should receive careful attention by prospective exporters, not as a deterrent, but rather as an indication of future opportunities. For many years to come Canadian conditions will favor the production here of many articles, affording our manufacturers the opportunity of building their reputation on solid foundations. What these foundations consist of must be clearly recognized by us, even as they are beginning to be recognized by competitors abroad—"Uniformity of quality and regularity of production are conditions absolutely essential and fundamental to success in any manufacture"—and in no case we might add is the necessity more vital than in export work.

SHELL-MAKING IN CANADA OF PRE-WAR ORIGIN

IT may not be generally known that shell-making in Canada did not have its inception as a result of the outbreak of the present war. The latter, however, established it as a real industry, aside from its possible permanence as such. The fact that we have a Dominion Arsenal may likewise be news to many of our readers.

Some six years ago or thereabouts a shell-making department was organized at said Arsenal, and three years afterwards, according to the findings of Col. Sir. H. W. W. Barlow, following an investigation into the affairs of the institution as a whole, it was found that not a single shell had been produced which conformed to dimension requirements. The machinery for turning out shells was found to be in such poor condition that a considerable time would elapse before it could be put in shape again. Further, of the 8,000 shells in stock, the Barlow Commission recommended that such as were nearly correct to dimensions should be tested and salvaged if possible. On putting the recommendation into effect, not a single shell could be found that was properly shaped. The monetary loss as a result was estimated to amount to over $100,000. Evidently the Dominion Arsenal got off to a bad start and was dogged by the influences responsible for same right up to the time of its reorganization under the superintendence of Col. Lafferty.

The Arsenal activities since then have been many and varied, although related to munitions production in a wider sense, for in less than a year after the installation of the new regime, war broke out; the manufacture of shells then became a nation-wide affair with the outcome and progress of which all of us are more or less familiar. What this institution with its high sounding title of Arsenal made and had condemned in three years, our quite medium size and unpretentious machine shops turned out perfectly in about as many weeks, and undoubtedly at a lower cost per shell in spite of the fact that our metal-working plants have been reproached for accepting the earlier contracts at so-called fabulous prices.

As already stated, the activities of the Dominion Arsenal have been many and varied since the outbreak of the war, for while the widespread distribution of shell contracts has relieved that establishment of the necessity of carrying a proportionate share of these, much more responsibility has been thrown on its administration nevertheless. It would seem then that the Barlow Commission investigation and the resulting reorganization of the Arsenal administration, were timely, if not actually inspired, and it may not be too much to assume that our whole shell industry achievement had there its beginning in the dual role of a patriotic undertaking and a business enterprise worth while.

It might be stated that, in the "clean-up" referred to, and relative more particularly to small arms ammunition, while Woolwich standard gauges were understood to be employed in its manufacture, no trace of even one of such gauges was in evidence at the Arsenal. Millions of rounds of .303 cartridges, therefore, met the same fate as the shells of which we have written.

SELECTED MARKET QUOTATIONS

Being a record of prices current on raw and finished material entering into the manufacture of mechanical and general engineering products.

PIG IRON.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents

Montreal, Que., March 20, 1916.—The steel situation continues to be the outstanding feature of the week's market. It is felt that constant advances on top of the present heavy demand will exercise a retarding effect on certain domestic activities with the possibility of a temporary shut down in some cases. Ocean tonnage continues in an acute state with its attendant delays in transportation, but the opening of navigation is expected to afford some relief through the resumption of lake traffic.

Pig Iron

Despite the condition of the steel market, the situation in the pig iron field continues comparatively steady. The supply is sufficient to meet the steel requirements, although prices, like steel, continue to advance. General conditions are unchanged throughout the Canadian pig iron field and prices remain firm. A further advance of $50 is reported for prompt ferromanganese (f.o.b. seaboard), the present price being quoted at $400 per ton. Future importations are, however, listed at $175 on contract.

Steel

The situation continues to grow more acute as each week fails to bring any indication of relief, the ever-increasing demand for all classes of steel gradually bringing us to the stage of a runaway market. With the weekly advances quoted in steel prices the demand for material does not diminish, and prices on all steel can only be considered as nominal.

Pittsburg quotations on open-hearth, sheet bar billets show an advance of $1 a ton, being quoted at $45. Forging billets, Pittsburg, with an advance of $5, are now selling at $65 per ton. Montreal prices are unchanged, but dealers intimate that quotations may advance before next week. Iron bars, New York, are $3 higher, this week's price being 2,569. Steel bars are quoted at $2.75 Pittsburg, being an advance of $5 a ton. Montreal prices f.o.b. are now $60 a ton. Following the general advance of $3 to $5, boiler plates are now quoted at $3.75 for ¼ to ½-inch plates; $4 for heads, and $4.05 for 3-16-inch tank plates; this is an increase over last week of 35 cents a hundred. Structural shapes are 10c a hundred higher, and the demand is fairly heavy. A slight reduction is noted in the price of railroad spikes, which are 10c a hundred lower. Structural and boiler rivets have advanced $3 a ton, and are now bringing $3.15 and $3.25 respectively. The carload discount, Pittsburg, on cold rolled shafting is now 25 to 20 per cent. in place of 30 per cent. A heavy demand is reported for the principal grades of sheets, more especially for blue annealed and sheets for deep stampings. Automobile firms are using large quantities of special sheets. This, coupled with the continual advance of sheet bars, has resulted in a further advance on all grades of iron sheets. American prices have been advanced $1.50 a hundred on black and $2.50 on blue annealed. Montreal dealers have recently revised their lists, and are now quoting black sheets, No. 10 gauge, at $4.35; Canada dull, 52 sheets, $4; Apollo, 10¾ oz. galvanized, $7; Queen's head, 28 B.W.G., $7.50; Fleur-de-Lis, 28 B.W.G., $7.25; Gorbal's best, $7.50; Premier, No 28 U.S., $6.75, and 10¾ oz., $7.50. Viking metal is lower, and quoted at $6.50.

The continued rise on all steel products has again affected the price on seamless boiler tubes, and an advance of 10 per cent. is noted in this week's quotations. The increase brings the prices up to $19.55 for 1-inch, and $49.50 for 4-inch seamless tubes.

Metals

With the exception of tin and lead, the situation generally remains the same. Copper continues comparatively quiet, with a slight undertone of strength. Recent developments, following an apparent scarcity of tin, had the effect of advancing the price of that metal, but latest reports indicate an easier feeling. Foreign spelter markets have shown weakness with declining prices, but local dealers have held firm, and a steadier tone is believed to prevail abroad. The feature of the week has been the market in lead.

Copper.—Little improvement is reported in the copper situation, but the market appears somewhat stronger. According to advices from the London market, statistics show a reduction in the total visible supply of over 2,100 tons since the 1st of March. This, however,

following the increased supply of the latter part of February of nearly 1,300 tons, leaves a net decrease of about 800 tons. English traders seem a little sceptical as regards any copper famine in America, but there is little doubt that with present conditions prevailing for an extended period of time the British stock of copper will gradually become exhausted.

The recent weakness of the market here has had little effect upon prices, as consumers are well covered for their immediate needs, and the market is held comparatively firm by demands for future delivery. London quotations show an advance of £3½ on spot and £3 for futures. New York prices, which showed a weakness earlier in the week, are ¼c higher on lake and electrolytic, and ½c on castings. Quotations are 27¾c and 26¼c per pound. Local conditions are unchanged, with a tendency to take on strength. Prices quoted are 31c and 30c for lake and electrolytic and castings respectively.

Tin.—The irregular condition of the tin situation at present has placed the market in a somewhat unsettled state. For some time the spot prices for tin have been exceedingly high and futures comparatively low. The scarcity of metal and the British shipping regulations have influenced the New York market. In an effort to attract purchasers, dealers have gradually reduced quotations on spot tin until the price is now 4c less than the previous week.

In direct contrast to this, London quotations show an advance of £6 on spot and £2 on futures. New York prices are all nominal, ranging from 46½c April delivery to 42¾ October delivery. Spot 52c a pound. Local dealers report a strong and rising market, with an advance of 2c. Prices are nominal at 52c per pound.

Spelter.—Following the activity of the market, which was evident in the earlier part of the week, the situation has become quieter, but New York quotations show a slight advance over a recent decline. From these developments prices for futures and early metal have drawn closer together. This is largely due to consumers buying in advance. Dealers here report unchanged conditions, with quotations firm at 23c per pound.

Lead.—The market is very strong and quotations continue to advance. The Trust price remains 1c below the open market, to prevent any unreasonable advance. This action may not please the producer, but it would seem inadvisable at this time to elevate the market further. London reports a spot advance of £2 per ton and an advance of £1 18s. on futures. New York's quotations are 7c Trust, and an outside nominal price of 8⅛c per pound. This is an advance for the week of 4c and 1c respectively. Local dealers, following the lead of the foreign markets, are quoting 9¾c, being an advance of 1c per pound.

Antimony.—The general market remains unchanged, with slight improvement shown in futures. Dealers here report a quiet situation, with quotations firm at 48c per pound.

Aluminum.—Situation quiet and unchanged, with an easier feeling. Prices here firm at 68c.

Machine Tools and Supplies

Continued activity in the munition field is resulting in comparatively good business. Considerable improvement has been noted recently in increased inquiry for 4.5 and larger equipment. Machine tool builders in the States are experiencing considerable inconvenience owing to the shortage of labor; and this factor is expected to become emphasized as the weather improves. What the 1st of May will bring is at present an unknown quantity; but it is anticipated that further handicap will be placed upon production in many branches of metal working activities. All kinds of supplies are in good demand, with prices gradually advancing.

CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.

Old Materials

Considerable buying is reported in heavy melting steel scrap, also machine and composition turnings. The market is, however, generally quiet, but prices are holding firm. Wrought iron scrap is in good demand, with light supply. Quotations on old wrought iron are stronger by 1c, pipe being quoted at 10½c and No. 1 scrap at 14¾c per pound. Scrap copper of all kinds is in good demand, and dealers report good business, with prices holding firm. The advance in the price of lead has had a proportional effect on scrap, and this week's prices show an increase of ½c per pound; heavy lead is now quoted at 7c and tea lead at 6c per pound.

Toronto, Ont, March 21.—Industrial conditions continue satisfactory and as spring approaches activity in business circles increases. Many of the principal industries in Canada are experiencing a period of unusual prosperity owing to the large volume of business coming forward. Many factories are working at capacity and are unable to handle all the business offering. A shortage of labor is beginning to be felt which will no doubt become more serious in the course of a few months particularly with regard to skilled help. This activity is due largely to war orders but the domestic demand is steadily improving as the country becomes more prosperous and the financial situation easier.

Prices generally, particularly on iron and steel products, continue in an upward direction and there is no improvement in deliveries. Congestion of freight on the railways is causing considerable delay to shipments. It is reported that more ships will be put into service later on in the Spring and so relieve the situation in regard to ocean freights, but it is difficult to see how the ships can be spared from their present work. An advance in boiler plates is announced this week and other steel products will be afforded in the near future. A sharp advance in lead is the feature of the ingot metal market.

Steel Market

The market is very strong and the upward movement in prices continues. The steel mills are working at overtaxed capacity, both domestic and export demand being exceedingly good. All indications point to the present activity lasting throughout the year as the mills are in a sold out condition. The scarcity of steel and shortage of tonnage is causing considerable anxiety to the steel companies, as there is every prospect of the scarcity of steel becoming more acute, while there is little hope of more ships being available to relieve the export situation. Prices of all steel products are very firm and some advances have been made this week. Boiler plates ¼ to ½ in., have advanced 10c and are now quoted at $3.50; heads $3.75; and tank plates 3-16 in., $3.80 per 100 pounds. The situation in plates as regard to supply is getting steadily tighter and it looks as if some consumers will come far short of getting enough to meet their needs. Quotations on cold rolled shafting are unchanged but higher prices may be expected in the near future. The new demand is heavy and some makers report being sold up for six months or longer. Wrought iron pipe has advanced in the States, makers there being sold up for four or five months with an abnormally heavy demand. Boiler tubes have advanced approximately 10 per cent. Other products which may advance shortly include wire nails, boiler and structural rivets, machine screws. Iron and steel bars are firm and un-

changed at $2.75 base, per 100 pounds.

The galvanized sheet market is strong and quotations on all brands are higher. An unusually heavy demand for black and blue annealed sheets has strengthened the market and quotations on these products are higher. The continued high price of spelter and uncertainty in the market is also affecting the galvanized sheet situation. Premier sheets No. 28 U.S. are quoted at $6.90. and 10¾ oz. at $6.95; other prices are given in the selected market quotations.

Prices of steel products in the United States continue to advance and there is no indication that the end of the upward movement is near; on the contrary higher prices are predicted. It is generally thought that prices have reached a dangerous level but the demand is as insistent as ever, being considerably more than the mills can produce. While this condition lasts there is no hope of prices being held in check. Bars, plates and shapes have advanced $5 per ton and are now quoted as follows at Pittsburgh. Bars 2.75c; plates 3c and shapes 2.50c. These figures are largely nominal as early deliveries bring premiums. The demand for billets is heavy and prices have again advanced. Bessemer and open hearth billets are now quoted at $45 and forging billets at $65 base per ton Pittsburgh. Open hearth sheet bars are higher at $45 base per ton Pittsburgh. Wire rods are unchanged at $65 per ton in Pittsburgh. The ferromanganese situation is acute and unprecedented prices are being paid for this material, ranging as high as $350 to $400 for immediate delivery. Chicago warehouse prices on bars, plates and shapes are higher and are as follows: Bars and shapes, $3.10, and plates at $3.50.

Pig Iron

The pig iron situation is unchanged and quotations are at the same level as last week. Hamilton and Victoria brands are quoted at 24 per ton with a strong market.

Old Materials

The market is firm for all kinds of old metals but quotations are practically unchanged with one or two exceptions. The domestic demand continues light, most of the business being for munitions. Lead has made a slight advance and No. 1 wrought iron is also higher. Shafting rails, and tires have advanced slightly, but malleable scrap and heavy melting steel are weaker.

Machine Tools

Increased activity in the machine tool market is looked for now that further large contracts for shells are assured for Canadian shops. A number of plants that were working on 18 pdr. high explosive shells are now being equipped for making 4.5 in. and 6 in. shells. Further contracts for still larger shells will be placed and heavy duty lathes will be required. Makers of large swing lathes and special tools for shells continue busy, while there is also a steady demand for standard equipment. Deliveries do not show much if any improvement and prices continue to advance steadily.

Supplies

Steady business is reported in machine shop supplies, the ordinary demand as well as that for shell plants showing considerable improvement. Prices on practically all lines are very firm but there are few changes to announce this week. Turpentine is higher being now quoted at 79c per gallon. Prices of white lead have been withdrawn temporarily and an advance is expected any time on account of the pig lead situation. Gasoline is unchanged but higher prices are inevitable as crude is advancing steadily; Pennsylvania crude being now quoted at $2.60 a barrel. Linseed oil is firm and unchanged. Lead sheets have advanced $2 per 100 lbs.

ALLIES PURCHASING AGENTS

The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:

International Purchasing Commission, India House, Kingsway, London, Eng.

French.—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendence Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.

Russian.—Col. N. Golejewski, Military Attachè, Room 904 Flat Iron Building, New York City.

Metals

The feature of the metal markets this week is the continued upward movement of lead in New York due to the scarcity of supplies. Although the London market is quieter but firm with quotations nominal. There is no change in the copper situation and the market is dull. There is no indication of any falling off in the demand for copper and the position of this metal is a good one. Spelter has recovered and the market is strong again, heavy buying having had the effect of advancing prices in New York. Little interest has been shown in antimony lately, and the situation is unchanged. The aluminum market is easier but prices are unchanged. There has been no change in the price of solder this wek.

Copper.—The market is dull and prices unchanged. Consumers are well covered for early needs and what demand exists, is for the far off positions. Indications point to a steady market for some time to come as it seems hardly probable that quotations will go much higher or that there will be any marked decline. Quotations are nominal at 30½ cents per pound.

Tin.—The scarcity of spot tin in New York and the great difficulty to obtain licenses to ship from London have been the controlling factors in the market for several days. The supplies of tin are increasing but the consumption seems to be able to take care of all of it. Quotations are unchanged and nominal at 56c per pound.

Lead.—The situation in the lead market appears to be getting more acute. The large export demand is still the disturbing feature in New York and producers seem to be unable to figure on even a small fraction of the enquiries which are in the market. The scarcity of supplies is not temporary but extends for several months. The "Trust" have advanced their price to 7c New York but outside prices range from 7.87½c to 8.12½c, all prices being entirely nominal. Lead has advanced 1½c locally and is nominal at 10½c per pound, the highest price touched since the war began.

Spelter.—The market is strong in New York and the buying movement appears to be in progress. In London the upward movement has been well sustained on good demand. Spelter has advanced 1c locally and is quoted at 22c per pound.

Antimony.—The market is quiet and lacking in interest. The situation is unchanged and quotations are nominal at 48c per pound.

Aluminum.—The market is a shade easier and demand dull. Quotations are unchanged at 68c per pound.

Solder.—Prices are firm and unchanged. Guaranteed is now quoted at 31½c and strictly at 29¼c per pound.

Winnipeg, Man., March 18.—It is understood that most of the engineering shops in Winnipeg have received further orders for high explosive shells, which is keeping them fairly busy. There is a fairly good demand for machine tools, especially for small lathes, but these are hard to get. There is a good demand also for wood-working tools, especially from box factories, who appear to be especially busy. The reason for this is that wholesalers are doing a big trade, and are buying large

quantities of boxes. The Caledonia Box Co. and the Moncrieff Box Co., Winnipeg, both bought machinery recently. The Gregg Mfg. Co., Winnipeg, have also been in the market for some machinery for the manufacture of implements. Saw mills are fairly busy, and enquiries are coming in here and there. Transmission machinery business is particularly good, belting, although the market for the latter is in rather an uncertain state just now, and considerable cutting of prices is going on to secure business. Boilers are selling fairly well for different classes of work. Very little is doing in contractor's supplies. Small tools are selling exceedingly well. Laundries throughout the West are buying quite a lot of machinery, and on the whole, business generally is in a much more favorable condition than it has been for a long while.

Jobbers are sounding a note of warning to customers to place orders for all lines of steel goods required throughout the year, at an early date, reminding customers that manufacturers are experiencing great difficulty in securing raw material. Among the lines whose prices are up this week are wire goods, nails, and galvanized sheets. Another advance has gone into effect on brass valves. Wrought iron pipe, both black and galvanized, has again taken a jump.

METAL PRICES HIGHER

PRACTICALLY every metal for which there is a commercial use has felt the impetus of a greatly enlarged demand, due to the enormous munition orders by the belligerent nations. In some cases a positive shortage has resulted, forcing the price to levels that have never before been even approximated.

Metals for which heretofore there has been but little demand have doubled and tripled in price within a year because they were necessary in the manufacture of munitions. Others have been affected less directly, but it is safe to say that, with a few exceptions, the demand created by the war is largely responsible for the high prices now prevailing.

Nickel is the same price as a year ago, however, although the demand is much larger, and in spite of the fact that one company enjoys a virtual monopoly of the production and sale of nickel. There has been but one advance in the price of nickel since the beginning of the war, although the demand has multiplied many times. In July, 1914, ordinary nickel was quoted at 40 cents and electrolytic at 45 cents a pound.

W. H. Hairchild, of Brantford, Ont., has been appointed city engineer of Galt, Ont.

CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

CANADIAN TRADE COMMISSIONERS.

Argentine Republic.
H. R. Poussette, Reconquista, No. 46, Buenos Aires. Cable address, Canadian.

Australasia.
D. H. Ross, Stock Exchange Building, Melbourne. Cable address, Canadian.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

Engineering

Stratford, Ont.—Fire on March 16 did about $5,000 damage to the MacDonald Thresher Co.'s plant.

Ottawa, Ont.—The Ottawa Steel & Iron Co. will rebuild their plant, which was recently damaged by fire.

Cobourg, Ont.—The Cobourg Felt Co. is in the market for a 16-in. engine lathe, 4 to 6 ft. between centres.

Fort Erie, Ont.—The directors of the International Safe Co. have decided to build an addition to their plant.

Vancouver, B.C.—The Canadian Consolidated Mining and Smelting Co. have started work on the construction of a large copper refinery at Trail.

Montreal, Que.—The plant of the Canadian Metal Manufacturing Co. was recently damaged by fire to the extent of $15,000.

Yamachiche, Que.—The Brunelle Furnace & Boiler Co. propose to instal electric motors and equip their machinery for electrical operation. Manager, A. Heroux.

Renfrew, Ont.—The Renfrew Machinery Co. plant was completely destroyed by fire on March 14. The loss is estimated at approximately $100,000, which is covered by insurance.

Port Arthur, Ont.—Work has been started on the erection of an addition to an elevator for The Davidson & Smith Elevator Co. Barnett & McQueen, are the contractors, Fort William. Estimated cost, $250,000.

Walkerville, Ont. — The Canadian Brush Machinery Co. will establish a plant here for making the Liebig solid back brush machines, now being manufactured at Detroit, Mich. The company has recently been granted a Dominion charter, with the following officers: W. G. Liebig, president; W. M. Swan, vice-president; W. Elsey, managing director and secretary-treasurer.

Electrical

Bedford Mills, Ont.—The Bedford Mills Electric Co., Newboro, Ont., contemplate the installation of a 60-k.w. dynamo, water wheel, transformers, etc. Estimated cost, $6,000. Manager, R. P. Tett.

Russell, Man.—It is proposed to raise $5,000 to extend and complete the electric lighting system.

Kintore, Ont.—An effort is being made to have hydro power installed in East Nissouri Township.

Municipal

Lindsay, Ont.—The Town Council will purchase a truck for the fire hall.

Galt, Ont.—The City Council are considering the purchase of a motor fire engine.

Kingston, Ont.—The City Council has decided to purchase road-making machinery.

Burlington, Ont.—The Town Council contemplate purchasing a motor fire truck. A by-law will be submitted to the ratepayers to authorize the purchase.

Saskatoon, Sask.—An extension will be made to the city power house to make room for a new rotary converter and switchboard, which are being supplied by the Ferranti Co.

Elmira, Ont.—The Town Council have let the contract for extensions to the waterworks system to A. M. Bauman. Contractor is now receiving prices on iron and lead piping, brass fittings and pig lead.

General Industrial

Lindsay, Ont.—F. R. Wilford & Co., have prepared plans for an addition to their factory on Kent Street.

Lethbridge, Alta.—The City Council proposes to purchase a motor-driven booster pump. Estimated cost, $4,000.

Orillia, Ont.—The Canada Builders Ltd., of Toronto, propose building a planing mill here.

Listowel, Ont.—Nathan Calder proposes to instal equipment at his planing mill, to be operated by hydro power.

Peterborough, Ont.—The Bonner-Worth Co., will build an addition to their factory here. Estimated cost $8000.

Montreal, Que.—Fire at the Canadian Rubber Co.'s factory on Notre Dame Street East, on March 19, did about $50,000 damage.

Orillia, Ont.—The Town Council are considering the installation of new machinery at the sewage pumping station. Engineer, W. K. Greenwood.

Aylmer, Que.—The Town Council have been ordered by the Provincial Board of Health to construct a filtration plant. Estimated cost, $20,000.

Saskatoon, Sask.—The Alaska Bedding Co., of Winnipeg, have purchased a site here and will build a factory. F. S. Baker, the manager of the Winnipeg factory, has charge of the work.

Owen Sound, Ont.—The Galbraith Woodenware Co. are making arrangements to develop their lines of wood specialties. New machinery will be installed. Edward Galbraith is manager.

Contracts Awarded

Stratford, Ont.—The Stratford Bridge Iron Works have been awarded a contract for iron castings by the City Council.

Ottawa, Ont.—Doran & Devlin, of Ottawa, have been awarded a contract by the City Council for the construction of the pumping station on Lemieux Island at $54,000.

Ottawa, Ont.—The City Council have let contracts to the Victoria Foundry Co. for cast iron pipe and specials at $9,233, and for valves to the General Supply Co., Ottawa, at $7,666.

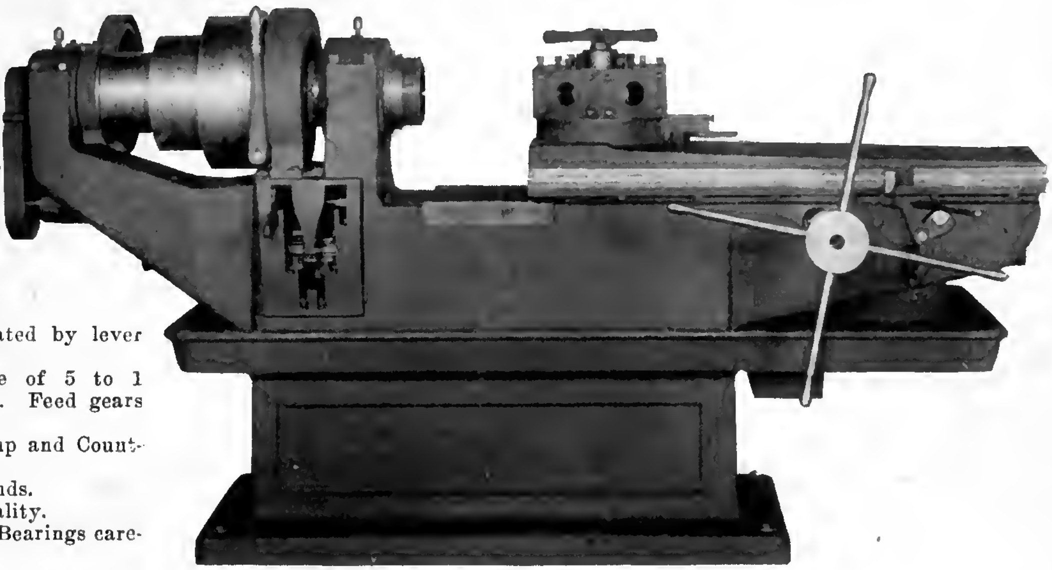
Hamilton, Ont.—The Board of Education has awarded the following contracts for the Robert Land School: Electrical work, the Electric Supply Co., $4,766; hand rails, Canada Wire Goods Co., $149.

Winnipeg, Man.—The Dominion Bridge Co. has been awarded the contract for the steel work for the T. Eaton Co. new building. The cost of the steel alone is estimated at $200,000. The building will be 200 ft. long by 123 deep and eight storeys high. The Cater-Halls-Aldinger Co. are the general contractors for the first unit.

GREENSBORO TURRET LATHE

For Boring and Recessing Base of 4.5 and 6" Shells

Spindle is made of Carbon Steel, 8" diam. in front bearing and bored 6¼" diam. 8" deep, so part of shell is held within bearing to prevent overhang.
Spindle runs in heavy bronze bearings.
Head has friction back gear, 5½" belt.
Turret is bored for 3" Bars, has power feed with automatic stop.
Quick-change feeds operated by lever under head.
Turnstile has a leverage of 5 to 1 though gearing into rack. Feed gears made of steel.
Equipment: Oil Pan, Pump and Countershaft.
Weight: About 6,000 pounds.
Workmanship of Best Quality.
All Spindles ground. All Bearings carefully scraped.



THE A. R. WILLIAMS MACHINERY CO., LIMITED
TORONTO CANADA

O. K.

"Wish to say that in my estimation Geometric Tools are O.K."--J. W. D., Shop Foreman.

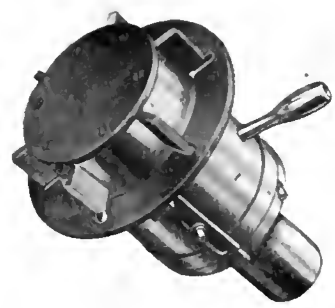
The opinion of this Shop Foreman is the opinion of all users of Geometric Screw-cutting Tools.

Every Die Head and Collapsing Tap bearing the stamp of distinction—"**Geometric**"—has been tested by experts.

Can be arranged with shank to fit any make of Screw Machine.

Geometric Threading Tools will produce for you either external or internal screw threads of any diameter, length, pitch and form.

Make our acquaintance now, through our literature, and when you are ready to order, you will know just the tool needed. Tell us the class of thread-cutting that interests you, and we will send booklet describing tools to suit.



The Geometric Tool Company

NEW HAVEN, CONN.

Canadian Agents: Williams & Wilson, Ltd., Montreal. The A. R. Williams Mchy. Co., Ltd., Toronto, Winnipeg, St. John, N. B.

Tenders

St. Marys, Ont.—Bids will be received until March 31 by the superintendent of the waterworks department for a 2,000,000-gallon centrifugal pump.

Barrie, Ont.—Tenders, will be received until Thursday, March 30, for the supply of road oil for the year 1916. J. S. Laing, Town Engineer .

Ottawa, Ont.—Tenders will be received by the Board of Control, up to Tuesday, March 28, for two motor driven street flushers. Specifications may be obtained on application to the city engineer's office, City Hall, F. C. Askwith, acting city engineer.

Toronto, Ont.—Tenders for watt hour meters, addressed to the chairman Toronto Electric Commissioners, will be received until Tuesday, March 28th. Specifications and forms of tender may be obtained at the office of the purchasing agent, 15 Wilton Avenue.

Port Hope, Ont.—Tenders will be received up to Saturday, March 25, for the construction of 71 ft. concrete arch truss superstructure on Peter Street. Plans with J. W. Sanders, Town Clerk, Port Hope, Ont., and Bowman & Connor, 31 Queen Street West, Toronto.

Quebec, Que.—Tenders for freight shed and grain galleries, will be received at the Quebec Harbour Commissioners' Office, Pointe-a Carey Wharf, Quebec, up to April 15 next. Plans and specifications of the contemplated work may be seen at the Harbour Engineer's Office, Pointe-a-Carey Wharf. St. George Boswell, Chief Engineer

Toronto, Ont.—Tenders for underground work, addressed to the chairman Toronto Electric Commissioners, will be received until Tuesday, April 4th. Details of work to be performed, consisting of laying of cable ducts, building man-holes and transformer vaults. Specifications and form of tender may be obtained at the Engineering and Purchasing Department, 15 Wilton Avenue.

Building Notes

Vancouver, B.C.—The Ford Motor Co. propose building a service and assembling plant here. The building will be 110 by 115 feet.

Toronto, Ont.—Robertson Brothers have been granted a permit to erect a five-storey brick addition to the factory at 103 Queen East, at a cost of $25,000.

Toronto, Ont.—The Gutta Percha Rubber Co. have been granted a permit to erect a two-storey brick machine shop and garage on the east side of West Lodge Avenue, at a cost of $18,000.

Fergus, Ont.—It is proposed to raise $10,000 by way of a loan to the Superior Barn Equipment Co. A by-law will be submitted to the ratepayers.

Windsor, Ont.—The Board of Education have decided to appropriate a further sum of $90,000 for the new Collegiate Institute. A by-law will be submitted to the ratepayers to authorize the additional outlay.

New Incorporations

The Zenith Coal & Steel Products, Ltd., has been incorporated at Ottawa with a capital of $35,000 to carry on the business of steel, metals, chemicals, and machinery merchants and manufacturers. Head office to be situated at Montreal, Que. Incorporators, J. W. Blair, F. J Laverty and C. A. Hale, all of Montreal

The Foundry and Machine Co., has been incorporated at Ottawa, Ont., with a capital of $200,000 to operate brass, iron or other metal foundries, with head office at Montreal. Incorporators: John James Tolland, Joseph Ulric Emard and Charles Emard all of Montreal.

The Jewel Mfg. Co., Hamilton, Ont., has been incorporated with a capital stock of $10,000 by Harry H. Hannon and Albert M. Boyington of Hamilton, John S. McConkey and others of London, Ont., to manufacture paper presses, etc.

The Gill Motor Co., of Montreal, Que., has ben incorporated to manufacture machinery, mechanical specialties, motors, engines, etc. $99,000 capital stock; by Thomas M. Gill of Lewiston, Me., George M. Smyth, Walter Gill and others of Montreal.

Canadian Hardwoods Ltd., have been incorporated at Toronto with a capital of $150,000 to carry on a lumbering and saw mill business with head office at Ottawa. The provinsional directors are Charles Magee, John T. MacCraken and Edward McMahon all of Ottwa.

The Acme Tire & Rubber Co. has been incorporated at To,ronto with a capital of $400,000 to manufacture tires and rubber goods with head office at Toronto. The provisional directors are J. Max Bullen, Harold L. Steele and Francis H. Hurley all of Toronto.

The Bay of Fundy Tide-power, Ltd., has been incorporated at Ottawa with a capital of $50,000 to carry on the business of an electric light, heat and power company. Head office to be situated at Wolfville, N. S. Incorporators, G. B. Cutton, R. P Clarkson and W. L. Archibald all of Wolfville, N.S.

The Salt & Potash Co. of Canada, Ltd., has been incorporated at Ottawa, with a capital of $500,000 to manufacture, methylate, chemicals, spirits, explosives and other products. Head office to be situated at Toronto, Ont. Incorporators, T. A. Burgess, J. O. Carss and C O. Wood all of Ottawa, Ont.

The Utility Electric Manufacturing Co., has been incorporated at Toronto with a capital of $40,000 to manufacture electric ranges, stoves, heaters, and any or all kinds of electrical goods or appliances. Head office to be situated at London, Ont. Incorporators, R. J. Gracey and J. Sussex of London, Ont.

The Canadian Brush Machinery Co., has been incorporated at Ottawa, with a capital of $50,000 to carry on business as mechanical engineers, machinists and manufacturers of machinery and tools, at Walkerville, Ont. Incorporators, W. G. Liebug and W. M. Swan of Detroit, Mich., and William Elsey of Windsor, Ont.

The Acme Steel Goods Co., of Canada, Ltd., has been incorporated at Ottawa, Ont., with a capital of $3,000 to manufacture all kinds of steel goods at Montreal, Que. The incorporators are James Edwin MacMurray and George Claude Longman of Chicago, Ill., and Poseph E. Beauchamp, of Montreal, Que.

The Kingdom Mining, Smelting & Mfg. Co., has been incorporated at Ottawa, Ont., with a capital of $750,000 to prospect for, and develop mineral deposits and to smelt ores, metals, etc., Head office Montreal, Que. and the incorporators are Louis Anathase David, Adhemar Gaston Munich, and S. Hinson Read all of Montreal.

The Doty Engine Co., has been incorporated at Ottawa with a capital of $100,000 to carry on the business of iron founders, mechanical engineers and manufacturers of machinery, tool makers, brass and other metal products. Head Office to be situated at Toronto. Incorporators, J. S. Lovell, W. Bain, and J. J. Dashwood all of Toronto.

The Consumers Metal Co., has been incorporated at Ottawa, Ont., with a capital of $40,000 to manufacture all classes of base and combined metals and metal powders, liquids, etc., with head office at Montreal, Que. The incorporators are Henry Mulvena, Thomas Barnard Gould, and Duncan MacDonald all of Montreal, Que.

The Canadian Calumet & Montana Mining Co. has been incorporated at Ottawa, with a capital of $40,000, to de-

velop mineral and other deposits, and to smelt, roast and otherwise treat ores, metals and mineral substances of all kinds. Head office to be situated at Toronto. Incorporators: T. A. Burgess, J. O. Carss and C. O. Wood, all of Ottawa.

Refrigeration

Sarnia, Ont.—The Sarnia Creamery Co., it is reported, has decided to enlarge its creamery and install a refrigerating and ice making plant.

Red Deer, Alta.—It is announced that a large pork packing establishment may be located here during the coming season. Finances to the extent of a million dollars are assured.

Cranbrook, B. C.—Walkley & Johnson, are having their meat market equipped with a 3-ton refrigerating plant supplied by the Armstrong Machinery Co., Spokane, Wash.

Railways--Bridges

Ottawa, Ont.—A new bridge over the Niagara River is projected in the bill incorporating the Ontario-Niagara Connecting Bridge Co., which is in process of going through Parliament. E. R. Wood, of Toronto, heads the list of incorporators.

Marine

Collingwood, Ont. — The Northern Navigation Co. steamer "City of Midland" was destroyed by fire here on March 17. The loss is estimated at $40,000.

Sarnia, Ont.—The Northern Navigation Co. has started a $25,000 repair job on the forward cabins of the steamer Saronic, which were badly burned last Fall, at the time the steamer Majestic was destroyed.

Kingston, Ont. — The Department of Public Works is now taking definite action to secure data about Kingston harbor, so that extensive improvements that will make it ready for the deepening of the Welland Canal may be made.

Sarnia, Ont.—Activity on the local water front is gradually increasing. The owners of the many freighters and lake boats tied up here have started fitting out, to be ready for the opening of navigation, which is now only about six or seven weeks away.

Sarnia, Ont.—The underwriters are asking bids for raising the sunken steamer Charles S. Price, which lies upside down on the bottom of Lake Huron, thirteen miles from Sarnia, where she turned turtle on Sunday, November 9, 1913, during the big storm. The ship lies in 70 feet of water.

Port Arthur, Ont. — Ice conditions seem favorable to an early opening of navigation. The ice breaking tugs will be ready to cut a channel any time after March 15, and the first of April may see the boats moving. Grain in the elevators at the head of the lakes totals approximately 35,000,000 bushels.

Vancouver, B.C.—Plans and specifications for the car ferry slips at Patricia Bay and the temporary transfer facilities at New Westminster for the Canadian Northern Railway's barge service between the Mainland and Vancouver Island, are expected to arrive from Toronto shortly, according to Mr. McLeod, general manager of the C. N. R.. The contract for the slips and for the barges and tugs will be let before Mr. McLeod leaves for the East. A contract for a $20,000 trestle has already been let.

Halifax, N.S.—The Halifax Graving Dock Co. is making another addition to its plant by building and equipping a floating electric welding plant. The outfit will be a complete one on a barge, and will generate its own electricity. It will be able to go alongside of a ship anywhere on the waters of the harbor. The equipment is also designed for building up weak plates in a ship's hull.

New Freighter Launched.—A steel bulk freighter constructed for the Geo. Hall Coal Co. of Ogdensburg, N.Y., was successfully launched from the Wyandotte yards of the Detroit Shipbuilding Co. on March 11. The new steamer will be known as the George L. Eaton, and is to be used in the coal trade on the lower lakes and St. Lawrence River. She is of full Welland Canal size, 244 feet long, 43 feet beam, and 20.5 feet deep. Her carrying capacity is about 3,000 tons.

Personal

F. Orr Lewis, president of Canadian Vickers Ltd., has returned to Montreal after an extended visit to England.

Lorne Thompson, head of the Stores Department of the C. N. R., has joined the staff of the Munitions Board to look after the transport end of the board's business.

J. B. Walker, formerly machine tool salesman with H. W. Petrie, Ltd., has accepted a similar position with the Garlock Machinery Co., 197 Wellesley Street, Toronto.

John Keillor, gas engineer, Hamilton, has received the appointment of superintendent to the Vancouver Gaslight Co., Vancouver, B.C. Mr. Keillor was previously manager of the Hamilton Gaslight Co.

Trade Gossip

The Canadian Cartridge Co., have surrendered their charter and the company has been dissolved.

The Dickson Bridge Works Co., Cambellford, Ont., have increased their capital stock to $100,000.

The Riordan Paper & Pulp Co., Merritton, Ont., will spend $200,000 on a plant for making bleached pulp.

The Lincoln Paper Mills, of Merritton, Ont., are going into the manufacture of gasine and grease proof paper.

The Interlaken Tissue Paper Mills, of Merritton, Ont., who make all kinds of tissue paper will make an extension to their plant, estimated to cost $50,000.

The Mainland Engineering Co., Victoria, B.C., has been incorporated, and will take over the old Mainland Iron Works plant for the manufacture of machinery, tools, etc.

The Toronto Transmission Co., have equipped a plant at 840 Dundas St., Toronto, for making general transmission machinery, such as hangers, clutches, pulleys, etc. Fred K. Robinson, formerly sales manager with the Dodge Co., Toronto, is manager of the new concern.

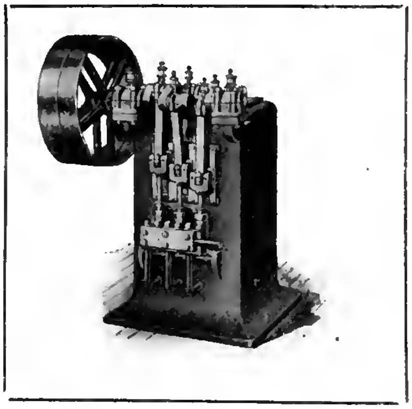
Fraser & Chalmers of Canada, Ltd., of Montreal, have recently been awarded the contract by the City of Regina, covering the delivery and erection of a 300 h.p. steam turbine, direct connected to two centrifugal pumps, having a total capacity of seven million Imperial gallons per twenty-four hours.

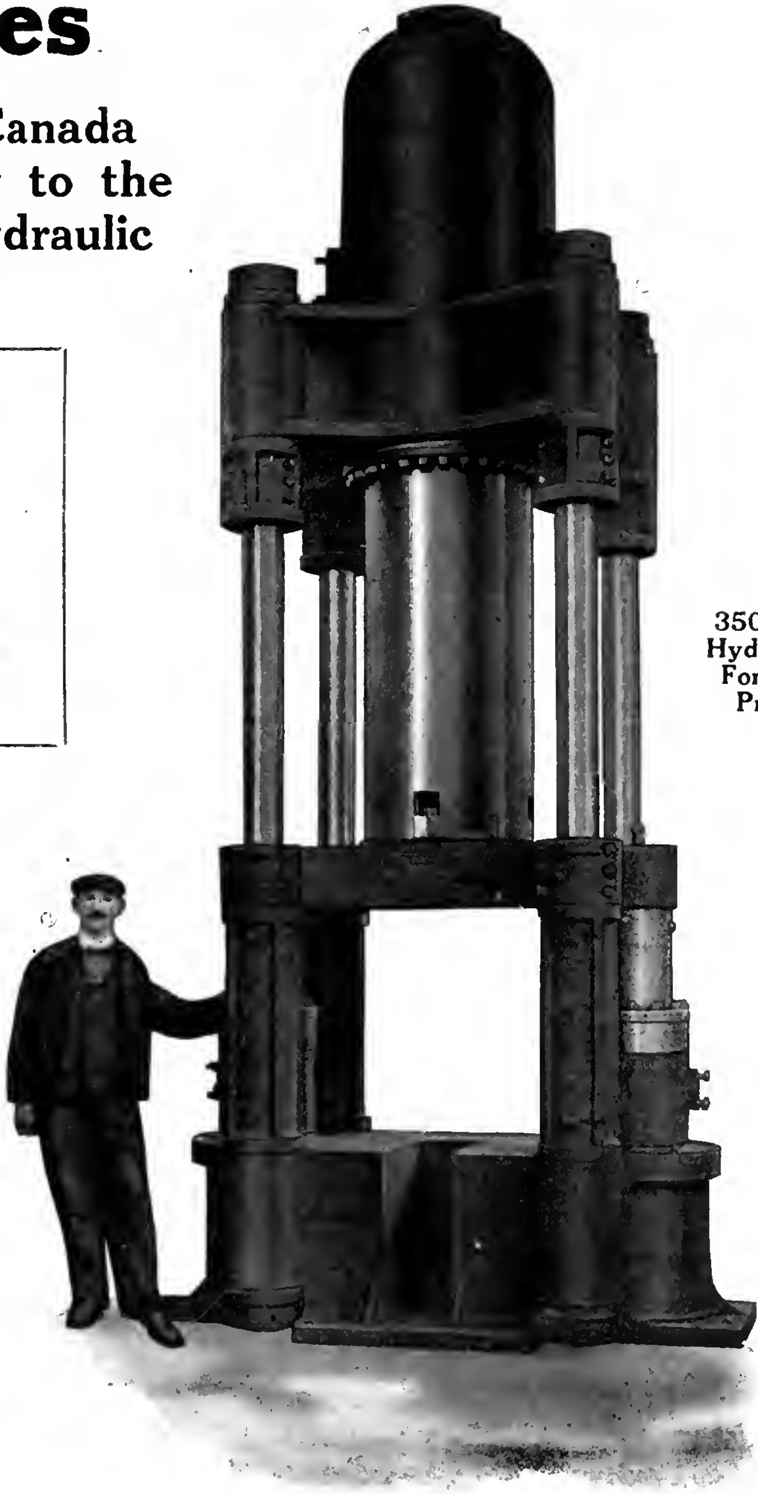
The Turbine Equipment Co., Engineers, Toronto, Ont., have recently secured an order from the Imperial Oil Co., for ten De Laval steam turbine-driven centrifugal pumps to be installed at their new refinery, Montreal; also a contract from the Standard Chemical, Iron & Lumber Co., for a one and a-half million gallon De Laval motor-driven centrifugal pump.

Vancouver, B.C.—The British Columbian Fisheries, Ltd., will sell their entire plant and equipment, including buildings, machinery, tools, refrigerating plant, sawmill and machinery, fertilizer plant and equipment, power plant equipment, steam trawlers and scows, etc. Tenders will be received up to April 15, 1916, and full particulars may be obtained from James Keppel Ball, Yorkshire Building, Vancouver, B.C.

Presses for All Purposes

The only shop in Canada devoted exclusively to the manufacture of Hydraulic Equipment





350-Ton Hydraulic Forging Press

Forging Presses

CANADIAN BOOMER & BOSCHERT PRESS COMPANY, LIMITED

18 TANSLEY STREET, MONTREAL. **Cable Address: "PRESSCO"**

Charles Sellers, president of the Peerless Furnace Co., Toronto, which he founded over twenty-five years ago, died on March 20, aged 82. Mr. Sellers was a native of Glasgow, Scotland, but had resided in Toronto for over 60 years. He was superintendent of the Gurney Foundry Co. for more than 20 years.

Britain Restricts Exports.—The Daily Gazette, London, says that among the additional articles whose exportation to all destinations is prohibited are, cinematograph films, gramophone and other sound instruments, records, sensitive films and plates, both exposed and unexposed, tungsten, clinical thermometers and surgical instruments.

Toronto Harbor Commission. — A $700,000 programme has been outlined by the Harbor Commission in connection with next summer's work. The work in Ashbridge's Bay and at the Humber will be continued, and, in addition, the work of transforming the old old harbor will be commenced. It is announced from Ottawa that a permanent head line has been established in the harbor, from Bathurst to Yonge Street. The plans provide for the establishing of a 17-acre industrial area at the foot of Bathurst Street, which will be served by 800 feet of dock and 20 feet of water. There will also be modern freight sheds and a factory building. In connection with the new windmill line, the railways have waived their riparian rights between Bathurst and York Streets and the companies will join the commission in an application to the Government for approval of the new pierhead and bulkhead lines, and the Harbor Commissioners will receive the patents to the new lots lying between pierhead and bulkhead lines, Hon. Mr. Rogers and Hon. Mr. Hazen both having signed them.

Catalogues

Air Hoists.—Catalogue No. 119, issued by the Whiting Foundry Equipment Co., Harvey, Ill., illustrates and describes an interesting and varied line of air hoists for different classes of work. The special features of the various types are dealt with in detail, and a table is included giving capacities and other data covering the standard sizes of hoists. A copy of this catalogue will be sent free on request.

The Monometer Mfg. Co., Birmingham, England, have sent us a series of bulletins dealing with a metal melting furnace, automatic heat control and an aluminum melting furnace. The metal melting furnace is designed for handling ingot metals and metal alloys. The automatic heat control is done by means of a self-acting heat regulator used in conjunction with the furnaces. The third bulletin describes a specially designed furnace for melting aluminum without oxidation. The bulletins are fully illustrated and printed in two colors.

Grinding and Polishing Machinery.—The Builders' Iron Foundry, Providence, R.I., has published a new 104-page catalogue describing its complete line of "Builders'" grinding and polishing machinery and patented "Pull" countershafts, which are well known as a safety device. The catalogue is 6 in. x 9 in., and bound in myrtle green antiquarian stock, and contains altogether 48 different half-tone illustrations. Both halftones and printed matter are set off by a green tinted background. The catalogue is conspicuous because of its careful arrangement and the high grade of printing and engraving which it represents. Copies will be forwarded upon request.

Vacuum Traps.—The W. E. Clark Co., Toronto, Ont., have issued bulletin "B" dealing with the "Clark" vacuum trap for heating systems. Considerable space is devoted to steam heating systems and troubles often met with, followed by a description of the "Clark" vacuum system and diagram showing a typical installation. The "Clark" trap is described and its action fully explained while the construction is clearly shown by means of a cross sectional drawing. Other lines dealt with include the "Clark" air line valve and a temperature booster for hot water systems. Copies of this bulletin may be had gratis on application.

Book Review

Forest Protection in Canada, 1913-1914, is the title of a report just issued by the Commission of Conservation, Ottawa. The report was compiled by Clyde Leavitt, Chief Forester of the Commission, and is of particular interest in view of the statement that Sweden proposes to cut off the export of chemical pulp to Great Britain. It contains much information respecting the work of the provincial forest services and of Federal departments entrusted with the care of our forests. The report treats exhaustively with the question of fire protection of forest lands along railway rights-of-way. Through co-operative action, great headway has been made in securing the reduction of forest losses through fires traceable to railway causes. The forests of British Columbia and on Dominion lands in the West have been dealt with in reports containing the results of special studies conducted by Dr. C. D. Howe and J. H. White. The Trent watershed in Ontario has also received

especial attention in a report of an investigation by Dr. C. D. Howe, in the Townships of Burleigh and Methuen. This district is important in that, while of very little value as an agricultural area, it is being repeatedly overrun by forest fires and the little remaining merchantable timber destroyed. It is suggested that the area be placed under the control of the Dominion Forestry Branch for protection from fires and for reforestation.

CREDIT ESTABLISHED FOR MUNITION ORDERS

THE Canadian chartered banks, through the Canadian Bankers' Association, have agreed to establish in Canada a credit of $75,000,000 for the Imperial Treasury, to be drawn upon by the Munitions Board as required from time to time in payment of munitions orders to be placed in Canada during the next two months. This arrangement is the result of the negotiations which have been proceeding during the past two months or so between the bankers, the Finance Minister, and J. W. Flavelle, chairman of the Imperial Munitions Board.

The credit thus established, in addition to the fifty millions placed by the Government to the credit of the Imperial Board out of the domestic loan of last year, gives a total amount of $125,000,000 raised in Canada towards financing the British war orders in the Dominion. The total amount of these orders is now upwards of $300,000,000, so that Canadians' share of the financing has been about one-third.

New Orders Now Ready

New orders are now ready to be placed by the Munitions Board, and during the next three months it is expected the total of these orders from Britain will run up to over one hundred millions. In anticipation of the financial arrangements just completed with the bankers, the Imperial Ministry of Munitions has already authorized during the past two weeks further orders in Canada aggregating twenty millions.

If continued satisfactory arrangements for financing war orders in Canada can be arranged during the coming summer, there is no doubt but that there will be a steadily increasing flow of orders from Britain for munitions of all kinds so long as the war lasts.

Further Arrangements Later

Before the present additional credit of $75,000,000 is exhausted it is probable that further arrangements will be made for new credits to finance the orders of following months.

A second domestic loan, and another large advance from Canadian banks, may be expected later on.

FOR SALE

FOR SALE—NO. 2 UNIVERSAL MILLING machine. J. A. Harvey, 16 Pearl St., Toronto.

FOR SALE—FIFTEEN HUNDRED GALLON Duplex Steam Pump, used sixty days. Size twenty x twelve x sixteen stroke. Apply Fraser & Chalmers of Canada, Limited, Montreal. (12)

FOR SALE—GARAGE IN GOOD WHEAT district. Snap for a good, practical man. About forty cars in vicinity. Will sell cheap if taken at once. Address Box 74, Hanley, Sask. (13)

FOR SALE—ELECTRIC GENERATOR TO run 80 lamps, 110 volts, 300 r.p.m., including switchboard and indicator; in good condition. Richards-Wilcox Canadian Company, London, Ont.

FOR SALE OR TO EXCHANGE FOR A smaller tool—Bertram gap lathe, 16-ft. bed, swing 40 inches in gap, two face plates, one 4-jaw chuck, one steady rest, one turret head, and countershaft. All in first-class condition. Offered at a big reduction. Shipment could be made in ten days. Box 182, Canadian Machinery.

FOR SALE—THE FOLLOWING CANADIAN General Electric motors: 1 KT 8-5-900 C, 550 V., less base with pulley; 2 MTC 5200, 5 H.P., 900-500 V., 60 cyc., A.C., 3-phase, with solenoid brakes mounted, with controller and rheostat; 1 MTC 5200, 5 H.P., 900-500 V., 60 cyc., A.C., with controller and rheostat; 1 MTC 5200, 5 H.P., 900-550 V., 60 cyc., A.C., with controller and rheostat. Whiting Foundry Equipment Co., Harvey, Ill., U.S.A.

FOR SALE — COMPLETE LUMBER AND lath mill machinery, daily capacity seventy-five thousand feet, consisting of gang, single and double bandsaws, engine, boilers, etc. Fully equipped blacksmith and machine shops. Silsby fire engine, 2 streams of 2½ inch; good order. Log loader, capacity fifty thousand feet, ten hours; almost new. Exceptional manufacturing site bargains. Address The Rathbun Company, Deseronto, Ont. (18)

FOR SALE—1 CLEVELAND ACME MAchine Co.'s 6" Cap. Single Head, Tapping Machine—back-geared, automatic feed, cone step pulleys and countershaft with two extra chucks. Particulars from Taylor-Forbes Company, Limited, Guelph, Ont. (13)

FOR SALE, AT A SACRIFICE—SAW MILL outfit, A1 condition; 50 H.P. stationary boiler, 45 H.P. "Leonard" engine, "Green" carriage, Simonds saw, edger, planer, lathmill, etc. Easy terms. Write quick. R. Parker & Sons, Uno Park, Ont. (12)

FOR SALE—2-PHASE INDUCTION MOTORS, 1 only WESTINGHOUSE, Type C, 50 H.P.; 1 only WESTINGHOUSE, Type CCL, 50 H.P.; 1 only CANADIAN GENERAL, type 10, 20 H.P. In excellent condition. Prices attractive. Full particulars on application. Cummer-Dowswell, Limited, Hamilton, Ont.

FOR SALE—PLANING MILL AND FACTory, doing good business. Terms $2,000.00 cash. Balance to suit buyer. Address O. Ribble, Bronte, Ont. (13)

AUTOMOBILE BUSINESS AND NEW Garage for sale. Overland agency; lots of repairing; also Overland roadster, new tires, $300.00; 10 light D.C. generator, $25.00; K.W. magneto (new), $15.00. W. E. Hawes, Otterville, Ont. (13)

SITUATIONS VACANT

JUNIOR DRAFTSMAN, EXPERIENCE ON structural work an advantage; permanent position to right man; give fullest possible particulars. Box 174, Canadian Machinery. (7)

WANTED — MACHINISTS AND FLOOR hands on heavy and miscellaneous medium work; steady employment, modern shop, good wages. Apply, stating age and experience, P.O. Box 6, Walkerville, Ontario. (6)

SITUATIONS WANTED

MECHANICAL SUPERINTENDENT, EFFICIency engineer and master mechanic having twenty years' experience in all lines of general machine, blacksmith, carpenter and pattern shop practice, foundry work, power plant, refrigerating and electrical engineering, is open for engagement. Box 177, Canadian Machinery. (11)

CHIEF ENGINEER — 26 YEARS' EXPERIence. Factory and Central Station, Alternating and Direct Current, Gas or Steam Engines, efficiency guaranteed, own instruments, best of references. Box 181, Canadian Machinery. (12)

AS MAINTENANCE ENGINEER OF FACTory, power or lighting plant, where economy is a factor, wide experience, best of references. Box 180, Canadian Machinery. (12)

WANTED

WANTED TO RENT — SMALL MACHINE shop, two or three small lathes, miller, drill, motor, furnace, usual small tools. Full particulars and terms. Box 179, Canadian Machinery. (13)

AGENTS WANTED

BRITISH HOUSE MAKING SYRINGES AND spraying machines for every possible use, need Canadian agents. The line is the most complete in the world and includes knapsack and ordinary spraying machines for fruit growers, limewashing machines for farms, factories, etc. Disinfecting machines for all purposes. Anything in the way of spraying and washing machines made to suit the market. Agents must be aggressive and ready to work the line thoroughly. Write: Spraying Machines, c/o Canadian Machinery, 143 University Avenue, Toronto.

INDEX TO ADVERTISERS

The Manufacture of Mark II Gaines for 18 Pdr H.E. Shells

Staff Article

To a greater extent than any other part of a shell, the gaine offers full scope for the application of automatic machinery. Simplicity of operations and the use of easily worked material aid largely in the rapid production of pieces with continued high degree of accuracy.

NOT the least important of the component parts of the high explosive shell fuse is the gaine, which, since it contains the detonating charges may be correctly known as the "exploder." This part is secured to the fuse by means of the adapter, from which it extends downwards into the body of the shell.

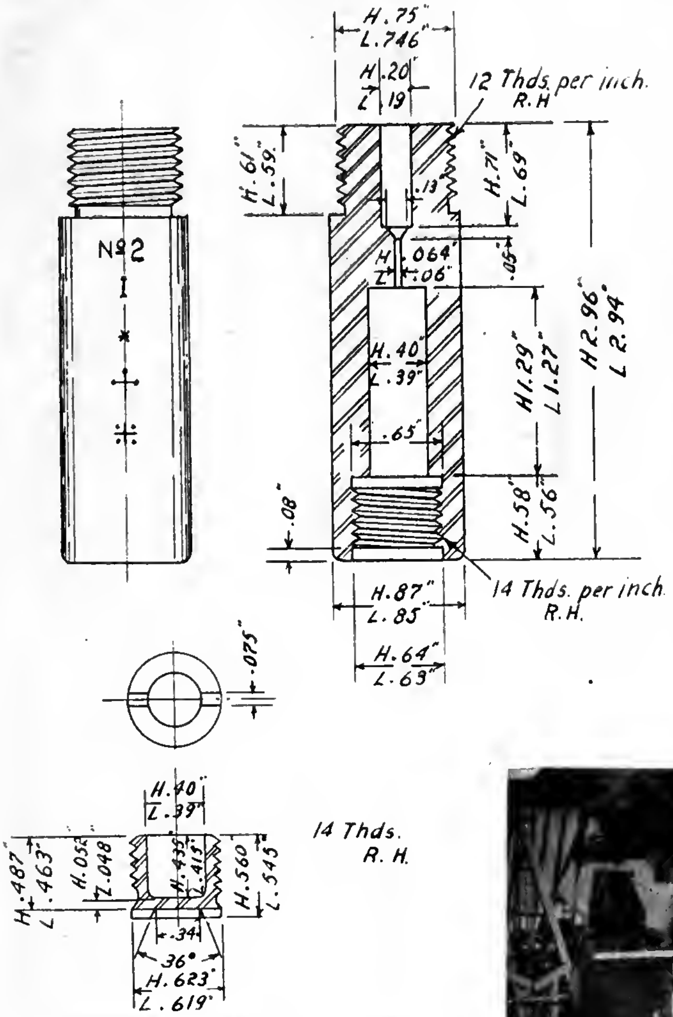

FIG. 1. SKETCH OF GAINE AND PLUG.

The mark II. gaine here referred to, is used in connection with that type of shell commonly known as the 18-pounder, and its constructional features and the manner in which it is exploded may be briefly described as follows: Referring to Fig. 1 it will be seen that the gaine, which is made of a good quality cold rolled steel is composed of two parts, the body and the bottom plug. The body is provided with two chambers, which are connected by means of the small flash hole shown. Both chambers are loaded with the necessary explosive. The plug which is screwed into the bottom recess of the gaine, is also made of cold rolled steel, and its purpose is merely to hold the explosive in place.

Function of the Gaine

The gaine is exploded upon impact of the fuse only. When the shell is fired, the force or impact of the explosive charge in the cartridge case causes a small pin in the fuse to drop back and compress a detent spring. Being thus forced back, the action of gravity permits the pin to fall to one side, where it is caught by the edge of a recess and prevented from assuming its original position.

The pin referred to holds the centrifugal bolt in position, but the centrifugal action of the shell now causes this to drop back, clear of the graze pellet. All that prevents detonation now is a hair spring which is of sufficient tension to hold the graze pellet back thus preventing the primer which is held in the counter-bored end of the pellet, from coming in contact with the needle. An explosion is now free to take place upon the slightest impact of the shell. When this occurs the graze pellet jumps forward, compressing the spring, until the primer comes in contact with the needle and is exploded. The flame now extends downwards and explodes the material in each respective chamber of the gaine, the explosion in the bottom chamber being of such intensity that the gaine is shattered, and the charge of lyddite contained in the shell is exploded.

Type of Machine Used

The machining operations on the gaines with the exception of the tapping are done exclusively on Brown & Sharpe automatics; the general arrangement of these machines being shown in Fig. 2. By this method of laying out the plant, the floor space is used to the best advantage.

For the first operation, a number of B. & S. automatics No. 2, similar in design to that shown by Fig. 3, are used.

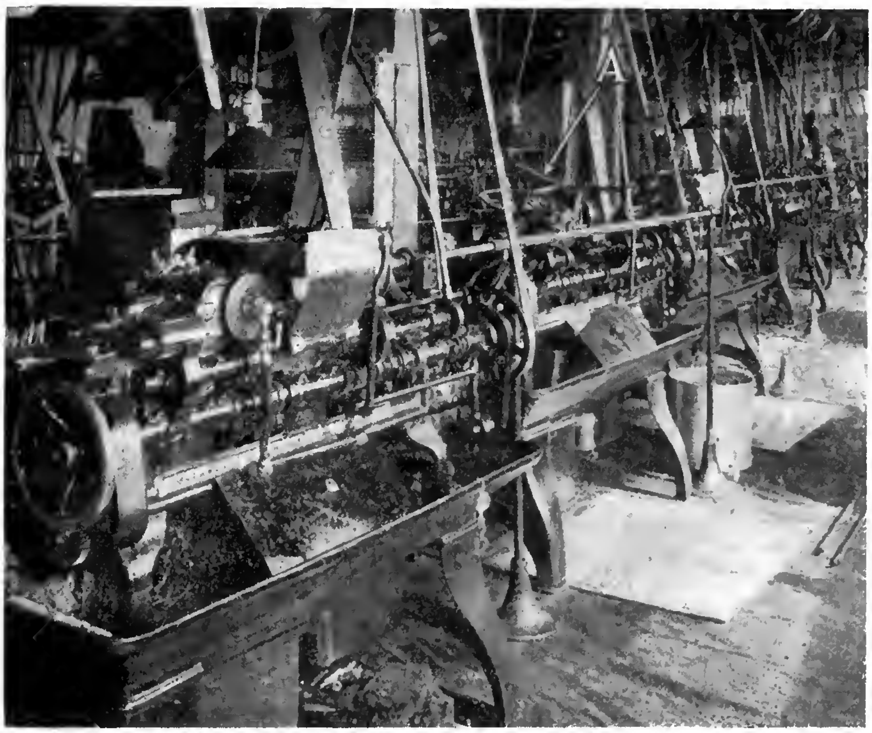

FIG. 2. ARRANGEMENT OF AUTOMATIC MACHINES.

A sketch showing the arrangement of the tools on both the turret and cross-slide shown respectively at A and B, Fig. 4, and the sequence of each respective operation is shown in Fig. 5. The stock is first rough drilled to form the diameter of the internal threaded portion, which is next reamed to the correct size and the bottom shoulder squared. The third turret face has a special attachment as shown for recessing the back and front ends of this diameter, while the tools 4 and 5 rough drill, and ream and square face respectively, the main or bottom chamber. While the turret is completing this cycle of operations the two cross-slide tools A and B are also being fed into the work. The forming tool B, the design of which is shown at A, Fig. 6, is placed in the rear cross-slide and forms the threaded diameter at the same time recessing the end of this diameter as shown. In the meantime the front cross slide holding the cutting off tool A feeds into the stock, cutting it off to the necessary length.

Recessing Tool

An interesting feature used in connection with the first operation is the recessing tool, and holder, a sectional view of which is shown at B, Fig. 6. The body A is provided with a suitable shank which fits the turret hole. The tool-holder B is pivoted to the body as shown and is held in its central position by the loop spring C. The tool, the shape of which is clearly shown, is securely held in position by means of a block and the set screw indicated. In operation, the tool enters the work to the required distance, at which point the front cross-slide advances and acts upon the adjusting screw D. This action presses the holder B to the rear, at the same time causing the inverted tool to cut the desired depth of recess. Upon the completion of the work the tool is relieved by the cross-slide receding and is returned to central position by the action of the spring, which forces the holder back till the stop pin F is in contact with the plug E.

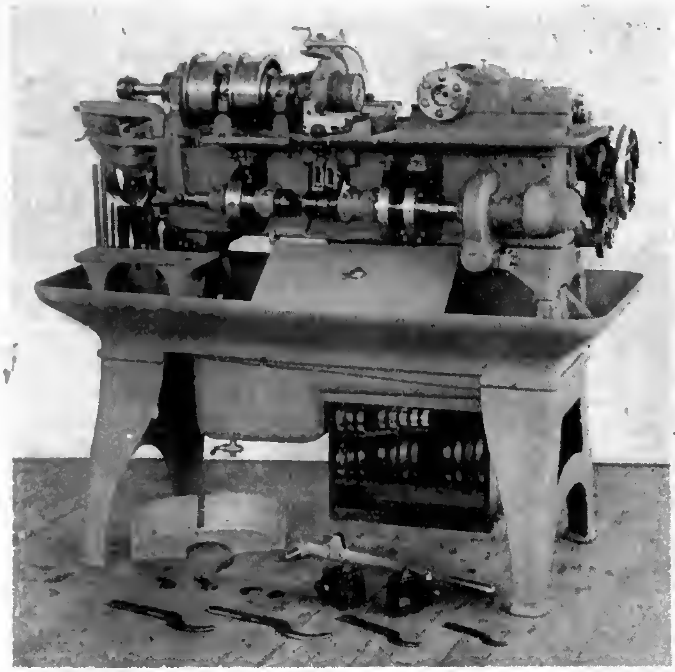

FIG. 3. BROWN & SHARPE AUTOMATIC NO. 2.

Threading and Trimming

Upon the completion of the cycle of operations included in operation I, the semi-completed gaine is ready for the next operation, which includes cutting the external thread and trimming to length. The machine used is of the same style as that used in the previous operation and it contains several interesting appliances which materially add to the output of the machine.

The work is fed into the machine through the stock feed tube inserted in the spindle and a magazine shown at A, Fig. 2. During the operation the feed tube is filled with gaines back to where an opening in the tube allows

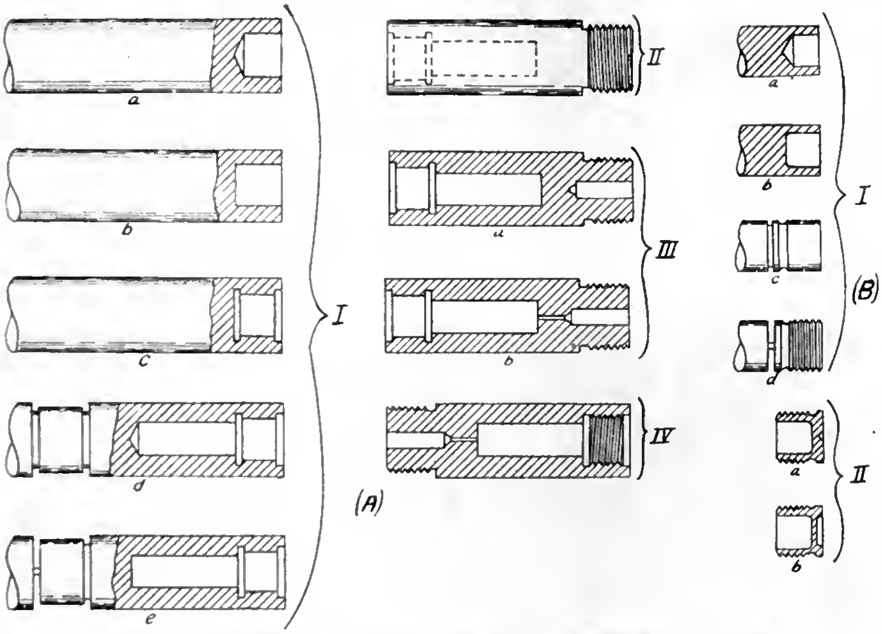

FIG. 5. SEQUENCE OF OPERATIONS ON GAINES AND PLUGS.

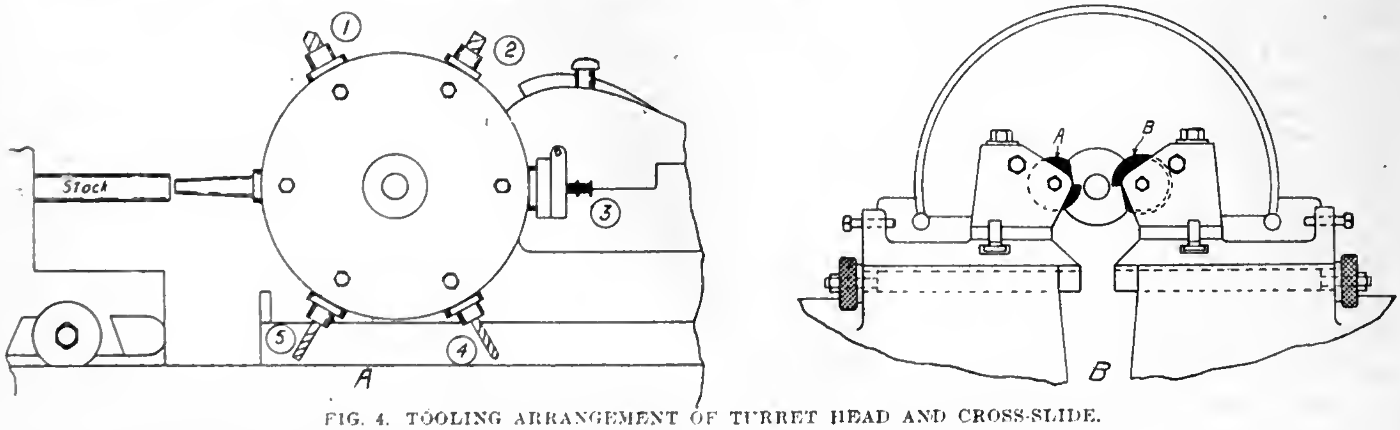

FIG. 4. TOOLING ARRANGEMENT OF TURRET HEAD AND CROSS-SLIDE.

them to drop in from the magazine, which the operator keeps filled with fresh pieces. When the chuck is released upon the completion of the operation the feed plunger advances beyond the slot in the tube forcing the finished gaine out, and at the same time causing another to take its place. The plunger then returns to its former position and as it leaves the tube slot open another piece is dropped in from the magazine.

Gauging Device

An excellent arrangement whereby the work, as it is fed into the chuck is gauged so as to be in proper relation to the thread milling cutter is shown in the foreground Fig. 7. The block A is secured to the rear cross-slide and the trigger-arm B is pivoted to it as shown. The latter acts against an adjustable stop C, which is clamped in the post E attached to the front of the block. In operation the device operates as follows: As the completed gaine is leaving the chuck the cross-slide advances to the required distance which allows the point of the trigger B to act as a stop against the shoulder of the following gaine. As the latter is being forced forward, the shoulder acting against the trigger advances it until it comes in contact with the stop pin C. This positions the work in the chuck and as the latter closes on the work the cross-slide recedes and when the point of the trigger is free of the shoulder the action of the springs shown forces it back to its original position against the stop pin D.

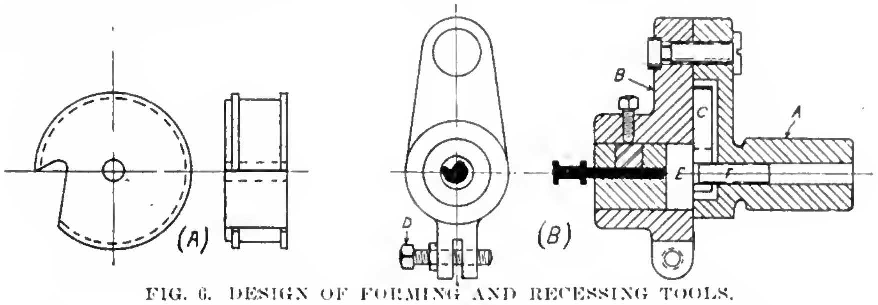

FIG. 6. DESIGN OF FORMING AND RECESSING TOOLS.

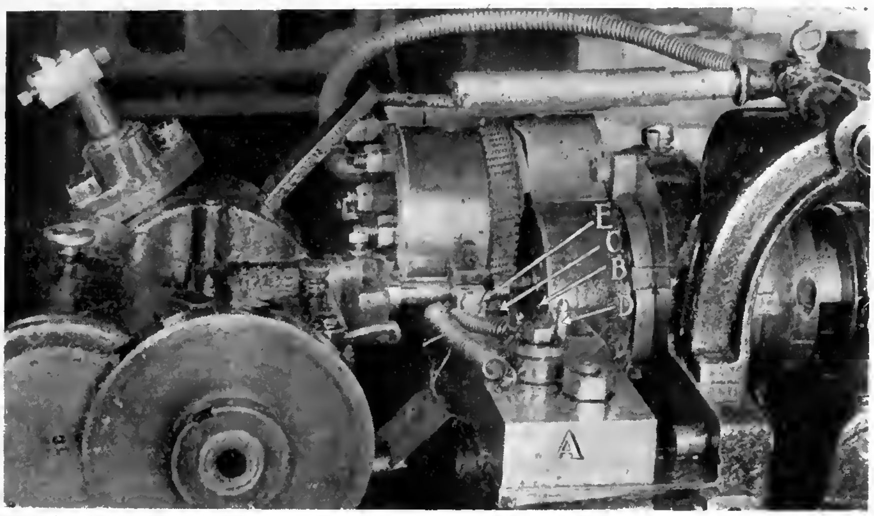

FIG. 7. LOCATING AND THREAD MILLING ATTACHMENTS.

The work being now chucked in the proper position the machining operations are next performed. These include milling the thread by means of the attachment, secured to the front cross-slide as shown, and also removing the centre burr and centring for the next drilling operation, and chamfering the end of the gaine by means of the tools shown secured in the turret head. Very little explanation of these operations is necessary, as they are clearly shown in the accompanying cut. The milling cutter is driven in the reverse direction to the work through a train of gears enclosed in the gear box placed to the left of the cutter. The reason for this method of driving the cutter is to insure that all unnecessary play which might occur would be taken up by the gears.

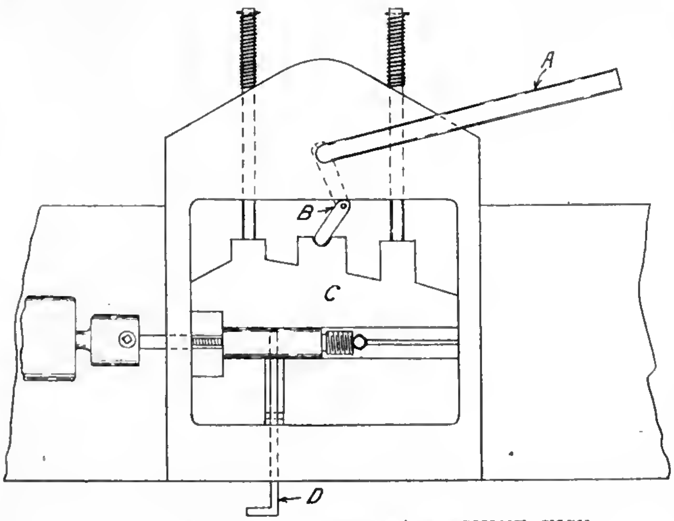

FIG. 18. PLAN VIEW TAPPING MACHINE VISE.

Leather Pads Preserve Work

With reference to the turret head arrangement this is fitted with three duplex tools similar to those shown, and three leather pads secured to the intermediate faces. These tools work in conjunction with the threading operation, as can be readily seen by referring again to the Fig. 7. As that thread is being milled as shown, the turret is advancing; the tools being shown as they are about to enter the work. Upon the completion of these operations all tools recede, the turret head rotating at the same time until the leather pad is opposite the work.

This pad acts as a cushion for the completed gaine as it is ejected from the chuck and prevents the threaded portion from becoming marred as it otherwise would should it come directly in contact with the turret head.

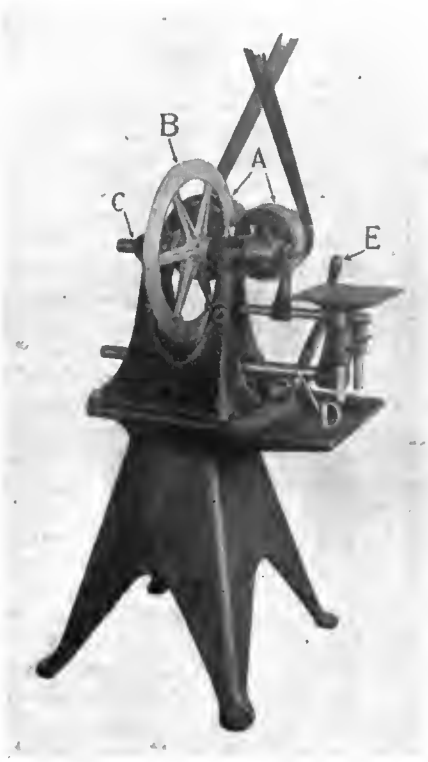

FIG. 9. RICKERT-SHAFER FRICTION TAPPING MACHINE.

The gaine, the outside diameter of which is now completed, next passes to a B. & S. semi-automatic on which the two remaining diameters, i.e., the top

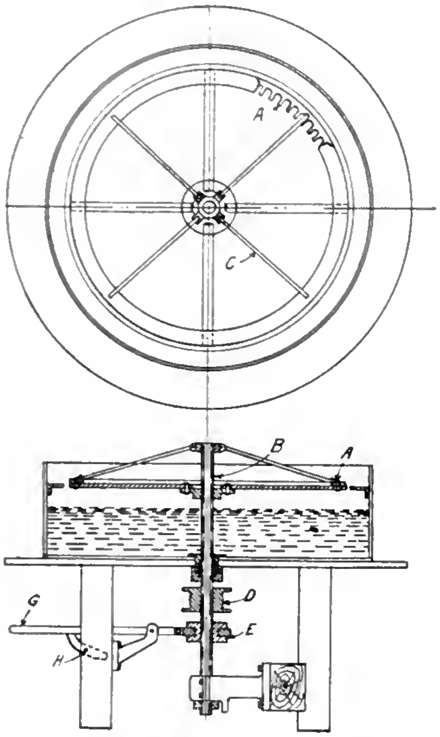

FIG. 10. PLAN AND SECTIONAL VIEW OF LACQUERING MACHINE.

chamber, and flash hole, are drilled and reamed. These operations need no explanation as the method of procedure is similar to the drilling operations used in operation I.

Tapping Diaphragm Chamber

To complete the gaine all that now remains is to tap the diaphragm chamber. This requires two operations, viz.: roughing and finishing.

The first of these is performed on a Garvin horizontal tapping machine which is somewhat similar in design to a small turret lathe. In place of the turret, however, a special chucking vise is used. A sketch showing the constructional features of this vise is shown by Fig. 8. In operation the gaine is placed in the position as shown and is securely held by means of the lever A operating through a toggle-joint B, the moveable vise jaw C. After the tapping operation the gaine is released by moving lever A, after which it is removed by pressing down on the ejector handle D. The ejector works on a pivot, thus, as the handle is pushed down the inner end of the ejector upon which the gaine rests, is raised.

The finish tapping operations are performed on Rickert-Shafer friction tapping machines which are particularly suited for this class of the work. By referring to the accompanying cut Fig. 9, an excellent idea of the possibilities of this machine will be obtained. The machine is driven by means of two friction pulleys A, driven by one belt, and which transmit the necessary forward and reverse motion to the spindle, through a large double-faced friction disc B attached to the latter. A considerable amount of thrust or end play is allowed the spindle C, and by this means the friction disc can be operated through either pulley as desired. The tap is held as shown, in a suitable chuck secured in the end of the spindle. In operation, the gaine is held in a convenient vise fastened to the machine table, and the motion imparted to the latter through the rack and pinion shown at D by means of hand lever E forces the work into the tap. The pressure thus exerted has the tendency to take up the thrust in the spindle until the disc is engaged with the forward drive pulley. Upon the completion of the tapping, the tap is relieved by exerting the reverse pressure on the hand lever which in turn causes the spindle to be relieved until the disc comes in contact with the reverse drive pulley.

Washing and Marking

Following the machining operations already described the gaines which are now practically complete are passed to the cleaning department, when all excess oil and cuttings are removed. After a preliminary bath in coal oil, the gaines are placed in large pails or callenders having a heavy screen bottom, and are placed in a kettle of boiling lye. After being subjected to a thorough cleansing they are removed and afterwards rinsed thoroughly in kettles of boiling water.. After being thoroughly rinsed a further precaution is taken to remove any chips by subjecting each gaine to a strong blast of compressed air.

The gaines now pass to the inspectors' room where, after being marked on a Dwight-Slate marking machine they pass through a rigid inspection as to lengths, internal diameter and size of threads.

Lacquering

Finally, after passing through the inspection department the gaines are ready for the last operation which includes lacquering, baking and packing. The first of these operations is taken care of on a special machine which although somewhat crude in construction is giving excellent service. A sketch of this machine is shown by Fig. 10, and as will be noticed it is somewhat similar in constructional and operating features to the ordinary oil extractor. The machine consists of a circular tank which is partly filled with lacquer and which is supported on substantially constructed legs. A circular rack A, which has accommodation for 64 gaines is secured to the upright shaft B, and is rigidly supported by stay rods C. The shaft is driven by means of a belt and pulley D, and can be raised or lowered by shifter E. The latter is operated by a lever G, which can be locked by the pin H, when the shaft is in its raised position. In operation the gaines are placed in position by being slipped over each respective lug, after which the shaft is lowered and the loaded rack immersed in the lacquer. After a thorough bath in this solution they are again raised to the former position and the lever locked in place, after which the rack is revolved at a high speed. The resulting centrifugal motion has the tendency to slightly raise the gaines permitting the excess lacquer to drain off, and causing the thin remaining coat to dry rapidly.

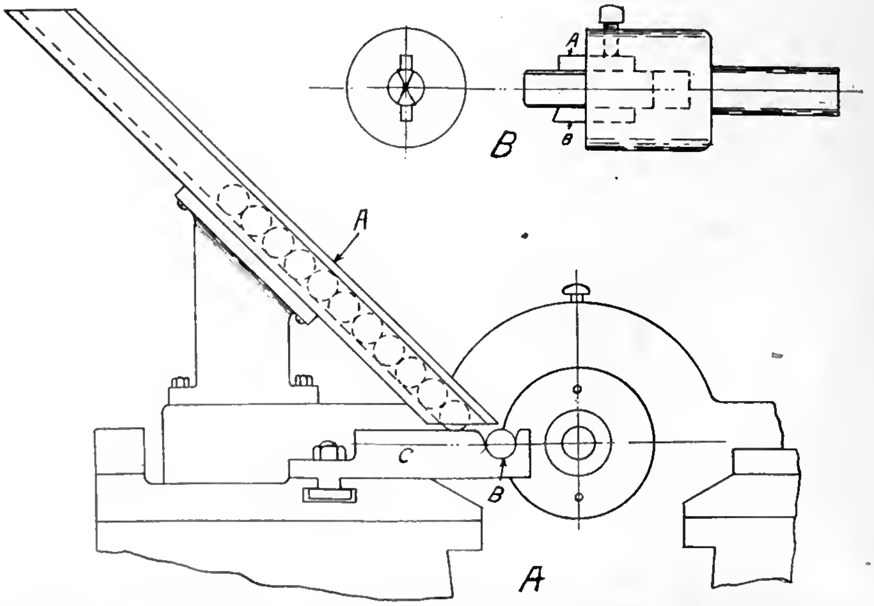

FIG. 11. (a)—MAGAZINE FEED ARRANGEMENT. (b)—REAMING AND FACING TOOL.

Baking

On being removed from this machine

the next operation in order is baking. This is accomplished on another very simple contrivance which consists of a long wooden box having a wire screen bottom. Beneath the screen are stretched several coils of electric heating wire. The gaines are placed in the box and passed slowly from one end to the other by which time they become sufficiently well baked.

The remaining and final operation consists of screwing the bottom plugs into place after which the completed gaines are wrapped and packed ready for shipment. In this case they are first wrapped separately by being placed in suitable card board cylinders after which they are packed in heavy wooden boxes, holding 500 completed gaines.

Bottom Plugs

The bottom plugs require but three machining operations, the first two of which are performed on B. & S. Automatics No. 0. The first operation consists of drilling, reaming and facing for length, by means of the turret tools while the cross-slide tools recess the end of the threaded diameter, thread the plug and cut off. The sequence of each respective operation is shown at B, Fig. 5.

The tooling arrangement of the turret needs no explanation beyond a description of the reaming and facing tool. A sketch of this is shown at B, Fig. 11, and it will be noticed that it really consists of three tools in one. The fluted reamer is held in a suitable shank which is also provided with slots to take the facing and chamfering cutters. A and B. The latter are so positioned as to insure the correct length being obtained. The cross-slide tooling arrangement consists of a combined recessing and cutting-off tool somewhat similar to that used in operation I on gaines, and a thread milling attachment secured to the rear cross-slide; similar in design to that previously described.

Magazine Feed

The second operation consists of removing the centre burr left by the cutting off tool, countersinking and reaming the desired counterbore. The only unusual feature about this machine is the special feeding attachment. This consists of a suitable magazine or trough conveniently located and secured to the body of the machine. This device is shown at A, Fig. 11. The magazine is filled from the top with the semi-completed plugs which are automatically released, one at a time into the recess B. which is formed in the block C, secured to the front cross-slide. When the plug is in position as shown by the sketch the cross-slide moves forward until the centre of the plug is in a direct line with the centre of the chuck. The turret then advances and a plunger secured to a turret face pushes the plug into position in the chuck The cross-slide then returns to its former position to receive the next plug while the one just deposited in the chuck is being machined by the turret tools.

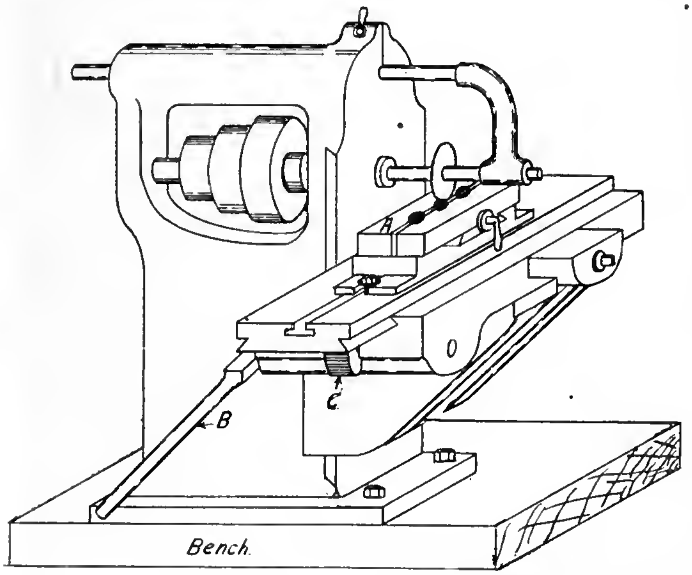

FIG. 12. SLOTTING PLUGS ON BENCH MILLING MACHINE.

Cutting Slots

The remaining operation which calls for the cutting of the slot is accomplished on a small bench milling machine, the details of which are shown by Fig. 12. Secured to the machine table is a vise A, which is constructed as shown to accommodate three plugs. These are placed in position and after being locked are slotted by being passed beneath the cutter. This machine is capable of slotting 250 plugs per hour.

All that remains now to complete the plugs is the operation which includes lacquering and baking. Both of these operations are performed on the same machines as are used in connection with the gaines: the only difference being the manner in which the plugs are held on the lacquering machine rack. The latter is so constructed that the space allowed between each respective lug is sufficient to allow the plugs to be slipped on and held snugly in position by the recessed diameter. When the desired number of plugs are in position, they are dipped in the lacquer, after which they are dried and baked in the same manner as the gaines.

TAPPING BLAST FURNACES

AT the Edgar Thompson works of the United States Steel Corporation, blast furnaces are tapped by a method devised by the engineering department of the Westinghouse Electric & Mfg. Co. An electric arc is drawn between an electrode and the chilled metal in the tap hole; the heat of the arc burns through the chilled metal until the fluid contents of the furnace are reached. If during the opening operation non-conducting material be encountered, it is necessary to stop the arc and drive a steel bar through this mass. The process of melting is then continued, the arc following this bar of metal. A 250-volt circuit is used, the pressure being reduced by means of a water rheostat. A current of from 800 amperes to 1,000 amperes is ample for the operation.

The apparatus required consists of a special electrode holder, electrodes, cable, a resistance, and a head shield or protector for the operator. The electrode holder consists of an iron pipe 4 ft. or 5 ft. long, in one end of which the electrode material is placed and clamped by means of a ring; the end of the pipe is split in order to give a clamping effect when the ring is forced down towards the end of the pipe. In the other end of the pipe a wooden pole is placed, the cable connection being made to the iron pipe. The entire length of the electrode and its holder is about 12 ft.

Steel articles that have been tempered or blued and show a light color, either straw or blue, cannot be tinned without first removing the thin film of oxide which gives color to the hardened and tempered steel. A bath of dilute hydrochloric acid is necessary to remove this thin film of oxide. It will require only a few seconds' immersion to do so, after which the object should be dipped into the lead and tin bath while wet. Place it immediately afterwards in the melted bath, and the lead and tin alloy will immediately coat the surface and form an excellent foundation for further soldering.

The extreme pressure at which open-hearth steel furnaces are being worked in Britain has caused rather a shortage in the supply of the silica bricks of which they are built. The output of the bricks is said to have fallen off by one-half, whereas the consumption has nearly doubled during the progress of the war.

MACHINING AND ASSEMBLING ENGINE PISTON VALVES—II.

By George Black

Machining the body or spool is the next operation, and reference to Fig. 9, which is section through spool, will show that a bar of rectangular section, A, is cast in each end, the use of which is to carry the centres upon which the ends of the body will be turned; the bars are for machining purposes only and will be removed when the turning operation is completed. Although this method of handling the work entails a small increased cost both in extra metal and labor, it was found to be that which was most economical in the end.

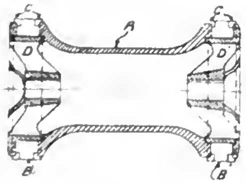

FIG. 1. SECTION THROUGH PISTON VALVE.

First Operation.

The first operation to the body is to mark out the centres and drill with a Slocum drill, and would consist of:

	Min.
(1)—Lay off and mark center	1.0
(2)—Set up in drill press	.5
(3)—Drill center	1.0
(4)—Remove	.5
(5)—Repeat for other end	3.0
	Min.: 6.0

Second Operation.

The body then passes to a 21-in. Le Blond heavy-duty lathe, where the ends are turned, faced and recessed for the bull-ring and follower fit. Fig. 10

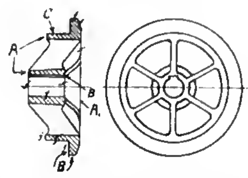

FIG. 2. SECTION THROUGH CENTRE OF FOLLOWER.

is a view of the lathe with the body in the centres, and the detail operations are:

	Rev. per min.	Feet per min.	Depth of cut.	Feet per rev.	Time in Min.
(1)—Lift from floor, place in centers					1.0
(2)—Set tool and cut					.5
(3)—Turn outside diameter	18	55′	1-32″	.025″	1.25
(4)—Reset tool and cut. Change feed					.5
(5)—Turn O. D. 2nd cut	18	55′	1-32″	.03″	1.00
(6)—Reset tool and cut. Change feed					.5
(7)—Rough turn face	18	55′	⅛″	.025″	3.0
(8)—Reset tool and cut					.5
(9)—Finish turn face	18	55′	1-32″	.025″	3.00
(10)—Change and reset tool and cut					.75
(11)—Rough turn recess	18	54′	3-16″	H.F.	3.00
(12)—Reset tool and cut					.5
(13)—Finish turn recess	18	54′	1-32″	H.F.	3.00
(14)—Reset tool					.25
(15)—Turn clearance	18	54′	⅛″	H.F.	1.5
(16)—Remove addage and smooth					1.0
(17)—Remove body. Clear chips					1.0
(18)—Repeat for other end of body					22.25
				Min.	44.50

Third Operation.

The bars in the end of the body, having served the purpose for which they were intended, are now removed and this

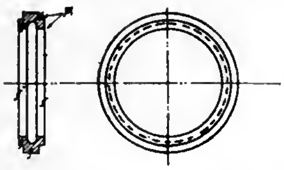

FIG. 6. BULL RING.

is best accomplished by drilling 1 ¾-in. hole through the bar at each end of same; the bar can now be knocked out and the rough spot on each side dressed up with a hammer and chisel. The time required for this work is 12 min., the details of which are:

	Min.
(1)—Mark each end of bar for drill and place in position	.75
(2)—Drill 1—¾″ hole. Note—Care required in going through	1.25
(3)—Reset for 2nd end	.25
(4)—Drill 1—¾″ hole	1.25
(5)—Remove body	.25
(6)—Break out bar. Dress up with chisel	2.00
(7)—Repeat for other end	5.75
Min.:	11.5

Piston Valve Rings.

With the exception of drilling at each end of the body for the dowel pin, which is handled by the fitters at the assembling bench, the body is finished and the remaining machine operations are those necessary for making the piston valve rings. These rings are of "L" section, as seen in Fig. 1, turned to 14 5-32 inches outside diameter, 7-16 in. cut out, closed with a 1-32 in. liner between the ends and re-turned to the same diameter as the bore of the valve

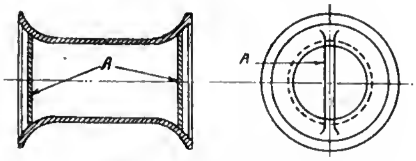

FIG. 9. SECTION THROUGH SPOOL.

bushing; they are usually made from hunt-spiller or gun iron metal, and are machined from hoops which have 3 lugs cast upon the bottom, Fig. 11; these lugs are used to clamp the casting to the face-plate, and in order to guard against the possibility of the lugs breaking off under the strain of roughing out the hoop, a driving plate is clamped to the face-plate and drives directly at the root of the lug. Fig. 12 shows this operation, but the driving plate is obscured by chips. Occasionally a lug is broken off the hoop, and in that event, a ¾-in. hole is drilled in the hoop about 1 in. above the lug, and a finger clamp, inserted in this hole, is utilized in the place of the lug for clamping purposes.

First Operation.

The first operation to the hoop consist of:

The 1st operation to the hoop consists of:—	Rev. per min.	Feet per min.	Depth of cut.	Feet per rev.	Time in Min.
(1)—Chuck and true up hoop					10.0
(2)—Set tool and cut					1.0
(3)—Face top of casting	18	57′	⅛″	.042″	1.0
(4)—Set tools and cuts					2.0
(5)—Rough turn O.D.) (6)—Rough turn I. D.)	18	57′	3-16″	.042″	16.0
(7)—Reset heads, tools and cuts. Change feeds					2.5
(8)—Finish turn O. D.) (9)—Finish turn I. D.)	18	57′	1-32″	.33″	3.0
(10)—Reset heads, tools and cuts. Change feeds					2.5
(11)—Recess top of casting	18	57′	3-16″	.014″	2.0
(12)—Change and set tools					1.0
(13)—Face recess to depth	18	57′	1-64″	.014″	2.0
(14)—Change and set tools and cuts. Change feeds					2.0
(15)—Part of ring	18	57′	⅜″	.007″) .014″)	2.0
(16)—Remove ring. File burrs					.5
Repeat items 12—16 inclusive for 9 other rings					67.5
Remove scrap. Clear chips					2.0
Total time for 10 rings:—Min.					117.0
Total time for 1 ring:—Min.					11.7

The above details require no explanation except item 15, "part off ring." In this operation the centre head and the side head are working, one from the inside and the other from the outside. The centre head carries a parting tool ⅜-in. wide, while the side head holds a parting tool ⅛-in. wide. The sketches, Fig. 13 and 13a, illustrate the way the tools are used; the wide tool carries double the feed of the outside or ⅛-in. tool, but having nearly double the resistance to travel, the time is about equally divided. It will be noticed that this method of parting off the rings leaves the following ring, with the step or recess roughed out and in item 13, "face recess to depth." this step is finished to gauge with the centre or turret head which carries a tool-holder equipped with tools as shown in Fig. 14.

Second Operation.

The ring now passes to the adjoining engine lathe, where it is skimmed up to width and to gauge on the second side; see finish mark, Fig. 17. This operation was found to be necessary and more economical than attempting to part them off the hoop correct to gauge. Fig. 15 shows the lathe and the adapter for holding the ring during this operation, and reference to Figs. 16 and 17 will explain the operation of same. The letters have reference to the component parts of the adapter; "A" is a heavy face-plate strongly ribbed to render the plate

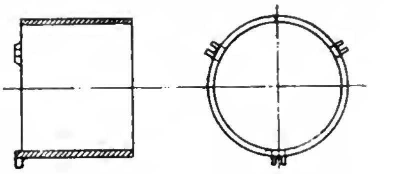

FIG. 11. PISTON VALVE RING CASTING.

rigid; "B" is a loose ring, the outside diameter of which is 1-16 in. less than the middle diameter of the piston ring E. This loose ring, B, is centered upon spigot C, and is of various diameters to suit the different piston rings; it has a cone

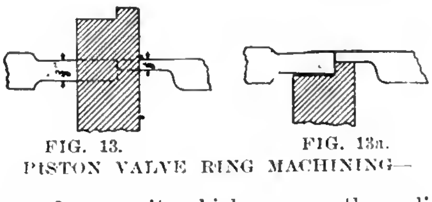

FIG. 13. FIG. 13a.
PISTON VALVE RING MACHINING—

turned upon it which causes the split ring D to expand into the piston ring E when forced up by the nut operating

upon Plate F. It will be readily seen that this arrangement chucks the piston ring true immediately; the finished face of the piston ring, taking up against the ring B, gives a parallel ring when the opposite side is faced off, while the split ring D holds the piston ring true on the outside diameter, grips firmly, yet without distorting the work. The details of this operation are:

	Rev. per min.	Feet per min.	Depth of cut.	Feet per rev.	Time in Min.
(1)—Chuck ring					.75
(2)—Face ring	14	50′	1-32″	.014″	3.75
(3)—Gauge and remove					.5
				Total time	5.0

In the above operation the saddle was locked in one position, while the cross slide was fed across the ring and then drawn back out of the way when placing a new ring in position; by this means, time spent in gauging the work was reduced to a minimum, the only adjustment necessary being due to the wear of the tool.

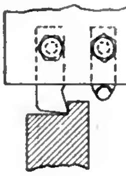

FIG. 14. PISTON VALVE RING MACHINING — FIRST OPERATION.

Third Operation.

The next operation to the ring is that of cutting out the amount necessary to give the required "spring." In this case the amount was 7-16 in. and while "ganging" and splitting on the milling machine gives good results, it means tying up a very valuable machine, hence it was decided to use an old discarded lathe for the job. Fig. (18) will give a general idea of the rigging, which consisted of a mandril upon which was mounted a pair of 6 in. diameter metal saws. The ring was placed upon a flat cast iron plate, which was secured to the top rest of the cross slide by a bolt in the plate of the tool post. The ring was centered on the plate by two 1/4 in. pins and securely clamped in one movement by the cam handle A, Fig. (19) a movement of which through about 90 degs. being all that was required. The clamping plate B, is pivoted on bolt C, which is provided with a knife edge washer and can be adjusted to suit varying thicknesses of rings, by the nut D, and also adjusts the movement of the cam handle. A coiled spring under the plate B, lifts the same away from the ring when removing or replacing rings. The capacity of this old lathe on this work, was 600 rings per day of 10 hours.

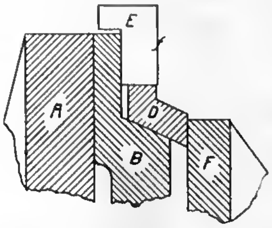

FIG. 17. PISTON VALVE RING MACHINING — SECOND OPERATION.

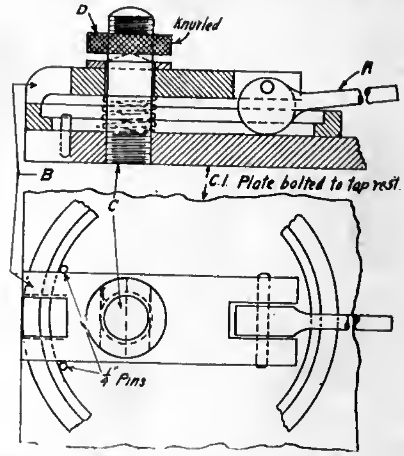

FIG. 19. PISTON VALVE RING MACHINING—THIRD OPERATION.

Fourth Operation.

The split rings now pass to the next lathe for the re-turning operation. In this operation it is necessary to draw the split piston ring together, until the ends butt against a 1-32 in. liner inserted between them, it is then clamped in this position and the outside diameter turned up to the required size. Fig. (20) shows the various parts of the rigging with which the lathe was furnished to handle this work. An adapter with spigot "A" the outside diameter of which corresponds with the bore of the piston ring, is screwed on the nose of the lathe; the 4 split piston rings are next placed in the clamping ring "B." a 1-32 in. liner inserted between the ends of the ring and by means of the bolt in ring "B." the whole are pulled up tight; they are then pushed over spigot A and the clamping plate "C" operated by the stud "D" pulls the 4 rings up snug against the shoulder at end of spigot "A," clamping ring "B" is now slacked off and removed by sliding over plate "C." leaving the rings ready for returning on the outside diameter. This operation is handled by the two tools as shown in Fig. (20), in which "E" is the roughing tool and "F" the square-nosed finishing tool. The cross slide is moved up to a positive stop giving the correct diameter, which eliminates much caliper measurements, and the saddle is operated through the usual friction feed while roughing the rings to diameter; when the diamond point tool has run off, the friction feed is disengaged and the lead screw nut dropped into gear and as the square nosed tool is following in tool post "F," the result is a fine finish and a ring to size. The detail operations are as follows:—

	Rev. per min.	Feet per min.	Depth of cut.	Feet per rev.	Time in Min.
(1)—Place 4 rings in band clamp and apply brass liner...					.25
(2)—Apply to jig					.75
(3)—Clamp and remove hand clamp					.75
(4)—Set tool and cut					.25
(5)—Rough turn	12	48′	1-32″	.02″	10.0
(6)—Finish turn	12	48′	1-64″	.125	1.75
(7)—Remove rings					.75
				Time for 4 rings:	14.75

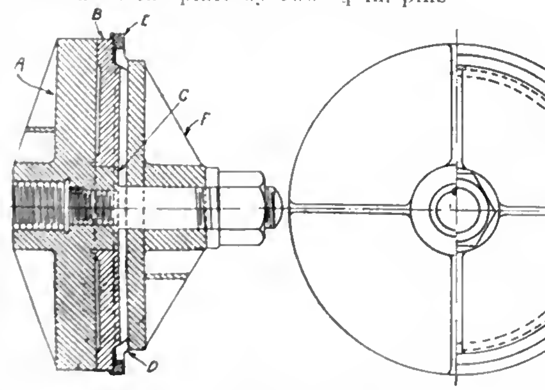

FIG. 16. PISTON VALVE RING MACHINING—SECOND OPERATION.

Final Assembly.

The component parts of the valve are now all ready for the assembly bench, where the work consists of drilling for dowel pins and fitting same, assembling the split rings, bull rings and follower together, fitting and marking the rings and finally bolting up complete with the body or spool. The output from two men would average 10 sets or 20 valves per day of 10 hours, when the operators were being paid on a piece-work basis.

J. W. Calder, assistant city engineer at Port Arthur, Ont., has been appointed town engineer and electrical superintendent of Swift Current, Sask.

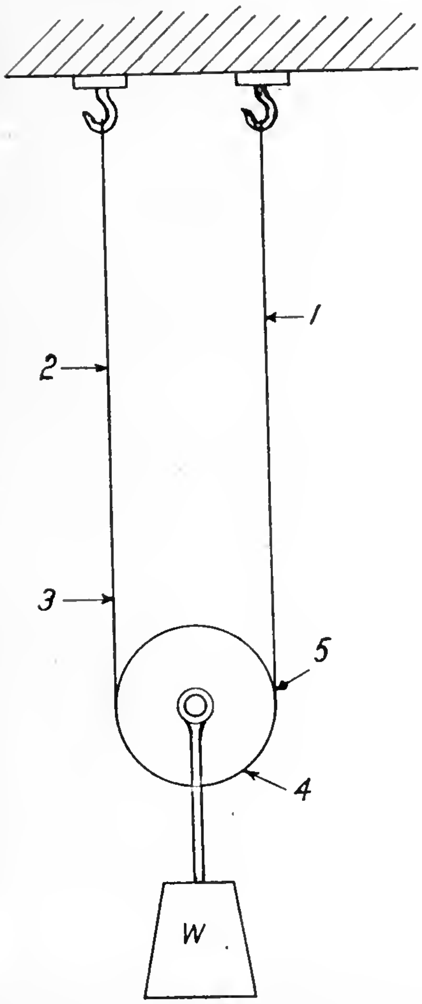
ROPE STRAIN PROBLEM

By N. G. Near.

WITH reference to the query of J. R. H. under the above title in a recent issue, we all have doubtless known for a great many years



ROPE STRAIN PROBLEM. DIAGRAMMATIC PROOF OF SOLUTION.

that there is no difference in tension between Figs. 1 and 2, appearing there. This is true because of the old law of physics—"Action and reaction are equal and opposite in direction." Yet, that isn't a good answer. Just because a law says a certain thing it doesn't necessarily prove that the thing is right, for even laws may sometimes be wrong. It is stated, for example, that the well-known laws of gravitation aren't "absolutely accurate," but are very close—close enough for all practical purposes. Perhaps, as far as I know, they are "absolutely accurate." I am merely quoting others who have studied laws of gravitation more than I have and should therefore know more about them In consequence, we will assume for the present that the old "action and reaction law is wrong," and go after the "proof" which J. R. H. desires.

I rigged up a little device as shown in the sketch and instead of a rope used a string around the pulley. I applied load enough with my hands to break the string. I used five different lengths of string, all from the same ball, and noted the places where the string broke each time. In no test did the string break at the "middle" of the contact with the pulley. It broke in the places I have indicated by number, the numbers designating the number of the tests made.

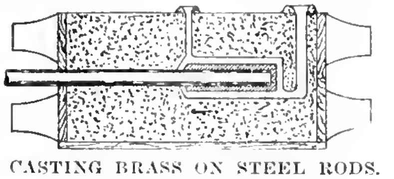
Since a string is fairly uniform in strength from end to end, and since my results are fairly uniform, I consider this pretty good "proof" that the tension is equal all over the rope or string, as the case may be, and that therefore no difference in tensions exist in the two figures accompanying the original query. The old "Action and Reaction Law" is also vindicated.

CASTING BRASS ON STEEL RODS

By B. R. S.

A foundry operation which is accomplished in many instances with no small amount of trouble is that of casting a brass covering or liner on steel rods, for use as pump plungers, etc. The difficulty lies chiefly in the fact that the castings are to a certain extent porous, resulting in a poor working surface when machined.

This difficulty can be overcome by casting two layers of metal on the rod, in which case the porosity of the first or inner layer will in no way effect the work. The rod should be cleaned bright, be absolutely free from rust, and by further washing with a solution of copper sulphate, thus covering it with a thin film of copper, better results will be obtained. The rod should also be heated to a comparatively high temperature in order to insure that the metal covering will not be chilled.



CASTING BRASS ON STEEL RODS.

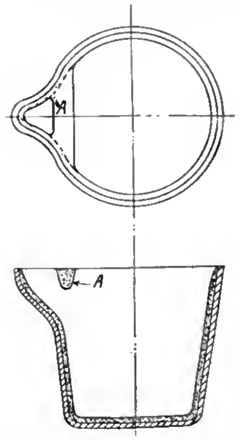
The method of pouring the second layer is shown in the accompanying sketch. In this case a wet sand mould is used, and it will be noticed that a suitable riser is employed, to draw off any dirt that may appear. A fairly high runner is used in order to maintain sufficient pressure to run the metal through in as short a time as possible.

Where the casings are thin, dried moulds faced with plumbago can be more profitably employed, as in such the metal runs better than in the ordinary wet sand mould. In both cases, however, the inner casing should be thoroughly scratch-brushed and the metal fluxed with dry zinc chloride.

TRICKS OF THE TRADE

By "Gov"

A serviceable skimmer that may be applied to either a hand or larger sulky foundry ladle, and which, in both cases gives good results by pouring off several



TRICKS OF THE TRADE—A LADLE SKIMMER.

heats without requiring a renewal, is shown by the accompanying sketch.

The skimmer consists merely of a clay bridge, A, constructed across the top of the ladle. In constructing the bridge, a strong clay mixture should be used, reinforced with wire or a piece of wood, until the clay is set, after which the bridge becomes self-supporting. In forming the pouring spout, a gate pin or any round plug of the desired size, is requisitioned, and around this the clay is worked up till the bridge is of the required shape.

Since a skimmer of this description can be constructed while the ladles are being "daubed up," the extra time and material required are of little or no consequence.

SHALL I BUY OR MAKE MY POWER?

By W. B.

THIS is an easy question to ask oneself, but not so easy to answer. We must first work ourselves into a state of

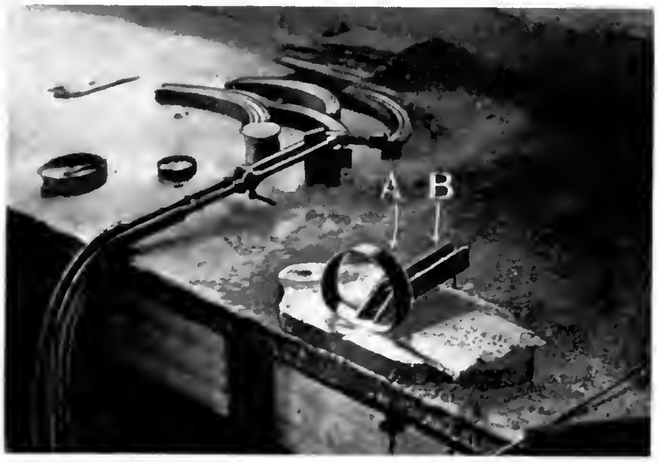
profound analysisitis and gain a clear understanding of first cost and the "ifs and ands" connected therewith. Perhaps it is first cost and then again, it isn't first cost at all.

Generally we are of the belief that the money we immediately "shell out" is first cost, but with a mortgage on the place, a small prepayment, and a promise to pay, it can sometimes be shown that there is no first cost at all. It is just added to the depreciation, subtracted from the sinking fund, divided by a safety factor and multiplied by two.

In the long run, after sifting the ashes, picking out the good coal, and playing a game of dice with them, we can decide the problem with the most sensible of logic.

A BRAZING CLAMP

THE clamp shown is used for holding small bands or hoops while brazing the ends together. The hoop is placed as shown at A, with the ends overlapping and the clamp B holding them down. The brazing is then done with the torch shown at the left. The clamp is held down by means of a spiral spring underneath the bench, and, when the work is to be released a foot treadle is pressed which pulls on a wire fastened to the back end of the clamp. This tips it up in front and releases the hoop



A BRAZING CLAMP.

BUYING AN ELECTRIC MOTOR

NOW that the demand for electric motors is so general, it often happens that an order has to be placed or a purchase effected by a person having little or no technical knowledge of electrical machinery. The non-technical buyer will much appreciate the hints which have been given by a well-known firm of machine tool makers for his guidance when making a selection of electric motors for works purposes.

It is of little importance whether the main frame of the motor is of iron or steel, but the feet should be planed, and laminated shoes fitted to the pole tips. The supports for the field coils should be so designed that the coils are firmly held, but at the same time there must be no sharp corners which would cut through the insulation by vibration. Obviously the shafts should be as stiff as possible, and oil throwers must be fitted to prevent any possibility of oil creeping along to the commutator and armature and affecting the insulation.

Ventilation should be provided in the armature so that the heat is evenly distributed, and this is usually obtained by means of ventilating ducts, both parallel and at right angles to the shaft. The armature cores are now all built up of laminated sheets insulated from each other, and having the conductors embedded in slots and held in position by strong steel bands, or in the case of large machines by wedges. It is desirable to have the commutators as large as possible in diameter in relation to the diameter of the armature, so that there are no bad bends in bringing the armature conductors into the commutator.

Armature Balancing

Very careful attention should be given to the balancing of the armature, particularly when the machine is required to be of the variable speed type for driving machine tools. Some buyers specify a certain radial wearing depth for the commutator sections. This radial wearing depth should not be too small, otherwise the commutator would need renewing at a comparatively early date, but on the other hand it is undesirable to specify too great a radial depth, as this puts up the cost of the machine unnecessarily. A good commutator will last as long as the machine, provided the machine is designed to run sparklessly.

The design of the bearings should not be niggardly, and it is very good practice to have two oil rings to each bearing, so that if by any chance one ring ceases to act the bearing is prevented from seizing. For ship-board use liberality in the design of the bearings is essential, and with two rings they should be so designed that during pitching or rolling at least one ring will be left free under any conditions to continue the lubrication. Most makers are now using the box type of brush gear, and it is a good feature to provide means of adjustment of the distance between the brush holders and the commutator, such that as the commutator wears down the same relation may be retained throughout.

Insulation

As regards insulation, the leading manufacturers now employ a special apparatus which exhausts all moisture from the insulator before forcing in under pressure the water-proofing varnish and, on general principles, a specified insulation resistance greater than one megohm should not be called for, as to obtain higher values a long baking at high temperatures may be required, which may permanently damage the insulating material. Breakdown tests should be applied, but in machines designed for moderate voltages a test pressure of three times the normal is sufficient.

The question of interpoles is one which is best left to the discretion of the manufacturers, but it can be taken for granted that, for variable speed motors, interpoles are necessary. In purchasing motors it must always be remembered that it is as essential to the manufacturer to know what his machine has to drive as it is for instance for the lathe maker to know what his customer requires the lathe to do.

Nickel and Acids.—Resistance of nickel to acids is considerably increased by the addition of from 5 to 10 per cent. of tantalum. An alloy of nickel with 30 per cent. tantalum can be boiled in aqua regia or any other acid without deterioration. The aloy is tough, easily rolled, hammered or drawn into wire.

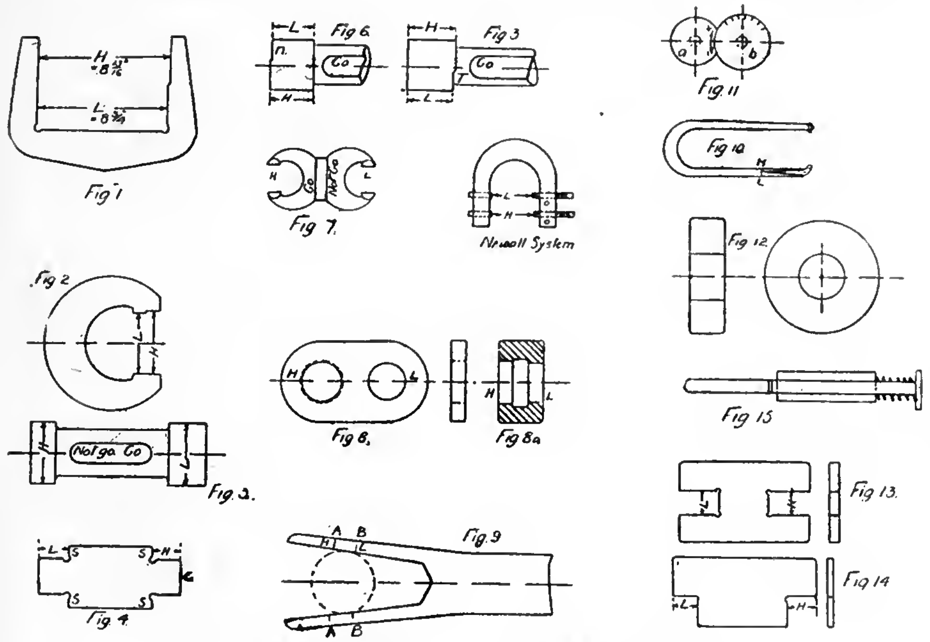
Tip to Business Men.—Ontario's Agent-General, Mr. Reid, who is in close touch with trade conditions, thinks that Canadian business men should not wait until the war is over, but should convene at once to formulate a policy on Imperial trade and submit it to the British Parliament, who says that suggestions should come from the Dominions.

Limit Gauge Principles and Practical Applications--I.*

By W. H. Booth, F.G.S.

As the author aptly remarks, there exists a real lack of grasp of the purpose of limit gauges, even although more or less appreciation may be evidenced by the great bulk of operatives that interchangeability of parts of a particular mechanism being manufactured is an indispensable condition. The writer deals with the various phases of the subject in such a way as to brush aside much of the mystery surrounding limit gauges generally and as will make their service application less irksome, as well as more effective of purpose.

LIMIT gauges have come very slowly into use, and are by no means yet generally understood. It may however be laid down in general terms that the limit gauge is essential to economical manufacturing on the interchangeable plan. The widespread interest in the production of munitions has brought the employments of the limit gauges very much to the front, for a shell is an object which, in spite of its short and merry life, is used in immense numbers, and should therefore be cheaply made, while at the same time quite interchangeable. A shell affords an excellent example of an article to be made as roughly as permissible, and yet as good as is imperative. This brings up at once a particular feature of the limit gauge system. A limit gauge is distinctly commercial. It is not designed for the purpose of producing specially fine work, as so many imagine. It is not a thing to be feared by the mechanic, but rather to be welcomed by him as an aid to rapid progress.



LIMIT GAUGES FOR VARIOUS SERVICES.

Elements of System

To understand the system in its elements, let the case of the building brick be considered. A brick is intended to occupy a space of 9 in. length in a finished wall. Its length should, therefore, be 9 in., less the thickness of the mortar joint. For good outside work the mortar joint should be thin. Suppose that anything from 1/8 in. to 1/4 in. be allowed. Then a limit gauge for inspecting bricks should be, as in Fig. 1, with the two dimensions of 8 7/8 in. and 8 15-16 in. This will ensure that mortar joints do not average more or less than 1/4 in. and 1/8 in. respectively.

Metal Work Application

Applied to metal work, even of the roughest description, the same principles will rule, but, of course, the amount of the clearance will be very much less. The illustration, however, shows that the term "limit" signifies the degree of departure of work from strict accuracy, and the system is based on the fact that absolute accuracy cannot be attained. Small departures from absolute accuracy can be worked to approximately, and may be regarded as accurate in the very finest machine work.

Accuracy is very difficult and expensive to attain, and it is useless to attempt it in commercial work. Practical men, therefore, fix upon the amount by which any dimension may be allowed to differ from the nominal size. Let this difference be, say 0.0001 of an inch either way. Then, for a piece nominally 2-in. diameter the gauge will have two gauging jaws, or two steps, as in Fig. 2, one measuring 2.001; the other measuring 1.999. All pieces must in consequence enter easily the 2.001 end, or step, and must fail to enter the 1.999 end. Thus, if properly worked to, the piece is not so far from nominal size as the gauge by which it is made.

This is one of the notable points of the limit gauge system, and it brings up another. There must be no attempt to fit the piece to the "go on" end, or high end, of the gauge, as any attempt to fit to the gauge destroys the advantages of the system, for it increases the cost of the work needlessly. Men fresh to the system do almost invariably attempt to fit to one end of a double gauge, fearing to miss the other end entirely, but with practice they learn to hit the mean very fairly. The "go on" gauge should drop easily upon the piece of work. Even with a limit of only 0.0004 the "go on" end can rattle on the piece, and the other end can still refuse to go on. Men can, in fact, work more closely than they think they can. They are afraid of the figures, but have better skill than they believe themselves to possess.

Since it is easier to vary an outside than an inside dimension, it is better to base a limit gauge system on uniformity of hole than of shafts, spindles, etc., which are turned or formed on machines like the lathe. To produce a true hole it may first be drilled through by a twist drill, and reamed out to size with a fixed reamer, followed by a very light cut of an adjustable reamer. A double-ended cylindrical gauge of the form of Fig. 3 is used for testing. The spindle to fit the hole is made to one or three or four nominal dimensions, according as the pieces go together, such as a shrink or hydraulic fit, a hammer fit, a push fit, or a running fit.

Varieties of Running Fit

There are at least three varieties of running fit in ordinary engineering work, class A, for fine work of the toolroom order; class B for work of the good steam-engine class; and class C for heavy machinery. Running fits require care-

*From a paper read before the Association of Engineers-in-Charge.

ful fixing of nominal sizes and tolerances, but these are matters for the manufacturer and depend very much on circumstances.

The object of the limit gauge system being to facilitate work, it appears at first sight that if it be desired to run a 2-in. shaft in a 2-in. hole, the hole should be exactly 2-in., and the shaft 1.99 in., if the oil space allowed 0.005 in. or half a hundredth all round the shaft. Suppose, then, that the hole is gauged by a plug gauge with one end 2.001. and the other end 1.999, and the shaft is turned up to fit between 1.989 and 1.991, then the slackest possible fit would be represented by the difference between 2.001 and 1.989 or .012. In certain work however, it will be found that the largest possible shaft diameter will actually be greater than the minimum possible hole diameter. In other words, the shaft would not enter the hole. Such crossed limits, as they are termed, are frequently found given on drawings.

Cross Limits — Inexperienced Operators

It has been already said that workmen fresh to the system will almost invariably tend to hug one of the limit dimensions. They will insist on fitting the turned shaft tightly in the gauge, and often so tightly that the piece is larger than the maximum unstressed gauge dimension. Similarly, they will bore the hole so small that the "go in" end will very nearly not "go in," it will be so tight. With crossed limits and green workers it will often happen that when such parts come to be assembled they will either not go together at all or they will fit far too tightly.

Experienced workers on the other hand make the "go in' and "go on" gauges quite slack fits without trenching upon the "not go" quality of the opposite end of the gauges, and, even with crossed limits, perhaps it will not happen once in a thousand cases that the largest and smallest pieces come together in assembling and prove to be misfits. Even when this does happen, the assembler puts one of the pieces aside, and picks up another piece instead. It may happen that one piece is actually rejected, but this is a small loss in comparison with the continuous gain due to the system. A piece thus rejected should be promptly destroyed if not remediable, and, usually, with small parts it does not pay to remedy an odd piece or two.

Mean Sizes Average

The foregoing, while it explains how apparently erroneous dimensioning is really good commercial practice, serves to illustrate the facts which make limit gauging a success, viz., that the parts gauged tend to average at mean sizes, and, by the doctrine of chance, probability or improbability, the extremes of two sets of parts do not meet. Obviously, if it often occurred that parts did refuse to assemble properly it would be necessary to reconsider the limits or to examine the gauges, or trace out the man who was responsible for hugging one limit—a fault of lack of confidence which is costly in gauges, for it leads to rapid wear of the gauge due to forcing it in or on, and so tends to intensify the mischief.

Limit Gauge Forms

Limit gauges take a wide variety of forms, some of the commoner forms being as follows:—

Fig. 4 is a depth gauge, one end of which is inserted into a drilled hole, and touches the bottom of the hole before the shoulders s s make contact on the top surface. The other end rocks on the shoulders s s, because the end C cannot reach the bottom of the hole. Therefore, the depth of the hole is somewhere between the length of the two ends.

Fig. 5 is a depth gauge which not only measures the "go in" diameter of the hole, but also the depth. A small shaving is taken off the shoulder at T, and the upper surface of the metal must stand above T, but below the unshaved remainder.

Fig. 6 shows a gauge which measures the tapped hole in a plate of metal, and the thickness of that plate of metal must be such that, while the end of the gauge may project through it, the shaved step N is below the metal surface. This shaving off or stepping is a very common way of marking limits.

In Fig. 7 is shown an ordinary double-ended snap gauge, one end to "go on" and the other "not to go."

Fig. 8 is the same gauge, single-ended, one jaw having the limit step cut across it, so that the gauge will drop upon a shaft, and must be stopped by the step from going further.

Fig. 9 shows a form of gauge which is sometimes employed. Its jaws are long and alligator-mouthed, and the work to be gauged must enter the jaws to some point between the lines A A, B B, ruled across the jaws. In a gauge of this description, the distance between the points of contact of the piece gauged and the two jaws is less than the diameter of the piece, and this fact must be allowed for when scribing the lines. The actual diameter of the circle gauged is D, and $D = C \times \tan \frac{Q}{2}$, where C is the distance between the jaws at the contact point, and Q is the angle of divergence of the jaws, or $D = C \tan a$ for $a = \frac{Q}{2}$

It is often desired to measure the thickness of a long cylinder. For this purpose, the gauge (Fig. 10) is like a long pair of pincers, the gauging points being placed at the end of the handles and the nipping ends being arranged so that a finger on one jaw indicates upon a graduated curve formed on the other jaw. This finger is usually made in the form of a multiplying lever, and the zero point of the scale may be the point marked by the finger when the wall is of the nominal thickness, any difference being shown by the deviation right or left of the indicator.

It is not necessary further to describe forms of fixed limit gauges which are used on work to be produced in large quantities. In a factory such as an engine shop there will always be a large amount of simple turned and ground cylindrical work and plain boring, also much breadth and thickness work also capable of limit gauge treatment. Upon the conditions of manufacture, the forms of gauges employed must largely depend, and it will frequently be the case that an adjustable gauge system will be cheaper to employ wholly or partially.

Adjustable Snap or Caliper Gauge

An adjustable snap or caliper gauge on the limit system is of the form of the usual C gauge with the gauging jaws extended to carry, on the one, a pair of fixed anvil points, and on the other, which is split, a pair of micrometer screws, the flat ends of which form the gauge points, and the body of each screw can be gripped in the split jaw by a gripping screw. The two screws can each be set, say, 2 in. from its opposing anvil point in the other jaw, by means of a standard setting block. In each screw face is a small drilled hole, into which fits the spindle of a little circular dial plate, as in Fig. 11.

One disc (a) is hollowed on the edge to fit the circle of the other disc (b), and (a) carries the zero point, while (b) is divided round its edge into one hundred divisions, each representing .00025 in., the pitch of the screw being .025 or 1-40th in. The dial can be set by estimation of the eye to .000125 in., and even to .0000625 with fair approximation, or, if necessary, the fixed dial (a) might be made to show even closer adjustment by means of a vernier scale on its edge.

This system of adjustable gauge and limit settings is the Newall system, and it is usual for each gauge to comprise a ½-in. range. Thus, a 1-in. size will have a screw range of ½ in. The 2-in. gauge extends to 2½, and so on, and a few gauges will fill the full range from 0 up to any desired size. It is not thought desirable to extend the screwing beyond the ½ in. Any possible error in the pitch of the screws is negligible, for the screw only comes into play when setting the small limits from the nominal size.

Mineral Production of Canada for Calendar Year 1915--II.

By John McLeish, B-A. *

The accompanying statistics have become available through the issuance of a preliminary report by the Department of Mines, Ottawa. Although subject to slight additions or modifications of detail pending final compilation at a later date, we believe a more than ordinary interest will be taken in the data presented, particularly on account of the war-created activity which has marked almost every section of Canada's mineral resources development.

IRON ore shipments in 1915 amounted to 398,112 short tons valued at $774,427, compared with 1914 shipments of 244,854 short tons valued at $542,041. The 1915 shipments included hematite 205,989 tons, roasted siderite 132,906 tons, and cobbed magnetite and concentrates 59,217 tons. The 1914 shipments included hematite 89,454 tons, roasted siderite 109,838 tons, and cobbed magnetite and concentrates 45,562 tons. In the Great Lakes area the same ore prices prevailed as in 1914 and 1910 which were the lowest recorded in many years. Mine operators report 93,444 tons of ore exported to the United States and 304,668 tons shipped to Canadian furnaces.

According to the records of the Customs Department exports of iron ore amounted to 79,770 tons valued at $206,823 and imports of iron ore to 1,499,722 tons valued at $2,320,066. Shipments of iron ore from Wabana Mines, Newfoundland, in 1915, by the two Canadian companies operating there were 686,451 short tons of which 620,128 tons were shipped to Cape Breton and 66,323 tons to England. In 1914 the shipments were 639,430 short tons, of which 422,920 tons went to Cape Breton and 216,510 to the United States and Europe.

Pig Iron

The total production of pig iron in Canadian blast furnaces in 1915 was 913,719 short tons, valued at approximately $11,592,819 as compared with a production of 783,164 short tons in 1914 valued at approximately $10.002.856. A large proportion of this production is used directly in the manufacture of steel and the values are in part estimated. The 1915 output shows an increase of 130,555 tons or 16.67 per cent. over that of 1914, and compares favorably with the average of recent years. Of the total production in 1915, 13,692 tons were made with charcoal and 900,027 tons with coke. Included in the ore charged to blast furnaces, there was 293,305 short tons from Canadian mines and 1,463,681 tons of imported ore. Of the imported ore approximately 840.587 tons came from Newfoundland.

The blast furnace plants, operated for varying periods of time, included those of the Dominion Iron & Steel Co., at Sydney, N.C., the Nova Scotia Steel & Coal Co., at North Sydney, N.S., the Standard Iron Co., at Deseronto, Ont., the Steel Co., of Canada at Hamilton, Ont., the Canadian Furnace Co. at Port Colborne, Ont., and the Algoma Steel Co. at Sault Ste. Marie, Ont.

There was also in 1915 a production in electric furnaces of 10,794 tons of ferro-alloys (chiefly ferro-silicon with a very small tonnage of ferro-phosphorus), valued at $753,486 as compared with a production in 1914 of 7,524 tons valued at $478,355. About two-thirds of the ferro-silicon production in 1915 was of 50 per cent. grade, and the balance was of 75 and 85 per cent. grade.

Pig Iron Exports and Imports

The exports during 1915 of pig iron were 17,307 short tons valued at $231,551 or an average per ton of $13.38, and of ferro-silicon and ferro-compounds 9,238 tons valued at $537,081, an average of $50.81 per ton, or a total of 26,545 tons valued at $768,632 as compared with a total in 1914 of 19,063 tons valued at $486,366. The imports were 47,482 tons of pig iron valued at $624,200, or an average of $13.15 per ton, and 13,758 tons of speigeleisen, ferro-manganese and ferro-silicon valued at $807,312. or a total of 61,240 tons valued at $1.431,512.

Electro Metals, Ltd., producing ferro-silicon, have considerably enlarged the capacity of their plant at Welland, Ont., to meet the increased demand for their product occasioned by the war. In addition to sales for Canadian consumption a large and important tonnage has been furnished to Great Britain, Russia and the United States.

Steel Ingots and Castings

The production of steel ingots and castings in 1915 including 5,626 tons from electric furnaces, was 1,020,335 short tons, as compared with a production in 1914 of 828,641 tons. The 1914 production included open-hearth ingots 608,383 tons; Bessemer ingots 203,184 tons; direct open-hearth castings 15,315 tons; and other steel castings 1,759 tons, these figures being a revision of those previously published.

Asbestos

The asbestos production in 1915 was obtained from the same field in Quebec as heretofore. The output was less than in 1914, but sales showed an increase of about 17 per cent. Stocks on hand at the end of the year showed a noticeable decrease. The total output in 1915 was 106,558 tons, as against 107,668 tons in 1914, showing a decrease of 1,110 tons or 1.03 per cent. The sales and shipments during 1915 were 113,115 tons valued at $3.491.450, or an average of $30.87 per ton. as against sales in 1914 of 96,542 tons valued at $2,892,266 or an average of $29.92 per ton. The 1915 sales were larger in quantity than those of 1914 by about 17 per cent. and in value by about 20 per cent. Stocks on hand at December 31st, 1915, were 22,052 tons, as compared with stocks on hand of 31,171 at the end of the previous year. The number of men employed in the mines or quarries and mills were 2,393 and the amount paid in wages was $1,089,976 as against 2,992 men employed in 1914 to whom was paid in wages $1,283,977. The total quantity of asbestos rock milled during the year is reported as 1,795.472 tons, which with a mill production of 102,571 tons shows an average estimated content of about 5.71 per cent. of asbestos fibre in the rock. The estimated content of fibre in rock milled in 1914 was 6.03 per cent.

Asbestos Sales and Exports

The total sales of crude asbestos in 1915 were 5,366.7 tons valued at $1,071,860, or an average of $199.72 per ton as against sales in 1914 of 4,147.9 tons valued at $773,193 or an average of $186.42 per ton. The total sales of mill stock in 1915 were 107,748 tons valued at $2,419,590 or an average of $22.46 per ton, as against sales in 1914 of 92,394 tons valued at $2,119,073, or an average of $21.64 per ton. There was also a production of asbestic of 25,700 tons valued at $21,819.

Exports of asbestos during the calendar year 1915 were 84,584 tons valued at $2,734,695. or an average of $32.45 per ton, as against exports of 81.081 tons in 1914 valued at $2.298.646 or an average of $28.35 per ton. There was also an export of asbestos sand amounting to 25.103 tons valued at $157,410. or an average of $6.27 per ton and of manufactures of asbestos valued at $125,003. Imports of asbestos manufactures for the year amounted to $168,894.

*Chief of Mineral Resources and Statistics Division, Mines Branch, Department of Mines, Ottawa.

Coal and Coke

Coal.—The total production of marketable coal for the year 1915 (comprising sales and shipments, colliery consumption, and coal used in making coke, or used otherwise by colliery operators), was 13,209,371 short tons valued at $31,957,757, as against 13,637,529 tons valued at $33,471,801 in 1914 showing a decrease of 428,158 tons, or 3.14 per cent. in quantity, and of $1,514,044 or 4.52 per cent. in total value. In estimating the values of the coals, arbitrary values are assumed for the Nova Scotia and British Columbia production viz.: $2.50 per long ton for the former and $3.50 per long ton for the latter. The values used for coal production in the other provinces are those furnished by the operators.

The Nova Scotia production was 7,429,888 tons, an increase of 58,964 tons, or 0.8 per cent. over that of 1914: the Alberta production 3,320,431 tons, a decrease of 362,584 tons, or 9.8 per cent.: the British Columbia production 2,089,966 tons, a decrease of 149,833 tons, or 6.7 per cent.; the Saskatchewan production 236,940 tons, an increase of 4,641 tons, or about 2 per cent.; the New Brunswick production 122,422 tons, an increase of 24,373 tons, or 24.85 per cent.; and Yukon Territory, a production of 9,724 tons, a decrease of 3,719, or 28 per cent.

Coal Exports and Imports

The exports of coal in 1915 were 1,766,543 tons valued at $5,406,058, as compared with exports of 1,423,126 tons in 1914 valued at $3,880,175, an increase of 343,417 tons or 2.41 per cent.

The imports of coal in 1915 were made up as follows: Bituminous round and run of mine; 6,106,794 tons, valued at $7,564,369, or an average of $1.24 per ton; bituminous slack 2,286,916 tons valued at $2,027,256, or an average of $0.89 per ton; and anthracite 4,072,192 tons valued at $18,753,980, or an average of $4.61 per ton, making a total of 12,465,902 tons valued at $28,345,605.

Imports during 1914 included bituminous, round and run-of-mine 7,776,415 tons valued at $14,954,321 or an average of $1.92 per ton; bituminous slack 2,509,632 tons valued at $3,605,235, or an average of $1.43 per ton; and anthracite 4,435,010 tons valued at $21,241,924 or an average of $4.79 per ton, making total imports of 14,721,057 tons valued at $39,801,498.

The above figures show that in 1915 there was a decrease from imports of the previous year in quantity of 2,255,155 tons, of 15.3 per cent., and in value of $11,455,893, or 28.78 per cent. The larger decrease in value is due to the average value of bituminous, round, and run of mine dropping from $1.92 per ton in 1914 to $1.24 per ton in 1915, and that of bituminous slack from $1.44 to $0.89. The details of the decreases in imports are as follows:—In bituminous, round and run-of-mine 1,669,621 tons or 21.5 per cent.: in bituminous slack of 222,716 tons, or 8.9 per cent.; and in anthracite of 362,818 tons or 8.2 per cent. The apparent consumption of coal during 1915 was therefore 23,849,040 tons, as against a consumption the previous year of 26,852,323 tons. Canadian mines contributed 48 per cent. of the domestic consumption, and the balance was imported. The total Canadian production was equivalent to about 53.4 per cent. of the consumption.

Coke.—The total output of oven coke during 1915 was 1,200,766 short tons made from 1,856,393 tons of coal of which 1,425,172 tons were of domestic origin and 431,221 tons were imported. The total quantity of coke sold or used by the producers during the year was 1,168,921 tons valued at $4,253,536 or an average of $3.64 per ton. In 1914 the total output was 1,015,253 tons, and the quantity sold or used by the producers was 1,023,860 tons valued at $3,658,514 or an average of $3.57 per ton. Returns for 1915 show a production of 0.647 tons of coke per ton of coal charged, as compared with 0.658 tons of coke per ton of coal charged in 1914.

Provincial Coke Output

The output of coke by provinces in 1915 was as follows: Nova Scotia 584,993 tons, an increase of 239,113 tons over 1914 production; Ontario 316,211 tons, a decrease of 61,303 tons; Alberta 24,187 tons, a decrease of 4,354 tons; and British Columbia 275,375 tons, an increase of 12,057 tons. The Ontario production was entirely from imported coal. By-products from coke ovens which included 10,448 tons of ammonium sulphate, 7,365,931 gallons of tar, and 4,089,602 thousand cubic feet of gas, made in 1915 were in excess of the production in 1914; there was also for the first time a production of benzol and associated compounds. The production of trinitrotoluene near the close of the year was reported by Col. Carnegie of the Shell Committee, as 100,000 pounds per week

The ovens operated during the year were those at Sydney, Sydney Mines and Westville, N.S., Sault Ste. Marie, Ont., Coleman, Albert, and Fernie, Michel, and Union Bay (Comox), British Columbia. At the close of the year there were about 1,742 ovens in operation, as contrasted with only 797 in operation, at the end of 1914. Over 800 ovens at Stellarton and Londonderry in Nova Scotia; Port Arthur, Ont.; Lille and Passburg, Alberta; Carbonado and Hosmer, British Columbia, were idle throughout the year. Imports of coke during 1915 amounted to 637,857 tons valued at $1,608,464, and exports were 35,869 tons valued at $160,053.

TRAVELLING WORKSHOP FOR MOTOR AMBULANCES

THE latest type of travelling workshop has been designed and built under the supervision of the R. A. C. Engineers' Department for the British Red Cross Society, and is described in a recent issue of the "Car." At least one of these workshops accompanies each convoy of motor ambulances, and it is explained that within the next few weeks there will be about twenty of these indispensable vehicles in actual use in France, Belgium and Italy. The whole of the near side can be raised when required to form a roof to protect the workers from the weather. As soon as this roof is fixed in position a hinged flap can be lowered and supported in such a way that the floor space is doubled. This enables the men to work from either side of the bench.

Special attention has been paid to the lighting, which is in duplicate—acetylene gas and electric light. Shear legs are provided at the back, and are used in conjunction with a 15-cwt. pulley block for hoisting the engine out of the frame, or in the case of a complete breakdown the front of the disabled vehicle can be lifted off the ground, and it can then be towed away on its rear wheels. In practice this shear leg attachment has been found to be one of the most useful fittings of the workshop. At the back of the car is an extra wide and strong step, and on this a large vise is permanently fixed. This step forms a useful rough bench, and is much appreciated by the mechanics in charge.

The tool equipment includes a 6-in. hollow mandrel lathe, a ½-in. vertical drilling machine, a double wheeled emery grinder, and a 400-watt charging and lighting dynamo. These are driven by a three horse-power vertical two-stroke petrol engine. There are also a rivet forge, a brazing pan, large and small petrol blow lamps, small hand tools of all kinds, various sizes of round, square and hexagon steel—mild and nickel—key steels, brass and steel tubing, brass sheet and copper sheet, and a large supply of nuts, bolts and washers. The body is mounted on a three-ton commercial chassis, and the weight of the complete vehicle is about 4½ tons.

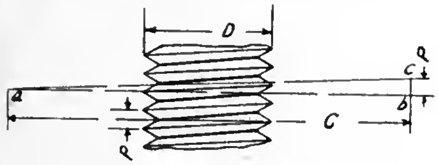
Stellite.—Stellite is not steel, it contains neither iron nor carbon, but is a tungsten. It is entirely unaffected by any degree of heat that can be generated by cutting, and, it is claimed, will maintain its edge at speeds which no high speed steel can stand, as well as be used on materials which high speed steel will not cut. Stellite must be held in a tool holder, as it is of a brittle nature.

Series of Practical Questions and Answers for Mechanics

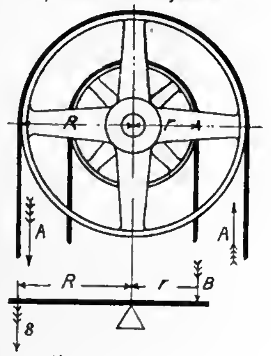
Every care is being taken to include only pertinent practical questions, and give same direct, reliable answers. Catch questions will be avoided. Arithmetic, consisting of simple addition, subtraction, multiplication and division will be found a useful companion study.

Question.—When we have been turning small shafts of a length exceeding twelve times the diameter, we have often been troubled with the shaft being out of true. How can this be avoided?

Answer.—When turning shafting, the heat that is generated by the action of the cut has a tendency to elongate the



Inclined plane, wedge & screw.



Pulley & Lever.

shaft. This is more perceptible in small work, and it is often necessary to release the pressure on the tailstock centre to avoid undue strain in the metal. When the work is long and light, the tendency is to distort the shaft, and in the case of heavier work the action is directly against the centres; this pressure will then cause tailstock centre to cut into the metal, and if the density is not uniform, the centre will wear eccentric to the shaft circumference.

* * *

Question.—What is meant by the elementary mechanical powers?

Answer. — Original works on mechanics state that there are five mechanical powers—that is, the inclined plane, the wedge, the screw, the lever, and the pulley. However, by closely observing the accompanying sketch, it will be clear that in reality these five powers can be placed in two classes—that is, the wedge or inclined plane and the lever. In the top sketch the triangle a b c forms a wedge, the angle c a b forms the inclined plane, and this angle also is that derived from the development of the screw shown, where D is the diameter, c b equal to the pitch, and a b equal to the circumference C. In the pulley and lever sketch the similarity is shown between the two powers. The arrows A indicate the direction of motion and the arrows B indicate the direction of force and resistance, and the radii R r of the pulleys represent the two arms of the lever.

* * *

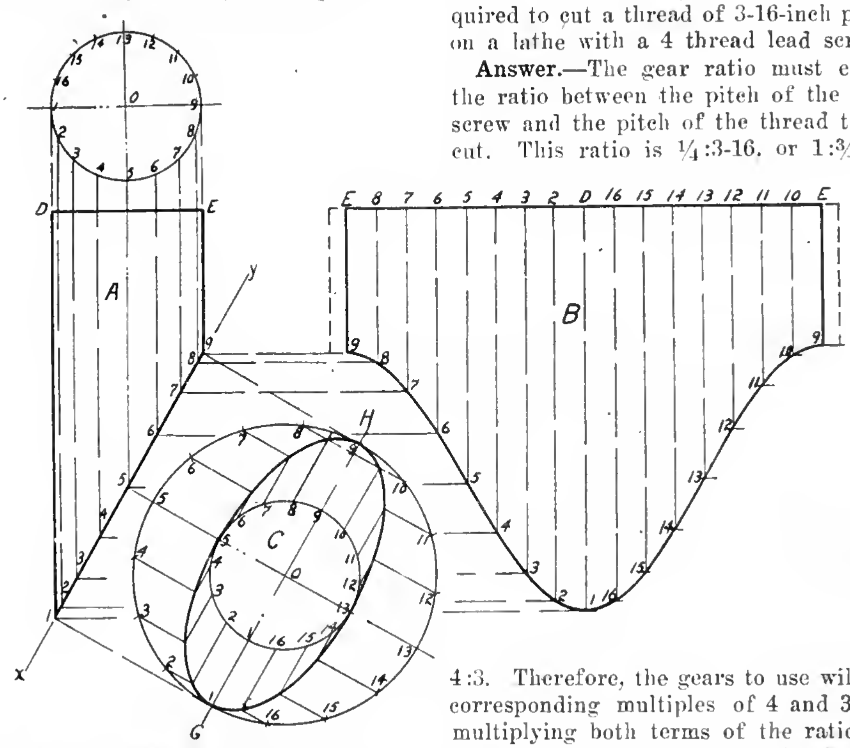
Question.—Is it any advantage to use oil when drilling or tapping cast iron?

Answer.—The drilling of cast iron is best accomplished when no oil is used, when conditions are normal, dry drilling is always to be preferred. When tapping cast iron many mechanics prefer to use no oil, and in many cases this can be considered good practice. However, the use of oil is not objectionable, provided it is of a good quality of light oil and only a few drops used to lubricate the teeth, but in no case is it advisable to use oil profusely.

* * *

Question.—A round pipe 10 inches in diameter is to be fitted to a roof, having a pitch of 60 degrees with the horizontal. What would be the shape of the opening in the roof, and also the shape of the pipe before being rolled?

Answer.—To determine the correct shapes and dimensions it is necessary to develop the outline upon the flat stock. First, draw a side elevation, as shown at A, the line x y forming the angle of 60



degrees and D E representing the diameter of the pipe. Directly above draw a circle, representing a plan of the pipe, and divide it into any number of equal parts, in this case sixteen. From these divisions, project lines, cutting the line x y as shown.

To find the shape of the roof opening, draw the line G H parallel to the line x y and some distance to the right. From the point 5 draw a line perpendicular to x y, and cutting the line G H at 0. From the point 0 draw two circles—one with a diameter equal to that of the pipe and a larger one with a diameter equal to the distance 1, 9 on the line x y. Divide these circles into the same number of equal divisions, and from these points project lines until they intersect as shown. The curve drawn through these intersections will give the outline of the roof opening. (All intersections must be from corresponding divisions).

To develop the blank B, first draw the line E E in line with the top of the pipe elevation, and divide it into 16 equal divisions. The intersection of the vertical projections of these points and the horizontal projections of corresponding points on the line x y will give the points through which to draw the curve, so that when rolled the pipe will fit the slope of the roof and sit in a vertical position.

* * *

Question—What gears would be required to cut a thread of 3-16-inch pitch on a lathe with a 4 thread lead screw?

Answer.—The gear ratio must equal the ratio between the pitch of the lead screw and the pitch of the thread to be cut. This ratio is $\frac{1}{4}$:3-16, or 1:$\frac{3}{4}$ or 4:3. Therefore, the gears to use will be corresponding multiples of 4 and 3, or multiplying both terms of the ratio by the same number, we obtain the desired gears. Thus: $4 \times 10 = 40$ and $3 \times 10 = 30$, or $4 \times 16 = 64$ and $3 \times 16 = 48$. Then 40 and 30 or 64 and 48 would cut the re-

quired thread. To determine the studs upon which the respective gears should go, always remember that the threads per inch on the lead screw multiplied by the gear on the lead screw must equal the gear on the spindle multiplied by the threads per inch on the work. In this case $4 \times 40 = 5\ 1\text{-}3 \times 30 = 160$. Therefore, the 30-gear will go on the spindle stud and the 40-gear on the lead screw.

* * *

Question.—A grinding wheel is specified to run at a surface speed of 4,000 feet per minute. If the wheel is 10 inches in diameter and running at a speed of 1,475 revolutions per minute, what should the speed of a 4-inch diameter shaft be to meet the surface speed condition?

Answer.—Surface speed of grinding wheel equals $\frac{10 \times 3.1416}{12} \times 1{,}475 = 3{,}862$ feet per minute.

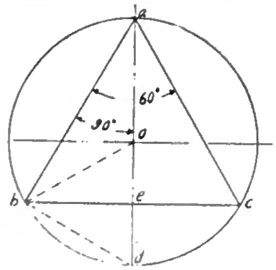
Surface speed of shaft being ground, will then be 4,000 minus $3{,}862 = 138$ feet per minute. Therefore, speed of 4-inch shaft will be 138 divided by circumference, or $138 \div \frac{4 \times 3.1416}{12} = 131$ revolutions per minute.

* * *

Question.—What would be the length of a side of an equilateral triangle that could be enclosed by a 9-in. circle.

Answer.—The length of the side will be .866 times the diameter of the circle, or $9 \times .866 = 7.794$ inches.

To find by calculation we proceed as shown in the sketch. As the sides of the triangle are all the same length, it follows that the distance b e will be one-half the length b c. Now as the triangle b o d is also equilateral, the distance o e will equal e d. Then $b\ e = \sqrt{[(b\ o)^2 - (o\ e)^2]} = \sqrt{(4.5^2 - 2.25^2)} = \sqrt{15.1875} = 3.897$ inches. Then length of side $b\ c = 3.897 \times 2 = 7.794$ inches.



* * *

Question.—A large pipe is required to carry away the discharge from 20 1¼-inch pipes. Allowing 5 per cent. over capacity, what would be the diameter of the large pipe?

Answer.—The area of each 1¼-inch pipe would be $1.25^2 \times .7854 = 1.227$ sq. in. Then 20 pipes would have a total area of $1.227 \times 20 = 24.54$ sq. in. With an over allowance of 5 per cent. the area of large pipe should be $24.54 \times 1.05 = 25.767$ square inches. Therefore, diameter of large pipe should be $\sqrt{\frac{25.767}{.7854}} = \sqrt{32.81} = 5.72$ inches.

* * *

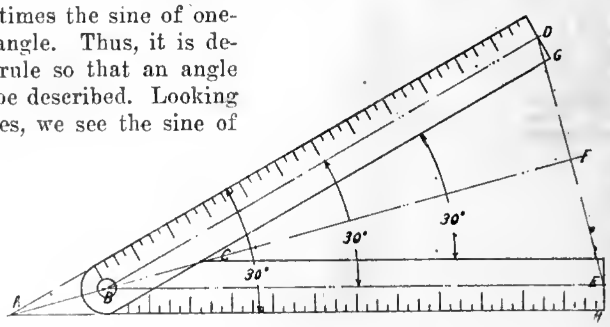
Question.—A large casting is placed in a tank of water, and it is found to raise the level of the water 4 inches. If the dimensions of the tank are 8 ft x 6 ft. x 5 ft. deep, what is the approximate weight of the casting when the specific gravity of the metal is 7.21?

Answer.—The volume of water displaced by the casting would be $8 \times 6 \times \frac{4}{12} = 16$ cu. ft. One cubic foot of water weighs 62.5 lbs., then the approximate weight of the casting will be the weight of water displaced, multiplied by the specific gravity of the metal, or $62.5 \times 16 \times 7.21 = 7{,}210$ lbs.

* * *

Question.—How can a two-foot hinged rule be used to determine the size of an angle?

Answer.—With the use of a table of sines any desired angle can be formed by opening the rule so that the distance D E will equal 24 times the sine of one-half the required angle. Thus, it is desired to open the rule so that an angle of 30 degrees can be described. Looking in the table of sines, we see the sine of 15 degrees to be .25882; then multiplying this by 24, we obtain 6.2 inches for the distance D E. As the points D and E may be inconvenient to work from, it would be better to measure from the points G and H. Any desired angle may be very accurately determined by this means. However, for general use the table here given may be of service:



Degrees	Length D E in inches	Degrees	Length D E in inches
5	1.04	50	10.12
10	2.09	55	11.08
15	3.12	60	12.00
20	4.17	65	12.89
25	5.21	70	13.76
30	6.21	75	14.61
35	7.20	80	15.43
40	8.21	85	16.21

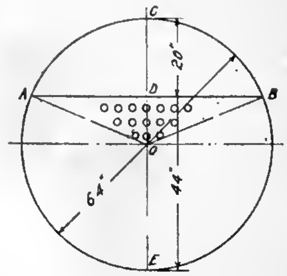
* * *

Question.—At what speed should a belt be run to obtain the best results?

Answer.—Existing conditions will have much to do with the speed of belting, but the generally accepted speed at which maximum economy and efficiency is shown is about 4,000 feet per minute.

Question.—A horizontal return tubular boiler, 64 inches in diameter and 16 feet long, is filled with water to within 20 inches of the top. What is the approximate steam space and quantity of water if boiler contains 160 2-inch tubes?

Answer.—As shown by the sketch, the volume of the steam space will be



the area of the segment A C B multiplied by the length of the shell. The length of the line A B can be found from the equation C D : D B = D B : D E, or $(D\ B)^2 = C\ D \times D\ E = 20 \times 44 = 880$; then $D\ B = \sqrt{880} = 29.66$ inches.

The area of the triangle A O B equals $29.66 \times 12 = 355.92$ sq. in. To find angle D O B, use the formula, cosine $= \frac{\text{side adjacent}}{\text{hypotenuse}} = \frac{12}{32} = .37500$, and the angle corresponding is 68 degrees. Therefore, angle A O B = 136 degrees. Area of boiler head $= 64^2 \times .7854 = 3217$ sq. inches.

Area of sector A O B C $= \frac{136}{360}$ of $3217 = 1{,}215$ sq. in.; then area of segment $= 1215 - 356 = 859$ sq. in.

Volume of steam space $= \frac{859}{144} \times \frac{16}{1} = 95.44$ cu. feet.

Volume of 160 two-inch tubes equals $\frac{2^2 \times .7854 \times 16 \times 12 \times 160}{1728} = 55.87$ cubic feet.

Volume of water equals $(\frac{2358}{144} \times \frac{16}{1}) - 55.87 = 206.13$ cub. feet.

Quantity of water in U.S. gallons will approximate $7.48 \times 206.13 = 1542$ gallons.

PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

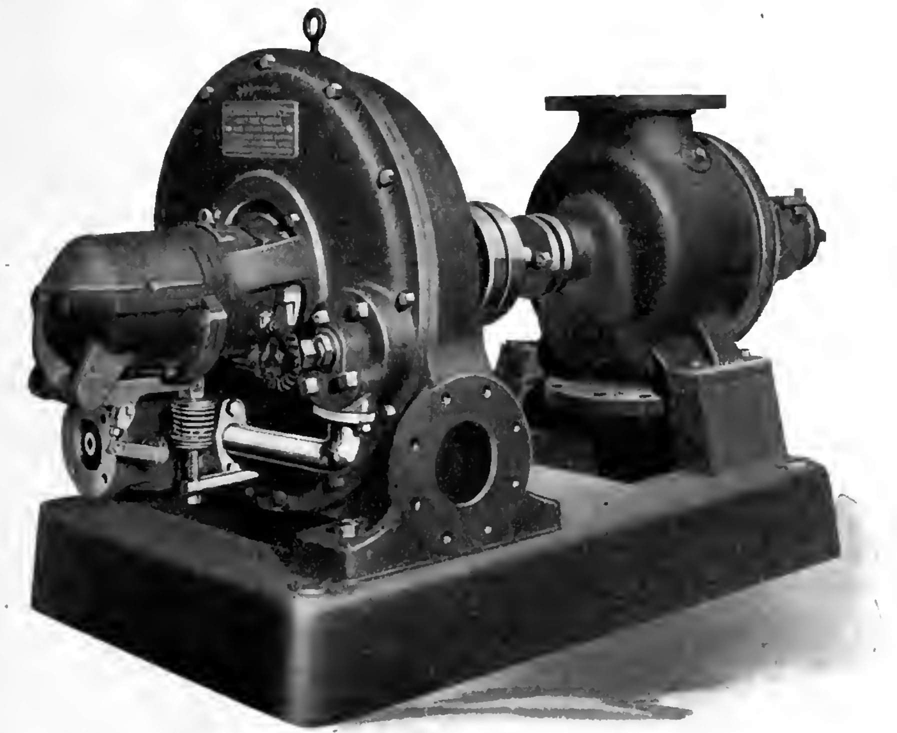
STEAM TURBINE DRIVEN, LOW LIFT CENTRIFUGAL PUMP

THE illustration shows a low lift centrifugal, turbine-driven pump recently supplied to the Canadian Salt Co., Windsor, Ont., by the Goldie & McCulloch Co., of Galt, Ont., for condenser service in connection with the 800 k.w. triple expansion, vertical quick revolution engines also supplied by the same concern. It is capable of delivering 1,000 U.S. gallons per minute against a total head of 40 feet when running at approximately 2100 r.p.m. Under these conditions the makers of the pump guaranteed an efficiency of 60 per cent. with a maximum b.h.p. of 16.85 at pump coupling. A flexible coupling connects the pump to a steam turbine of 20 b.h.p. when operating at about 140 pounds gauge and with back pressure of 5 lbs. gauge.

The pump is of the Rees-Roturbo pattern, the design of which is exceedingly simple, consisting of a pressure drum rotating in a casing at moderately high speed. This pressure drum is mounted on a central horizontal shaft mounted in ring-oiled, babbitted bearings. There are no moving parts in contact except at the bearings, and the whole of the internal arrangements are such that the group is in hydraulic balance. The packing arrangements are also exceedingly simple.

When running, the water gravitates, or is drawn into the eye of the revolving pressure drum where it is stationary relative to the drum. The water is carried round by the revolving partitions, and a pressure is created in the revolving drum by the centrifugal action of rotation. The capacity of the drum being large the water slowly moves toward the periphery where are located a number of short nozzles curved in a direction opposite to the direction of rotation. These nozzles convert a portion of the pressure into velocity and the water passing through them behaves as in a water turbine, assisting the rotation of the revolving drum and thereby giving self regulating effect. The escaped water still having velocity in the direction of rotation is passed between stationary diffusion channels which convert the remaining velocity into pressure.

The special feature of the pump is the construction of the impeller which instead of being built as a flat disc runner with the main object of securing velocity of water in the expanding channels of the fixed casing, is designed in the form of a barrel or pressure chamber, the object aimed at being to secure a constant pressure inside the revolving drum or impeller equivalent to the height of the lift. The impeller having this large capacity, the water inside as it approaches the rim becomes practically stationary relatively to the impeller, thus eliminating all friction losses and generating a pressure by centrifugal force which is the main feature of the patent.



STEAM TURBINE-DRIVEN LOW-LIFT CENTRIFUGAL PUMP.

The steam turbine in this set was also made by the Goldie & McCulloch Co., who supply this same type for both pumping and electrical units. In these smaller power units not more than two nozzles are needed, one being directly in series with the throttle governing valve, while the other one may be controlled by means of a hand valve. As in the other types the latter constitutes an auxiliary valve for use when the load increases over the capacity of the main nozzle which is usually designed to carry approximately full load. The governing mechanism and carbon stuffing rings are similar to those used on the larger power units and the same care is taken in the balancing and overspeed testing. These turbines are supplied either of vertical or horizontal split pattern.

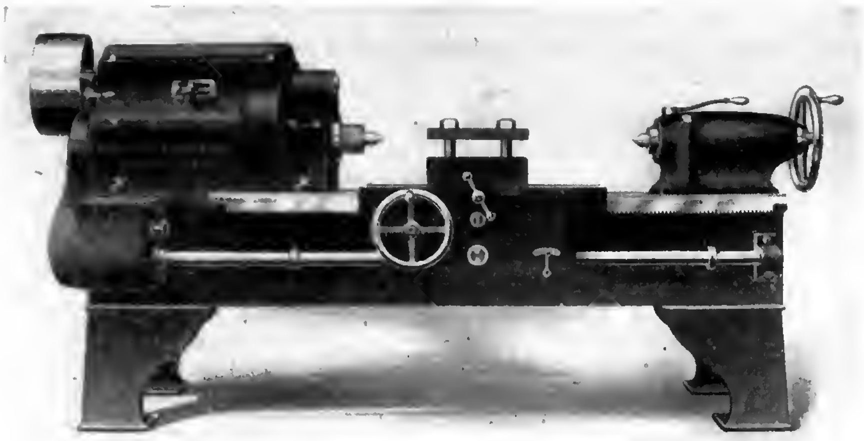
18 IN. GEARED HEAD MANUFACTURING LATHE

AN 18 in. manufacturing lathe possessing simplicity of design and convenience of arrangement which has been been placed on the market by Robert H. Snider & Co., Philadelphia, is shown in the accompanying illustration.

The headstock is of the single pulley gear-drive type; the minimum gear reduction being 2.75 to 1 and the maximum, 12 to 1. The driving pulley has an eight-inch width of belt, and is mounted on the end of the initial drive-shaft which carries the sliding gears. By means of a single hand lever, it is possible to put any of the sliding gears in mesh with its corresponding gear on the lower shaft, to which these gears are keyed fast. The lower shaft also carries a pinion which meshes with the large gear on the lathe spindle.

Only the gears at work are in mesh, it being impossible to engage more than one pair at a time. Power is transmitted from the pulley to the drive shaft through a friction clutch, the lever for

which is interlocked with the gear-shift lever, making it absolutely necessary that the clutch be released before gears can be shifted, and also that gears be properly in mesh before clutch can be re-engaged. The enclosed headstock allows the provision of an oil bath for lubricating the gears; oil wells with ring oilers being provided for the spindle bearings.



18 IN. GEARED HEAD MANUFACTURING LATHE

Four spindle speeds are obtained from the headstock gearing, these being doubled by the two-speed countershaft, giving a total of eight spindle speeds. The bed, carriage, and tailstock are of ample proportions to withstand the severest duty, and as at present offered for shell work the lathe is equipped with simple gear change, rod feed, and plain rest.

The principal dimensions are: Swing over bed, 18 in.; over carriage, 11¼ in.; between centres, 8 ft. bed, 38 in.; front spindle bearing, 5 x 7 in.; rear, 4½ x 10 in.; No. 5, Morse taper centres; tailstock spindle, 4 in. dia. x 9 in. travel; feeds, ⅛, 1-16, 1-32 in.; net weight, 4,100 pounds.

SHELL MARKING AND RIVETING MACHINES

THE illustrations Figs 1 and 2, show two machines for shell manufacture which have been developed by the Grant Mfg. & Machine Co., Bridgeport, Conn. The first of these is a shell marking machine which is so arranged that the blow is brought to bear on each individual letter and figure successively, while the blow can be adjusted to give a shallow or deep impression which is uniform for each letter or figure.

In operation, the marking chuck containing the characters is fastened on the end of the shell by means of a thumb screw. The shelf is then supported in an inverted position by a ball bearing revolving fixture, the base being now in position to receive the blow from the vibrating hammer. The work is completed in one revolution of the shell which is done by hand, the time required to mark a shell perfectly being 15 seconds. The machines are for 18 pdr., 4.5 in., and 60 pdr. high explosive shells.

FIG. 1 MACHINE FOR MARKING SHELL BASES

Fig. 2 illustrates a machine for riveting base plugs in shells of the high explosive type of 4.5 in., 5 in., or 6 in. size. A special supporting table, as shown is fitted with a support for the side of the shell, the nose resting in a suitable block which maintains the shell in the proper position under the hammer.

The riveting device is actuated by compressed air, and is fitted with a foot treadle which brings the hammer into action, leaving the operator with both hands free to handle the work.

The hammer strikes about 1,000 blows per minute which enables the plug to be riveted perfectly tight in one complete revolution, occupying about 20 seconds. The weight of this machine is 300 lbs.; free air per min. 18 cub. ft.; air pressure 80 to 100 lbs. per sq. in.

BRITISH exports of ferromanganese, spiegeleisen and ferrosilicon in 1915 are officially reported at 103,077 gross tons, but probably most of this was ferromanganese. In 1914 these exports were 111,788 tons and in 1913 they were 178,919 tons. Of the 103,000 tons exported in 1915, the United States received only 55,201 tons, showing that considerable quantities went to other countries.

In 1913 about 10,000 tons was imported from Germany by the United States.

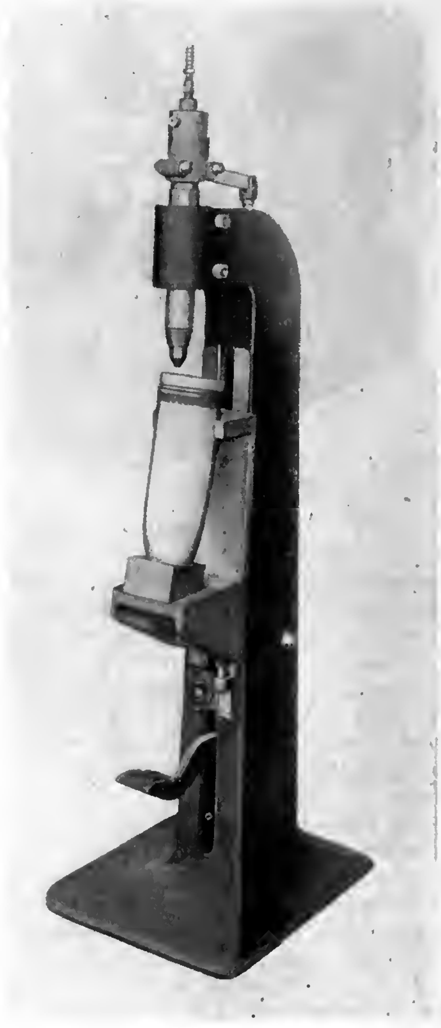


FIG. 2—PNEUMATIC RIVETER FOR SHELL BASE PLUGS

ZINC SMELTING

By F. E. Pierce.*

GENERALLY speaking, zinc sulphide ores will carry from 45 to 60 per cent. zinc and 30 per cent. sulphur, and one ton of average ore 50 per cent. will yield about 850 pounds of spelter and one ton of what is known as 60-degree sulphuric acid.

To-day is the golden age of the zinc business. Spelter sold recently for 17 cents pound. A ton of 50 per cent. ore costs about $100. The working costs are about $15 per ton of ore. About 850 pounds of spelter and a ton of acid are recovered. The spelter is worth about $135 and the acid about $40. The total receipts are, therefore, $175 and the costs $115, leaving profits of $60 per ton of ore. A 200-ton plant would return $12,000 per day, or pay for itself in less than eight months. In normal times, it would be lucky to pay for itself in 10 years.

Characteristics

Zinc has an atomic weight of 65.4; it is bluish white in color and has a crystalline fracture. It tarnishes on exposure, has a specific gravity of about seven, weighs about 435 pounds per cubic foot and has a tensile strength depending on its structure and purity of from 3,000 pounds and 10,000 per square inch. It is quite brittle when cold, but malleable and easily rolled between temperatures of 250 degrees and 300 degrees Fahr.; it is brittle again at 400 degrees Fahr., melts at 790 degrees Fahr., and boils at 980 degrees Fahr. Spelter is the commercial name for metallic zinc. Ordinary slabs of spelter weigh from 45 pounds to 70 pounds and measure 7 inches to 9 inches wide, 16 inches to 18 inches long and 1 to 1¾ inches thick.

Roasting

Zinc dust, of blue powder, is very finely divided metallic zinc superficially oxidized and is produced by the sudden cooling of zinc vapors. It is used where a strong reducing agent is required. In roasting zinc sulphide ore (ZNS) zinc oxide is produced and the loss in weight is approximately 15 per cent. In other words, 100 tons of green or raw ore will, when roasted, result in about 85 tons of roasted ore.

Every spelter man has his own pet formula for his retort and condenser mixes, but the proportions of grog and plastic clay are approximately half and half. To this is sometimes added graphite or coke dust in the proportion of 10 per cent. more or less. The spelter furnaces used in representative plants in this country include the Hegeler producer fired furnace; the natural gas furnace of the Hegeler type and the regenerative furnace of the Siemens or Neureuther type. Both the Hegeler and the natural gas furnaces have middle walls with ledges for supporting the butts of the muffles and front walls made of pillars and plates, held in place by buckstays. These furnaces have two arches, making really two furnaces in one block, back to back.

Classes of Ores

Zinc ores broadly are of two classes, oxidized and sulphides. The oxidized ores are easily reduced and play an important part in the smelting operation, but they are relatively of small tonnage and are used mainly for special purposes as a front charge, or for mixtures to obtain a more reducible or non-slagging charge. The sulphides are the basis of nearly all the spelter produced. They are obtained from the well known districts of Joplin, Missouri, Wisconsin, Montana, Utah, Colorado, Mexico, Australia—almost everywhere in fact. In addition to the zinc, they may contain 2 to 10 per cent. of lead, 2 to 15 per cent. of iron and varying percentages of silica, lime, etc., and they may carry in small percentages, silver, copper and gold. In almost all cases, the ores are concentrates from the run of mine of the district in which they occur.

Great attention has been given of late to the treatment of furnace residues, principally because of the silver values which they contain. A spelter furnace can be worked so that 60 to 70 per cent. of the silver in the ore will remain in the residues. This may amount to 10 ounces per ton of residue. About 50 per cent. of the lead in the ore will remain. This may amount to 50 to 100 pounds per ton of residues.

*From a paper read before the Engineers of Western Pennsylvania.

ALUMINUM AS EXPLOSIVE

THE USE of aluminum in aeroplanes is now widely known, but its use when filed to a powder is less understood. Yet in this condition it forms part of two of the most destructive agents used by the Central European Powers, says the London Standard.

The first is the high explosive used to charge the Austrian shells. This is known as "ammonal," a mixture of five or eight parts ammonium nitrate with one part of finely powdered aluminum. The exact proportions and the means for keeping the mixture dry are, of course, secrets which the Austrians keep to themselves, but even as made in English laboratories its explosive violence is tremendous.

It is one of the few explosives that has never been used as a propellant. No gun known to warfare could resist its suddenness. The explosion chambers would be smashed to pieces before the projectile had begun to move. So it is put inside the projectile itself, and allowed to explode amongst the enemy a few miles away from the gun. So far as we know it is only the Austrian howitzer shell that contains this horrible mixture.

MAGNESIUM IN FOUNDRY WORK

THE use of slightly less than 2 per cent. of magnesium in aluminum castings cleans up the aluminum and leaves 0.75 to 1½ per cent. in the casting, almost doubling its strength and quadrupling its resistance to shock or jar. It reduces the cost of machining more than 50 per cent., halving the number of resets on the cutting tool, giving clean cut machine surfaces, and permitting a polish to be secured with the last cut instead of a separate operation. With care, 1½ per cent. of magnesium at $5.50 per pound is all that is needed: i.e., 8¼ per pound of casting actually required to do the same work. The increase in strength means, in some cases, a reduction in weight of casting of 50 per cent.

The reduction in casting weight is generally not less than 25 per cent. The weight of a pure aluminum casting may therefore be reduced, if this 1½ per cent. of magnesium is used, by from 25 to 50 per cent. This is a great saving even at normal prices of aluminum, since it amounts to about one-fourth of 20c, or 5c. With aluminum at 60c per pound, it amounts to 15c worth of aluminum saved, with a stronger and more stable mechanical result. The saving in machine work alone, when the casting is to receive much machining, more than pays for the use of magnesium.—Dr. W. H. Grosvenor.

SO FAR as the effect of oils on concrete is concerned, the general conclusion, based on the results of tests and actual experience, seems to indicate that mineral oils (under which head may be classed lubricating oils and gasoline) show only a slight tendency to soak into the concrete and perhaps reduce its strength somewhat.

Several engineers have made investigations of concrete structures subject to the effect of engine oil and the like, and have found that in the few cases where there was any evidence of disintegration the concrete itself was of poor quality or the workmanship was inferior. If the concrete exposed to the mineral oils is porous, injured by frost while hardening, of a lean mixture, poorly mixed or improperly cured, there is no doubt that general penetration and weakening of the concrete will result. If, however, the concrete is made of well graded materials, properly proportioned, mixed and placed so as to obtain a dense, compact mass, the oils will have no destructive effect on the concrete.—Kinney.

RUSSIAN LANGUAGE A FACTOR IN SECURING RUSSIAN TRADE

OF the many and varied trade opportunities being dangled before the Western eye meantime, those believed or known to exist in Russia have taken most tangible shape both in bulk and detail comparatively. The war has discovered Russia, in that through it her capacity to absorb raw and manufactured products of other countries has been more fully appreciated than ever before. She, of course, was not wholly neglected and allowed to shift for herself as best she could, although she could have done so by intensive development of her own known national and other resources. No, her alert neighbor Germany had, if not a strangle hold on her more immediate requirements, at least a two hand grip on these. In the years 1912 and 1913, the total imports into Russia amounted to $603,462,707 and $707,627,456 respectively, of which Germany's share was $274,158,035 and $335,887,510 respectively. In a word, Germany monopolized practically 50 per cent. of Russia's whole import business. A husky slice of this 50 per cent. constitutes the opportunity offering.

We are inclined to think that a somewhat hazy idea exists in most minds as to what is implied when we speak of Russia and the capture of her important trade. We fail in large measure to appreciate the extent of the territory involved or the contained population. It is not too generally known that the country is rich in minerals and agricultural products, that were her civilization as advanced, at least so far as the great bulk of her population is concerned, as is that of Western nations, she has everything to constitute an entirely self-contained condition. Russia's mineral wealth compares quite favorably with the richest of nations in that respect, gold, silver, copper, platinum, manganese, iron, coal, timber, etc., being available. Enterprise in development of resources and cultivation of manufacturing skill has been, however, limited in scope and application, hence our export opportunities.

It is becoming daily very evident that to Russia more than to any other nation or state, initiation and extension of trade relationships are directed, and not the least outstanding feature of the situation is that pertaining to the part which familiarity with the Russian language and the business habits of the Russian people will play in achieving worth while and permanent results. Regarding knowledge or use of the Russian language, it may be at once affirmed that this is absolutely indispensable on the part of those who would seek to negotiate business by representative or otherwise. Canada at the moment is much interested in establishing an export connection with Russia, and in the matter of the language some few facts may therefore not come amiss here.

Russian, we are in a position to state is in no sense a language hard of acquirement, and has this attractive feature when pressed into service that it is the common language throughout the length and breadth of the country. At the moment, many Britishers are studying it, and with a view to backing up still further their efforts in that direction, a Russian Directory of British Manufacturers has recently been published; the latter constituting thereby a real practical and forward step towards stimulating British trade with Russia already established, and a powerful weapon whereby Germany's enormous exports to Russia can be diverted to British manufacturers.

This Directory contains nearly 400 pages, carries trade headings in both the Russian and English languages, and includes a brief supplement entitled "Sidelights on Russia," as well as numerous advertising pages. The volume otherwise is printed in Russian, is edited by R. A. Lenski, and is indicative of the support of at least the leading representative British manufacturers.

The demand for catalogues and specifications in the Russian language has never been so keen as at the present time says a British contemporary. Russian buyers are at a loss to find out whence to obtain prompt and reliable information as to where special requirements may be bought. The British Vice-Consul at Ekaterinburg reports that in the Ural mining works a great dearth of machinery in general is now beginning to be felt and to a serious extent, and fears exist as to whether Allied and Neutral Powers will be able to take the place of Germany as far as the tremendous quantity of machinery formerly supplied by her to Russia is concerned.

The British Board of Trade Journal advises that immediate and complete preparations should be made by all firms anxious to share in Russian business following the war. Here again, a good knowledge of the Russian language as well as a technical and practical knowledge of machinery is insisted on. The situation, moreover, in this particular territory is apparently so desperate now that representatives equipped as above are requested to be sent at once. The Russians, it is added, will be only too glad to offer every assistance. Owing to the meantime difficulty of obtaining spare and renewal parts for the German equipment installed, it is expected that the conclusion of the war will see existing plants worn out, necessitating entire renewal.

No attempt has been made in the foregoing to go beyond the language feature as bearing on the initiation of an export trade with Russia, data relative to business methods to be employed, being probably found as complete and instructive in this direction in the Preliminary Report on Russian Trade issued by the Department of Trade and Commerce, Ottawa. Canadian manufacturers, accustomed as they are to maintaining a staff of qualified salesmen for the distribution of their product in English-speaking territory, and who place a more or less potential value on their advertising mediums, whether trade and technical journal or catalogue, will not fail to realize that language appropriation in their trade expansion campaign in Russia constitutes next to quality of product their most powerful weapon of success.

INDUSTRIAL NOTABILITIES

ROSS HUNTINGTON McMASTER, director and manager, Steel Company of Canada, Hamilton, Montreal, etc., was born at Montreal, Oct. 11, 1880, the son of William and Lucy (Greene) McMaster.

He was educated at Montreal High School and Collegiate Institute, and began his business career as office boy with The Sherwin-Williams Co., Montreal and Cleveland, later becoming assistant to the vice-president and general manager, 1897-1903. He became assistant to the vice-president and general man-

ROSS HUNTINGTON McMASTER

ager, Montreal Rolling Mills Co., 1903, occupying that position until formation of the Steel Company of Canada, when he became Manager of the Montreal plant.

Mr. McMaster married Ruth M. Laing, daughter of Peter Laing, Montreal, June 24, 1908; the family consisting of one son and one daughter.

His clubs are St. James' and Forest and Stream, Montreal; Beaconsfield Golf; M.A.A.A., and Indoor Tennis, Montreal, while his recreations are tennis, golf, riding. He is a lieutenant in the 3rd Victoria Rifles.

Mr. McMaster is Conservative in politics and Presbyterian in religion. He resides at 43 McGregor St., Montreal, Que.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents

Montreal, Que., March 27, 1916.—While the present industrial activity is largely due to war conditions, there are increasing indications that the domestic life of Canada is gradually improving. The prosperity of the past eighteen months has indirectly opened up new fields of industry, which will during the coming year be considerably developed. Many lines of manufactured articles, heretofore produced in foreign countries, are now being made here, and many others are under consideration.

The shipment of material, both by land and water, has been greatly restricted owing to embargoes and lack of ocean vessels. This, however, is expected to receive some relief in the near future.

Pig Iron

Reported additions to steel plants and foundries, both here and in the States, will likely have some effect on future conditions of the pig iron market. In view of the fact that smelting facilities are now taxed to capacity, any additional pressure for steel-making iron will result in an advance on the present price of pig iron. It is generally believed that prices will shortly advance, and the market generally is much stronger than a week ago. Bessemer pig, Pittsburg, has advanced 50 cents a ton, and several grades of American iron show similar increase. Local conditions, however, are comparatively unchanged, and prices are holding firm.

Steel

Advices from the Pittsburg district report that the continued advances on all steel and steel products is creating considerable anxiety among some consumers, and many are showing a tendency to hold off from placing contracts for far future delivery, preferring to take chances on future conditions.

Steel prices, especially in the Pittsburg district, continue to advance. Bessemer billets and steel bars have advanced $5 a ton, being quoted at $45. Wire rods also show an increase from $55 to $60 a ton. Steel hoops are higher by ¼c, being quoted at 2¾c. Plate mills are working at capacity in an effort to supply the demand, and prices on plates are ever upward. A further advance is noted in Pittsburg quotations; a price of 2.60c is given for mill convenience delivery; three month 3.50c, and small earlier lots are as high as 4c. The demand for structural shapes is on the increase, with the resulting effect of higher prices asked. An advance of $3 Pittsburg is noted. Sheet mills are practically unable to supply the heavy demand, being in many instances booked for the remainder of the year. Blue annealed sheets are especially active, and quotations are higher; Pittsburg 3c. mill convenience and Philadelphia prices run as high as 4.15c; all prices, however, are nominal. Cold-rolled steel strip stock shows an advance of 50c a hundred, present quotation being 6c a pound.

Following the advances noted in last week's market quotation, Montreal steel prices are holding firm, with the exception of billets, which have been increased this week. The advance this week shows an additional $3 on Bessemer and open-hearth billets, and $2 on forging billets, the respective quotations being $48 on Bessemer and open-hearth, and $68 on forging billets. Montreal dealers are quoting $58 on wire rods, being an advance of $3 a ton. War business continues to predominate, but domestic possibilities are showing improvement.

Metals

The general situation in metals is unchanged, and a tone of quiet prevails. The copper market is easier, following a short spell of activity earlier in the week. Tin is unsteady, and interesting developments may be expected shortly. Spelter is dull again after a few days of brisk business. The attitude of the Trust is one of the influencing features of the lead situation. This stand of the leading interest may have an important bearing on future conditions in the lead market. An apparent scarcity of antimony seems to be developing. Aluminum is slightly stronger, but prices are firm.

Copper.—The copper situation, while apparently unchanged, shows an undertone of unsettled conditions. While the production seems to maintain a fair relation to the demand, the foreign supply is gradually decreasing. This is somewhat pronounced by the fact that the London price has again advanced £6 on spot and £4 on futures. This is in addition to last week's advance of £3 10s. and £3 respectively. In direct contrast to

reported peace negotiations, producers are being continually flooded with requests for bids and specifications on war supplies and munitions.

The visible supply in the United States is somewhat in excess of the demand, and the market is showing signs of dullness, with a tendency to weakness. Some difficulty is being experienced owing to railway freight embargoes, and delivery is very irregular. Some dealers are reported to have shipped considerable copper by express in order to accommodate customers. However, the general feeling appears to be a somewhat easier market, and Friday's quotation on New York market shows a falling off of ¼c per pound, lake and electrolytic being quoted at 27½c and castings at 26c a pound nominal. Local dealers report a steady market, with prices firm at 31c for lake and electrolytic. and 30c a pound for castings.

Tin.—The situation in tin continues to take on strength, and there is considerable speculation as to the reason of recent advance quoted in London. The contention that this is caused by the British regulations regarding foreign shipments does not coincide, as this condition should, if anything, make the market easier in London than elsewhere; whereas the advance in tin amounts to £4 10s. on spot, £3 on future standard, and £4 on spot tin from the Straits. The scarcity of nearby tin is disclosed by the fact that efforts have been made to purchase tin afloat for America. However, as the greater portion of tin now in the holds of vessels is under contract, the advance, reported in London, may be traced to this fact. Far-off deliveries can be contracted for about 43¼c, but prices for intermediate positions vary up to the nominal figure of 50c early delivery. Local dealers who reported an advance of 2c last week have declined a similar amount, and they are again quoting 50c a pound.

Spelter.—Following a recent advance on the London market, a decline of £1 is noted during the past few days. However, the week's quotations show an advance of £3 on futures. Slight improvement is noted in the week's activities, and general conditions indicate a stronger market, but American prices have temporarily declined ¼c per pound. Local conditions are unchanged, and prices are firm at 23c per pound.

Lead—The situation in lead is comparatively quiet at present. London quotations for spot and futures are drawing closer together, spot having advanced 5s and futures declined 2s. The conditions here are for a stronger market, and quotations show an advance of ¼c a pound, this week's price being 10c per pound.

Antimony.—Very little change is noted in antimony, but there is an evident scarcity of metal, which is having the effect of maintaining a strong market. Prices are firm and unchanged at 48c.

Aluminum.—Aluminum is firm and unchanged at 68c a pound.

Machine Tools and Supplies

The general situation in the machine tool industry remains unchanged, but increased activity is looked for in view of the fact that orders have recently been placed for additional shells of the smaller sizes, with others pending. There are also prospects of increased business in the larger shells, which will necessitate the placing of orders for additional equipment. In the case of the smaller shells, the orders, in all likelihood, will go to those firms who are at present manufacturing these shells, and there is not, therefore, so much possibility of further new equipment from these sources.

The demand for machine accessories and supplies, in connection with the production of munitions. continues to keep the small tool makers exceptionally busy.

> **CANADIAN GOVERNMENT PURCHASING COMMISSION**
>
> **The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.**

Old Materials

The demand for heavy melting steel scrap is comparatively heavy, and dealers are paying relatively high prices, which continues to keep the steel scrap market in a fairly strong condition. The Pittsburg district shows a little advance of 25c a ton, while New York is quoting $5 a tin lower than last week. Dealings in copper scrap are not so active, but the market is generally strong; light copper quotation has advanced ¼c per pound. Machine compositions and turnings are in good demand, and the market is becoming stronger on advancing prices. No. 1 machne is quoted at $16.50 and composition turnings at $14.75, being an advance in each case of ¼c per pound. The evident scarcity of wrought iron scrap is having the effect of advancing prices; wrought iron axles this week showing an advance of ¾c, and quoted at 18c per pound.

The prevailing strength of the pig lead is having a similar effect on the scrap lead situation, and dealers report further advances in heavy and tea lead. the former quoted $7.25 and the latter at $6.25 per hundred, being an advance over last week of ¼c per pound.

Scrap zinc is firm, with prices higher, being quoted at 15¾c, and old aluminum has advanced 1c, present price being 35c a pound.

Toronto, Ont., March 28—There is no material change in the industrial situation, but further improvement in business is anticipated with the approach of more open weather. The outlook is favorable and the manufacturers are looking forward to a year of continued activity. The scarcity and high prices of raw materials is becoming an important factor to be considered and many manufacturers are being handicapped on this account. The cost of practically all finished products is steadily advancing and a scarcity in many lines is anticipated. This is particularly true of steel products and indications point to higher levels before the top of the market is reached. The principal advances made this week include steel bars, wrought iron and galvanized pipe, boiler plates, shafting, iron rivets, plate washers, bright and brass wood screws and nuts, pipe fittings, files, soldering coppers, lead wool. In the ingot metal market, tin is weaker, otherwise prices are unchanged.

Steel Market
